Gross Alpha/Beta Preparation Information
High hygroscopic salt content in evaporated samples can cause the sample mass to fluctuate due to moisture absorption. To minimize this interference, the salts are converted to oxides by heating the sample under a flame until a dull red color is obtained. The conversion to oxides stabilizes the sample weight and ensures that proper alpha/beta efficiencies are assigned for each sample. Volatile radioisotopes of carbon, hydrogen, technetium, polonium and cesium may be lost during sample heating, especially to a dull red heat. For this sample set, the prepared planchet was counted for beta activity before being flamed. After flaming, the planchet was counted for alpha activity. This sequence causes the alpha count run data to record over the beta count run data in AlphaLims, therefore only the alpha count data will appear on the instrument runlog.

Z	Paint Filter qualifier: Particulates passed through the filter. No free liquids were observed.
d	The 2:1 depletion requirement was not met for this sample
h	Sample preparation or preservation holding time exceeded.

N/A indicates that spike recovery limits do not apply when sample concentration exceeds spike conc. by a factor of 4 or more.
** Indicates analyte is a surrogate compound.
^ The Relative Percent Difference (RPD) obtained from the sample duplicate (DUP) is evaluated against the acceptence criteria when the sample is greater than five times (5X) the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control limit of +/- the RL is used to evaluate the DUP result.
For PS, PSD, and SDILT results, the values listed are the measured amounts, not final concentrations.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the QC Summary.

The analyst prepared three standard verification sources for Tc-99 source 0718-B by transferring portions of the standard into tared glass liquid scintillation vials. Ten mL of Ready Gel liquid scintillation cocktail was added to each vial and the vials were shaken to mix. A Blank vial was prepared in a similar fashion using 1 mL of DI water and 10 mL of Ready Gel cocktail. The standard verification vials and Background source were dark adapted for two hours and counted on LSC Yellow (Wallac) using Protocol 14 for Tc-99 source standard verification. The Tc-99 efficiency calibration which was used for verification calculations was performed on 2/4/05 using source 0247-A
(Tc-99). Calibration data is recorded in this logbook under Tc-99 0247-A. Each verification source calculation was performed as follows:

Source dpm/g = (A - B)/(C)(D)
where:
A = Ver. source cpm,
B = BKG cpm,
C = System efficiency, (cpm/dpm), and
D = mass used for standard verification.

Physical data

Recommended half life: 29.12 ± 0.24 years (1 year = 365.25 days)

Strontium-90: 100% beta particle emission.
Yttrium-90: 100% beta particle emission. Half life 64.1 ± 0.1 hours.

The activity of the yttrium-90 is equal to the activity of the strontium-90.

Remarks

This product meets the quality assurance requirements for achieving traceability to NIST as defined in ANSI N42.22-1995.

Tests made over a period of 2 years on standardised solutions of strontium-90 stored in glass ampoules have shown that loss of strontium-90 from solution is negligible other than by radioactive decay.

Description Principal radionuclide: Strontium-90

Product code: SIZ64
Solution number: S6/7/19

Measurement Reference time: 1200 GMT on 1 April 1996

Nuclear data Nuclear data quoted on this certificate are taken from the Joint European File, Version 2.2.

Expression of uncertainties The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor $k = 2.00$, which for a *t*-distribution with $\nu_{eff} = \infty$ effective degrees of freedom corresponds to a coverage probability of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

Unless indicated, all other uncertainties are expressed at the confidence level associated with one standard uncertainty.

The format used for the uncertainties in the values of radionuclidic purity is illustrated by the following examples;

6.5(21)	=	6.5 ± 2.1
6.54(21)	=	6.54 ± 0.21
6.543(21)	=	6.543 ± 0.021

Certificate of calibration of standardized tritium labeled water

Description

Radionuclide: TRITIUM (HYDROGEN-3) Product code: TRY·64

Chemical form: water Batch: 111

Measurement

Reference time: 1200 GMT on 1 March 1996

Radioactive concentration of tritium: 488.0 kilobecquerels per gram of water

which is equivalent to: 13.19 microcuries per gram of water

or: 2.93×10^7 disintegrations per minute per gram of water

Method of Measurement
This reference material was calibrated by direct comparison with a standard of tritium-labelled water obtained from the National Institute of Standards and Technology, USA.

Accuracy

The OVERALL UNCERTAINTY of the result quoted above is estimated to be less than ±2.5%

This estimate of uncertainty was calculated in accordance with the recommendations of the International Commission on Radiation Units and Measurements (ICRU Report 12). The limits of uncertainty were taken as the arithmetic sum of the uncertainty due to random variations, calculated at the 99·7% confidence level, and the estimated systematic uncertainties.

Purity

No radioactive impurities were detected. (Impurities with total activity greater than 0.001% of the activity of the tritium would have been detected).

Physical Data

Half-life of tritium: 12·43 ± 0·11 years

Maximum beta energy of tritium: 18·6 keV

Remarks:

The S.I. unit of radioactivity is the becquerel.

1 becquerel (Bq) = 1 nuclear transformation per second, therefore
1 curie (Ci) = $3{\cdot}7 \times 10^{10}$ becquerels exactly.

Useful conversion factors are:

1 microcurie (μCi) = $3{\cdot}7 \times 10^4$ Bq = 37 kilobecquerels (kBq)

1 kilobecquerel (kBq) = 27·027 nanocuries (nCi)

This product meets the quality assurance requirements of NRC Regulatory Guide 4.15 for achieving implicit NIST (NBS) traceability as defined in NCRP58 (1985).

Rule 1 = The certificate value (NOT including any uncertainty) shall lie within the 95% confidence interval determined from the mean and two sigma standard deviation of the three measurements
Rule 2 = The two sigma value used for the 95% confidence interval shall not exceed 10% of the mean value of the three verification measurements.
Rule 3 = The determined mean value shall be within 10% of the certificate value.

The analyst prepared three standard verification sources for H-3 source 0134-H by transferring 0.5 mL portions of the standard into glass liquid scintillation vials. Ten mL of Ready Gel liquid scintillation cocktail was added to each vial and the vials were shaken to mix. A Blank vial was prepared in a similar fashion using 1 mL of DI water and 10 mL of Ready Gel cocktail. The standard verification vials and Background source were dark adapted for two hours and counted on LSC Yellow (Wallac) using Protocol 18 for H-3 source standard verification. The H-3 efficiency calibration which was used for verification calculations was performed on 7/19/05 using 0020-A (H-3). Calibration data is recorded in this logbook under H-3 0020. Each verification source calculation was performed as follows:

Source dpm/g = (A - B)/(C)(D)
where:
A = Ver. source cpm,
B = BKG cpm,
C = System efficiency, (cpm/dpm), and
D = mass used for standard verification.

Standard Radionuclide Source

70361-278

5 mL Liquid in Flame Sealed Vial

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

Certificate of Participation

Analytics, Incorporated

is a participant for the period January 1, 2005, through December 31, 2005, in a radioactivity measurements assurance program conducted by the National Institute of Standards and Technology, in cooperation with the Nuclear Energy Institute. Continued participation is evidenced by dated Reports of Traceability issued for particular radionuclides, which indicate the deviation of the participant's reported value from that measured by the National Institute of Standards and Technology. The significance of these Reports is addressed below.*

For the Director,

Michael P. Unterweger, Acting Leader
Radioactivity Group
Physics Laboratory

*As guidance for the proper use of Reports of Traceability, it should be emphasized that the National Institute of Standards and Technology is concerned only with fostering good measurements capability and consistency with the national measurements system. The assurance of the proper application of that capability to the ultimate consumer products is the responsibility of each manufacturer of these products and of the Federal regulatory agencies.

A continuing traceability program in radioactivity demonstrates, to the degree established by the periodic assays of calibrated radioactivity samples, a continuing competence to maintain the methods and standards necessary for accurate measurement. Such a program cannot, however, endorse each and every measurement nor the final product, any more than a spot check can vouch for every unchecked item. Care should be taken, therefore, not to imply such endorsement. The proper use of this Report is governed by section 200.114 of Title 15 of the Code of Federal Regulations. These regulations may be met if Reports are quoted only in their entirety. Excerpts out of context may be misleading.

THE LEAK TEST(S) INDICATED BY THE CHECKED BOX(ES) WAS(WERE) APPLIED TO DETERMINE THE INTEGRITY OF THE SOURCE DESCRIBED ON THE FRONT SIDE

☑ **1. STANDARD WIPE TEST**

The source is wiped over its entire surface with a moistened filter paper disk. After drying, the disk is checked for activity using a windowless proportional counter or end-window G.M. tube. Activity levels exceeding 0.001 μCi beta-gamma or 0.0001 μCi alpha are cause for rejection of the source.

☐ **2. SOAK TEST**

The source is immersed in distilled water and maintained at 50 ± 10° C for a minimum of four hours. After removal of the source, the liquid is a) checked for activity using a liquid scintillation counter, or b) evaporated in a planchet and the residue is checked for activity using a windowless proportional counter or end-window G.M. tube. Activity levels exceeding 0.001 μCi beta-gamma or 0.0001 μCi alpha are cause for rejection of the source.

☐ **3. SOAK TEST -- BERYLLIUM WINDOW**

The source is immersed in distilled water and maintained at 50 ± 10° C for 20 minutes. The entire surface of the source is then wiped with a moistened cotton swab or filter paper disk. After drying, the swab or disk is checked for activity using a windowless proportional counter or end-window G.M. tube. Activity levels exceeding 0.001 μCi beta-gamma or 0.0001 μCi alpha are cause for rejection of the source.

☐ **4. GAS SOURCE TEST (Radioactive Gas)**

The source is placed in a vacuum desiccator and maintained at a pressure of less than 1 mm Hg for not less than 12 hours. The activity is checked by introducing air into the desiccator and monitoring the air with an end-window G.M. tube. Activity levels exceeding 1000 cpm are cause for rejection of the source.

☑ **5. OTHER LEAK TEST**

The ampoule is kept in an inverted position on a filter paper disk for a minimum of 16 hours. The filter paper disk is then checked for activity using a windowless proportional counter or end-window G.M. tube. Activity levels exceeding 0.001 μCi beta-gamma or 0.0001 μCi alpha are cause for rejection of the source.

☐ **6. LEAK TEST NOT APPLICABLE**

The active area of this source is uncovered or is protected by a very thin coating. Although the deposit is adherent, it is not designed or certified to pass a standard leak test. The inactive portions of the source have been checked using the standard wipe test. Levels of removable activity did not exceed 0.001 μCi beta-gamma or 0.0001 μCi alpha at the time of shipment.

The analyst prepared three standard verification sources for standard ***445-96-2-BB*** using 0.1 mL for each source. Each standard was combined with 0.1 mL of ***Am-241*** standard ***0533-E*** and 50 micrograms of Nd carrier in a disposable centrifuge tube. Each standard was diluted to 4 mL with 2 M HCl and 2 mL of DI Water. Two mL of 48% HF was added to precipitate Nd(and **Americium**) fluoride. After 30 minutes, each sample was filtered following routine procedures for alpha spectroscopy source preparation. Each source was counted using routine alpha spec procedures. DPM values for ***Am-243*** were calculated by comparison to ***Am-241*** certified values.

Standard Reference Material 4334H
Plutonium-242 Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive plutonium-242 nitrate and nitric acid dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of alpha-particle counting instruments and for the monitoring of radiochemical procedures.

Radiological Hazard: The SRM ampoule contains plutonium-242 with a total activity of approximately 150 Bq. Plutonium-242 decays by alpha-particle emission. None of the alpha particles escape from the SRM ampoule. During the decay process, X-rays and gamma rays with energies from 10 keV to 160 keV are also emitted. Most of these photons escape from the SRM ampoule but their intensities are so small that they do not represent a radiation hazard. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard: The SRM ampoule contains nitric acid (HNO_3) with a concentration of 3 moles per liter of water. The solution is corrosive and represents a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2. The ampoule should be opened only by persons qualified to handle both radioactive material and strong acid solution.

Storage and Handling: The SRM should be stored and used at a temperature between 5 °C and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least January 2015. The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) both because of the radioactivity and because of the strong acid.

Preparation: This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, M.P. Unterweger, Acting Group Leader. The overall technical direction and physical measurements leading to certification were provided by L.L. Lucas of the Radioactivity Group. The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program.

Recommended Procedure for Opening the SRM Ampoule

1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.

2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it. Work in a fume hood. In addition to the radioactive material, the solution contains strong acid and is corrosive.

3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.

4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.

5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.

6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.

7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.

8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.

9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss.

NOTES

[a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.
Distance from Ampoule (cm): 1 30 100
Approximate Dose Rate (μSv/h): <0.1 - -

[b] The plutonium-242 master solution was chemically purified at 1200 EST, 07 June 1994.

[c] **Massic activity** is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].

[d] The reported value, y, of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \ldots x_n)$, where f is a mathematical function derived from the assumed model of the measurement process. The value, x_i, used for each input quantity i has a **standard uncertainty**, $u(x_i)$, that generates a corresponding uncertainty in y, $u_i(y) \equiv |\partial y/\partial x_i| \cdot u(x_i)$, called a **component of combined standard uncertainty** of y. The **combined standard uncertainty** of y, $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty. The combined standard uncertainty is multiplied by a **coverage factor** of $k = 2$ to obtain U, the **expanded uncertainty** of y.

Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.

For further information on the expression of uncertainties, see references [2] and [3].

[e] The value of each component of combined standard uncertainty, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the massic response is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).

[f] The stated uncertainty is two times the standard uncertainty.

[g] Estimated limits of detection for alpha-particle-emitting impurities, expressed as massic alpha-particle emission rates (numbers of alpha particles per second per gram), are:
0.003 s−1•g−1 for energies less than 3.1 MeV,
0.03 s−1•g−1 for energies between 3.1 and 4.4 MeV, and
0.003 s−1•g−1 for energies greater than 5.0 MeV.

[h] The plutonium-242 master solution was chemically purified at 1200 EST, 07 June 1994. Americium-241, the daughter of plutonium-241, was removed but has been growing in since that time.

[i] Estimated limits of detection for photon-emitting impurities, expressed as massic photon emission rates (numbers of photons per second per gram), are:
5 × 10-5 s−1•g−1 for energies between 19 and 39 keV,
7 × 10-5 s−1•g−1 for energies between 49 and 92 keV,
2 × 10-5 s−1•g−1 for energies between 106 and 507 keV,
1 × 10-5 s−1•g−1 for energies between 515 and 1456 keV, and
5 × 10-6 s−1•g−1 for energies between 1465 and 2750 keV,
provided that the photons are separated in energy by 4 keV or more from photons emitted in the decay of plutonium-242, plutonium-241, or americium-241.

[j] The stated uncertainty is the standard uncertainty.

[k] Relative standard uncertainty of the input quantity x_i.

[m] The relative change in the output quantity y divided by the relative change in the input quantity x_i. If $|\partial y/\partial x_i|\cdot(x_i/y) = 1.0$, then a 1% change in x_i results in a 1% change in y. If $|\partial y/\partial x_i|\cdot(x_i/y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y.

[n] Relative component of combined standard uncertainty of output quantity y, rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y \equiv |\partial y/\partial x_i|\cdot u(x_i)/y = |\partial y/\partial x_i|\cdot(x_i/y)\cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y/\partial x_i|\cdot(x_i/y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.

DC-S-041-003F

[p] The relative standard uncertainty of $\lambda \cdot t$ is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainty of t is negligible.

[q] $|\partial y/\partial x_i| \cdot (x_i/y) = |\lambda \cdot t|$

[r] The live time is determined by counting the pulses from a gated crystal-controlled oscillator.

[s] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i$ = 100%. $|\partial y/\partial x_i| \cdot (x_i/y)$ = {(response per Bq of impurity)/(response per Bq of Pu-242)}•{(Bq of impurity)/(Bq of Pu-242)}. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

[t] The stated uncertainty is the standard uncertainty. The plutonium-241 activity was calculated from a gamma-ray measurement of the americium-241 ingrowth as of 25 November 1998, assuming that americium-241 was completely removed at the time of chemical purification.

[u] Using alpha-particle spectrometry, no alpha-particle emission was detected that could reliably be ascribed to these radionuclides. The value shown is an estimated upper limit based upon background and counting statistics. Measurements were made at the Lawrence Livermore National Laboratory (LLNL) in July of 1994.

[v] Using alpha-particle spectrometry, no alpha-particle emission was detected that could reliably be ascribed to these radionuclides. The stated uncertainty is the standard uncertainty. Measurements were made at the National Institute of Standards and Technology (NIST) in June and July of 1999.

The analyst prepared three standard verification sources for standard **0688-E** using 0.1 mL for each source. Each standard was combined with 0.1 mL of **U-238** standard **0389-G** and 50 micrograms of Nd carrier in a disposable centrifuge tube. Each standard was diluted to 4 mL with 2 M HCl, and 2 mL of DI water. One mL of TiCl3 was added. Two mL of 48% HF was added to precipitate Nd(and **Uranium**) fluoride. After 30 minutes, each sample was filtered following routine procedures for alpha spectroscopy source preparation. Each source was counted using routine alpha spec procedures. DPM values for **U-232** were calculated by comparison to **U-238** certified values.

Standard Reference Material 4321C
Natural Uranium Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive natural uranium nitrate and nitric acid dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of alpha-particle counting instruments and for the monitoring of radiochemical procedures.

Radiological Hazard

The SRM ampoule contains uranium-238, uranium-235, and uranium-234 with a total activity of approximately 2600 Bq. Uranium decays by alpha-particle emission. The progeny of uranium-238, uranium-235, and uranium-234 have a total activity of approximately 2600 Bq and decay by alpha- and beta-particle emission. None of the alpha or beta particles escape from the SRM ampoule. During the decay process X-rays and gamma rays with energies from 11 keV to 2.0 MeV are also emitted. Most of these photons escape from the SRM ampoule but their intensities are so small that they do not represent a radiation hazard. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard

The SRM ampoule contains nitric acid (HNO_3) with a concentration of 1 mole per liter of water. The solution is corrosive and represents a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2. The ampoule should be opened only by persons qualified to handle both radioactive material and strong acid solution.

Storage and Handling

The SRM should be stored and used at a temperature between 5 and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least August 2007.

The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) both because of the radioactivity and because of the strong acid.

Preparation

This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, J.M.R. Hutchinson, Group Leader. The overall technical direction and physical measurements leading to certification were provided by L.L. Lucas of the Radioactivity Group.

The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program by N.M. Trahey.

Recommended Procedure for Opening the SRM Ampoule

1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.

2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it. Work in a fume hood. In addition to the radioactive material, the solution contains strong acid and is corrosive.

3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.

4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.

5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.

6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.

7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.

8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.

9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss.

NOTES

[a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.

Distance from Ampoule (cm):	1	30	100
Approximate Dose Rate (μSv/h):	<0.1	-	-

[b] The stated uncertainty is two times the standard uncertainty.

[c] **Massic activity** is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].

[d] The reported value, y, of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \ldots x_n)$, where f is a mathematical function derived from the assumed model of the measurement process.

The value, x_i, used for each input quantity i has a **standard uncertainty**, $u(x_i)$, that generates a corresponding uncertainty in y, $u_i(y) \equiv |\partial y/\partial x_i| \cdot u(x_i)$, called a **component of combined standard uncertainty** of y.

The **combined standard uncertainty** of y, $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty.

The combined standard uncertainty is multiplied by a **coverage factor** of $k = 2$ to obtain U, the **expanded uncertainty** of y.

Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.

For further information on the expression of uncertainties, see references [2] and [3].

[e] The value of each standard uncertainty component, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the massic count rate is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).

[f] Estimated limits of detection for photon-emitting impurities are:
1.4 $\gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 8 and 59 keV,
1.1 $\gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 67 and 88 keV,
0.5 $\gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 102 and 197 keV,
0.3 $\gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 205 and 762 keV,
0.2 $\gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 770 and 996 keV, and
0.1 $\gamma \cdot s^{-1} \cdot g^{-1}$ for energies between 1006 and 1900 keV,
provided that the photons are separated in energy by 4 keV or more from photons emitted in the decay of uranium-238, uranium-235, uranium-234, or their progeny.

[g] The stated uncertainty is the standard uncertainty. See reference [5].

RC-S-034-051e

[h] Relative standard uncertainty of the input quantity x_i.

[i] The relative change in the output quantity y divided by the relative change in the input quantity x_i. If $|\partial y/\partial x_i| \cdot (x_i/y) = 1.0$, then a 1% change in x_i results in a 1% change in y. If $|\partial y/\partial x_i| \cdot (x_i/y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y.

[j] Relative component of combined standard uncertainty of output quantity y, rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y \equiv |\partial y/\partial x_i| \cdot u(x_i)/y = |\partial y/\partial x_i| \cdot (x_i/y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y/\partial x_i| \cdot (x_i/y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.

[k] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i = 100\%$. $|\partial y/\partial x_i| \cdot (x_i/y)$ = {(response per Bq of impurity)/(response per Bq of U-238)}•{(Bq of impurity)/(Bq of U-238)}. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

Data Qualifiers (see following sections for detailed explanations)

Summary/General Comments

The samples were prepared and analyzed with approved procedures using method EPA 8260B (VOCs). Data were reported for all required analytes.

See attached Data Assessment Worksheets for supporting documentation on the data review and validation.

This validation was performed according to DOE-NNSA Service Center Model Data Validation Procedure Rev. 4.

Sample Shipping/Receiving

All COC, analysis request, and sample receipt documentation was complete and correct.

Holding Times and Preservation

The samples were analyzed within the prescribed holding time and properly preserved.

Instrument Tune

All instrument tune requirements were met.

Calibration

All initial and continuing calibration QC acceptance criteria were met with the following exceptions. The initial calibration response factor (RF) for 1,4-dioxane was < 0.01. 1,4-dioxane was detected in sample GU06010GMC401, and should therefore be **qualified J-.** 1,4-dioxane was not detected in the other samples, therefore the sample results should be **qualified R.** The initial calibration intercept for carbon disulfide was negative with an absolute value > 3X the MDL. Carbon disulfide was not detected in any of the samples, therefore all the sample results should be **qualified R**. The initial calibration RFs for isobutyl alcohol, acrolein, and acetonitrile were < 0.05 but > 0.01. The compounds were not detected in the samples, therefore the sample results should be **qualified UJ.** The percent difference (%D) for acrolein in the CCV associated with the sample was > 40% with a negative bias. Acrolein was not detected in the samples, therefore all sample results should be **qualified UJ.** The percent differences (%D) for methylene chloride, carbon tetrachloride, 2-chloro-1,3-butadiene, and vinyl acetate in the CCVs associated with the samples were > 20% with a positive bias. The compounds were not detected in the samples and should not be qualified.

The matrix spike and matrix spike duplicate were re-analyzed because the original runs were after the tune window expired. The %Ds for five compounds in the associated CCVs were > 20% with a positive bias. The %Ds for acrolein, isobutyl alcohol, and 1,4-dioxane in the associated CCVs were > 20% with a negative bias. The recoveries (%R) of these compounds were within the acceptance limits in both the MS and MSD, therefore based on professional judgment, no results should be qualified.

Blanks

Because the MS and MSD were rerun on a different day, two method blanks (MBs) were associated with the batch. Both method blanks met all acceptance criteria.

The field blank (FB) and field trip blanks (FTB) met all acceptance criteria, with the following exceptions. Acetone and 2-butanone were detected in FB GU06010GMC401-FB, but not in any other samples, therefore no results should be qualified.

Surrogates

All surrogate recoveries met the acceptance criteria.

Internal Standards

All internal standards met the acceptance criteria.

Matrix Spike/Matrix Spike Duplicate (MS/MSD)

The MS and MSD met all acceptance criteria.

Laboratory Control Sample (LCS)

Because the MS and MSD were rerun on a different day, four LCSs were associated with this batch. LCS 1201026795 and 1201028020 were associated with the MS and MSD only. The recoveries for dichlorodifluoromethane and acrolein were < the lower acceptance limits. The MS and MSD met all acceptance criteria, therefore based on professional judgment; no sample results should be qualified.

LCS 1201025326 and 121025327 were associated with the sample analyses. All LCS acceptance criteria were met, with the following exception. The %R for acrolein was < the lower acceptance limit but > 10%. Up to five LCS %R infractions are allowed since 78 LCS analytes were reported, however, because the CCV results were also low, the acrolein results should be **qualified UJ.**

Detection Limits/Dilutions

Detection limits were reported in the data package. The samples were not diluted.

Tentatively Identified Compounds (TICs)

Analysis for TICs was requested and reported but not assessed for data validation.

Other QC

No other specific issues that affect data quality were identified.

Sample GU06010GMC401-FB	The result for SiO2 should be **qualified J-, IWQ6** due to a negative initial calibration intercept with an absolute value > 3X the MDL. The result for Na should be qualified **432U, I4a** due to blank contamination.

Summary/General Comments

All samples were prepared and analyzed with approved procedures using methods EPA 6010B (ICP-AES), EPA 6020 (ICP-MS), EPA 245.2 (CVAA mercury), and SM 2340B (Hardness by calculation). Data were reported for all required analytes.

See attached Data Assessment Worksheets for supporting documentation on the data review and validation.

This validation was performed according to DOE-NNSA Service Center Model Data Validation Procedure Rev. 4.

Sample Shipping/Receiving

All COC, analysis request, and sample receipt documentation was complete and correct.

Holding Times and Preservation

All samples were properly preserved and analyzed within the prescribed holding times.

ICP-MS Instrument Tune

The ICPMS tunes met all the acceptance criteria.

Calibration

All initial and continuing calibration acceptance criteria were met, with the following exceptions. The initial calibration intercept for SiO_2 was negative with an absolute value > 3X the MDL. All sample results for SiO_2 except the result for GU06010GMC401-FB were > 3X the absolute value of the intercept and should not be qualified. The SiO_2 result for sample GU06010GMC401-FB was < 3X the absolute value of the intercept and should be **qualified J-.**

Reporting Limit Verification

All CRA/CRI acceptance criteria were met.

Blanks

Cr and Na were detected in the method blank (MB) and/or associated CCBs. Cr was detected in samples GF06010G8WT01, GF0601G14R101, GU06010G8WT01, and GU0601G14R101 at concentrations < 5X the highest blank, therefore those Cr results should be **qualified 5.75U.** Cr results in the other samples were either > 5X the blank, or Cr was not detected; therefore no qualification should be applied. All Na results except sample GU06010GMC401-FB were > 5X the associated blanks and should not be qualified. Na was detected in GU06010GMC401-FB at a concentration < 5X the highest associated blank, and should be **qualified 432U.**

SiO_2, Na, and Ni were detected in the field blank (FB) GU06010GMC401-FB. All SiO_2 and Na results were > 5X the FB and should not be qualified. Ni was detected in samples GF06010G8WT01, GF0601G14R101, GU06010G8WT01, and GU0601G14R101 at concentrations < 5X the FB, therefore those Ni results should be **qualified 3.20U.** The Ni results in the other samples were > 5X the FB and should not be qualified.

Because the raw values for Ca and Mg are employed in Hardness by Calculation, Hardness was detected in the field blank although Ca and Mg were not detected in the FB. All field sample results for Hardness by Calculation were > 5X the FB, and should not be qualified.

ICP-MS Internal Standards

All internal standard acceptance criteria were met. Samples GU0601G14R101, GF06010GMC401, and GU06010GMC401 were rerun for Ni due to high ^{45}Sc recovery in the initial runs of the samples. The recoveries were acceptable in the reruns and those Ni results were reported. No sample results should be qualified.

Matrix Spike

All MS acceptance criteria were met, with the following exception. The recovery of SiO_2 was > the upper acceptance limit. The native sample concentration of SiO_2 was > 4X the spike added. SiO2 results may have been qualified for lack of matrix specific accuracy evaluation. The serial dilution is also a measure of matrix accuracy, however, and the serial result for SiO_2 was acceptable. Based on professional judgment, no SiO_2 results should be qualified.

Laboratory Replicate

All laboratory replicate acceptance criteria were met.

Laboratory Control Sample

All LCS acceptance criteria were met.

Detection Limits/Dilutions

All detection limits were properly reported. The samples were not diluted.

ICP Interference Check Sample (ICS)

All ICS acceptance criteria were met. Several analytes were present in the ICSA solution with absolute values >MDL. Aluminum, calcium, iron and magnesium were not present in the samples at concentrations comparable to the ICS solution; therefore no data should be qualified.

Serial Dilution

All serial dilution acceptance criteria were met.

Other QC

No other specific issues that affect data quality were identified.

Data Qualifiers (see following sections for detailed explanations)

Sample GU06010G8WT01	The results for o-nitrotoluene, m-nitrotoluene and p-nitrotoluene should be **qualified UJ, LI4** because the initial calibration response factors were < 0.05 but > 0.01. The result for tris(o-cresyl)phosphate should be **qualified UJ, LMS3** because the MS recovery was < the lower acceptance limit but >10% and **UJ, LL3** because the LCS recovery was < the lower acceptance limit but > 10%. The result for 2,4-diamino-6-nitrotoluene should be **qualified UJ, LL3** because the LCS recovery was < the lower acceptance limit but > 10%.
Sample GU0601G14R101	The results for ALL compounds should be **qualified UJ, LS2** because the surrogate recovery was < the lower acceptance limit but > 10% in both the primary and secondary compounds analyses. The results for o-nitrotoluene, m-nitrotoluene and p-nitrotoluene should be **qualified UJ, LI4** because the initial calibration response factors were < 0.05 but > 0.01. The result for tris(o-cresyl)phosphate should be **qualified UJ, LMS3** because the MS recovery was < the lower acceptance limit but >10% and **UJ, LL3** because the LCS recovery was < the lower acceptance limit but > 10%. The result for 2,4-diamino-6-nitrotoluene should be **qualified UJ, LL3** because the LCS recovery was < the lower acceptance limit but > 10%.
Sample GU0601G14R101RE	The results for o-nitrotoluene, m-nitrotoluene and p-nitrotoluene should be **qualified UJ, LI4** because the initial calibration response factors were < 0.05 but > 0.01. The result for tris(o-cresyl)phosphate should be **qualified UJ, LMS3** because the MS and MSD recoveries were < the lower acceptance limit but >10% and **UJ, LL3** because the LCS

recovery was < the lower acceptance limit but > 10%. The result for HMX should be **qualified UJ, LMS4** because the RPD between the MS and MSD was > the acceptance limit.

Summary/General Comments

All samples were prepared and analyzed with approved procedures using method EPA 8321A modified (High Explosives). Data were reported for all required analytes. For the secondary analyte analysis, internal standard was not added to the sample extracts. No sample data should be qualified as a result.

See attached Data Assessment Worksheets for supporting documentation on the data review and validation.

This validation was performed according to DOE-NNSA Service Center Model Data Validation Procedure Rev. 4.

Sample Shipping/Receiving

All COC, analysis request, and sample receipt documentation was complete and correct.

Holding Times and Preservation

All samples were properly preserved and analyzed within the prescribed holding times, with the following exception. Sample GU0601G14R101 was re-extracted and re-analyzed out of holding due to low surrogate recoveries in the original analysis. The re-extracted, re-analyzed results (noted as sample GU0601G14R101RE) were identical to the original results; therefore based on professional judgment the results should not be qualified for the holding time infraction.

Calibration

Sample GU0601G14R101 was re-extracted and re-analyzed due to low surrogate recoveries. The analysis of the primary compounds for sample GU06010G8WT01 and the original analysis of GU0601G14R101 were run under the calibration performed on 02/2/06 on instrument LCMSMS1. The analysis of the primary analytes for the re-extracted sample GU0601G14R010RE was run under the calibration performed on 02/09/06 on instrument LCMSMS1. All analyses for the secondary compounds were performed under the calibration performed on 02/09/06 on instrument LCMSMS3.

The initial calibration intercept, slope and R2 for PETN was not assessed for the calibration performed on 02/02/06 on LCMSMS1 because the compound was calibrated with a second order (quadratic) curve. All other initial and continuing calibration acceptance criteria were met for the calibration performed on 02/02/06, with the following exceptions. The initial calibration response factors for o-nitrotoluene, m-nitrotoluene, and p-nitrotoluene were < 0.05 but >0.01. The three compounds were not detected in samples GU06010G8WT01 and GU0601G14R101, and should be **qualified UJ**. The percent difference (%D) for tetryl was > 20% with a positive bias in the ICV and an associated CCV. Tetryl was not detected in the samples, and should not be qualified.

The initial calibration intercept, slope and R2 were not assessed for PETN and 4-amino-2,6-dinitrotoluene for the calibration performed on 02/09/06 on instrument LCMSMS1 because the compounds were calibrated with a second order (quadratic) curve. All other initial and continuing calibration acceptance criteria were met for the calibration performed on 02/09/06, with the following exceptions. The initial calibration response factors for o-nitrotoluene, m-nitrotoluene, and p-nitrotoluene were < 0.05 but >0.01. The three compounds were not detected in sample GU0601G14R101RE, and should be **qualified UJ**. The %Ds for m-nitrotoluene and PETN were > 20% with a positive bias in the ICV, but the compounds were not detected in the sample and should not be qualified.

The initial calibration intercept, slope and R2 were not assessed for 2,4-diamino-6-nitrotoluene, 2,6-diamino-4-nitrotoluene, 3,5-dinitroaniline, and tris(o-cresyl)phosphate for the calibration performed on 02/09/06 on instrument LCMSMS3 (the secondary compounds for all samples) because the compounds were calibrated with a second order (quadratic) curve. All other initial and continuing calibration acceptance criteria were met.

It should be noted that the ICV and CCVs were reported as percent recovery instead of %D. Percent difference was calculated for data validation.

Blanks

No target analytes were detected in the method blank or instrument blanks.

Reporting Limit Verification

The CRI percent recoveries (%R) met QC acceptance criteria, with the following exceptions. The PETN percent recovery (%R) in the CRI immediately preceding samples GU06010G8WT01 and GU0601G14R101 was > the upper acceptance limit, but PETN was not detected in the samples and should not be qualified.

The %Rs of p-nitrotoluene, PETN, and HMX were > the upper acceptance limits in the CRI immediately preceding sample GU0601G14R101RE, but the compounds were not detected in the sample and should not be qualified.

Surrogates

All surrogate QC acceptance criteria were met, with the following exception. The surrogate recovery for GU0601G14R101 was < the lower acceptance limit but >10%. The results for ALL compounds should be **qualified UJ.** The sample was re-extracted and rerun with identical results, except the surrogate recoveries were acceptable. Both sets of results were reported.

Internal Standards

All internal standards met QC acceptance criteria.

Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD acceptance criteria were met with the following exceptions. The %R for tris(o-cresyl)phosphate was < the lower acceptance limit but > 10% in the MS associated with sample GU06010G8WT01 and GU0601G14R101. Tris(o-cresyl)phosphate was not detected in the samples, and should be **qualified UJ**. The %R for TATB was > the upper acceptance limit in the MSD associated with samples GU06010G8WT01 and GU0601G14R101. TATB was not detected in the samples and should not be qualified.
The %Rs for tris(o-cresyl)phosphate in the MS and MSD associated with sample GU0601G14R101RE were < the lower acceptance limits but > 10%. Tris(o-cresyl)phosphate was not detected in the sample, and should be **qualified UJ.** The relative percent difference (RSD) between the MS and MSD for HMX was > the acceptance limit in the MS and MSD associated with sample GU0601G14R101RE. HMX was not detected in the sample, and the result should be **qualified UJ.**
It should be noted that the MS and MSD analyses were performed on samples from other LANL WQH SDGs for both the original batch and the batch that included GU0601G14R101RE. No results should be qualified.

Laboratory Control Sample (LCS)

All LCS acceptance criteria were met with the following exceptions. The %Rs for tris(o-cresyl)phosphate and 2,4-diamino-6-nitrotoluene were < the lower acceptance limit but > 10% in the LCS associated with samples GU06010G8WT01 and GU0601G14R101. Tris(o-cresyl)phosphate and 2,4-diamino-6-nitrotoluene were not detected in the samples and the results should be **qualified UJ.**
The %R for tris(o-cresyl)phosphate was < the lower acceptance limit in the LCS associated with sample GU0601G14R101RE. Tris(o-cresyl)phosphate was not detected in the sample and should be **qualified UJ.**

Detection Limits/Dilutions

All detection limits were properly reported. All samples were diluted 2X with acidified HPLC grade water.

Other QC

No other specific issues that affect data quality were identified.

Sample GU06010GMC401	The result for ammonia as nitrogen should be **qualified R, IWQ6** due to a negative initial calibration intercept with an absolute value > 3X the MDL, **UJ, IWQ2** due to a negative method blank result > the MDL, and **UJ, I3e** due to MS and MSD recoveries < the lower acceptance limit but > 30%.
Sample GU06010GMC401-FB	The result for pH should be **qualified J, I9** because the sample was analyzed beyond 2X the holding time. The result for ammonia as nitrogen should be **qualified R, IWQ6** due to a negative initial calibration intercept with an absolute value > 3X the MDL, **UJ, IWQ2** due to a negative method blank result > the MDL, and **UJ, I3e** due to MS and MSD recoveries < the lower acceptance limit but > 30%.

Summary/General Comments

The samples were prepared and analyzed with approved procedures using methods EPA 300.0 (Chloride, bromide, fluoride, sulfate), EPA 310.1 (Alkalinity), EPA 314.0 (Perchlorate), EPA 350.1 (Ammonia as nitrogen), EPA 351.2 (Total Kjeldahl Nitrogen (TKN)), EPA 353.1 (Nitrate/Nitrite (NO_3/NO_2)), EPA 335.3 (Total CN), EPA 365.4 (Total P), EPA 120.1 (Specific Conductivity), EPA 150.1 (pH), and EPA 160.1 (Total Dissolved Solids (TDS)). Data were reported for all required analytes.

See the attached Data Assessment Worksheets for supporting documentation on the data review and validation.

This validation was performed according to DOE-NNSA Service Center Model Data Validation Procedure Rev. 4.

Sample Shipping/Receiving

All COC, analysis request, and sample receipt documentation was complete and correct.

Holding Times and Preservation

The samples were analyzed within the prescribed holding times and properly preserved with the following exceptions. The pH analyses for the samples were performed after 2X the holding time. The results for pH should be **qualified J.** It should be noted that the laboratory received the samples the day the 2X holding time for pH expired.

Calibration

Multiple calibrations were applied to various analyses in this SDG; therefore the calibrations and continuing calibrations were assessed and noted individually.

The initial calibration intercept for NO_3/NO_2 was negative with an absolute value > 3X the MDL. NO_3/NO_2 was detected in samples GF06010G8WT01 and GF0601G14R101 at concentrations < 3X the absolute value of the intercept and should be **qualified J-.** NO_3/NO_2 was detected in sample GF06010GMC401 at a concentration > 3X the absolute value of the MDL and should not be qualified. NO_3/NO_2 was not detected in GU06010GMC401-FB and should be **qualified R.**

The initial calibration intercepts for Cl and SO_4 were > 3X the MDL. All Cl and SO4 results were > 3X the intercept, or Cl and SO_4 were not detected, therefore no results should be qualified.

Three initial calibrations were associated with ammonia as nitrogen sample analyses. All three initial calibration intercepts were negative with absolute values > 3X the MDL. Ammonia as nitrogen was not detected in any of the samples, therefore all ammonia as nitrogen results should be **qualified R.**

Three initial calibrations were associated with TKN sample analyses. The initial calibration intercept associated with sample GU06010G8WT01 was negative with an absolute value > 3X the MDL. TKN was not detected in that sample, and the result should be **qualified R.** The initial calibration intercept associated with samples GU0601G14R101 and GU06010GMC401-FB was > 3X the MDL. TKN was detected in sample GU0601G14R101 at a concentration < 3X the intercept, and should be **qualified J+.** TKN was not detected in sample GU06010GMC401-FB and should not be qualified. The TKN calibration associated with sample GU06010GMC401 met all acceptance criteria and no results should be qualified.

Blanks

Because multiple calibrations and/or batches were associated with various analyses, blank results were noted individually.

Total dissolved solids (TDS) and specific conductivity were detected in the field blank GU06010GMC401-FB. All specific conductivity results were > 5X the conductivity of the field blank, and should not be qualified. The TDS results for samples GF06010G8WT01 and GF0601G14R101 were < 5X the amount in the field blank (FB), and should be **qualified 120U.** The TDS result for sample GF06010GMC401 was > 5X the amount in the field blank, therefore the result should not be qualified.

Negative instrument and method blank results were associated with the ammonia as nitrogen analysis of samples GU0601G14R101 and GU06010GMC401-FB. Ammonia as nitrogen was not detected in these samples and the results should be **qualified UJ**. The instrument blank results associated with sample GU06010G8WT01 were acceptable; however, the sample was associated with the negative method blank noted above. Ammonia as nitrogen was not detected in the sample, therefore the results should be **qualified UJ**. Negative instrument and method blank results > the MDL were associated with the ammonia as nitrogen analysis of sample GU06010GMC401. Ammonia as nitrogen was not detected in this sample, and the result should be **qualified UJ.**

Negative instrument blank results > the MDL were associated with the TKN analyses of samples GU0601G8WT01 and GU06010GMC401. TKN was not detected in sample GU06010G8WT01, and should be **qualified UJ.** TKN was detected in sample GU06010GMC401 at a concentration > 5X the MDL, and should not be qualified. The blanks associated with the analyses of samples GU0601G14R101 and GU06010GMC401-FB were acceptable and those results should not be qualified.

Total P was detected in the instrument and method blanks associated with this SDG, and in field blank GU06010GMC401-FB. The total P result for GU06010GMC401-FB was > 5X the highest associated blank and should not be qualified. The total P results for samples GF06010G8WT01, GF0601G14R101, and GF06010GMC401 were < 5X the FB, and should all be **qualified 5.6U.**

Matrix Spike (MS)/Matrix Spike Duplicate (MSD)

All MS and MSD recoveries and relative percent differences (RPDs) met the acceptance criteria, with the following exceptions. The recoveries of the MS and MSD for ammonia as nitrogen were < the lower acceptance limit but > 30%. Ammonia as nitrogen was not detected in any samples, therefore all the sample results should be **qualified UJ.** The spike analysis for ClO_4 was performed on a sample from another LANL WQH SDG. No results should be qualified.

Laboratory Replicate

The replicate analyses met all acceptance criteria. The replicate analyses were performed on a sample from another LANL WQH SDG for ClO_4, specific conductivity and pH. No data should be qualified.

Laboratory Control Sample (LCS)

All LCS recoveries met QC acceptance criteria.

Detection Limits/Dilutions

All detection limits were properly reported. The following dilutions were performed for the reasons noted by the laboratory. Sample GU06010G8WT01 was diluted 10X for ammonia as nitrogen due to matrix effects. Sample GU0601G14R101 was diluted 10X for ammonia as nitrogen and 5X for TKN due to matrix effects. Sample GF06010GMC401 was diluted 2X for Cl, 5X for ClO_4, and 10X for NO_3/NO_2 in order to bring the raw values within the calibration range of the instrument. Sample GU06010GMC401 was diluted 5X for ammonia as nitrogen due to matrix effects. Sample GU06010GMC401-FB was diluted 10X for TKN due to matrix effects.

Other QC

No other specific issues that affect data quality were identified.

Subject: LCMSMS Inorganic Data Review and Validation – LANL WQH
COC: WG-03621-GE, WG-03609-GE, WG-03616-GE
SDG: 154614
Laboratory: GEL
Analysis: Perchlorate

Data Qualifiers (see following sections for detailed explanations)

No perchlorate results should be qualified in this SDG.

Summary/General Comments

The samples were prepared and analyzed with approved procedures using method EPA 6850 modified (perchlorate by LC/MS/MS). Data were reported for all required analytes.

See attached Data Assessment Worksheets for supporting documentation on the data review and validation.

This validation was performed according to DOE-NNSA Service Center Model Data Validation (MDVP) Procedure Rev. 4.

Sample Shipping/Receiving

All COC, analysis request, and sample receipt documentation was complete and correct.

Holding Times and Preservation

The samples were analyzed within the prescribed holding time and properly preserved.

Calibration

All initial and continuing calibration QC acceptance criteria were met. The initial calibration verification (ICV) and continuing calibration verifications (CCVs) were calculated as percent recovery (%R) instead of percent difference (%D). The ICV and CCVs met the %D criteria as well. No data should be qualified.

Blanks

The method and instrument blanks met all acceptance criteria.

Reporting Limit Verification

The CRI percent recovery met QC acceptance criteria. It should be noted that the CRI spiked concentration was at the MDL, not 2X the MDL as stated in the MDVP. No sample data should be qualified.

Internal Standard

Internal standard retention time acceptance criteria were met for perchlorate-O(18). Recovery of perchlorate-O(18) met matrix spike recovery acceptance criteria.

Matrix Spike/Matrix Spike Duplicate (MS/MSD)

The MS and MSD met all acceptance criteria**.**

Laboratory Control Sample

The LCS recovery met all acceptance criteria.

Detection Limits/Dilutions

All detection limits were properly reported. Sample GF06010GMC401 required a 250X dilution in order to bring the raw value within the linear range of the instrument. Perchlorate was not detected in the sample run immediately after the undiluted run. No sample results should be qualified.

Perchlorate Chlorine Ratios

Chlorine isotope ratio acceptance criteria were met for all samples.

Interference Check Standard (ICS)

The ICS recovery met QC acceptance criteria.

Other QC

No other specific issues that affect data quality were identified.

DATA REVIEW QUALIFIER FLAG DEFINITION SHEET

General Engineering Laboratories, LLC

DATA QUALIFIERS FOR ORGANIC ANALYSES

Data Qualifiers used on Form 1s or Certificates of Analysis (COA) follow the specifications set forth in the technical specifications of the most current CLP Statement of Work and are defined as follows:

Section	Explanation	Location
A	The TIC is suspected aldol-condensation product.	COA, Form 1, and EDD
B	Analyte was detected in the associated method blank as well as in the sample.	COA, Form 1, and EDD
C	Pesticide analyte has been confirmed by GC/MS.	COA, Form 1, and EDD
D	Analyte(s) quantified in an analysis performed at a secondary dilution factor.	COA, Form 1, and EDD
E	Identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis.	COA, Form 1, and EDD
J	This flag indicates an estimated value concerning either, (1) estimating a concentration for tentatively identified compounds (TICs), or (2) analyte detected at a level less than the RDL or PQL and greater than or equal to the MDL.	COA, Form 1, and EDD
N	Presumptive evidence based upon a mass spectral library search to make a tentative identification of the analyte.	COA, Form 1, and EDD
NJ	Analyte has been tentatively identified and the associated numerical value is estimated based upon 1:1 response factor to the nearest eluting internal standard.	COA, Form 1, and EDD
P	- Pesticide/PCB target analyte that is greater than 25% difference for the detected concentrations between the two GC columns. - HPLC target analyte that is greater than 40% difference for the detected concentrations between detectors or columns.	Form 1 and EDD
U	Compound analyzed for but not detected (sample quantitation limit has been adjusted to reflect dilutions and percent moisture).	COA, Form 1, and EDD
X	Other reporting flag as defined in report narrative.	COA, Form 1, and EDD
**	Laboratory Control Sample recovery outside of acceptance limit.	QC Summary Report

All surrogate recoveries and acceptance ranges are reported at the bottom of Form 2 or COA.

General Engineering Laboratories, LLC

DATA QUALIFIERS FOR INORGANIC ANALYSES

Data Qualifiers used on Form 1s or Certificates of Analysis (COA) follow the specifications set forth in the technical specifications of the most current CLP Statement of Work and are defined as follows:

Section	Explanation	Location
E	The qualifier that is used when the percent difference between the parent sample and its serial dilution's concentration exceeds 10%. The sample's concentration must be greater than 50 times the IDL/MDL for ICP or 100 times the absolute value of the preparation blank's concentration for ICP-MS. However, if analyzing ILMO 4.0 (ICP-MS), the parent sample's concentration must be 20 times the CRDL before the "E" flag is applied.	Form 1 and EDD
*	The qualifier that is used to indicate the duplicate sample analysis for an analyte is out of control.	Form 1 and EDD
J	The qualifier is used to indicate that the reported result fell above the IDL/MDL but below the CRDL.	Form 1 and EDD
N	This qualifier is used to indicate that the matrix or pre-digested spike sample recovery for an analyte is not within the specified control limit.	Form 1 and EDD
U	Analyte analyzed for but not detected above the PQL/CRDL.	COA, Form 1, and EDD
X	Other reporting flag as defined in report narrative.	Form 1 and EDD
**	Laboratory Control Sample (LCS) recovery for an analyte is outside of specified acceptance limit.	QC Summary Report

All surrogate recoveries and acceptance ranges are reported at the bottom of Form 2 or COA.
Any recoveries falling outside the acceptance range will be flagged with a **.
All flags do not apply to QC Summary and Certificate of Analysis packages.

Preparation/Analytical Method Verification

SOP Reference
Procedure for preparation, analysis and reporting of analytical data are controlled by General Engineering Laboratories, LLC as Standard Operating Procedure (SOP). The data discussed in this narrative has been analyzed in accordance with GL-OA-E-038 REV# 9.

Calibration Information
Due to the limited capacity of software all of the current initial calibration files are not displayed here. If necessary, a calibration history will be inserted in the package prior to the appropriate Form 6.

Initial Calibration
All initial calibration requirements have been met for this sample delivery groups (SDG). A second source initial calibration verification (ICV) was included in the standard section directly behind the initial calibration.

Continuing Calibration Verification Requirements
All associated calibration verification standard(s) (ICV or CCV) met the acceptance criteria.

Quality Control (QC) Information

Method Blank (MB) Statement
The MBs analyzed with this SDG met the acceptance criteria.

Surrogate Recoveries
Surrogate recoveries, in all samples and quality control samples were within the acceptance limits.

Laboratory Control Sample (LCS) Recovery
The LCS recoveries were not all within the acceptance limits. However, the failures were less than 5% of the requested analyte list. This satisfies the client criteria. Please see the Form III's in the deliverable for a complete list of recoveries and acceptance limits. See NCR 289433.

QC Sample Designation
Sample 154614003 (GU06010G8WT01) was designated for spike analysis in this SDG.

Matrix Spike (MS) Recovery Statement
The MS recoveries for this SDG were within the required acceptance limits.

Matrix Spike Duplicate (MSD) Recovery Statement
The MSD recoveries for this SDG were within the required acceptance limits.

MS/MSD Relative Percent Difference (RPD) Statement
The RPD(s) between the MS and MSD met the acceptance limits.

Internal Standard (ISTD) Acceptance
The internal standard responses, in all samples and quality control samples, met the required acceptance criteria.

Technical Information

Holding Time Specifications
GEL assigns holding times based on the associated methodology, which assigns the date and time from sample collection or sample receipt. Those holding times expressed in hours are calculated in the ALPHALIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

Sample Preservation and Integrity
All samples met the sample preservation and integrity requirements.

Preparation/Analytical Method Verification
All procedures were performed as stated in the SOP.

Sample Dilutions
The samples in this SDG did not require dilutions.

Sample Re-extraction/Re-analysis
The MS and MSD were re-analyzed because they were initially analyzed outside the holding time.

Miscellaneous Information

Electronic Package Comment
The following package was generated using an electronic data processing program referred to as virtual packaging. In an effort to increase quality and efficiency, the laboratory is developing systems to eventually generate all data packages electronically. The following change from traditional packages should be noted:

Analyst/peer reviewer initials and dates are not present on the electronic data files. Presently, all initials and dates are present on the original raw data. These hard copies are temporarily stored in the laboratory. An electronic signature page inserted after the case narrative of each electronic package will indicate the analyst, reviewer, and report specialist names associated with the generation of the data and package. The data validator will always sign and date the case narrative. Data that are not generated electronically, such as hand written pages, will be scanned and inserted into the electronic package.

Nonconformance (NCR) Documentation
NCR # 289433 was generated for this SDG.

Manual Integrations
Data files associated with the initial calibration, continuing calibration check, and samples did not require manual integrations.

TIC Comment
Tentatively identified compounds (TIC) were required for this SDG.

Additional Comments
Additional comments were not required for this SDG.

System Configuration

The Volatile-GC/MS analysis was performed on a HP Mass Spectrometer.

Instrument ID	System Configuration	Column ID	Column Description	P & T Trap
VOA8.I	HP6890/HP5973	RESTEK	RTX-Volatiles, 30m x 0.25 mm, 1.0 um	Trap 10

Certification Statement

When the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

Review Validation

GEL requires all analytical data to be verified by a qualified data validator. In addition, all data designated for CLP or CLP-like packaging will receive a third level validation upon completion of the data package.

The following data validator verified the information presented in this case narrative:

Preparation/Analytical Method Verification

SOP Reference
Procedure for preparation, analysis and reporting of analytical data are controlled by General Engineering Laboratories, LLC as Standard Operating Procedure (SOP). The data discussed in this narrative has been analyzed in accordance with GL-OA-E-056 REV# 6.

PROPRIETARY INFORMATION - No unauthorized reproduction without written permission from GEL.

Calibration Information

Initial Calibration
All initial calibration requirements have been met for this SDG. Due to software constraints, all Initial Calibration Blanks must be designated as IPB001.

CCB Requirements
All continuing calibration blanks (CCB) bracketing the analyses associated with this batch were within acceptance criteria.

Low Level Standard (CRI) Requirements
All low level calibration verification (CRI) requirements were met by all bracketing CRI standards and may be based off of the grand mean average percent recovery of all target analytes.

Quality Control (QC) Information

Method Blank (MB) Statement
The MB(s) analyzed with this SDG met the acceptance criteria.

Interference Check Sample (ICS)
The interference check sample (ICS) met all recovery acceptance criteria.

Laboratory Control Sample (LCS) Recovery
The LCS spike recoveries met the acceptance limits.

QC Sample Designation
Sample 154614001 (GF06010G8WT01) was chosen for matrix spike analysis.

Matrix Spike (MS) Recovery Statement
The matrix spike recoveries were within the established acceptance limits.

Matrix Spike Duplicate (MSD) Recovery Statement
The matrix spike duplicate recoveries were within the established acceptance limits.

MS/MSD Relative Percent Difference (RPD) Statement
The RPD(s) between the MS and MSD met the acceptance limits.

Retention Time Standard Area Acceptance
The retention time standard areas were within the required acceptance criteria for all samples and QC.

During the analysis of perchlorate by LC/MS/MS, retention time shifts are commonly observed. These retention time shifts, which are caused by fouling of the column by the sample matrices, are problematic when the retention time is used as one of the criterion for confirmation. To overcome this problem, a known amount of O(18) labeled perchlorate was added to each sample as a retention time standard/marker. The presence of perchlorate was confirmed by the relative retention time (RRT) of the perchlorate peak and the O(18) standard. A RRT window of 0.98 to 1.02, as required by Method 332.0, has been used. In addition to the isotopic ratio, the presence of perchlorate in the samples associated with this data package have been confirmed using the relative retention criteria stated above, not the absolute retention time.

Technical Information

Holding Time Specifications
GEL assigns holding times based on the associated methodology, which assigns the date and time from sample collection of sample receipt. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

Preparation/Analytical Method Verification
All procedures were performed as stated in the SOP.

Sample Dilutions
Sample 154614008 (GF06010GMC401) was diluted to bring the over range concentration within the calibration range.

Sample Re-extraction/Re-analysis
Samples 1201019723 (GF06010G8WT01MS), 1201019724 (GF06010G8WT01MSD) and 154614001 (GF06010G8WT01) failed acceptance criteria. They were re-analyzed and passed acceptance criteria. The re-analyses are reported.

Miscellaneous Information

Nonconformance (NCR) Documentation
A nonconformance report (NCR) was not generated for this SDG.

Manual Integrations
Some initial calibration standards, continuing calibration standards, and/or samples required manual integrations due to software limitations.

Method Comments
The samples were originally analyzed using EPA Method 314.0.

Additional Comments
The Perchlorate Isotope Ratio on the Form I may differ slightly from the ratio on the corresponding raw data due to rounding rules and/or significant figures or due to software limitations when there are manual integrations, dilutions or other factors. The ratio value of the Form I is the correct value.

Due to software limitations, all initial calibration blanks must be designated as IPB001 in order for the forms to be correct.

The retention time marker, Perchlorate-O (18), is added to all samples, instrument blanks, and standards prior to injection. It is used to verify the retention time of Perchlorate and Perchlorate-101 and to insure an accurate injection occurred. Due to various anions affecting the recovery of Perchlorate-O (18) and not Perchlorate and Perchlorate-101, the calibration curves of Perchlorate and Perchlorate-101 are not internally corrected for using Perchlorate-O (18). They are external calibrations.

Perchlorate Isotope Ratio
The Perchlorate isotope ratio met acceptance criteria for all samples and QC samples. Please see the isotope ratio criteria in the Miscellaneous Section.

System Configuration

The laboratory utilizes a Waters LC 2795 liquid chromatography instrument for primary analyte analysis. It is coupled with a Micromass Quattro Micro Mass Spectrometer/ Mass Spectrometer. It is fitted with an electrospray probe that is operated in the negative electrospray ionization mode for perchlorate analysis. It is also fitted with an APCI (Atmospheric Pressure chemical Ionization) probe which is operated in the negative ionization mode for explosives analysis. The laboratory utilizes an Agilent 1100 liquid chromatography instrument for secondary analyte analysis. It is coupled with an Applied Biosystems 4000 Mass Spectrometer/ Mass Spectrometer. It is fitted with an electrospray probe that is operated in the negative electrospray ionization mode for perchlorate analysis. It is also fitted with an APCI (Atmospheric Pressure chemical Ionization) probe which is operated in the negative ionization mode for explosives analysis.

Chromatographic Columns

Chromatographic separation of perchlorate is accomplished through analysis on the following anion column:

Dionex: IonPac AG-16 2 x 50 mm.

Certification Statement

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

Review Validation:

GEL requires all analytical data to be verified by a qualified data validator. In addition, all data designated for CLP or CLP-like packaging will receive a third level validation upon completion of the data package.

The following data validator verified the information presented in this case narrative:

Isotope Ratio Criteria

Average Isotope Ratio
2.93

Standard Deviation
0.19

Sample Between the MDL and RDL (0.050-0.20ug/L)
Control Limits : 2.36-3.50

Sample Above the RDL (0.20ug/L)
Control Limits : 2.55-3.31

Tune Criteria

The tuning solution is introduced directly into the mass spectrometer using the ESI interface in the positive ion mode. The mass range scanned is 20 to 1100 amu using at least six scans. The observed mass for the target compound in the daily calibration standards must be within 0.2 amu of the expected value. If it is greater than 0.2 amu, then a mass calibration is performed and the instrument is re-calibrated.

Holding Time Specifications
All samples in this SDG in this analytical batch met the specified holding time. GEL assigns holding times based on the associated methodology, which assigns the date and time from sample collection of sample receipt. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration.

Preparation/Analytical Method Verification
All procedures were performed as stated in the SOP.

Sample Dilutions
Samples and/or QC were diluted due to matrix interference. According to the GEL SOP for Method 8321A, all sample and QC extracts are diluted 1:1 v/v with acidified HPLC grade water. The final dilution takes the 1:1 v/v dilution into account.

It is also fitted with a APCI (Atmospheric Pressure chemical Ionization) probe which is operated in the negative ionization mode for explosives analysis. The laboratory utilizes a Agilent 1100 liquid chromatography instrument for secondary analyte analysis. It is coupled with a Applied Biosystems 4000 Mass Spectrometer/ Mass Spectrometer. It is fitted with a electrospray probe that is operated in the negative electrospray ionization mode for perchlorate analysis. It is also fitted with a APCI (Atmospheric Pressure chemical Ionization) probe which is operated in the negative ionization mode for explosives analysis.

Chromatographic Columns

The detection of the primary analyte nitroaromatic and nitramines is accomplished through analysis on the following reversed phase column: Phenomenex: Ultracarb 5u ODS (20), 250 x 4.60 mm ID.

The detection of the secondary analytes is accomplished through analysis on the following reversed phase column: YMC: J'sphere ODS-H80, 150 x 4.6mm I.D.
