DEPARTMENT OF THE AIR FORCE
27TH SPECIAL OPERATIONS MISSION SUPPORT GROUP (AFSOC)
CANNON AIR FORCE BASE NEW MEXICO

ENTERED

FEB 2 4 2012

Colonel David C. Piech
Commander
110 E Sextant Avenue Suite 1098
Cannon AFB NM 88103

Ms. Lane Andress
Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East Bldg 1
Santa Fe NM 87505-6063

Dear Ms. Andress

Attached is the *Annual Ground Water Monitoring Report, Melrose Air Force Range, Roosevelt and Curry Counties, New Mexico, December 2011.* If you have any questions regarding this submittal, please contact Mr. Ronald Lancaster, Chief, Asset Management Flight at (575) 784-1146 or Mr. Matthew Higginbotham, Restoration Program Manager at (575) 784-1092.

Sincerely

DAVID C. PIECH, Colonel, USAF

RE: **December 2011 Annual Ground Water Monitoring Report**
Melrose Air Force Range, New Mexico
USACE Contract No.: W9128F-10-D-0091, Task Order 006

Dear Mr. Higginbotham,

Enclosed for your review is the *December 2011 Annual Ground Water Monitoring Report, Melrose Air Force Range, Roosevelt and Curry Counties, New Mexico.*

To ensure a timely response and to simplify the review process for the New Mexico Environment Department (NMED), we have considered recent commentary contained in Notice of Disapprovals issued by NMED on March 11, and August 19, 2011 for the *December 2010 Annual Ground Water Monitoring Report, Melrose Air Force Range, Roosevelt and Curry Counties,* and have incorporated results of these findings into this report where applicable.

We appreciate the opportunity to work with Cannon Air Force Base and USACE to provide service to Melrose Air Force Range. If you have any questions or need further information, please call me at (850) 613-6800.

Sincerely,
Trinity Analysis & Development Corp.

Richard L. Burdine, PG
Senior Vice President

1.0 INTRODUCTION

This Annual Ground Water Monitoring Report for the Melrose Air Force Range (AFR) has been prepared by Trinity Analysis & Development Corp. (TRINITY) on behalf of the Cannon Air Force Base (AFB) 27th Special Operations Wing (SOW) and Air Force Special Operations Command (AFSOC). TRINITY performed this work under contract to the US Army Corps of Engineers (USACE), Omaha District, Contract W9128F-10-D-0091, Task Order 006. The document was prepared for submission to the New Mexico Environment Department (NMED).

In 1975, the Department of Defense (DoD) established the Environmental Restoration Program (ERP) to provide guidance and funding for the investigation and remediation of hazardous waste sites caused by historical disposal activities at military installations that may have contaminated soil, ground water, and/or surface water. The Asset Management Flight (CEA) staff at the Cannon AFB 27th SOW is administratively responsible for oversight of ERP sites at Melrose AFR.

In accordance with a Resource Conservation and Recovery Act (RCRA) permit issued to Cannon AFB on December 30, 1994 an investigation of potential impacts to soil and ground water that may have resulted from seven Solid Waste Management Units (SWMUs) was conducted. In accordance with the RCRA Permit a *Phase I RCRA Facility Investigation for Melrose Air Force Range* (Foster Wheeler, 1996) and a *RCRA Facility Investigation Report Addendum* (Foster Wheeler, 2003) were completed and the reports submitted to NMED. NMED reviewed the Phase I RCRA Facility Investigation (RFI) and the RFI Addendum and provided a response dated February 1, 2006 which requested additional field investigation activities at Melrose AFR.

On May 9, 2007 the Department of the Air Force requested a deferral of a RFI Work Plan for the additional field investigation requested by NMED for Melrose AFR. The deferral was based on the fact that the entire facility is an "*active bombing or test range*." On June 19, 2007 NMED approved deferment of a revised RFI work plan with the stipulation that the purpose and scope of the work plan would be modified to indicate that continued ground water monitoring and reporting would continue and is *"... an interim measure, until the SWMUs are fully investigated....."*

Based on NMED comments (February 11, 2010) on the *Draft Work Plan for Annual Groundwater Monitoring, Melrose Air Force Range* (Tidewater, 2009), two separate monitoring well networks are sampled: the Semiannual SWMU Ground Water Quality Network which currently consists of ten wells, and the Annual Ground Water Quality Network which currently consists of 14 wells.

In the *Final Report, Initial Baseline Groundwater Monitoring, Melrose Air Force Range, New Mexico* (Tidewater, 2009) the consultant proposed a new background monitoring well upgradient of the SWMUs, adjacent to MWQ-8, which was dry. NMED reviewed the report and responded on October 27, 2009 approving the installation of a new background monitoring well and suggested that the well be installed adjacent to MWQ-10 (NMED, 2009). However, MWQ-10 is located on a portion of Melrose AFR (the Mesa) where ground water is not mixing with the underlying Chinle Formation. Based on ground water geochemistry data and the ground water flow direction, ground water collected from MWQ-8 is upgradient of the SWMUs and the Impact Area and is located on a portion of Melrose AFR that would provide a more representative ground water quality sample for the Impact Area.

TRINITY submitted an updated *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) in which a recommendation was made to consider utilizing existing cattle stock supply well (MWQ-23) as a potential background well. Implementation of this well as a background data source would preclude the additional expenditure of installing a new monitoring well, and based on site-specific geology and site configuration MWQ-23, which is located approximately 3,100 feet west of MWQ-8, appears to be able to provide adequate background data for the local flow system in the Impact Area. MWQ-23 was sampled twice during this reporting period. A more detailed discussion of the site specific geology and hydrogeology of Melrose AFR is provided in Section 4.0 below.

Monitoring wells associated with the Semiannual SWMU Ground Water Quality Network are sampled on a semiannual basis and include:

- One background ground water monitoring well (MWQ-23)

- Four ground water monitoring wells at SWMU 114;
- Four ground water monitoring wells at SWMU 130;
- One ground water monitoring well at SWMU 131.

Wells associated with the Annual Ground Water Quality Network are sampled on an annual basis and include:

- Fourteen wells, consisting of monitoring wells and active/inactive supply wells.

A more detailed discussion of the site sampling plan for the Semiannual and Annual Ground Water Quality Network is provided in Sections 6.1.1 and 6.1.2, respectively.

The water quality sampling and reporting is being performed to monitor for the presence of potential contaminants, gauge the effectiveness of the site's monitoring system, provide the foundation for correction or improvement to the monitoring plan as necessary, and to document the site's influence on the area's ground water quality, if any.

All field activities presented in this document were completed in general accordance with the data quality objectives (DQOs) presented in the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011).

This page intentionally left blank.

2.0 ANNUAL REPORT CONTENTS

Annual ground water monitoring reports for SWMUs at Melrose AFR are required by 20.9.9.13 New Mexico Administrative Code (NMAC). In accordance with NMED Solid Waste regulations, annual ground water monitoring reports should include:

- Site and background description;
- A description of the hydrogeologic setting;
- A description of the monitoring well network including a well construction summary table and site map(s) of well locations;
- Summary of ground water elevations including flow maps of the current sampling event and at least two previous sampling events;
- An interpretation of the ground water gradient and flow velocity;
- Description of ground water sampling activities, including summary tables and trend analysis of water quality data;
- An evaluation of the analytical results;
- A description of the suitability of the data (i.e. holding times, blanks, duplicates, etc.);
- Any necessary corrective actions, conclusions and recommendations.

This report is organized as following:

- Section 1: Introduction;
- Section 2: List of Annual Report contents;
- Section 3: Site description and background including a brief summary of the SWMUs at Melrose AFR;
- Section 4: Summarizes the geology and hydrogeology of Melrose AFR and vicinity;
- Section 5: Describes the requirements of the monitoring plan as it relates to semiannual and annual sampling conducted at Melrose AFR;
- Section 6: Provides a description of field activities conducted during the most recent year of sampling (2011);

- Section 7: Evaluates the analytical data, focusing on data from the most recent year of sampling (2011). Compares data to background/ambient conditions. Evaluates possible exceedances of regulatory standards and assesses the quality of the data;
- Section 8: Provides conclusions and recommendations.

3.0 SITE DESCRPTION AND BACKGROUND

3.1 Location/Access

The Melrose AFR is a bombing and air-to-ground gunnery range under management of Cannon AFB within AFSOC. The Melrose AFR is situated approximately eight miles southwest of the village of Melrose, and located predominately in Roosevelt County with a small parcel in Curry County, New Mexico (Figures 1 and 2). Access to the range is achieved by traveling south from Melrose on New Mexico State Road (SR) 267 for approximately 9.3 miles, then west on Sundale Valley Road for approximately seven miles to the security gate.

During World War II, the area was used by the United States (US) Army Air Corps (predecessor to the US Air Force) for training. It has been continuously used by the US Air Force since World War II. In 1952, the Air Force leased 7,771 acres of grassland for use as a bombing and air-to-ground gunnery range by the Tactical Air Command. Since 1952, the range has been expanded several times including land purchases and leases and currently comprises 87,925 acres. Current acreage includes Cannon AFB owned, public domain, and restricted easement land (Foster Wheeler, 2003).

The Impact Area of the Range is located northeast of the Mesa and consists of grasslands with a grid of access roads and bombing targets. The Impact Area is delineated by a historical boundary that previously delineated the extent of the entire Range (Figure 2). In 1990-91, the boundary of the Range was expanded through the acquisition of agricultural and range land parcels on all sides. These parcels (leased lands) are currently part of Range property but are leased back to the prior owners for continued use as agricultural and range land. Leaseholders use the unconfined aquifer for irrigation and livestock watering.

Live high-explosives-filled ordnance was used on the range prior to 1969. Since then, practice bombs and inert full-scale bombs have been used at the range. Practice bombs and inert bombs are known to contain only small explosive or pyrotechnic spotting charges. Additionally, live gun ammunition has been used continuously on the range for target practice.

Over the years, portions of the Melrose AFR have been used to dispose of a variety of military

and industrial waste from Melrose AFR and Cannon AFB. Wastes have included: unexploded ordnance (UXO), exploded ordnance, scrap metal, paints, solvents, pesticides, herbicides, putrescible waste, etc. (Foster Wheeler, 1996; Foster Wheeler, 2003). Currently, the Melrose AFR permit includes seven SWMUs located within its boundary. Three SWMUs have permanent monitoring wells in place, two SWMUs are located within the Impact Area and as such, do not have permanent wells in place, and the wells associated with remaining two SWMUs have been abandoned because they were dry (Figure 2). The SWMUs are described as follows:

SWMU 114 – Expended Ordnance and Industrial Waste Burial Site (Motor Pool Trenches)
SWMU 115 – Explosives-Contaminated Burial Site (Arroyo Burial Site)
SWMU 117 – Domestic Waste Burial Site (Southeast of Main Building)
SWMU 130 – World War II Cantonment Disposal Site (formerly Area of Concern (AOC) 1)
SWMU 131 – Domestic Waste Burial Site (East of Fire Station; formerly AOC 2)
SWMU 132 – Disposal / Burn Site (North Helicopter Pad; formerly AOC 3)
SWMU 133 – Northwest Munitions Disposal Site (Northwest Corner of Impact Area; formerly AOC 4)

3.2 SWMU Descriptions & History

3.2.1 SWMU 114 – Expended Ordnance and Industrial Waste Burial Site

SWMU 114 is located in the southeast quarter of the southwest quarter of Section 15 and the northeast quarter of the northwest quarter of Section 22, Township 1 North, Range 30 East, in Roosevelt County, New Mexico (Figure 3). The site and surrounding area are flat with sparse desert scrub vegetation consisting of prairie grass and cactus.

The military used a series of eight unlined burial trenches at SWMU 114 to dispose of a variety of military and industrial waste from Melrose AFR and Cannon AFB. Trenches were approximately 20 to 40 feet in width, 100 to 200 feet in length and up to 40 feet in depth (Foster Wheeler, 1996; Foster Wheeler, 2003). One trench approximately 15 feet deep and 400 feet

long is currently open but has not been used.

Exact dates and types of waste disposed at SWMU 114 are unknown. It is known, however, that between 1952 and 1962 drummed liquids were poured into the trenches and burned. Full drums of liquid, including possible unusable fuels, paints, sludge, and solvents may have also been placed in the trenches. For an unknown period of time, the military also disposed of an estimated 12,000 to 15,000 pounds per month of scrap metal from practice bombs and munitions in the trenches at SWMU 114 (Foster Wheeler, 1996; Foster Wheeler, 2003). According to the 1996 *Phase I RCRA Facility Investigation for Melrose Air Force Range* (Foster Wheeler, 1996) and the 2003 *RCRA Facility Investigation Report Addendum* (Foster Wheeler, 2003) the trenches at SWMU 114 were cleared of ordnance and have been backfilled and closed. Ground water at this location is present approximately 150 feet below land surface (bls).

Four monitoring wells were installed as part of the Phase I RFI. No organic compounds were detected above ground water standards during the Phase I RFI. Elevated metals concentrations were attributed to high turbidity and natural conditions. Elevated anion concentrations were attributed to natural conditions. Migration of metals from the disposal site to ground water was determined to be unlikely due to the high cation exchange capacity (CEC) of the surface and near surface soil and the alkaline nature of the formation. It has been determined that ground water at SWMU 114 has not impacted by disposal activities at the site (Foster Wheeler 1996; Foster Wheeler 2003).

3.2.2 SWMU 115 – Explosives-Contaminated Burial Site (Arroyo Burial Site)

SWMU 115 is located in the northeast quarter of the northeast quarter of Section 33, Township 1 North, Range 30 East in Roosevelt County, New Mexico (Figure 3). The site lies within a small arroyo located in the south-central portion of Melrose AFR. SWMU 115 was used for the disposal and burial of UXO in 1989. UXO and other exploded ordnance were collected from the surrounding areas, pushed into the arroyo, and covered with a thin layer of soil. Storm water flows intermittently down the arroyo during heavy rains.

The ground surface at the site is relatively free of debris. The disposal area was 600 feet long, 15 to 20 feet wide, and 15 to 20 feet deep. The contents of SWMU 115 are believed to consist

entirely of UXO and other exploded ordnance, including 750-pound and 2,000-pound bombs covered with a thin layer of soil. Ground water is present approximately 25 to 30 feet below land surface. During the Phase I RFI, ground water samples were collected utilizing direct-push technologies. No organics or explosives related compounds were detected in ground water. Elevated metals concentrations were attributed to elevated turbidity in the samples. It has been determined that ground water at SWMU 115 has not been impacted by disposal activities at the site (Foster Wheeler 1996; Foster Wheeler 2003).

3.2.3 SWMU 117 – Domestic Waste Burial Site (Southeast of Main Building)

SWMU 117 is located in the northeast quarter of the southwest quarter of Section 22, Township 1 North, Range 30 East, in Roosevelt County, New Mexico (Figure 3). This site is located southeast of the main control building at the Melrose AFR. The area is within a slight depression that receives storm water runoff from the surrounding area.

This SWMU was formerly used to dispose of domestic waste from the control building, including such items as food waste and common household items. Other items possibly disposed in this area could include used oil and grease, solvents, batteries, pesticides, or herbicides (Foster Wheeler, 1996; Foster Wheeler, 2003). Disposal at the site appears to have begun circa 1973 as evident in aerial photographs. The area used for disposal at SWMU 117 was approximately 300 feet by 300 feet or approximately two acres. It is a closed site and currently covered by native grasses.

Ground water was not encountered at a maximum depth of 182 feet during the Phase I RFI. The four borings were backfilled to the top of a potential confining layer (caliche) at approximately 41 feet bls with wells installed to intercept potential seasonal or transient ground water. These four wells have been historically dry and have therefore been abandoned at NMED's request. Based on the lack of ground water and the lack of significant contamination in soil samples it was concluded that contamination of ground water at SWMU 117 was unlikely (Foster Wheeler 1996; Foster Wheeler 2003).

3.2.4 SWMU 130 – World War II Cantonment Disposal Site

SWMU 130 is located in the northeast quarter of Section 17, Township 1 North, Range 30 East, in Roosevelt County, New Mexico (Figure 3). SWMU 130 was formerly referred to as AOC 1. The military used SWMU 130 as a sanitary landfill during World War II for a cantonment area (temporary housing area for troops). No documentation exists for specific wastes disposed at the site; however, it is possible that the waste stream included all items from domestic wastes to motor pool waste, UXO, munitions, batteries, oil and fuels, etc. The exact location of the disposal site is unknown; however approximately 50 acres were investigated during the Phase I RFI. Ground water is present approximately 140 to 145 feet bls at SWMU 130. Four monitoring wells were installed as part of the Phase I RFI. No organic compounds were detected and only one metal (thallium) was detected above applicable ground water standards. The elevated thallium concentration was attributed to natural conditions (Foster Wheeler 1996; Foster Wheeler 2003).

3.2.5 SWMU 131 – Domestic Waste Burial Site (East of Fire Station)

SWMU 131 is located in the northwest quarter of the southwest quarter of Section 22, Township 1 North, Range 30 East, in Roosevelt County, New Mexico (Figure 3). SWMU 131 was formerly referred to as AOC 2. This site is east of the Melrose AFR Fire Station and consists of approximately 0.5 acres. SWMU 131 was used for disposal and/or burning of wastes; however, the type and volume of wastes is unknown (Foster Wheeler 2003). The suspected waste stream possibly included spent fuels, motor oil, batteries, paints, pesticides, and metals in addition to domestic waste. Waste first appears to have been disposed of at SWMU 131 circa 1966.

Two monitoring wells, a shallow and deep were installed in the investigative borings to depths of 50 and 185 feet bls, respectively. The shallow well was installed above a confining layer (caliche) to intercept seasonal or transient ground water. The shallow well has been historically dry and has therefore been abandoned at NMED's request. Ground water is present in the deep well at approximately 105 feet bls.

No organic analytes were detected in the ground water during the Phase I RFI. Selenium and thallium were reported at concentrations above applicable ground water standards; however, due

to a lack of selenium or thallium in overlying soil samples it was determined that ground water had not been impacted by SWMU 131 (Foster Wheeler 1996; Foster Wheeler 2003).

3.2.6 SWMU 132 – Disposal / Burn Site (North Helicopter Pad)

SWMU 132 is located in the southwest quarter of Section 22, Township 1 North, Range 30 East, in Roosevelt County, New Mexico (Figure 3). SWMU 132 was formerly referred to as AOC 3. This site is less than 0.5 acres located north of the former helicopter pad at the Melrose AFR operations area. SWMU 132 was reportedly used for burning and/or disposal of unknown wastes types and quantities. Possible wastes included domestic waste, motor oil, metals, and residue from burning. Waste first appears to have been disposed of at SWMU 132 circa 1973.

During the Phase I RFI no ground water was encountered during drilling to a total depth (TD) of 182 feet bls. The boring was backfilled to the top of a potential confining layer (caliche) at approximately 50 feet bls to intercept seasonal or transient ground water. Due to land-use (helicopter pad) the well was installed flush mount. The well was dry during the Phase I RFI (1996) and during the RFI Addendum (2003) and therefore could not be sampled. Based on the lack of ground water this well was abandoned at NMED's request. Due to the lack of ground water it was determined to not have been impacted by the presence of SWMU 132 (Foster Wheeler 1996; Foster Wheeler 2003).

3.2.7 SWMU 133 – Northwest Munitions Disposal Site (NW Corner of Impact Area)

SWMU 133 is located in the northwestern corner of the impact area. SWMU 133 was formerly referred to as AOC 4. This site is located in the east-central part of Section 17 with some overlap into Section 16, Township 1 North, Range 30 East in Roosevelt County, New Mexico (Figure 3). The site is flat with native scrub vegetation and areas free of vegetation. SWMU 133 was used from 1952 to 1960 for disposal of exploded ordnance and UXO.

Ground water was present approximately 112 to 127 feet bls. During the Phase I RFI, ground water samples were collected from three of four borings utilizing direct-push technologies. Water was not encountered in one of the borings. No organics were detected in ground water. Concentrations of several metals exceeded applicable ground water standards. A pattern of increased concentrations of five of the metals from west to east across the site might suggest

impacts from SWMU 133 or from naturally occurring lateral changes in bedrock (Foster Wheeler 1996; Foster Wheeler 2003). Permanent monitoring wells were not installed due to the location of SWMU 133 in an overflight approach route along the northern portion of the active Impact Area. In a letter to Cannon AFB dated June 19, 2007 NMED stated, that "…NMED will prepare a "corrective action-only" permit to be implemented once the range is closed, transferring, or transferred." (NMED, 2007). When the Range is deactivated additional assessment will likely be required.

4.0 HYDROGEOLOGIC SETTING

4.1 Geology

The stratigraphic units of interest at Melrose AFR are the Chinle, Ogallala, and Blackwater Draw Formations. In eastern New Mexico, these units form the Southern High Plains Aquifer, which is part of a larger aquifer system extending from eastern New Mexico and Colorado into Texas, Oklahoma, Kansas, Nebraska, and South Dakota (Langman, 2004). The Chinle Formation (Triassic age) is the base of the unconfined Southern High Plains Aquifer and is composed of red shales with interbedded sands (redbeds) deposited by low-energy streams in floodplains and deltas. The top of the Chinle Formation is marked by an erosional unconformity with up to several hundred feet of relief (Lee Wan and Associates, Inc., 1990). The Ogallala Formation (Tertiary age) is the uppermost formation for the central and southern parts of Melrose AFR and it lies unconformably over the upper unit of the Chinle Formation. The Blackwater Draw Formation (Quaternary age) overlies the Ogallala Formation in the northern part of Melrose AFR (Figure 4).

In the vicinity of Melrose AFR, the Ogallala dips gently to the southeast; no faults or buried structural lineaments are known to exist in the area. The thickness of the Ogallala Formation may vary significantly over short north-south distances. The base of the High Plains Aquifer (Ogallala Formation) lies at approximately 200 feet bls in the northern portion of Melrose AFR (Hart, 1985). Drilling conducted as part of the Phase I RFI (Foster Wheeler, 1996) indicated that the depth of the Ogallala Formation along the northern margin of Melrose AFR exceeds 182 feet.

Typically, the erosional surface of the upper unit of the Chinle Formation forms an uneven contact with the Ogallala Formation and in many places is marked with gravel, cobble, or boulder deposits. The Tertiary aggradational stream deposits filled the valleys, uplands, and fluvial channels of the eroded Triassic deposits (Gustavson, 1996). Coarser materials were deposited in the channels and valleys with finer material between channels. The middle sections of the Ogallala are characterized by unconsolidated fluvial sands, silts, and clays in a fining-upwards sequence, with the upper portion consisting of eolian sands and silts deposited over the fluvial sediments and upland areas separating paleovalleys (Hart, 1985). The unconformity and variable deposition between the Chinle and Ogallala formations and within the High Plains

Aquifer have resulted in vertical and horizontal changes in the unit's porosity and permeability and produced a discontinuous aquifer within the Ogallala Formation.

Sediments encountered during drilling at Melrose AFR were predominately silts and very fine sand. Gravel, cobble, and boulder deposits normally associated with the base of the Ogallala formation and a fining up sequence above were not identified during drilling activities at Melrose AFR. The silts and very fine sand encountered during drilling is likely representative of the eolian sequence of the Ogallala Formation.

Except where strongly cemented by calcium carbonate (caliche), the near-surface sediments of the Ogallala Formation are loose and friable. Sediments encountered during drilling at Melrose AFR were predominantly silts and very loose sands and are most likely representative of the eolian sequence of the Ogallala Formation. Sediments below approximately 50 feet bls become increasingly indurated with depth, resulting in slow drilling rates and poor sample recovery. This high induration appears to have been misinterpreted as sandstone, siltstone, and claystone in areas of Melrose AFR.

Authigenic and allogenic clays are found as trace to abundant matrix minerals in the Ogallala (Lee Wan and Associates, Inc., 1990). As reported by Lee Wan and Associates, five zones have been distinguished within the Ogallala Formation of east-central New Mexico on the basis of clay minerals. The clay zones are characterized by moderate to high CEC values. The Ogallala Formation as a whole has a relatively high CEC value, which should inhibit the migration of metals in ionic form.

Caliche is a major feature of the Ogallala Formation, occurring in nearly continuous to discontinuous layers throughout. The uppermost caliche, termed the "climax caliche," crops out around playas and the bounding escarpments of the Ogallala Formation, and is locally termed "caprock." It is typically three to five feet thick. At Melrose AFR, this caprock forms a resistant layer on top of the Mesa. Caliches that occur lower in the Ogallala Formation are platy and harder. Caliche is likely to either be thin or absent below playas. A particularly thick layer of caliche occurs between approximately 45 and 55 bls at Melrose AFR.

4.2 Hydrogeology

Melrose AFR is located near the western margin of the Southern High Plains Aquifer of which the Ogallala Formation is the primary water bearing unit. The Southern High Plains Aquifer forms the primary aquifer for both potable and irrigation water in the vicinity of Melrose AFR and throughout the eastern New Mexico region. In addition, there are several localized shallow water-bearing zones across the region used for irrigation purposes. No deeper aquifers are known to be in use in the vicinity of Melrose AFR. However, ground water of poorer quality does occur in the Chinle Formation, which underlies the Ogallala. Regional well yields from the Southern High Plains Aquifer vary from less than one gallon per minute (gpm) in thin silts and sands to more than 1,600 gpm in thick sands and gravels (Lee Wan and Associates, Inc., 1990). Within New Mexico, ground water in the Southern High Plains Aquifer generally flows eastward (Hart, 1985), which is considered the overall direction of regional flow in the unconfined aquifer.

The Southern High Plains Aquifer was mapped by Hart as unsaturated or saturated only in isolated channels in the area occupied by the southern and western portions of Melrose AFR and as saturated in the northern portion (Hart, 1985). At Melrose AFR, the non-potable supply well produced 14 gpm at 35 pounds per square inch (psi) during a pump test in 1985 (William Matotan and Associates Inc., 1985). Static water levels have varied over the years in this well, ranging from 138 feet bls in 1978 (William Matotan and Associates 1985) to 96 feet bls in summer 1995 (Foster Wheeler, 1996). The supply well is located within approximately one mile of all the monitoring wells installed during the Phase I RFI (Foster Wheeler, 1996), but its terminus is approximately 20 feet deeper. Its high production rate and higher static water elevation as compared to other monitoring wells at the investigation sites indicates it was completed in a more permeable, and possibly, confined aquifer that differs substantially from the water-bearing zones accessed by the other monitoring wells (Foster Wheeler, 1996).

The ground water hydrology and water quality of the Southern High Plains aquifer at Melrose AFR was characterized by the United States Geological Survey (USGS), in cooperation with the US Air Force, based on data collected in 2002 and 2003 and discussed in *Ground-Water Hydrology and Water Quality of the Southern High Plains Aquifer, Melrose Air Force Range, Cannon Air Force Base, Curry and Roosevelt Counties, New Mexico, 2002-03* (Langman, 2004).

A 29-well monitoring network that included wells in the impact area and leased lands of Melrose AFR was investigated. Water level measurements and water quality data from the Southern High Plains Aquifer of the Ogallala Formation (28 wells) and deeper, confined aquifer of the Chinle Formation (one well) were analyzed. Information from previous investigations, including water level and water quality data collected statewide and dating from 1962, and results from the Phase I RFI (Foster Wheeler, 1996) and RFI Addendum (Foster Wheeler, 2003) were evaluated as part of the 2004 USGS study.

USGS monitoring data show that water levels in the Southern High Plains Aquifer at Melrose AFR declined between 1962 and 2003. At 13 wells monitored since 1962, water levels declined between one foot and 18 feet during varying periods of record. In wells installed above a localized confining unit (caliche), as part of the Phase I RFI, appear to never have contained ground water. Previous reports have indicated that these shallow wells have become dry due to declining water table (URS, 2009; Tidewater, Inc., 2010). However, during the Phase I RFI, minimal water was measured in the silt trap of several wells but never appeared to rise above the bottom of the screen. Recent inspection of these wells appears to indicate moist silt has accumulated in the silt traps likely the result of condensation in the well. These wells never appear to have contained ground water.

Using 1978 data, the regional ground water flow direction in the Southern High Plains Aquifer of the Ogallala Formation in the Melrose AFR is to the northeast with a hydraulic gradient of about 0.013 feet per foot (ft/ft), and inferred that the depth to ground water ranged from 40 to 120 feet bls from southwest to northeast across the active portion of the range (Hart, 1985). Based on data from limited aquifer testing during the Phase I RFI, hydraulic conductivities in the Southern High Plains Aquifer of the Ogallala Formation at Melrose AFR ranged from 0.001 to 0.073 feet per day and hydraulic gradients were between 0.007 and 0.014 ft/ft. Assuming an effective porosity of 25 percent, linear flow velocities at Melrose AFR appear to range from 0.01 to less than 5 feet per year (ft/yr) (Foster Wheeler, 1996). Depths to ground water measured during the Phase I RFI (Foster Wheeler, 1996) varied from an average of 45 feet bls at SWMU 115 in the central part of Melrose AFR to average depths ranging from 112.5 feet to more than 182 feet at all other sites. However, Phase I RFI data also indicate that as many as five separate and

possibly discontinuous water-bearing zones may be present at Melrose AFR, none of which may correlate with the Southern High Plains Aquifer discussed by Hart (1985). The median ground water surface and flow direction within the regional aquifer based on depth to water measurements in 2002 to 2003 is depicted on Figure 5 (Langman, 2004).

Recharge to the Southern High Plains Aquifer is primarily through precipitation. The recharge rate has been estimated to be very low (0.5 to 0.8 inch/year) and is much lower than the discharge rate (Kearney, 1987). Because of the high evapotranspiration rate and low precipitation, recharge can only occur during cool months, when precipitation my exceed evapotranspiration, or during heavy rainfall events in which the infiltration capacity of the soil is exceeded. When the infiltration capacity of the soil is exceeded, runoff flows to playas. In this instance, the presence of the water in the playas may allow deep percolation to the aquifer. The fact that percolation has occurred is indicated by the presence of clay deposits in playas and the likelihood that caliche is thin or absent directly below the playas. Caliche is soluble in acidic rainwater and over time the solution forms percolation pathways through sediments. Discharge from the Southern High Plains Aquifer occurs through well pumping and springs located along the eroded margins. No discharging springs are known to occur on or near Melrose AFR.

Water level contours for the unconfined Southern High Plains Aquifer indicate ground water flows predominantly to the northeast from the Mesa to the Portales Valley (Figure 5). The flow direction changes in the Portales Valley, indicating two flow systems are present, one local, and one regional. In the local flow system, ground water in the southwestern part of Melrose AFR flows northeast, while regional flow is to the east to southeast across the northern part of Melrose AFR. It appears that the direction of ground water flow reflects the contact between the Ogallala and Chinle formations, which determines ground water gradient and saturated thickness of the Southern High Plains Aquifer. The local flow-system gradient is about 1.3 percent, and the regional flowsystem gradient is about 0.1 percent. The saturated thickness of the aquifer increases as the local and regional flow systems merge.

Regional water quality in the Southern High Plains Aquifer is generally good, with total dissolved solids (TDS) ranging from 250 to 500 milligrams per liter (mg/L) (Gutentag, 1984)

and fluorides ranging from 2.2 to 2.7 mg/L (William Matotan and Associates Inc., 1985). Water quality data for the Melrose AFR supply well (screened in the Ogallala Formation) provided by Cannon AFB in September 1995 indicated dissolved solids at 555 mg/L, filterable residues at 461 mg/L, and fluoride at 2.1 mg/L.

Groundwater in the Chinle is of poorer quality than the Ogallala Aquifer and is generally characterized by high concentrations of TDS (<1,000 to 10,000 mg/L) and sodium (in some locales the sodium concentrations are high enough to make the ground water unusable for irrigation purposes). Uranium commonly occurs throughout the Dockum Group of which the Chinle Formation is a member and is the source for commonly elevated radium-226 and radium-228 levels in the ground water (Bradley & Sanjeev, 2003). Three monitoring wells at Melrose AFR are installed in the Chinle Formation and include MWQ-2, MWQ-20, and MWQ-22.

Results of water quality analysis for samples collected in 1995, 2000, and 2002-2003 indicate three areas or sources of different water types at Melrose AFR: (1) local flow system near the Mesa and ephemeral channels, (2) local flow system in the impact area, and (3) regional flow in the Portales Valley (Langman, 2004). Ground water quality near the Mesa was similar to that of the regional flow system and to water from the southern part of Melrose AFR. Ion concentrations in ground water from the center of the impact area were similar to ground water from the underlying Chinle Formation, indicating likely connection with the deeper water-producing zone. Results of monitoring in 2004 showed that higher concentrations of dissolved solids and metals occur in the impact area; thereby confirming that ground water in the impact area is different from other ground water at Melrose AFR. No pesticides, explosives, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), or organic halogens were found in the ground water samples from the 2002-2003 events (Langman, 2004). Perchlorate was detected at estimated concentrations in wells MWQ-14 (2.6 micrograms per liter (µg/L)) and MWQ-15 (20 µg/L). However, Langman (2004) attributed the perchlorate results to analytical method interference due to elevated chloride concentrations in these samples.

Ground water age, determined during the USGS study, indicates ground water is less than 55 years old across the range, with younger ground water occurring near the Mesa and ephemeral

drainages (less than 25 years) and older water toward the Portales Valley (25 to 55 years) (Langman, 2004). The Ogallala Formation is the primary source of water for domestic, municipal and irrigation uses in this region of New Mexico.

4.3 Topography

Melrose AFR is located in the Southern High Plains physiographic region and lies atop a large plateau known as the Llano Estacado (Hawley, 1976). The Llano Estacado is a nearly flat plain that slopes gently (typically 10 to 15 feet per mile) to the east and southeast from eastern New Mexico into western Texas. In eastern New Mexico, the Llano exceeds 4,000 feet above mean sea level (amsl), and elevations in the vicinity of Melrose AFR range from 4,200 to 4,650 feet amsl Figure 6. Streams in the region are ephemeral and the regional drainage pattern is poorly developed. The closest named drainages to Melrose AFR are Chapman Draw, approximately two miles west of Melrose AFR, and Cañada del Tule, about two miles southeast of the southeastern corner of Melrose AFR. Chapman Draw drains to the north, and Cañada del Tule drains to the east. The surface topography of Melrose AFR slopes to the northeast and overland flow and ephemeral drainage from the area of the sites is toward the northeast and not toward either named drainage.

The most prominent geomorphic features in the vicinity of Melrose AFR are two spurs of an escarpment known as the Mesa, which rise about 200 feet above the average elevation of the surrounding surface. The northern spur, referred to as the West Mesa, which runs near the western side of the active impact area, ends in a small butte near the center and overlooks much of the facility. Various observation and communication and control facilities associated with operations at Melrose AFR are located on the butte. The eastward-trending southern spur, which bounds the southern side of the active impact area, is referred to as the South Mesa.

Melrose AFR topography (excluding the Mesa) is open and mostly flat, gently sloping to the northeast. The Mesa dominates the southwest part of Melrose AFR. It is a topographic high and is part of the Western Caprock Escarpment that defines the western boundary of the Southern High Plains aquifer. The Mesa has a plateau area of about 7,775 acres ranging in altitude from 4,600 to 4,700 feet amsl and forms the surface basin boundary between the Pecos River Basin to

the west and the Portales Valley to the east. The Impact Area gently slopes from southwest to northeast, away from the Mesa.

4.4 Soils

According to the soil survey of Curry and Roosevelt County (USDA 2010), soil types in the Melrose AFR area include loams, fine sandy loams, and loamy fine sands of the Amarillo-Clovis association and calcareous soils of the Potter-Mansker association. These soils would be classified as fine sandy silt (ML), silty fine sand (SM), clayey sand (SC), and clayey sand to silty, fine sandy clay (SC-CL) under the Unified Soil Classification System, and as aridisols (calciorthids) under the US Department of Agriculture-Soil Conservation Service Comprehensive Soil Classification System.

4.5 Surface Water Drainage Systems

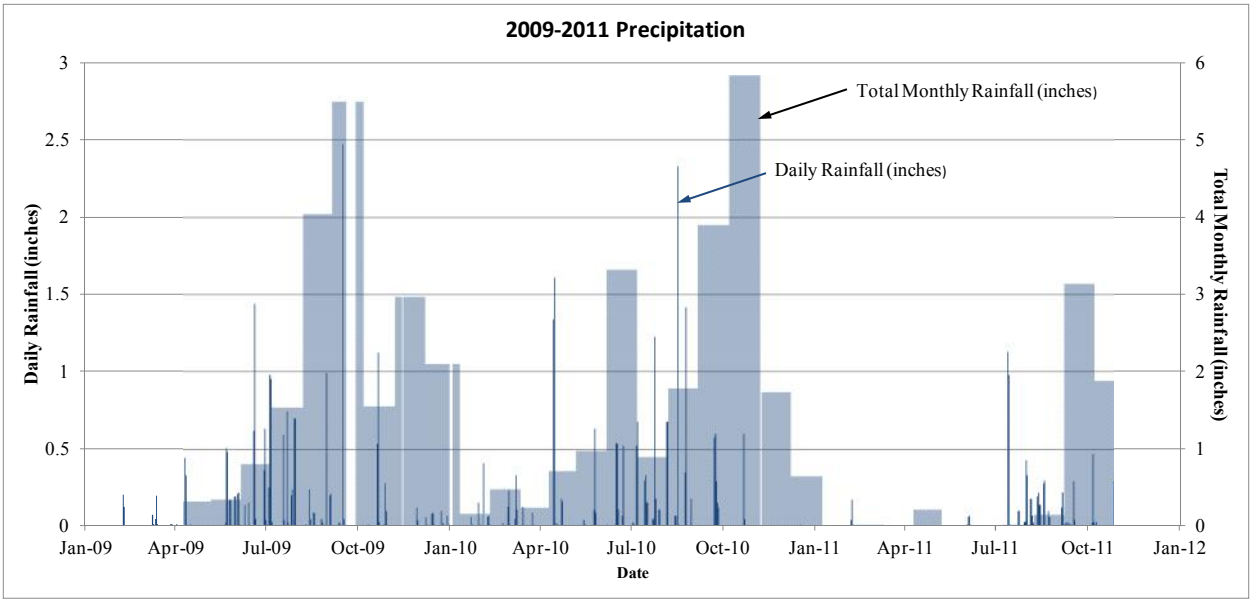
Relict sand dunes and minor playas are located to the north of Melrose AFR, along the southern side of the US Highway 84, and larger playas with surface areas greater than 1/3 square mile are present one to two miles north of Melrose AFR. During periods of rainfall, the playas collect surface runoff to form ephemeral playa lakes.

An arroyo drainage rises in the southwest corner of Melrose AFR, at the intersection of the West and South mesas, and extends about four miles to the northeast across the active impact area before its surface expression fades out. Other than the arroyo, no streams or integrated drainage pattern exists on or near Melrose AFR. An impoundment formed by an earthen dam about a mile upstream of the drainage's terminus intermittently stores surface water during periods when precipitation is sufficient to generate flow. During most of the year both the arroyo and impoundment are dry. No other surface water bodies are located within Melrose AFR except minor ephemeral channels including the Chapman Draw and the Cañada del Tule, which originate at the Mesa.

4.6 Climate

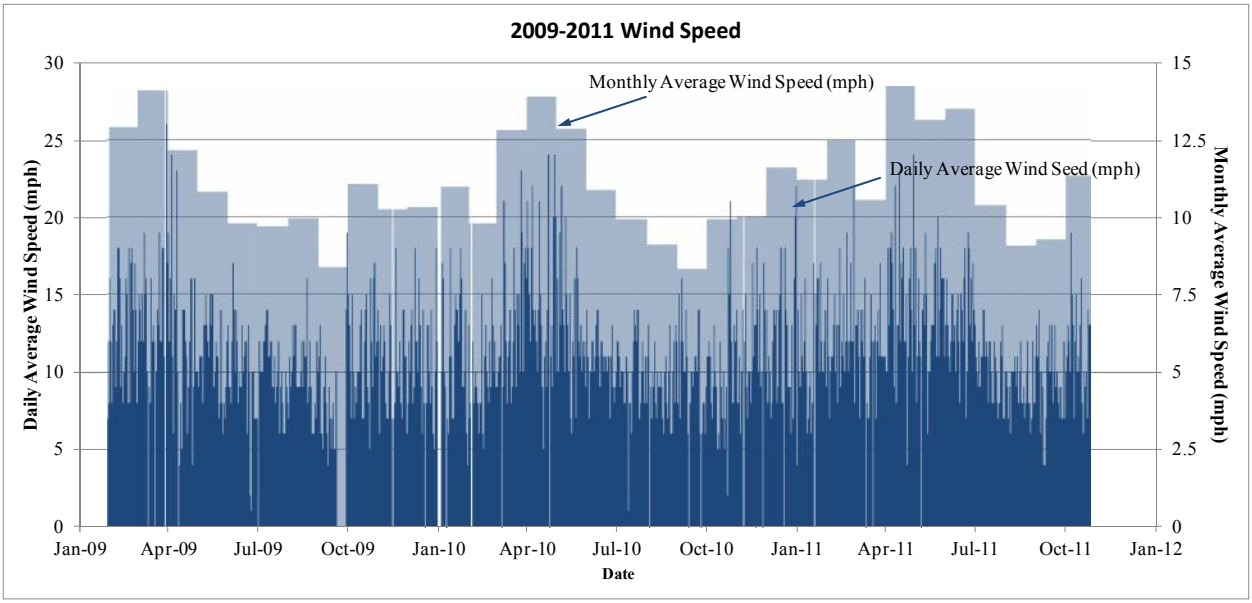
The climate of the east-central New Mexico area is tropical semiarid. Based on data collected

from 1914 to 2007 for the village of Melrose, the average annual minimum and maximum temperatures are 42.3 and 72.8 degrees Fahrenheit (°F); the maximum temperatures and precipitation occur during the summer months. The Melrose area is characterized by highly variable precipitation patterns; the average monthly precipitation ranges from 0.42 inches in January to 2.91 inches in July. The average annual precipitation is 16.19 inches, and most of the precipitation is lost to evaporation. Annual pan evaporation at a weather station in Clovis, New Mexico, is 86.68 inches; evaporation is greatest between May and August (Western Regional Climate Center). In the chart below, recent local rainfall (daily and monthly) is plotted for Melrose AFR. As is evident from the chart, the site vicinity receives the majority of annual rainfall during the summer months. The total annual rainfall for 2010 and 2011 (to date, November 21, 2011) was 20.06 and 7.02 inches, respectively. Rainfall in 2010 exceeds the annual average for the vicinity of 16.19 inches (Weather Undergound, 2011). Rainfall in 2011 is below the annual average. The area is characterized by highly variable precipitation patterns, the apparent greater than normal rainfall in 2010 and the lower than normal in 2011 may not be altogether atypical.



Prevailing winds are from the west with an average speed of 8 miles per hour. Windblown dust is generated frequently in this region of the country because the winds are often gusty and the

climate is semiarid. The Texas Panhandle/eastern New Mexico area is considered to have the highest dust particulate counts in the continental United States; occasionally, this windblown dust is of sufficient quantity to restrict visibility. Most of the seasonal dust storms occur in March and April, when the average daily wind speed commonly exceeds 20 to 20 mph and the average monthly wind speed approaches 15 mph (Weather Undergound, 2011).



5.0 MONITORING PLAN

5.1 Monitoring Requirements

5.1.1 Semiannual – SWMU Ground Water Quality Network

Based on the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) the current ground water monitoring plan provides for semiannual testing at ten wells associated with the Semiannual SWMU Ground Water Quality Network. A proposed background monitoring well (MWQ-23), upgradient of the SWMUs, was sampled as part of the 2011 sampling schedule. The accompanying tables summarize testing requirements.

5.2 Data Summary

Although this report includes water quality data collected since January 2004, focus is on data collected in the most recent one-year reporting period (2011). The table below summarizes water quality testing events conducted at Melrose AFR and presented in this report. It should be noted that this table is likely not comprehensive of all ground water sampling conducted at Melrose AFR. As additional data is discovered or made available it will be included in summary tables and utilized for the purposes of discussion.

[1] Filtered ground-water samples were analyzed for explosives, metals, nitrate plus nitrite, ammonia as nitrogen, phosphorus, anions (bromide, chloride, fluoride, and sulfate), sulfide, organic carbon, alkalinity, dissolved solids, and perchlorate.

[2] Filtered ground-water samples were analyzed for volatile organic compounds, semi-volatile organic compounds, organochlorine pesticides, organophosphorus pesticides, metals, anions (bromide, chloride, fluoride, and sulfate), alkalinity, dissolved solids, organic carbon, phosphorus, sulfide, ammonia, nitrate plus nitrite, and perchlorate.

[3] 2009 Semiannual samples were collected and analyzed for VOCs, SVOCs, organochlorine pesticides, metals, hexavalent chromium, perchlorate, bromide, chloride, fluoride, sulfate, explosives, TOC, phosphate, and ammonia.

[4] 2010-2011 Annual samples were collected and analyzed for metals, TDS, hexavalent chromium, alkalinity, TOC, phosphate, ammonia, and nitrate/nitrite.

[5] 2010-2011 Semiannual samples were collected and analyzed for VOCs, explosives, metals, chloride, sulfate, nitrate, nitrite, total dissolved solids, alkalinity, cyanide, perchlorate, and hexavalent chromium.

This page intentionally left blank.

6.0 SUMMARY OF FIELD ACTIVITIES

The Annual Ground Water Monitoring Report focuses on data collected during the most recent one-year reporting period (2011). The 2011 spring sampling event, which included sampling associated with both the Semiannual SWMU Ground Water Quality Network and the Annual Ground Water Quality Network was conducted between May 3 and May 18, 2011. The 2011 fall sampling event, which included sampling associated with the Semiannual SWMU Ground Water Quality Network was conducted between November 27 and October 3, 2011.

The most recent field activities were completed in general accordance with field protocols included in the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011). Activities planned for the recent field sampling events included collecting ground water samples from the Semiannual SWMU Ground Water Quality Network and the Annual Ground Water Quality Network, collecting ground water levels from the entire monitoring network, inspecting the monitoring well network (Semiannual SWMU Ground Water Quality Network and the Annual Ground Water Quality Network), abandoning six shallow, dry wells, well head maintenance, and geophysically logging selected wells. Activities associated with each task are discussed in more detail below. Semiannual sample locations are depicted on Figure 3, Annual sample locations are depicted on Figure 7, and well construction details are summarized in Table 1.

6.1 Monitoring Well Network - Ground Water Sampling

Prior to sampling, the wells were purged using low-flow sampling techniques using a QED SE-1102PM stainless steel bladder pump or a Proactive SS Mega-Monsoon stainless steel submersible pump. Field parameters were monitored with an YSI 600-XLM multi-parameter water quality meter with attached flow through cell. The YSI multi-parameter water quality meter monitored dissolved oxygen (DO), temperature, pH, conductivity, and oxidation reduction potential (ORP). Turbidity was monitored with a Hanna HI-98703 Turbidity Meter. Ground water levels were measured prior to pumping and during pumping to monitor drawdown. Water levels were measured with a Solinst Water Level Meter (600 foot). The water quality meter was calibrated once per day before use. The turbidity meter is calibrated once every three months,

with the calibration verified each day of use, per the manufacturers instruction. Ground water sampling logs are provided in Appendix A.

Gulf Coast Analytical Laboratories, Inc. (GCAL), Baton Rouge, LA was used for sample analysis during this investigation. GCAL is accredited in accordance with the National Environmental Laboratory Accreditation Conference (NELAC) (Certificate Number 01955), and the DoD Environmental Laboratory Accreditation Program (ELAP) (Certificate Number 1482). The laboratory provided coolers, sample containers (including preservatives where applicable), custody seals, and chain-of-custody documents. Analytical data validation was conducted by third party Environmental Data Professional, LLC (eDATApro), Lake Charles, LA.

In accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) a quality control-split sample was collected and submitted to an alternate laboratory. The purpose of the split sample is to use the alternate laboratory to verify the accuracy of the primary laboratory. Accutest Laboratories (Accutest), Tampa, FL was used for analysis of the split sample. Accutest is accredited in accordance with the NELAC (Certificate Number E83510), and the DoD ELAP (Certificate Number L2229). The laboratory provided coolers, sample containers (including preservatives where applicable), custody seals, and chain-of-custody documents.

In accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) Field Duplicate samples and Equipment Blanks were collected at a 10-percent rate (i.e., one per every 10 samples collected) for all parameters. Laboratory quality control (QC) samples, including matrix spike/matrix spike duplicates (MS/MSDs), were collected at a 5-percent rate (i.e., one per every 20 samples collected) for all parameters. Trip Blanks were analyzed for VOCs and were included in each cooler shipped to the laboratory from the field. Split Samples were collected at a 5-percent rate (i.e., one per every 20 samples collected). For ease of reporting the Annual Ground Water Quality Network and the Semiannual Ground Water Quality Network were reported by the laboratory as separate Sample Delivery Groups (SDGs). As such, QC samples collected in the field are associated with one or the other SDG but not both. All Trip Blanks are associated solely with the Semiannual Ground Water

Quality Network as VOCs are not collected as part of the Annual Ground Water Quality Network.

Analysis of samples within the prescribed holding time is critical to ensuring that samples may be considered valid and representative of the sample matrix. Sample holding time is defined as the interval between sample collection and sample preparation/analysis. Allowable holding times for analyses employed in this investigation are included in the table below.

Appropriate Sample Containers, Preservatives, and Holding Times

Analytical Parameter	Method	Container	Preservation	Maximum Holding Time
Alkalinity	SM2320B	Plastic	Cool, ≤6 °C	14 days
Cyanide	SW 846 9012A	Plastic	Cool, ≤6 °C, NaOH to pH>12	14 days
Explosives	EPA 8330	Glass Amber	Cool, ≤6 °C	14 days
Hexavalent Chromium	SW 846 7196A	Plastic	Cool, ≤6 °C	24 hours
Metals	EPA 6010C	Plastic	HNO3 to pH<2	6 months
Nitrate + Nitrite	EPA 353.2	Plastic	Cool, ≤6 °C	48 hours
Perchlorate	EPA 314.0	Plastic	Cool, ≤6 °C	28 days
Chloride, Sulfate	EPA 300.0	Plastic	Cool, ≤6 °C	28 days
Total Dissolved Solids	SM2540C	Plastic	Cool, ≤6 °C	7 days
VOCs	8260B	G, FP-lined septum	Cool, ≤6 °C, HCl to pH 2	14 days

Samples intended for chemical analyses were packed on wet ice in sealed coolers for preservation during transport to the laboratory. Preservation ensures a temperature of 4º ±2°Celsius (°C) upon receipt by the contract laboratory. Samples were shipped by overnight commercial courier to the designated laboratory. Proper shipping and handling protocol included: filling of containers with an appropriate amount of sample medium, ensuring that container lids were tight, ensuring that labels were completed, wrapping containers in bubble wrap for protection, double bagging of ice, and inclusion of appropriate quality assurance/quality control (QA/QC) blanks. Chain-of-custodies (COCs) accompanied samples in a waterproof plastic bag taped to the inside of the cooler lid. Copies of the COCs are provided in Appendix A.

Decontamination procedures were in general accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011). Sufficient quantity of clean equipment was transported to the field to last the entire day. Disposable equipment was used when possible to eliminate the possibility of cross contamination. Additionally, new sample containers

for laboratory analyses were provided by the laboratory for each sample collected.

6.1.1 2011 Semiannual Spring - Ground Water Quality Network

Ground water samples were collected from the following wells at the dates and times specified:

Sampling Schedule

SWMU 114	M114MW001	05/09/2011 09:55
	M114MW002	05/06/2011 11:35
	M114MW003	05/06/2011 14:30
	M114MW004	05/05/2011 15:16
SWMU 130	MAO1MW001	05/09/2011 14:16
	MAO1MW002	05/16/2011 09:35
	MAO1MW003	05/10/2011 13:20
	MAO1MW004	05/10/2011 11:11
SWMU 131	MAO2MW001D	05/05/2011 12:23
Proposed Background	MWQ-23	05/16/2011 11:10

The monitoring wells were purged and sampled using low-flow sampling techniques using a Proactive SS Mega-Monsoon stainless steel submersible pump. All monitoring wells were sampled from within the screened interval. Sample locations are depicted on Figures 3 and 7 and well construction summary details are provided in Table 1. After purging was completed as demonstrated by stabilized water quality parameters, samples were collected and analyzed for VOCs, explosives, total and dissolved metals, chloride, sulfate, nitrate, nitrite, TDS, alkalinity, cyanide, perchlorate, and hexavalent chromium. A summary of analytical and field data from the most recent sampling event is provided in Table 2 and Table 3.

Well MWQ-23 is plumbed with a pressure tank and dedicated submersible pump. The well has a pressure tank (approximately 20 gallons) to aid in providing a constant supply of water for the cattle. In general accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) it is necessary to ensure that the sampling protocol accounts for the "system volume" when purging the wells. Incorporating maximum expected well and tank parameters purge volume of approximately 100 gallons. This is necessary to provide an assurance that the ground water being collected is representative of the ground water in the formation versus potentially stagnant water from the pressure tank or well column. Therefore, prior to collection of stabilization parameters the spigot closest to the pump will be opened and allowed to flow at maximum flow to purge a sufficient volume from the pressure tanks. Stabilization parameters will then be collected. All wells were sampled from within the

screened interval.

Groundwater samples were placed in appropriately-labeled sample containers, packed in coolers with wet ice to attain a temperature of 4 °C, and shipped to GCAL in Baton Rouge, Louisiana via Federal Express.

QC samples collected in the field included:

- Field Duplicates: MW114MW001
- MS/MSD: MAO1MW001
- Split Sample: MAO2MW001D
- Equipment Blank: EB-1
- Trip Blanks: TB-1, TB-2, TB-4, TB-5, TB-6, TB-7, TB-8, and TB-9 (TB-3 was submitted to Accutest as part of the Split Sample)

6.1.2 2011 Annual Spring - Ground Water Quality Network

Ground water samples were collected from the following wells at the dates and times specified:

Sampling Schedule

	MWQ-2	05/05/2011 09:26
	MWQ-3	05/03/2011 09:15
	MWQ-4	05/03/2011 10:18
	MWQ-5	05/03/2011 11:57
	MWQ-6	05/03/2011 13:12
Background	MWQ-7	05/03/2011 13:53
Background	MWQ-10	05/03/2011 15:23
	MWQ-14	05/13/2011 12:31
	MWQ-18	05/12/2011 12:40
	MWQ-19	05/12/2011 09:50
	MWQ-20	05/17/2011 13:22
	MWQ-21	05/11/2011 13:05
	MWQ-22	05/11/2011 11:01
	MWL-6	05/18/2011 14:30

Due to the depth to water and the TD of the wells, MWQ-2, MWQ-20, and MWQ-22 were purged and sampled using low-flow sampling techniques by using a QED SE-1102PM stainless steel bladder pump. Wells MWQ-14 and MWL-6 were purged and sampled using low-flow sampling techniques using a Proactive SS Mega-Monsoon stainless steel submersible pump. With the exception of MWQ-4, the remaining wells are plumbed with pressure tanks and

dedicated submersible pumps. Well MWQ-4 is plumbed with a dedicated submersible pump powered by a solar panel. Due to the shallow depth to ground water MWQ-4 is not plumbed to a pressure tank.

The wells have pressure tanks (approximately 20 to 50 gallons) to aid in providing a constant supply of water for the cattle. In general accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) it is necessary to ensure that the sampling protocol accounts for the "system volume" when purging the wells. Considering maximum expected well and tank parameters, purge volumes range from 100-350 gallons. This is necessary to provide an assurance that the ground water being collected is representative of the ground water in the formation versus potentially stagnant water from the pressure tank or well column. Therefore, prior to collection of stabilization parameters the spigot closest to the pump will be opened and allowed to flow at maximum flow to purge a sufficient volume from the pressure tanks. Stabilization parameters will then be collected.

Sample locations are depicted on Figures 3 and 7 and well construction summary details are provided in Table 1. After purging was completed as demonstrated by stabilized water quality parameters, samples were collected and analyzed for total and dissolved metals, chloride, sulfate, nitrate, nitrite, TDS, alkalinity, cyanide, perchlorate, and hexavalent chromium. A summary of analytical and field data from the most recent sampling event is provided in Table 2 and Table 3.

Groundwater samples were placed in appropriately-labeled sample containers, packed in coolers with wet ice to attain a temperature of 4 °C, and shipped to GCAL in Baton Rouge, Louisiana via Federal Express.

QC samples collected in the field included:

- Field Duplicates: MWQ-5 and MWQ-20
- MS/MSD: MWQ-10 and MWQ-14
- Split Sample: MWQ-22
- Equipment Blank: EB-2

6.1.3 2011 Semiannual Fall - SWMU Ground Water Quality Network

Ground water samples were collected from the following wells at the dates and times specified:

Sampling Schedule

SWMU 114	M114MW001	09/30/2011 12:36
	M114MW002	10/03/2011 09:32
	M114MW003	10/03/2011 11:46
	M114MW004	09/30/2011 10:00
SWMU 130	MAO1MW001	09/27/2011 09:33
	MAO1MW002	09/29/2011 13:06
	MAO1MW003	09/27/2011 12:21
	MAO1MW004	09/29/2011 11:10
SWMU 131	MAO2MW001D	09/28/2011 10:28
Proposed Background	MWQ-23	09/29/2011 08:40

The monitoring wells were purged and sampled using low-flow sampling techniques using a Proactive SS Mega-Monsoon stainless steel submersible pump. All monitoring wells were sampled from within the screened interval. Sample locations are depicted on Figures 3 and 7 and well construction summary details are provided in Table 1. After purging was completed as demonstrated by stabilized water quality parameters, samples were collected and analyzed for VOCs, explosives, total and dissolved metals, chloride, sulfate, nitrate, nitrite, TDS, alkalinity, cyanide, perchlorate, and hexavalent chromium. A summary of analytical and field data from the most recent sampling event is provided in Table 2 and Table 4.

Well MWQ-23 is plumbed with a pressure tank and dedicated submersible pump. The well has a pressure tank (approximately 20 gallons) to aid in providing a constant supply of water for the cattle. In general accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) it is necessary to ensure that the sampling protocol accounts for the "system volume" when purging the wells. Considering maximum expected well and tank parameters, a volume of approximately 100 gallons was purged. This is necessary to provide an assurance that the ground water being collected is representative of the ground water in the formation versus potentially stagnant water from the pressure tank or well column. Therefore, prior to collection of stabilization parameters the spigot closest to the pump will be opened and allowed to flow at maximum flow to purge a sufficient volume from the pressure tanks. Stabilization parameters will then be collected. All wells were sampled from within the screened interval.

Groundwater samples were placed in appropriately-labeled sample containers, packed in coolers with wet ice to attain a temperature of 4 °C, and shipped to GCAL in Baton Rouge, Louisiana via Federal Express.

QC samples collected in the field included:

- Field Duplicates: FD-1
- MS/MSD: MAO1MW003
- Split Sample: MAO2MW001D
- Equipment Blank: EB-1
- Trip Blanks: TB-1, TB-2, TB-4, TB-5 and TB-6 (TB-3 was submitted to Accutest as part of the Split Sample)

6.2 Investigation Derived Waste

Investigation-derived waste (IDW) from the Spring 2011 sampling event consisted of purge and decontamination water. All IDW collected during groundwater sampling was temporarily containerized in 5-gallon buckets with lids secured in the bed of the pickup truck. At the completion of daily field activities, the IDW was discharged into 55-gallon drums located at a designated area for IDW storage. The 55-gallon drums contained a limited amount of purge water from sampling conducted by URS in 2009. All IDW storage drums were labeled according to the field sampling plan outlined in the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011). During the Fall 2011 Sampling event TRINITY coordinated with Eco-logical Environmental Services, Inc. (ECO) for proper disposal on non-hazardous waste. ECO mobilized to Melrose AFR on October 5, 2011 to pick up the IDW. ECO transported and disposed of the IDW at Southwest Landfill in Canyon, Texas. Copies of the Waste Manifest are included in Appendix A.

IDW from the Fall 2011 sampling event was temporarily containerized in 5-gallon buckets with lids secured in the bed of the pickup truck. At the completion of daily field activities, the IDW was discharged into a 250-gallon carboy located at a designated area for IDW storage. TRINITY has submitted copies of the laboratory data to NMED and is currently waiting for approval to

dispose of the IDW in accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011).

6.3 Ground Water Elevation Measurements

Water levels were measured from the surveyed elevation reference points on the tops of the polyvinyl chloride (PVC) casings or, in the case of metal or concrete well casings, from the highest point of the casing using a Solinst Water Level Meter (600 foot). Measurements were taken to the nearest hundredth of a foot, and were documented in the log book. The probes were decontaminated before use, between wells, and at the conclusion of measurement activities. Recent and historical ground water level measurement information is presented in Table 5.

Water levels from the Spring 2011 sampling event were collected prior to the start of groundwater sample collection at all accessible monitoring wells prior to well purging and sampling between May 3 and May 16, 2011. Water levels from the Fall 2011 sampling event were collected between September 27, 2011 and October 3, 2011.

6.4 Monitoring Network Well Inspection/Maintenance

Well inspections sought to verify presence of: identification tag, total well depth, well type completion, presence, and condition of bollards, protective casings, well pads, type of cap, etc. Well conditions for the Semiannual SWMU Ground Water Quality Network and Annual Ground Water Quality Network are summarized in Table 1 and a photographic log of the wells inspected is presented in Appendix B. Due to access issues to the Impact Area it was not possible to inspect or collect water levels from MWL-3.

6.5 Monitoring Well Abandonment

TRINITY and Wilson Drilling Co. (New Mexico Well Driller License No. 1152) mobilized to the site on October 5, 2011 to abandon six wells. The six “dry” wells previously approved for abandonment by NMED are M117MW001, M117MW002, M117MW003, M117MW004, MAO2MW001S, and MAO3MW001. TRINITY had previously submitted request for and was

in receipt of approved abandonment procedures from the New Mexico Office of the State Engineer.

6.6 Geophysical Logging Activities

The geophysical logging suite selected consisted of natural gamma ray and induction resistivity logs. These logs were selected because of their ability to provide 'through-casing' measurements of various physical properties of the aquifer through existing well casings.

6.6.1 Gamma Logs

The natural gamma ray log is the most widely used nuclear log in ground water applications. The log provides a vertical profile or record of gamma radiation emitted by unstable elements in the formation. In most sedimentary environments, the radiation measured by the probe comes primarily from potassium-40 and daughter products of the uranium and thorium decay series. Of these three nuclides, potassium-40 originating from clay minerals such as illite (mica) and montmorillonite is usually the major contributor gamma radiation. As the logging probe is cycled in or out of the well, its scintillation detector receives gamma radiation emanating from the formation opposite the probe. Approximately 90% of the radiation measured by the probe originates within the first 6-12 inches of the formation being investigated. The scintillation detector uses a crystal that emits light when struck by gamma rays, which is then amplified and converted to an electrical signal by a photomultiplying tube. The electrical signal is then processed into a numerical value (counts per second) that is recorded versus depth.

The gamma log has many uses in hydrogeology that are applicable to the geology/hydrogeology at Melrose AFR. The most common uses are lithologic identification and stratigraphic correlation, which are particularly relevant to mapping ground water flow regimes and migration of contaminants. Other uses include qualitative identification of relative grain size trends in vertical profile and interpretation of depositional environment (also relevant to ground water flow and contaminant transport). The gamma log is also used for collecting data of a confirming or validating nature regarding well construction. Its ability to read though well casing make it useful for auditing physical descriptions of sediments recorded in boring logs and verifying well

screen targets.

Various rock types and sediments can be characterized by their gamma intensity, but the ranges of intensities are variable and often common to several materials, hence some background knowledge of local geology is needed to correctly interpret the gamma log. With respect to the Ogallala Aquifer and Chinle Formation, interpretation is based primarily on the assumption that clay and fine-grained detrital sediments contain more radioactive elements than quartz sand and are thus distinguished from the latter by greater gamma intensity. High counts/second readings on the log are interpreted to be more clayey sediment; low counts/second readings are interpreted as more sandy material. While the gamma log can be used to calculate clay content in some cases, particularly where enough laboratory data has been collected to support an empirical relationship, it is most commonly used as a qualitative indicator of sand and clay.

Extraneous effects that can complicate gamma log interpretation need to be considered when viewing the logs. Some of the more important ones relevant to the geology/hydrogeology at Melrose AFR include the fact that radioactive elements and minerals such as uranium and biotite may be present in sands, uranium can be concentrated in organic layers, and all clays are not necessarily equal in their gamma intensity. Extraneous effects relevant to any logging effort include tool position in the well (an eccentralized probe can give a different response than a centralized probe in larger diameter holes (≥8-inch diameter); borehole diameter has an effect on measured radiation, as do washouts and oversized filter-packs (the farther the formation is from the probe, the fewer counts/second received at the detector); a logging speed that outpaces the tool's sampling capability will skew the log's output; well construction materials can affect the gamma intensity measured by the probe, either increasing the counts/second because of radioactive minerals in construction materials (e.g., bentonite seal) or dampening counts/second (steel casing versus pvc casing).

The most accurate interpretation of the gamma log is made when these details are considered and the log is supplemented with other geophysical logs and drilling reports.

6.6.2 Induction Resistivity Logs

Electromagnetic induction resistivity logs are commonly used in plastic-cased boreholes since their operation does not require contact with the formation or the presence of a conductive fluid in the borehole. While the tool actually measures the electrical conductivity of the formation, its inverse (resistivity) is traditionally presented as the logging product.

The induction probe relies on two coils, one to transmit alternating current into the surrounding formation and a second coil to receive the return signal. As the probe passes through the well, the transmitted alternating current induces eddy currents in the formation that form a secondary magnetic field that in turn induces a voltage in the receiving coil. The received signal is amplified, converted to direct current, and transmitted up the cable to the logger, where it is manipulated to provide a record of resistivity (ohm-m) versus depth.

The electrical conductivity of a porous formation is a function of the combined electrical conductivity of the matrix material and the pore fluid. The resistivity plotted on the log is the inverse of the average conductivity of a constantly varying volume of material surrounding the probe. The volume of investigation depends partly on the nature of the formation material being investigated, but mostly on coil spacing, which varies between different manufacturers. Most induction probes investigate a sphere less than about 60 inches in diameter and are designed to be relatively insensitive to materials within a few inches of the sonde or probe axis.

Induction logging provides hydrogeologists with a mechanism for making resistivity measurements in wells where this information was not collected during drilling. Since formation resistivity is affected by the porosity, permeability, and clay content of the formation and by the dissolved solids concentration of the water within the formation, its potential applications in studies of freshwater aquifers such as the Ogallala Aquifer would be expected to be numerous. In practice, however, its application is limited because the tool is most responsive to small changes in resistivity in low-resistivity environments. Best results are achieved in formations with resistivities less than about 200 ohm-m. Bulk resistivity in the Ogallala Aquifer is routinely greater than 200 ohm-m. Despite this limitation, the tool can still produce important subsurface information, particularly when paired with the natural gamma log. Some of the more common

uses of the induction resistivity include locating freshwater/saltwater interfaces, saltwater intrusion monitoring, delineation of bed boundaries, water quality mapping (quantitative delineation is possible using empirical relationships established with sufficient laboratory data), and tracking of both conductive and non-conductive contaminant plumes.

The general concept for interpretation of the induction resistivity log in unconsolidated, granular freshwater aquifers such as the Ogallala Aquifer is that highest resistivities are usually associated with clean quartz sands saturated with low-TDS water and lower resistivities occur in finer-grained, clayey sediment. The resistivity recorded on the log is an apparent resistivity measurement or bulk measurement that includes the effect of all materials in the electrical path between transmitter and receiver. Upon development of a reliable formation factor, the bulk resistivity measurement can be corrected and used to calculate the resistivity of the formation water, which has many uses in water quality evaluation. Accurate interpretation of the resistivity log requires that extraneous effects be considered. Anything that affects water chemistry around the well can have effect on the resistivity measurement. Introduction of foreign fluids to the formation such as invasion of drilling fluids during well drilling and impacted ground water from contaminated sites can have effect. Other common influences include the degree of saturation in the formation's pore space, bed thickness, and presence of conductive objects used in well construction.

6.6.3 Logging Equipment

Geophysical logging was accomplished using digital wire-line equipment manufactured by Mount Sopris Instrument Co., Inc. of Golden, Colorado. The logging probes (2PGA-1000 natural gamma and 2PIA-1000 induction resistivity) were connected to a 4MXC-1000 winch with ⅛-inch single-conductor cable used to transmit log data to a MGX II log acquisition console for processing (MS-Log log acquisition software). The logger was operated with a Windows-based PC and the entire system was powered with a portable generator.

Details on the 2PGA-1000 gamma probe are summarized in the accompanying table. Approximately 90% of the radiation measured by the probe originates within the first 6-12 inches of the formation being investigated.

2PGA-1000 (Natural Gamma, SP, Single Point Resistance)

Length	79.5 cm (31.3")
Diameter	41 mm (1.63")
Weight	3.2 Kg (7 lbs)
Pressure Rating	13,790 kPa (2000 PSI)
Operating Temperature	10 - 70°C (14 - 120°F)
Sensor (Detector)	Na(tl) scintillation 22.2 mm dia. x 76.2 mm long (0.875 x 3")
Measurement Range	0 - 100,000 CPS gamma ± 1,500 mV SP 1 - 500 Ohms SPR
Accuracy	± 1% of full scale
Resolution	0.02% of full scale

Details on the 2PIA-1000 induction probe are summarized in the accompanying table. The coil array on the induction probe is designed to be insensitive to materials at a radial distance of less than about four inches from the sonde. Vertical resolution of the tool is approximately two feet. The volume of investigation is similar to that of a 16-inch normal resistivity probe.

2PIA-1000 Electromagnetic Induction

Length	158 cm (62.2")
Diameter	39 mm (1.5")
Weight	2.7 Kg (6 lbs)
Pressure Rating	10500 kPa (1500 PSI, higher pressure housing avail)
Operating Temperature	-20 to 50°C (6 - 122°F)
Sensor (Detector)	Magnetic-induced electric field coils @ 25 & 50 cm
Measurement Range	0 -10,000 mS/Meter
Accuracy	5% of full scale
Resolution	0.02% of full scale

6.6.4 Logging Procedure

The three deep wells (MWQ-2, MWQ-20, and MWQ-22) that are located in the Chinle Formation were selected based on their total depths and dispersion across Melrose AFR. Two shallow wells (M117MW001 and M117MW004) scheduled for abandonment were also logged. The following procedure was followed for each of the wells that were geophysically logged:

- The gamma probe was connected to the logging unit, centered over the well, and referenced to the well's top of casing. The probe was cycled to the bottom of the well (logger TD) and this measurement was compared to the physical TD measurement

previously recorded. The probe was then retrieved from the hole and 'logged up' (geophysical data collected only while logging up the hole). Logging speed was 10-12 feet/minute. The wire-line was cleaned (rinse/liquinox wash/rinse/isopropyl alcohol wipe) as the probe was retrieved from the hole. After logging, the probe was disconnected and similarly cleaned.

- The induction logging run was similarly conducted, except that a 10-15 minute temperature stabilization period was allowed for the tool while at the bottom of the well.
- Raw logging data (".las" and ".rd" data files) generated by the MS-Log acquisition software was imported into WellCAD, a Windows-based well management software package, and then processed.

6.6.5 Quality Assurance/Quality Control

Quality control was achieved primarily by following uniform logging procedure from well to well. Key practices included the use of the same logging equipment and tools throughout the logging project, maintaining consistent logging speed (10-12 feet/minute), and maintaining consistent logging direction (all wells were logged 'up'). Other relevant practices included careful positioning of the probes to a consistent reference point (top of well casing) and removing slack from the wire-line cable to measure true TD. The induction resistivity tool was also calibrated at the start of each day of logging (the gamma tool does not need this).

Depth accuracy was checked using two methods. Well depths, manually measured using an electronic water level indicator, were compared to the well depths recorded by the geophysical logger. Good agreement between the two measurements was observed as differences seldom exceeded 0.10 feet. An internal check was also made by comparing the logger's depth display to a mark on the wire-line that was referenced to starting and finishing points. Depth error was routinely less than 0.2 feet.

This page intentionally left blank.

7.0 MONITORING RESULTS

Although this report utilizes data (ground water elevations, hydraulic conductivities, water quality data, etc.) gathered since 1994, focus is on data collected in the most recent one-year reporting period (2011). Much of the information presented in this report is in the form of tables, charts, and diagrams. Limited discussion accompanies each section since most illustrations do not require detailed explanation. This report represents the second complete Annual Water Quality Report for Melrose AFR. A summary of analytical and field data from the most recent sampling event are provided in Table 2, 3, and 4. Available historic data is summarized in Appendix C and includes parameter summary tables and trend plots. Laboratory analytical data is included in Appendix D. In accordance with the *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) split samples were collected for submittal to an alternative laboratory. The analytical data for the split samples are also included in Appendix D.

To determine whether potential site-related contaminants exceed ground water screening guidelines the following procedure will be prioritized as follows:

1. Water Quality Control Commission (WQCC) NMAC Title 20 Environmental Protection, Chapter 6 Water Quality, Part 2 Ground and Surface Water Protections, Section 20.6.2.3103 Subsections A, B, and C values will be compared with the *United States Environmental Protection Agency (USEPA) Maximum Contaminant Levels for Drinking Water (primary and secondary)*. The lower value for either of these lists will be applied per analyte.
2. In the absence of a limit under the WQCC or USEPA Drinking Water standards, screening levels for tap water as published in the NMED *Technical Background Document for Development of Soil Screening Levels, Revision 5 (NMED SSLs)(December 2009)* would be applied.
3. In the event that the above lists do not have a value for a contaminant of concern, values found in the *USEPA Regional Screening Levels for Contaminants at Superfund Sites (RSLs) (May 2010)* would be used for evaluation.

The ground water screening guidelines are included on Table 2, 3, and 4 and on all summary

tables in Appendix C. Exceedances of ground water screening guidelines are highlighted in red.

New Mexico Administrative Code 20.6.2.3103 states that standards shall apply to the dissolved portion of the contaminants specified, with the exception that standards for mercury, organic compounds and non-aqueous phase liquids shall apply to the total unfiltered concentrations of the contaminants.

However, in an October 30, 2001 Position Paper, "Use of Low-Flow and Other Non-Traditional Sampling Techniques for RCRA Compliant Groundwater Monitoring" NMED states that RCRA and the New Mexico WQCC have different requirements for the collection of groundwater samples for metals analyses (NMED, 2001). RCRA requires unfiltered inorganic groundwater samples in an attempt to emulate drinking water maximum contaminant levels (MCLs). However, the NMED Groundwater Quality Bureau (GWQB), which derives its regulatory authority from the WQCC regulations, requires filtered samples. This statement seems to contradict NMAC. Therefore both were collected.

The presence of metals in ground water samples collected from monitoring wells can be natural, anthropogenic in origin, or both. Metals are common, naturally occurring, ubiquitous elements in sediments such as the Ogallala, and in some instances may naturally exceed applicable standards. Elevated metals in ground water samples may be an artifact of the well installation process in that formation damage incurred during drilling may not be sufficiently repaired and/or the well may not be completely developed, which result in elevated turbidity during well sampling. Additionally, and sometimes unavoidably, the targeting of less desirable strata, i.e., placing the screen intake opposite clayey sediment, can also result in the introduction of colloidal clay into samples, which may also produce high metals results. Sampling protocol can have significant effect on measured concentrations.

It is TRINITY's experience that for ground water collected from wells installed in clastic aquifers, such as this one, comparison of total and dissolved metals results is essential. Large discrepancies between total and dissolved results for ground water collected in this type of environment suggests 'artificial' influence from the well. When similar concentrations for total

and dissolved metals are reported during a single sampling event the total result is likely an accurate reflection of the metal concentration in ground water moving through the aquifer, and would suggest that the reported concentrations are ambient in origin, waste related, or both. To date, insufficient data has been collected to accurately determine a relationship between turbidity and elevated metals concentrations in total and dissolved ground water samples.

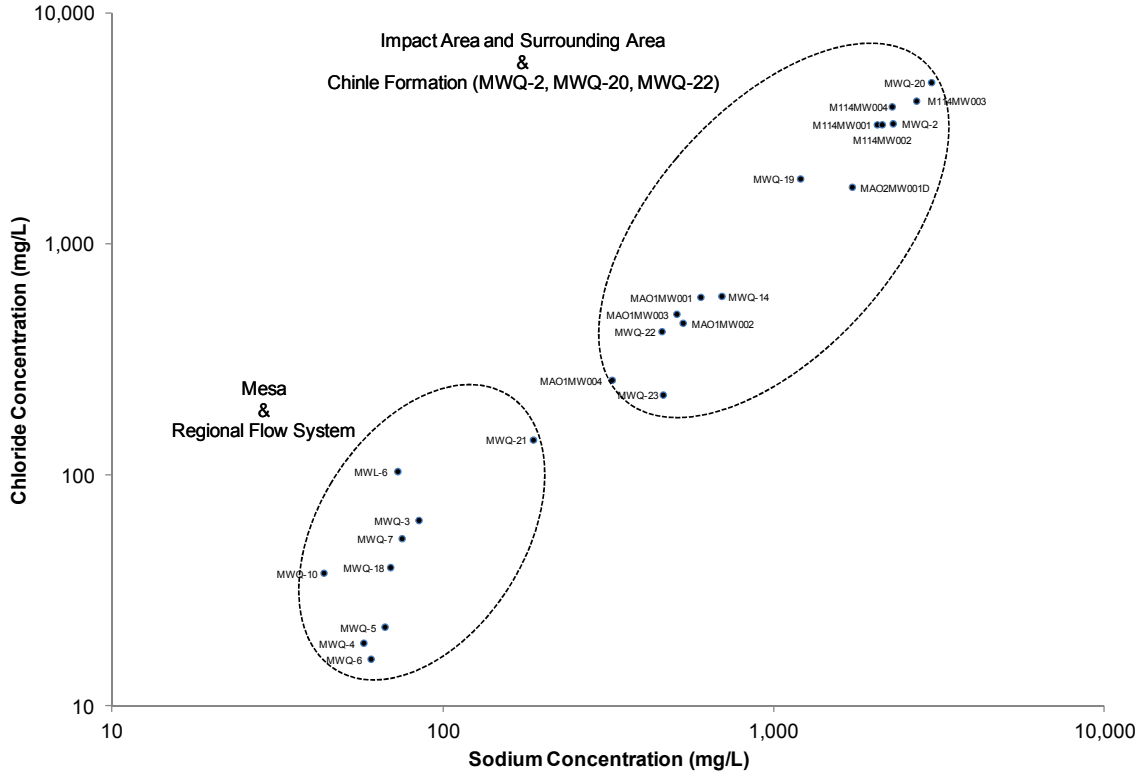
Previous sampling events conducted at Melrose AFR have included dissolved (filtered) metals results. In the majority of sampling conducted prior to January 2010 only dissolved metals results appear to have been reported. NMED has previously accepted the use of dissolved metals data at Melrose AFR to support the argument that increased turbidity may result in increased metals concentrations. Documents where data has previously been submitted and accepted include but are not limited to:

- Phase I RCRA Facility Investigation for Melrose Air Force Range, 1996;
- RCRA Facility Investigation Report Addendum, 2003;
- Final Report, Initial Baseline Groundwater Monitoring, Melrose Air Force Range, New Mexico, 2009.

7.1 Ground Water Quality

7.1.1 Background Water Quality

Based on major ion chemistry, temperature, specific conductance, and TDS, etc. the USGS identified three sources of different ground water in the immediate vicinity of the Melrose AFR: (1) local flow system near the Mesa and ephemeral channels, (2) local flow system in the impact area, and (3) regional flow in the Portales Valley (Langman, 2004). However, water from the local flow system near the Mesa and water in the regional flow system in the Portales Valley were determined to be of somewhat similar quality. Based on the USGS findings, ground water in the vicinity of the Melrose AFR Impact Area is a different flow system and not the same quality water as the Regional Flow System. The difference in water quality is likely attributable to the upward potential/migration of ground water from the Chinle Formation. Using the same geochemical technique, TRINITY averaged all sodium/chloride concentration data available from 2004 to present. The data is plotted below (log-log scale):



As demonstrated in the plot above, the data plotted very similar to that of the USGS, indicating a higher quality of water in the Mesa area and the Regional Flow System (Portales Valley) than the local flow system beneath the Impact Area

Based on previous discussions and agreements with NMED a new background well for the SWMUs was proposed to be installed adjacent to MWQ-10. However, MWQ-10 is located on a portion of Melrose AFR (the Mesa) where ground water is not mixing with the underlying Chinle Formation, as previously discussed. Based on ground water geochemistry data and the ground water flow direction, ground water collected from MWQ-8 is upgradient of the SWMUs and the Impact Area and is located on a portion of Melrose AFR that would provide a more representative ground water quality sample for the Impact Area. Wells MWQ-10 and/or MWQ-7 would be likely candidates for background water quality for non-mixing ground water (Mesa and Regional Flow System). Both wells are upgradient of the SWMUs and the Impact Area. Background water quality based on data collected from these three wells is summarized below. Background water quality data from MWQ-8 is based on data presented by USGS (2004), data from MWQ-7 and MWQ-10 is based on data presented in this report.

General Background Water Quality

	Impact Area (mixing)		Mesa & Regional Flow System (non-mixing)	
	MWQ8		MWQ7	MWQ10
Conductivity	3,190		0.87	0.64
Dissolved Oxygen	2.5		6.90	8.03
pH	7.6		7.57	7.09
Temperature	18.2		17.43	17.82
Turbidity	---		0.22	0.84
Aluminum (ug/L)	---		<D.L.	<D.L.
Antimony (ug/L)	---		<D.L.	0.01
Calcium (ug/L)	51,000		57,675	55,229
Iron (ug/L)	---		16.7	8.0
Magnesium (ug/L)	21,000		24,700	31,414
Manganese (ug/L)	---		0.7	0.5
Sodium (mg/L)	662		76.75	24.80
Chloride (mg/L)	445		53	38
Sulfate (mg/L)	600		159	52
Total Dissolved Solids (mg/L)	1,900		514	397

<D.L. indicates value below detection limit; --- indicates parameter not analyzed for or data was unavailable.

TRINITY submitted an updated *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) in which it was recommended prior to the expenditure of additional funds to install a new monitoring well, that MWQ-23 be considered. Based on site specific geology this existing cattle stock supply well located approximately 3,100 feet west of MWQ-8, appears to be able to provide adequate background data for the local flow system in the Impact Area

The new background well (MWQ-23) was sampled during both the Spring 2011 and Fall 2011 sampling events. The data is summarized in Table 2, 3, and 4. The laboratory analytical data is provided in Appendix D. Based on major ion chemistry, temperature, specific conductance, and TDS, etc. it appears that the water quality associated with MWQ-23 is similar to ground water associated with the local flow system in the Impact Area. Due to the variability of mixing between the Chinle and Ogallala Aquifer above it may be difficult to locate a well upgradient of the Impact Area, that is not located within portions of the range that are actively being bombed, and is located on a portion of the range where water from the Chinle is leaking upward and mixing with the Ogallala Aquifer. MWQ-23 would therefore appear to be a viable option as a

background well for the collection of ground water quality samples. General background water quality from MWQ-8 (local flow system in the Impact Area) and MWQ-7 and MWQ-10 (Mesa and Regional Flow System) is compared to MWQ-23 in the table below.

General Background Water Quality-MWQ-23

	Impact Area (mixing)		Mesa & Regional Flow System (non-mixing)			Proposed Background Well for Impact Area
	MWQ8		MWQ7	MWQ10		MWQ-23
Conductivity	3,190		0.87	0.64		2.2
Dissolved Oxygen	2.5		6.9	8.03		0.18
pH	7.6		7.57	7.09		8.09
Temperature	18.2		17.43	17.82		19.71
Turbidity	---		0.22	0.84		1.6
Aluminum (ug/L)	---		<D.L.	<D.L.		<D.L.
Antimony (ug/L)	---		<D.L.	0.01		<D.L.
Calcium (ug/L)	51,000		57,675	55,229		14,550
Iron (ug/L)	---		16.7	8		0
Magnesium (ug/L)	21,000		24,700	31,414		9,715
Manganese (ug/L)	---		0.7	0.5		73
Sodium (mg/L)	662		76.75	24.8		48.5
Chloride (mg/L)	445		53	38		224
Sulfate (mg/L)	600		159	52		410
Total Dissolved Solids (mg/L)	1,900		514	397		1365

7.1.2 Suitability of the Data

All analytical data was evaluated by eDATApro. Level III Data Validation was performed according to guidance from *USEPA National Functional Guidelines for Organic Data Review* (USEPA, 1999), *USEPA National Functional Guidelines for Inorganic Data Review* (USEPA, 2004) and the project specific Quality Assurance Project Plan. The eDATApro Data Validation Reports are included in Appendix E. Two Sample Delivery Groups from the Spring 2011 sampling event and one from the Fall 2011 sampling event were evaluated by eDATApro and include the following:

7.1.2.1 Holding Times

Review of the sample collection and analyses dates involved comparing the COCs, the chemical results summary forms, and the raw data forms for accuracy, consistency, and holding time compliance. All samples were prepared and analyzed within the required holding time criteria with the exception of the following:

- **2011 Annual Spring (SDG 211050426)**
  1. MWQ-3 was received after expiration of the 24-hour holding time for Chromium VI. MWQ-4, MWQ-5, MWQ-5-DUP, MWQ-6, and MWQ-7 were received within the 24-hour holding time but were not processed through receiving prior to expiration of

the holding time. Accordingly, the sample results were qualified as estimated "J" or estimated non-detect "UJ."

- **2011 Annual Fall (SDG 2110928048)**
  1. Recovery of the surrogate analyte in samples MWQ-23, MA01-MW002, M114MW002 and M114MW003 exceeded lower acceptance criteria. The laboratory noted that re-extraction and analyses were performed on samples M114MW002 and M114MW003 with similar performance. Samples MWQ-23 and MA01-MW002 were not re-processed as the preparation holding time had expired. The laboratory reported the results for the target analytes for these samples as non-detect estimate; qualified with "UJ." No further qualification of these results was necessary.
  2. Samples MA01MW001, MA02MW001D, FD-1, MWQ-23 and M114MW002 were analyzed after expiration of the analytical holding time. Laboratory results for this analyte in these samples were modified to estimate (J, UJ).

7.1.2.2 Blank Samples

- **2011 Annual Spring (SDG 211050426)**
  1. Measurable quantities of arsenic (total), cadmium (total), and manganese (total) were observed at a concentration less than the laboratory reporting limit (RL) in preparation blank sample MB944205. Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RL and associated to this blank were modified to non-detect (U) at the corresponding RL.
  2. Measurable quantities of antimony (total) and lead (total) were observed at a concentration less than the laboratory RL in one or more initial calibration blank/continuing calibration blank (ICB/CCB) samples. Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RL and associated to these blanks were modified to non-detect (U) at the corresponding RL.
  3. A measurable quantity of (total) cadmium was observed at a concentration less than the laboratory RL in preparation blank sample MB948869. Laboratory results of this analyte in samples with measurable concentrations less than the laboratory RL and associated to this blank were modified to non-detect (U) at the corresponding RL.

4. Measurable quantities of (total) arsenic, cadmium, copper, and manganese were observed at a concentration less than the laboratory RL in the equipment rinsate sample. Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RL and associated to these blanks were modified to non-detect (U) at the corresponding RL.
5. Measurable quantities of arsenic (dissolved) and cadmium (dissolved) were observed at a concentration less than the laboratory RL in preparation blank sample MB944202. Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RL and associated to this blank were modified to non-detect (U) at the corresponding RL.
6. Measurable quantities of antimony (dissolved) and lead (dissolved) were observed at a concentration less than the laboratory RL in one or more ICB/CCB samples. Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RL and associated to these blanks were modified to non-detect (U) at the corresponding RL.
7. A measurable quantity of cadmium (dissolved) was observed at a concentration less than the laboratory reporting limit (RL) in preparation blank samples MB944905 and MB948869. Laboratory results of this analyte in samples with measurable concentrations less than the laboratory RL and associated to this blank were modified to non-detect (U) at the corresponding RL.
8. Measurable quantities of cadmium (dissolved), copper (dissolved), manganese (dissolved), nickel (dissolved), and zinc (dissolved) were observed at a concentration less than the laboratory RL in the equipment rinsate sample. Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RL and associated to these blanks were modified to non-detect (U) at the corresponding RL.

- **2011 Semiannual Spring (SDG 211050608)**
  1. A measurable quantity of acetone was observed at a concentration less than the laboratory RL in preparation blank sample MB945623. The laboratory qualified associated results with "B." This qualifier was removed from non-detect values.

Laboratory results of this analyte in samples with measurable concentrations less than the laboratory RL and associated to this blank were modified to non-detect (U) at the corresponding RL.

2. A measurable quantity of nitrite was observed at a concentration less than the laboratory RL in method blank sample MB456033. The laboratory result of this analyte in sample MA01MW001 was modified to non-detect (U) at the corresponding RL.
3. A measurable quantity of manganese (total) was observed at a concentration less than the laboratory RL in preparation blank sample MB944933. Laboratory results of this analyte in samples with measurable concentrations less than the laboratory RL and associated to this blank were modified to non-detect (U) at the corresponding RL.
4. Measurable quantities of total analytes barium (total), copper (total), manganese (total), and zinc (total) were observed at concentrations less than the laboratory RLs in equipment rinsate sample EB1. Laboratory results of field samples from this delivery group with measurable concentrations of these analytes less than the laboratory RLs were modified to nondetect (U) at the corresponding RLs.
5. Measurable quantities of barium (dissolved) and cadmium (dissolved) were observed at concentrations less than the laboratory RLs in preparation blank sample MB944905 (dissolved). Laboratory results of these analytes in samples with measurable concentrations less than the laboratory RLs and associated to this blank were modified to non-detect (U) at the corresponding RL.
6. A measurable quantity of barium (dissolved) was observed at a concentration less than the laboratory RL in a bracketing continuing calibration blank (CCB). The barium (dissolved) result in sample EB1 was modified to non-detect (U) at the RL.
7. Measurable quantities of aluminum (Dissolved), arsenic (Dissolved), cadmium (Dissolved), copper (Dissolved), and zinc (Dissolved) were observed at concentrations less than the laboratory RLs in equipment rinsate sample EB1. Laboratory results of field samples from this delivery group with measurable concentrations of these analytes less than the laboratory RLs were modified to nondetect (U) at the corresponding RLs.

- **2011 Annual Fall (SDG 2110928048)**
  1. An estimate concentration of acetone was reported in method blank sample MB992648. This analyte was not detected in samples associated with this method blank. No qualifications were necessary based on this observation.
  2. Estimate concentrations of acetone and methylene chloride were reported in trip blank sample TB-5. Laboratory results of these analytes in field samples associated to this blank reported with estimate concentrations were modified to non-detect (U) at the corresponding RL.
  3. Estimate concentrations of acetone and methylene chloride were reported in equipment rinsate blank sample EB-1. An estimate concentration of acetone was reported in trip blank sample TB-6. Laboratory results of these analytes in field samples associated to these blanks reported with estimate concentrations were modified to non-detect (U) at the corresponding RL.
  4. An estimate concentration of sodium (total) was observed in method blank (MB) sample MB992251. No estimate concentrations of this analyte were reported in samples associated with this preparation blank. No result qualifications were necessary.
  5. Estimated concentrations of sodium (total) were observed in the CCBs bracketing field samples MA01MW001, MA02MW001D, MWQ-23, MA01-MW004 and MA01-MW002. No estimated concentrations of this analyte were reported in these samples. No result qualifications were necessary.
  6. An estimate concentration of barium (total) was observed in preparation blank MB993097. The laboratory result for this analyte in sample EB-1 was modified to non-detect (U) at the RL.
  7. An estimate concentration of silver (total) was observed in the CCB sample following the analyses of samples M114MW004, EB-1, M114MW002 and M114MW003. The laboratory result for this analyte in sample EB-1 was modified to non-detect (U) at the RL.
  8. Estimate concentrations of manganese (total), nickel (total), and zinc (total) were reported in equipment rinsate blank sample EB-1. The laboratory results for

manganese in samples M114MW002 and M114MW003 and nickel in sample M114MW002 were modified to non-detect (U) at the RL.

7.1.2.3 Surrogate Compounds

- **2011 Annual Spring (SDG 211050426)**

  In accordance with the updated *Ground Water Monitoring Project Work Plan* (Trinity Analysis & Development Corp, 2011) VOCs and explosives are not part of the required analytical suite for Annual wells.

- **2011 Semiannual Spring (SDG 211050608)**

  Surrogate recoveries for all VOC and explosive samples were within evaluation criteria.

- **2011 Annual Fall (SDG 2110928048)**

  Recovery of the surrogate analyte in samples MWQ-23, MA01-MW002, M114MW002 and, M114MW003 exceeded lower acceptance criteria. The laboratory noted that re-extraction and analyses were performed on samples M114MW002 and M114MW003 with similar performance. Samples MWQ-23 and MA01-MW002 were not re-processed as the preparation holding time had expired. The laboratory reported the results for the target analytes for these samples as non-detect estimate; qualified with "UJ." No further qualification of these results was necessary.

7.1.2.4 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD)

- **2011 Annual Spring (SDG 211050426)**

  All LCS/LCSD QC samples were within evaluation criteria.

- **2011 Semiannual Spring (SDG 211050608)**

  Recovery of target analyte HMX in the LCS/LCSD from preparation batches 455907 and 456405 exceeded lower acceptance criteria. The laboratory results for this analyte in samples from these preparation batches were modified to non-detect estimate (UJ). The laboratory qualified these results with a "Q." This qualifier was removed during the validation review.

- **2011 Annual Fall (SDG 2110928048)**

  All LCS/LCSD QC samples were within evaluation criteria.

7.1.2.5 Field Duplicate Analysis

Field duplicate sample pair results were within evaluation criteria (25 percent relative percent difference [RPD] or within ±two times the RL if either the sample or duplicate are less than five times the RL) for VOCs, and explosives duplicate sample pairs. Some metals parameters did not meet the field duplicate criteria. Analytical results for the field duplicate sample pairs are presented in the table below.

Field Duplicate Analysis

Chemical Name	Units	2011 Semiannual Spring (SDG 211050608)				2011 Annual Spring (SDG 211050426)							2011 Annual Fall (SDG 2110928048)

7.1.2.6 Matrix Spike/Matrix Spike Duplicate Analysis

The MS/MSD recoveries for inorganic compounds (calcium, magnesium, and sodium) with sample concentrations greater than four times the matrix spike concentration did not require evaluation or qualification. The data review guidelines established in the QAPP state that organic data (mercury) will not be qualified based on MS/MSD data alone and LCS recoveries were within evaluation criteria, therefore no qualification of data was required. MS/MSD recoveries and RPDs that were outside control limits are listed in the following table.

Recovery of Cyanide in the matrix spike fortifications of samples MWQ-10 and MWQ-14 exceeded lower acceptance criteria. All sample results were non-detect and therefore qualified as estimated "UJ."

Recovery of numerous explosives analytes in the matrix spike and matrix spike duplicate

fortifications of parent sample MA01MW001 exceeded upper acceptance criteria. No measurable quantities of these target analytes were observed in field samples and recovery of these analytes in the associated LCS and LCSD sample were within acceptance criteria. No result qualifications were necessary.

7.1.3 Semiannual SWMU Ground Water Quality Network

This report represents the second complete Annual Water Quality Report for Melrose AFR. A summary of analytical and field data from the most recent sampling event is provided in Table 2, 3, and 4. Available historic data is summarized in Appendix C and includes parameter summary tables and trend plots. Laboratory analytical data is provided in Appendix D and Appendix E. Discussions provided below are based on data collected during the current reporting period.

7.1.3.1 SWMU 114

Ground water quality in the immediate vicinity of SWMU 114 is in the Impact Area (mixing) flow system and thus comparison to the background ground water quality at MWQ-23 is most representative. Of the analysis performed no VOCs, explosives, hexavalent chromium,

perchlorate, or cyanide were detected or were detected at concentrations below screening guidelines. A total of four parameters were detected above the ground water screening guidelines during the 2011 Annual reporting period. A summary of the exceedances of ground water screening guidelines is provided below:

SWMU 114														
						M114MW001		M114MW002		M114MW003		M114MW004	
Analyte	WQCC (NMAC Section 20.6.2.3103)	USEPA Drinking Water Maximum Contaminant Levels (May 2010)	NMED SSLs - Tapwater Screening Levels (Dec 2009)	Regional Screening Levels for Chemical Contaminants at Superfund Sites (May 2010)	Sampling Event	Total	Dissolved	Total	Dissolved	Total	Dissolved	Total	Dissolved
Aluminum	5000	**200**	3650	---	May-11	<D.L.	78	78.8	<D.L.	63.6	67	<D.L.	<D.L.
					Sep-11	100	<D.L.	85.3	<D.L.	**200.0**	<D.L.	110	<D.L.
Chloride	**250**	250	---	---	May-11	**3,280**	---	**3,660**	---	**4,550**	---	**4,180**	---
					Sep-11	**3,060**	---	**3,130**	---	**3,920**	---	**3,970**	---

					Sep-11	**1,810**	---	**1,580**	---	**1,880**	---	**1,630**	---
TDS	1,000	**500**	---	---	May-11	**8,270**	---	**7,800**	---	**9,540**	---	**7,000**	---
					Sep-11	**7,640**	---	**7,610**	---	**9,870**	---	**9,500**	---

Red indicates exceedance, not necessarily a water quality violation; Underscored value indicates estimated result between MDL and RL; <D.L. indicates value below detection limit; --- indicates parameter not analyzed for.

The reported concentrations for chloride, sulfate, and TDS are higher than that of the background well (MWQ-23). The higher concentrations at SMWU-114 are attributed to increased "mixing" of the ground water with the underlying Chinle Formation. MWQ-23 provides an adequate representation of background groundwater quality, however in this location less "mixing" appears to occur with the Chinle Formation. The higher concentrations of chloride, sulfate, and TDS are not believed to be associated with past disposal activities. Aluminum was detected above the screening guidelines; however, it was below the screening criteria in the filtered samples.

7.1.3.2 SWMU 130

Ground water quality in the immediate vicinity of SWMU 130 is in the Impact Area (mixing) flow system and thus comparison to the background ground water quality at MWQ-23 is most representative. Of the analysis performed no VOCs, explosives, hexavalent chromium, perchlorate, or cyanide were detected or were detected at concentrations below screening guidelines. A total of five parameters were detected above the ground water screening guidelines. A summary of the exceedances of ground water screening guidelines is provided

below:

SWMU 130															
						MAO1MW001		MAO1MW002		MAO1MW003		MAO1MW004	
Analyte	WQCC (NMAC Section 20.6.2.3103)	USEPA Drinking Water Maximum Contaminant Levels (May 2010)	NMED SSLs - Tapwater Screening Levels (Dec 2009)	Regional Screening Levels for Chemical Contaminants at Superfund Sites (May 2010)	Sampling Event	Total	Dissolved	Total	Dissolved	Total	Dissolved	Total	Dissolved
Aluminum	5000	**200**	3650	---	May-11	**276**	105	<D.L.	164	111	<D.L.	<D.L.	<D.L.
					Sep-11	84.3	<D.L.	<D.L.	<D.L.	<D.L.	<D.L.	<D.L.	<D.L.
Antimony	---	**6**	14.6	6.0	May-11	<D.L.	<D.L.	**102**	<D.L.	<D.L.	<D.L.	<D.L.	<D.L.

Chloride	**250**	250	---	---	May-11	**651**	---	**473**	---	**537**	---	**269**	---
					Sep-11	**525**	---	**431**	---	**477**	---	**251**	---
Sulfate	600	**250**	---	---	May-11	**704**	---	**544**	---	**616**	---	**352**	---
					Sep-11	**564**	---	**514**	---	**524**	---	**329**	---
TDS	1,000	**500**	---	---	May-11	**1,980**	---	**1,780**	---	**1,760**	---	**1,110**	---
					Sep-11	**1,990**	---	**1,720**	---	**1,790**	---	**1,130**	---

Red indicates exceedance, not necessarily a water quality violation; Underscored value indicates estimated result between MDL and RL; <D.L. indicates value below detection limit; --- indicates parameter not analyzed for.

The reported concentrations of chloride, sulfate, and TDS are similar to background water quality concentrations (MWQ-23). Aluminum was detected above the screening guideline in MAO1MW001 during the Spring 2011 sampling event; however, the concentration was below the screening criteria in the filtered sample. Additionally, during the Fall 2011 sampling event the concentrations were below the screening criteria for the total and dissolved samples. Antimony was detected above the screening guideline in MAO1MW002 during the Spring 2011 sampling event; however, antimony was not detected in the filtered sample. Additionally, antimony was not detected in the total and dissolved samples during the subsequent Fall 2011 sampling event.

7.1.3.3 SWMU 131

Ground water quality in the immediate vicinity of SWMU 131 is in the Impact Area (mixing) flow system and thus comparison to the background ground water quality at MWQ-23 is most representative. Of the analysis performed no VOCs, explosives, hexavalent chromium, or cyanide were detected or were detected at concentrations below screening guidelines. A total of six parameters were detected above the ground water screening guidelines. A summary of the exceedances of ground water screening guidelines is provided below:

SWMU 131							
Analyte	WQCC (NMAC Section 20.6.2.3103)	USEPA Drinking Water Maximum Contaminant Levels (May 2010)	NMED SSLs - Tapwater Screening Levels (Dec 2009)	Regional Screening Levels for Chemical Contaminants at Superfund Sites (May 2010)	Sampling Event	MAO2MW001D	
						Total	Dissolved
Manganese	200	**50**	876	---	May-11	**248**	**208**
					Sep-11	**209**	**188**
Selenium	**50**	50	183	50	May-11	**94.7**	**107**
					Sep-11	**117**	**132**
Chloride	**250**	250	---	---	May-11	**2,190**	---
					Sep-11	**1,640**	---
Sulfate	600	**250**	---	---	May-11	**2,130**	---
					Sep-11	**1,860**	---
TDS	1,000	**500**	---	---	May-11	**6,290**	---
					Sep-11	**5,620**	---
Perchlorate	---	---	---	**15**	May-11	**22.4**	---
					Sep-11	**23.8**	**19.6**

Red indicates exceedance, not necessarily a water quality violation; Underscored value indicates estimated result between MDL and RL; <D.L. indicates value below detection limit; --- indicates parameter not analyzed for.

The reported concentrations for chloride, sulfate, and TDS are higher than that of the background well (MWQ-23). The higher concentrations at SMWU-131 are attributed to increased "mixing" of the ground water with the underlying Chinle Formation. MWQ-23 provides an adequate representation of background groundwater quality, however in this location less "mixing" appears to occur with the Chinle Formation. The higher concentrations of chloride, sulfate, and TDS are not believed to be associated with past disposal activities.

Manganese was detected above the screening guidelines in both the total and dissolved samples. Manganese was detected in the background well (MWQ-23) at a similar concentration, also exceeding the screening criteria. Selenium was reported present in monitoring well MAO2MW001D at a concentration ranging from 94.7 to 117 ug/L during the last year of sampling. The dissolved sample reported similar results. The total and dissolved manganese concentrations appear to be in line with historic data. Selenium was also reported at concentrations above applicable ground water standards during the Phase I RFI; however, due to a lack of selenium in overlying soil samples it was determined that the elevated selenium concentration was likely natural (Foster Wheeler 1996; Foster Wheeler 2003).

Perchlorate was reported present in monitoring well MAO2MW001D at a concentration of 22.4 and 23.8 µg/L, above the screening criteria of 15 µg/L. The recent results appear to be in the same range as historic data (between 19.0 and 23.9 µg/L). During the Fall 2011 sampling event a dissolved perchlorate sample was also collected from MAO2MW001D. The total results (23.8 ug/L) were comparable to the dissolved results (19.6 ug/L). The results of a recent study of wells located throughout the High Plains indicate that perchlorate may be naturally occurring. The results of the study strongly indicate a surface source for the perchlorate concentrations, likely atmospheric deposition in arid and semiarid areas where evaporative concentrations and unsaturated transport may occur (Rajagopalan, et al., 2006). No evidence of specific activities associated with a release or discharge of perchlorate is noted, but due to Melrose AFB being an active test facility range it cannot be completely precluded however unlikely. The reported concentrations of perchlorate in monitoring well MAO2MW001D are well within the background range discussed in the recent study (Rajagopala, et. al,. 2006).

7.1.4 Annual Ground Water Quality Network

Ground water quality in the vicinity of the Mesa and Regional Flow System is similar to background ground water quality (MWQ-7 and MWQ-10). Of the analysis performed no VOCs, explosives, hexavalent chromium, perchlorate, or cyanide were detected or were detected at concentrations below screening guidelines. A total of eight parameters were detected above the ground water screening guidelines. A summary of the exceedances of ground water screening guidelines is provided in the tables below:

Analyte	WQCC (NMAC Section 20.6.2.3103)	USEPA Drinking Water Maximum Contaminant Levels (May 2010)	NMED SSLs - Tapwater Screening Levels (Dec 2009)	Regional Screening Levels for Chemical Contaminants at Superfund Sites (May 2010)	Sampling Event	MWQ-2		MWQ-3		MWQ-4		MWQ-5		MWQ-6		MWQ-7		MWQ-10

Red indicates exceedance, not necessarily a water quality violation; Underscored value indicates estimated result between MDL and RL; <D.L. indicates value below detection limit; --- indicates parameter not analyzed for.

Although water quality data from the three deep wells installed in the Chinle Formation is summarized above, they are excluded from the discussion below based on the naturally elevated concentrations of TDS, chloride, sodium, etc.

Chloride, manganese, sulfate, and TDS commonly exceed ground water screening guidelines in monitoring wells in the Annual Ground Water Quality Network with more elevated concentrations observed in MWQ-19 and MWQ-21. Monitoring wells MWQ-19 and MWQ-21 are installed deeper than most area supply wells and are installed to a depth near the base of the Ogallala Formation where mixing with ground water from the Chinle Formation may be occurring, thus degrading water quality. Background water quality (MWQ-7 and MWQ-10) generally has lower concentrations of chloride, manganese, sulfate, and TDS. The high variability of water quality, with respect to chloride, manganese, sulfate, and TDS appears to be attributable to variable degrees of "mixing" with ground water from the underlying Chinle Formation

Aluminum (total) has been detected in two of the 14 wells sampled during the 2011 Annual sampling event at concentrations above the screening criteria. However, analysis for aluminum (dissolved) has been less than the screening criteria.

The only exceedance for antimony is in MWQ-20, which as previously discussed has been

excluded from this discussion based on its installation in the Chinle formation. The elevated antimony concentration appears anomalous when compared to historic data.

Arsenic was reported present in supply wells MWQ-3, MWQ-4, and MWQ-6 at concentrations of 13.5, 11, and 10.2 ug/L respectively, all in excess of screening guideline of 10 µg/L. The concentration of 13.5 ug/L is consistent with historic data which ranges from 9.1 to 11.5 ug/L. The results from MWQ-4 and MWQ-6 while slightly higher are not inconsistent with historic data.

Iron (total) has been detected at concentrations above the screening criteria in several wells throughout the network. However, analysis for iron (dissolved) has typically been less than the screening criteria, with a few exceptions.

Perchlorate has been detected throughout the Annual Ground Water Quality Network during previous sampling events at concentrations ranging from less than one to 11.0 µg/L. Perchlorate concentrations in the Annual Ground Water Quality Network have been less than the screening criteria of 15 µg/L. No apparent trend exists at this time but will be monitored over time. However, as previously discussed perchlorate may be naturally occurring at concentrations typically less than 4 µg/L with some areas impacted by concentrations as high as 200 µg/L (Rajagopalan, et al., 2006).

Ground water quality in the Annual Ground Water Quality Network is generally good and does not appear to have been degraded due to activities in the Impact Area.

7.2 Ground Water Elevation, Gradient and Flow Velocity

A comprehensive round of water levels was collected from the Semiannual SWMU Ground Water Monitoring Network and Annual Ground Water Monitoring Network by TRINITY between May 3, 2011 and May 16, 2011 (Spring 2011 Sampling Event) and September 26, 2011 and October 3, 2011 (Fall 2011 Sampling Event). Recent and historic ground water elevations and trends are summarized in Table 5. Three ground water flow maps are presented, in chronological order, as part of this report:

1. Figure 5 - Median ground water flow direction based on data collected and analyzed by the USGS between 2002 and 2003 (Langman, 2004);
2. Figure 8 - Ground water flow direction based on data collected by TRINITY between May 3, 2011 and May 16, 2011.
3. Figure 9 - Ground water flow direction based on data collected by TRINITY between September 26, 2011 and October 3, 2011.

Water-level contours for the Southern High Plains Aquifer indicate two ground water flow systems – local and regional (Figures 5, 8, and 9). Locally, in southwest portions of Melrose AFR, ground water flows northeast from the Mesa to the Portales Valley. Ground water flow is southeast and east in the Portales Valley. This corresponds with the regional general flow direction for the Melrose AFR vicinity (Hart, 1985). A direct connection between the structural surface of the Chinle Formation confining unit and the direction of ground water flow is evident. Based on data from limited aquifer testing during the Phase I RFI, hydraulic conductivities in the Southern High Plains Aquifer of the Ogallala Formation at Melrose AFR ranged from 0.001 to 0.073 feet per day. The hydraulic conductivities for wells in the regional flow system have not been determined. The ground water gradient and flow velocities are summarized in the table below.

	gradient (ft/ft)		velocity (ft/y) [2]		
	local	regional	local		regional
			min	max	
1/1/2003 [1]	0.011	0.001	0.016	1.17	---
1/16/2009	0.015	0.001	0.022	1.60	---
10/25/2010	0.011	0.002	0.016	1.17	---
5/3/2011	0.014	0.002	0.020	1.49	---
9/26/2011	0.014	0.002	0.020	1.49	---

[1] The January 2003 ground water flow data is the "median altitude of water table" between 2002 and 2003 (Langman, 2004).
[2] Darcy's formula: V = KI/Ø where V = ground water velocity in ft/d; K = aquifer hydraulic conductivity in ft/d; I = ground water gradient in ft/ft; Ø = effective porosity. [3] The effective porosity is estimated to be 25 percent (Fetter, 1994).

It is not possible to calculate the flow velocity for ground water in the vicinity of the Portales Valley (regional flow system) due to a lack of data, i.e. hydraulic conductivities. Based on the limited data from the Phase I RFI and the increase in larger irrigation wells in the Portales Valley it would appear that the hydraulic conductivities increase to the north. However, as the hydraulic conductivities increase to the north the ground water gradient greatly decreases. Assuming a

hydraulic conductivity of 1.0 ft/day the flow velocity for ground water in the vicinity of the Portales Valley is likely to be on the same range as ground water in the local flow system.

7.3 Well Condition Inspection/Maintenance

The condition of the wells in the network, based on the most current inspection, is summarized in Table 1. As discussed, maintenance activities were undertaken during the Fall 2011 sampling event in conjunction with well abandonment activities. However, due to inclement weather it was not possible to reinstall the bollards at well cluster MWQ-18/19, MWQ-20, or MAO1MW004. However, fresh fill has been placed under all well pads with noted erosion. The bollards will be reinstalled during 2012 sampling events.

It had previously been noted by TRINITY that MWL-6 had been open and that it appeared that silt, and possibly cattle feces/hair had accumulated in the bottom of the well. Licensed well driller Wilson Drilling Co. (New Mexico Well Driller License No. 1152) mobilized to the site on May 17, 2011 to redevelop the well. The well was redeveloped by evacuating the well column with a steel bailer operated from a pump repair truck. The well was bailed for approximately one hour, until all silt/sediment had been removed from the bottom of the well case. The well was then pumped continuously by TRINITY until clear non-turbid water was produced. Subsequent to sampling activities the well head was properly secured. Additional wells previously identified as open were also properly secured.

In general, the condition of the Semiannual SWMU Ground Water Quality Network and Annual Ground Water Quality Network is adequate for ground water sampling activities.

7.4 Well Abandonment Activities

TRINITY and Wilson Drilling Co. (New Mexico Well Driller License No. 1152) mobilized to the site on October 5, 2011 to abandon the six wells (M117MW001, M117MW002, M117MW003, M117MW004, MAO2MW001S, and MAO3MW001). TRINITY had previously submitted request for and was in receipt of approved abandonment procedures from the New Mexico Office of the State Engineer. Monitoring well abandonment was conducted in

accordance with *NMED, Ground Water Discharge Permit, Monitoring Well Construction, and Abandonment Guidelines, Revision 1.0, July 2008* (New Mexico Environment Department, 2008) and *Well Driller Licensing; Construction, Repair and Plugging of Wells, adopted August 31, 2005*, 19.27.4 New Mexico Administrative Code (NMAC) (New Mexico Administrative Code, 2005).

The wells were abandoned by installing tremie pipe to the bottom of the well and tremie-grouting with neat Portland cement. The wells were filled with grout until overflow occurred, and then the tremie pipe was removed from the well. If the grout settled back into the well, it was continually topped off until the grout stabilized within a few feet of ground surface. Once grouting was complete, the well-pads, bollards, and protective metal casings were removed for proper disposal. The well pipe was cut-off just below ground surface and the land surface was restored as appropriate.

7.5 Geophysical Logging

The geophysical logging data collected is intended to enhance characterization of geology within the Ogallala and Chinle Formation at Melrose AFR. The geophysical logs are presented in Appendix F with the raw data. Four generalized cross-sections utilizing the logging data for determination of contacts have been constructed for Melrose AFR (Figure 10). It should be noted that our geologic interpretations are based almost primarily on the geophysical logging data. Supplemental data in the form of geologic surface interpretations by Langman (2004) were also utilized in the creation of the generalized cross sections. TRINITY has, to date, been unable to acquire the geologist's drilling logs for the three deep Chinle wells (MWQ-2, MWQ-20, and MWQ-22) at Melrose AFR.

8.0 CONCLUSIONS/RECOMENDATIONS

Based on the information and data collected during the 2010 Ground Water Quality sampling events, the following conclusions were reached:

- Based on the recent well inventory conducted by TRINITY, the measured TD of the wells, low turbidities during sampling activities, etc. the current condition of the SWMU – Semiannual Ground Water Quality Network and Annual Ground Water Quality Network generally appears adequate for the collection of representative ground water samples.

- Two complete rounds of ground water levels were collected from wells within the SWMU – Semiannual Ground Water Quality Network and Annual Ground Water Quality Network during the Semiannual and Annual sampling events. Based on the ground water flow maps and evaluation of geochemical data collected by TRINITY, the hydrogeological conceptual site model posed by the USGS in which three separate flow systems have been identified has been further strengthened. The USGS identified three sources of different water in the immediate vicinity of the Melrose AFR:

  (1) local flow system near the Mesa and ephemeral channels,
  (2) local flow system in the Impact Area, and
  (3) regional flow in the Portales Valley.

  Water from near the Mesa and water in the regional flow system in the Portales Valley were determined to be of somewhat similar quality. Based on the USGS findings, ground water in the vicinity of the Impact Area on Melrose AFR may possibly be mixing with water from the Chinle Formation (Mesa and Regional Flow System).

- Several wells are currently being utilized for the collection of water levels but have not been surveyed; these wells include MWL-11, MWQ-11, MWL-12, MWQ-12, and MWQ-13. The addition of these wells to ground water flow determinations would be beneficial.

- A total of 14 wells were sampled during the Spring 2011 Annual Ground Water Quality sampling. Ten wells were sampled during the Semiannual Ground Water Quality sampling event during the Spring and Fall 2011 sampling events. The ground water samples were submitted to the laboratory for the following analyses:
  - *Semiannual*: VOCs, explosives, perchlorate, metals (total & dissolved), hexavalent chromium, cyanide, mercury, nitrate, nitrite, chloride, sulfate, alkalinity, and TDS.
  - *Annual*: Perchlorate, metals (total & dissolved), hexavalent chromium, cyanide, nitrate, nitrite, chloride, sulfate, alkalinity, and TDS.

  Of all of the well samples and analyses performed during 2011, no VOCs, Explosives, Hexavalent Chromium, Cyanide, Mercury, Nitrate, or Nitrite were detected at concentrations above their respective screening criteria.

- MWQ-23 was previously proposed as a replacement background well for MWQ-8, which is dry. MWQ-23 has been sampled twice, during the Spring and Fall 2011 sampling events. The well appears to be an adequate background well for the SWMUs and Impact Area.

- Of the 24 metals that were analyzed in the ground water samples, only aluminum, antimony, arsenic, iron, manganese, and selenium, were detected at concentrations above a respective screening criterion.

- Aluminum was detected in two of the wells tested at concentrations exceeding the screening criteria in the samples for "total" analyses however the concentrations were less than the screening criteria for all samples for "dissolved" analyses. No apparent trend exists at this time but will be monitored over time.

- Antimony was detected in only two wells tested at a concentration exceeding the screening criteria in the samples for "total" analyses. In previous sampling events, antimony has never been detected above the screening criteria. Based on subsequent

testing and QA/QC results the reported antimony concentrations appear to be anomalous and will be tracked in future events.

- Arsenic was detected in three wells during 2011 ground water sampling at a concentration exceeding the screening criteria in the sample for "total" and "dissolved" analysis. The data appears consistent with historic data.

- Iron was detected in four of the wells tested at concentrations exceeding the screening criteria in the samples for "total" analyses however the concentrations were typically less than the screening criteria for all samples for "dissolved" analyses, with a few exceptions.

- Manganese (total) has been detected in four of the wells sampled during the 2011 ground water sampling at concentrations exceeding the screening criteria in the samples for "total" analyses. Manganese analytical results for "total" and "dissolved" were generally very similar. No apparent trend exists at this time but will be monitored over time.

- Perchlorate was reported present in only one monitoring well at a concentration slightly exceeding the screening criteria. However, perchlorate has been detected at low concentrations throughout the monitoring network. The results of a recent study of wells located throughout the High Plains of Texas and New Mexico indicate that perchlorate may be naturally occurring and strongly indicates a surface source for the perchlorate concentrations, likely atmospheric deposition in arid and semiarid areas where evaporative concentrations and unsaturated transport may occur (Rajagopalan, et al., 2006). No apparent trend exists at this time but will be monitored over time.

- Perchlorate was analyzed sing method EPA 6860; however, it was not possible to find an additional lab to analyze the split samples that utilized method 8260. Therefore the split sample was analyzed utilizing method EPA 6850, which has a slightly higher MDL.

- Selenium was reported present in only one monitoring well (MAO2MW001D) at a concentration exceeding the screening criteria. Selenium has been detected in this same well previously at concentrations above the screening criteria; however there does not

appear to be any discernable trend.

- During the Fall 2011 sampling event thallium was analyzed utilizing a MDL slightly higher than the screening guideline. Future testing will attempt to utilize a lower MDL.

- General water quality parameters of Chloride, Sulfate, and TDS were commonly detected across the Melrose AFR at concentrations exceeding their respective screening criteria, however were generally within the range of concentrations detected in the appropriate background ground water locations.

- "Low-flow" sampling techniques were previously proposed for several wells within the Annual Ground Water Quality Network that are used for cattle stock water supply and are installed within subsurface vaults. Upon further evaluation of the well construction details it has been determined that it is not possible to adjust the flow rate at the well head. Therefore, it was necessary to sample these wells by first evacuating a well volume and then collecting stabilization parameters.

- Based on review of the historical and recent 2011 ground water analytical data, the ground water beneath Melrose AFR does not appear to have been impacted by potential contaminants or activities associated with the SWMUs or activities associated with the Impact Area.

Digital data files; GeoBase/CAFB
Map is drawn after Figure 2 from USGS Scientific Investigations Report 2004-5158; Ground-Water Hydrology and Water Quality of the Southern High Plains Aquifer, Melrose Air Force Range, Cannon Air Force Base, Curry and Roosevelt Counties, New Mexico, 2002-03.

NOTES:

The Chinle Formation has various accepted names: Chinle Formation, Chinle Formation of the Dockum Group, and Chinle Group. All three names have been used for geologic description of areas in east-central New Mexico with usage dependent on locally identified units. Given a lack of identified units in the Range area, although this upper unit is possibly the Redonda Formation of the Chinle Group,"Chinle Formation" is used in this report. Locally, this formation is known as the "red beds."

These generalized cross sections are based on limited data from three wells that have been geophysically logged by TRINITY and by the geologic surface interpertations in Langman (2004).

[1] 15 Semiannual SWMU and 24 Annual Groundwater Quality Network wells were surveyed by Lydick, Inc., a professional surveyor licensed in the State of New Mexico, on January 14-16, 2009 as part of the initial annual groundwater sampling program. Land surveying was completed using the New Mexico East State Plane North American Datum (NAD) 83 and North American Vertical Datum (NAVD) 88 (adjusted) in decimal feet. All horizontal coordinates were measured to the nearest fiftieth of a foot. All vertical coordinates were measured to the nearest tenth of a foot.
Wells in gray scale are not sampled as part of the Annual or Semiannual Ground Water Quality Network. These wells are utilized for ground water levels or are scheduled for abandonment.
DSP = dedicated submersible pump
MW = monitoring well
NA = not applicable

Explosives		8330	Explosives were not detected in any ground water samples collected.					Explosives were not detected in any ground water samples collected.									

Notes: **BOLD** indicatesthe lowest screening value utilized to evaluate the data; **Red** indicates exceedance, not necessarily a water quality violation; *italicized* value indicates estimated result between MDL and RL; Greyscale indicates value below detection limit (MDL tabulated);
Laboratory: Gulf Coast Analytical Laboratory, Baton Rogue, LA; Sampling performed by Trinity Analysis & Development Corp.

CASE NARRATIVE

Client: TRINITY Analysis & Development Corp. **Report:** 211050426

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the sample cross-reference page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

METALS

The dissolved concentration for some analytes is greater than the total concentration of these analytes. This can be attributed to different aliquots of the samples. It can be assumed that these analytes are present in the dissolved state in these samples.

In the SW-846 6010C (Dissolved and Total) analysis, many samples had to be diluted in order to bracket the concentration of a target analyte within the linear dynamic range of the instrument. The dilutions are reflected in elevated detection limits.

In the SW-846 6010C analysis for prep batch 455675, the MS/MSD and post-digestion spike recoveries recoveries are not applicable for Calcium and Magnesium because the sample concentration is greater than four times the spike concentration.

In the SW-846 6010C analysis for prep batch 455676, the MS/MSD and post-digestion spike recoveries are not applicable for Calcium and Magnesium because the sample concentration is greater than four times the spike concentration. Barium was detected at a concentration > ½ the PQL in the method blank. The concentration is less than 1/10 the concentration detected in the associated samples.

In the SW-846 6010C analysis for prep batch 455823, the MS/MSD and post-digestion spike recoveries are not applicable for Calcium, Magnesium, and Sodium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Calcium and Sodium on ICP6, 05/25/11 at 1633. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 1739. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C analysis for prep batch 455827, the MS/MSD and post-digestion spike recoveries are not applicable for Calcium, Magnesium and Sodium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Barium and Sodium on ICP6, 05/25/11 at 1921. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 1949. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C analysis for prep batch 456691, the MS/MSD and post-digestion spike recoveries are not applicable for Calcium, Magnesium, and Sodium because the sample concentration is greater than four times the spike concentration. The method

blank was analyzed for Barium on ICP6, 05/27/11 at 1406 and for Sodium on ICP6, 05/31/11 at 1254. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 1505. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C analysis for prep batch 456692, the MS/MSD and post-digestion spike recoveries are not applicable for Calcium, Magnesium, and Sodium because the sample concentration is greater than four times the spike concentration.

In the SW-846 6010C analysis for prep batch 456846, the MS recovery is outside the control limits for Sodium. The MSD and LCS recoveries are acceptable. A post-digestion spike was performed on the QC sample for this batch with a recovery of 110%. The MS/MSD and post-digestion spike recoveries are not applicable for Calcium and Magnesium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Thallium on ICP6, 05/31/11 at 1448. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/26/11 at 1637. Only one schedule can be reported on a form 3 for a method blank. Manganese is flagged E, estimated on the serial dilution due to the fact that the % difference between the original result and the serial dilution result is greater than 10.

In the SW-846 6010C analysis for prep batch 456848, the MS/MSD recoveries are not applicable for Calcium and Magnesium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Beryllium and Thallium on ICP6, 05/31/11 at 1555. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/26/11 at 1758. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 7470A analysis for prep batch 457095, the MS and/or MSD recovery is outside the control limits for Mercury. The LCS recovery is within the control limits. This indicates the analysis is in control and the sample is affected by matrix interference.

In the SW-846 6010C analysis, the recovery for the low level check standard (CRDL) is outside 80-120% for Zinc (79%). This is associated with sample 21105190401 (MWL6). This sample was analyzed twice. The method blank concentration exceeded ½ PQL and was greater than 10% of the concentration detected in the sample in the first run. All other batch and instrument QC was acceptable. The only issue in the second run was the low recovery for the CRDL standard. The sample result for Zinc is comparable in both runs with a slightly higher result in the second run. The client was contacted and allowed the data to be reported with the CRDL exceedance.

In the SW-846 6010C analysis, Thallium was detected at a concentration greater than the LOD in one CCB (ICP6, 05/10/11, 1130). Thallium was not detected in the associated samples.

In the SW-846 6010C analysis, the sodium concentration in several CCBs (ICP6, 05/24/11; 1431, 1608, 1732) is greater than the LOD but less than the PQL. The

concentrations are less than 1/10 the concentration detected in the associated samples. Some samples required reanalysis.

CONVENTIONALS

In the EPA 300.0 analysis, all samples except 21105042622 (EB2 had to be diluted in order to bracket the concentration of target analytes within the calibration range of the instrument.

In the EPA 300.0 analysis for analytical batch 456395, the MS/MSD was analyzed on sample 21105042615 (MWQ-18) rather than sample 21105042616 (MWQ14) as requested on the COC.

In the EPA 353.2 analysis, samples 21105042602 (MWQ-4), 21105042603 (MWQ-5), 21105042604 (MWQ-5-DUP), 21105042605 (MWQ-6), 21105042606 (MWQ-7), 21105042607 (MWQ-10), 21105042608 (MWQ-10-MS), 21105042609 (MWQ-10-MSD), 21105042613 (MWQ21), 21105042616 (MWQ14), 21105042617 (MWQ14 MS), and 21105042618 (MWQ14 MSD) had to be diluted in order to bracket the Nitrate + Nitrite and/or Nitrite concentrations within the calibration range of the instrument. The Nitrate is based on the difference between the Nitrate + Nitrite and the Nitrite. The dilution is reflected in the elevated reporting limit.

In the SW-846 9012A analysis for prep batch 455725, the MS/MSD recoveries are outside the control limits for Total Cyanide. The LCS recovery was within control limits. This indicates the analysis is in control and the sample is affected by matrix interference.

In the SW-846 9012A analysis for analytical batch 456904, the MSD recovery is outside the control limits for Total Cyanide. The MSD and LCS recoveries are acceptable.

Sample 21105042601 (MWQ-3) was received after expiration of the 24-hour holding time for Chromium VI. Samples 21105042602 (MWQ-4), 21105042603 (MWQ-5), 21105042604 (MWQ-5-DUP), 21105042605 (MWQ-6), and 21105042606 (MWQ-7) were received within the 24-hour holding time but were not processed through receiving prior to expiration of the holding time. The client was contacted and authorized the laboratory to proceed with the analysis.

All samples analyzed for Hexavalent Chromium are filtered through a 0.45 micron filter as required by the method. The Hexavalent Chromium results for samples 21105042607 (MWQ-10) and 21105042613 (MWQ21) are greater than the Total Chromium results. This may be attributed to an interference in the colorimetric procedure.

MISCELLANEOUS

Sample 21105042615 (MWQ-18) was filtered and preserved at the laboratory for dissolved metals.

See the sub-contract lab report narrative for the Perchlorate analysis.

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations Utilized in this Report

ND	Indicates the result was Not Detected at the specified RDL
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
RDL	Reporting Detection Limit
00:00	Reported as a time equivalent to 12:00 AM

Reporting Flags Utilized in this Report

J	Indicates an estimated value
U	Indicates the compound was analyzed for but not detected
B	(ORGANICS) Indicates the analyte was detected in the associated Method Blank
B	(INORGANICS) Indicates the result is between the RDL and MDL

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with the NELAC standard and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer-readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

RE: DoD Perchlorate

Dear Dana Merrill:

DHL Analytical received 17 sample(s) on 5/20/2011 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of DoD QSM Ver 4.2 and NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. This report shall not be reproduced except in full without the written approval of DHL Analytical, Inc. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas & DoD Laboratory Certification Number: T104704211-11-5 & DoD ELAP #ADE-1416 v2

Laboratory Data Package Signature Page

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

- R1 Field chain-of-custody documentation;
- R2 Sample identification cross-reference;
- R3 Test reports (analytical data sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC 5.13
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate recovery data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- R5 Test reports/summary forms for blank samples;
- R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - c) The laboratory's LCS QC limits.
- R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limits (MQLs) for each analyte for each method and matrix;
- R10 Other problems or anomalies.

The Exception Report for every "No" or "Not Reviewed (NR)" item in laboratory review checklist.

Release Statement: I am responsible for the release of this laboratory data package. This data package has been reviewed by the laboratory and is complete and technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory as having the potential to affect the quality of the data, have been identified by the laboratory in the Laboratory Review Checklist, and no information or data have been knowingly withheld that would affect the quality of the data.

Scott Schroeder – Project Manager
John DuPont – General / QA Manager

Laboratory Review Checklist: Reportable Data

Project Name: DoD Perchlorate	Date: 6/3/11
Reviewer Name: Carlos Castro	Laboratory Work Order: 1105192
Prep Batch Number(s): See Prep Dates Report	Run Batch: See Analytical Dates Report

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
		Chain-of-Custody (C-O-C)					
R1	OI	1) Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				R1-01
		2) Were all departures from standard conditions described in an exception report?			X		
R2	OI	**Sample and Quality Control (QC) Identification**					
		1) Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		2) Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test Reports**					
		1) Were all samples prepared and analyzed within holding times?	X				
		2) Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		3) Were calculations checked by a peer or supervisor?	X				
		4) Were all analyte identifications checked by a peer or supervisor?	X				
		5) Were sample quantitation limits reported for all analytes not detected?	X				
		6) Were all results for soil and sediment samples reported on a dry weight basis?			X		
		7) Were % moisture (or solids) reported for all soil and sediment samples?			X		
		8) If required for the project, TICs reported?			X		
R4	O	**Surrogate Recovery Data**					
		1) Were surrogates added prior to extraction?			X		
		2) Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
R5	OI	**Test Reports/Summary Forms for Blank Samples**					
		1) Were appropriate type(s) of blanks analyzed?	X				
		2) Were blanks analyzed at the appropriate frequency?	X				
		3) Where method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		4) Were blank concentrations < MQL?	X				
R6	OI	**Laboratory Control Samples (LCS):**					
		1) Were all COCs included in the LCS?	X				
		2) Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		3) Were LCSs analyzed at the required frequency?	X				
		4) Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		5) Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SQLs?	X				
		6) Was the LCSD RPD within QC limits (if applicable)?	X				
R7	OI	**Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data**					
		1) Were the project/method specified analytes included in the MS and MSD?	X				
		2) Were MS/MSD analyzed at the appropriate frequency?	X				
		3) Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?		X			R7-03
		4) Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical Duplicate Data**					
		1) Were appropriate analytical duplicates analyzed for each matrix?			X		
		2) Were analytical duplicates analyzed at the appropriate frequency?			X		
		3) Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method Quantitation Limits (MQLs):**					
		1) Are the MQLs for each method analyte included in the laboratory data package?	X				
		2) Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		3) Are unadjusted MQLs included in the laboratory data package?	X				
R10	OI	**Other Problems/Anomalies**					
		1) Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				R10-01
		2) Were all necessary corrective actions performed for the reported data?	X				
		3) Was applicable and available technology used to lower the SQL minimize the matrix interference affects on the sample results?	X				

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).
3 NA = Not applicable.
4 NR = Not Reviewed.
5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Review Checklist (continued): Supporting Data

Project Name: DoD Perchlorate	Date: 6/3/11
Reviewer Name: Carlos Castro	Laboratory Work Order: 1105192

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial Calibration (ICAL)**					
		1) Were response factors and/or relative response factors for each analyte within QC limits?	X				
		2) Were percent RSDs or correlation coefficient criteria met?	X				
		3) Was the number of standards recommended in the method used for all analytes?	X				
		4) Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		5) Are ICAL data available for all instruments used?	X				
		6) Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and Continuing calibration Verification (ICCV and CCV) and Continuing Calibration blank (CCB):**					
		1) Was the CCV analyzed at the method-required frequency?	X				
		2) Were percent differences for each analyte within the method-required QC limits?	X				
		3) Was the ICAL curve verified for each analyte?	X				
		4) Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X				
S3	O	**Mass Spectral Tuning:**					
		1) Was the appropriate compound for the method used for tuning?	X				
		2) Were ion abundance data within the method-required QC limits?	X				
S4	O	**Internal Standards (IS):**					
		1) Were IS area counts and retention times within the method-required QC limits?	X				
S5	OI	**Raw Data (NELAC section 1 appendix A glossary, and section 5.12)**					
		1) Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		2) Were data associated with manual integrations flagged on the raw data?	X				S5-02
S6	O	**Dual Column Confirmation**					
		1) Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively Identified Compounds (TICs):**					
		1) If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) Results:**					
		1) Were percent recoveries within method QC limits?			X		
S9	I	**Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions**					
		1) Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method Detection Limit (MDL) Studies**					
		1) Was a MDL study performed for each reported analyte?	X				
		2) Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency Test Reports:**					
		1) Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards Documentation**					
		1) Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/Analyte Identification Procedures**					
		1) Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of Analyst Competency (DOC)**					
		1) Was DOC conducted consistent with NELAC Chapter 5C?	X				
		2) Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/Validation Documentation for Methods (NELAC Chap 5)**					
		1) Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory Standard Operating Procedures (SOPs):**					
		1) Are laboratory SOPs current and on file for each method performed?	X				

p

CASE NARRATIVE

This case narrative describes abnormalities and deviations that may affect the results and summarizes all known issues that need to be highlighted for the data user to assess the results. This case narrative and the report contents are compliant with DoD QSM Ver 4.2 and NELAC.

Samples were analyzed using the methods outlined in the following references:

Method SW6860 - Perchlorate Analysis (This parameter is not NELAC certified)

Exception Report R1-01

The samples were received on and log-in performed on 5/20/11. A total of 17 samples were received and all were analyzed. The Chain-of-Custody (COC) was not signed by the client when the samples arrived at DHL Analytical. The client emailed a signed copy of the COC. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Perchlorate analysis performed on 5/26/11 the matrix spike duplicate was above control limits. This is flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits. No further corrective actions were taken.

Exception Report R10-01

For Perchlorate analysis several samples were prepared with the smaller volume of 25 ml due to the high conductivity of the samples. The samples are: 21105042611, 21105042614, 21105042615, and 21105190401. Samples 21105042620 and 21105042621 were further prepared with a smaller volume of 10 ml for final analysis.

Exception Report S5-02

For Perchlorate analysis, some samples and/or standards were manually integrated. Please refer to the table on page 11 of this report for the full list of samples, standards, and the compounds that were manually integrated.

A summary of project communication follows:

Request for quote was sent to DHL Analytical from the client, via email on 5/5/11 and the quote was sent to client via email on 5/5/11. Email for work approved by both parties on 5/18/11 with P.O number 11-0446.

Communication from John DuPont to Dana Merrill concerning the ERPIMS EDD via emails on 5/20/11, 5/31/11 and 6/1/11.

This sample delivery group arrived at DHL Analytical 5/20/11. Sample summary sent via email from Log-in to client on 5/20/11.

Workorder: 211050426

Client: 4747 - Trinity Analytical & Development

Profile: 195817 - Melrose

Line Item: 1 - Waters 5/12/2011 0855 5/13/2011 0920 5/6/2011 0910 5/14/2011 0920 5/18/2011 0845 5/19/2011 0855

Received by: Raborn, Michelle

Received Date/Time: 5/4/2011 9:45:00 AM

Samples Received via: WET

Number of Coolers Received: 7

Cooler tracking numbers(s): 8735 2663 9247 , 8735 2663 9203 , 8735 2663 9225 , 8735 2663 8939 8735 2663 9247 , 8735 2663 9155 , 8735 2663 9166

Cooler temperature(s): Various noted on COC

Were all coolers received at a temperature of 0 - 6° C?	☑ Yes	☐ No	☐ N/A
Were all custody seals intact?	☑ Yes	☐ No	☐ N/A
Were all samples recevied in proper containers?	☑ Yes	☐ No	☐ N/A
Were all samples properly preserved?	☐ Yes	☑ No	☐ N/A
Was preservative added to any container at the lab?	☑ Yes	☐ No	☐ N/A
Were all containers received in good condition?	☑ Yes	☐ No	☐ N/A
Were all VOA vials received with no head space?	☑ Yes	☐ No	☐ N/A
Do all sample labels match the Chain of Custody?	☑ Yes	☐ No	☐ N/A
Was the client notified about any discrepancies?	☑ Yes	☐ No	☐ N/A

Containers preserved at the laboratory: 21105042615-4(L-HNO3)

Notes/Comments: Samples were received on multiple days Kept open due to client request. All dates and times on COC

Deliver To	TRINITY Analysis & Development Corp. 90 NW Beal Pkwy Suite A2 Fort Walton Beach, FL 32548 850-243-0072
Attn	Jonathan Kramer

Project Melrose AFB Annual

CASE NARRATIVE

Client: TRINITY Analysis & Development Corp. **Report:** 211050608

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the sample cross-reference page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

Additional Flags:

Q - LCS/LCSD recovery and/or RPD was outside control limits/CCV did not meet acceptance criteria.

VOLATILES MASS SPECTROMETRY

In the SW-846 8260B analysis, the %D is outside ±20% for Acetone (23) in the CCV (MSV11, 05/11/11).

In the SW-846 8260B analysis for analytical batch 456001, Acetone was detected at a concentration > ½ the RL in the method blank and is therefore flagged B on the form 1s for the associated samples. The concentration is acceptable at < RL for this common lab contaminant.

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY

In the SW-846 8330 analysis for prep batch 455907, the MS/MSD exhibited numerous recovery failures above the upper control limits. All LCS/LCSD recoveries are acceptable with the exception of recoveries below the lower control limit for HMX. One marginal exceedance is allowed based on the number of analytes.

In the SW-846 8330 analysis prep batch 456236, the LCS/LCSD recoveries are below the lower control limit for HMX. One marginal exceedance is allowed based on the number of analytes.

In the SW-846 8330 analysis, the recovery for HMX is outside the control limits in the ICV (HPLC2 05/11/11).

METALS

The dissolved concentration for some analytes is greater than the total concentration of these analytes. This can be attributed to different aliquots of the samples. It can be assumed that these analytes are present in the dissolved state in these samples.

In the SW-846 6010C dissolved and total analysis, many samples had to be diluted in order to bracket the concentration of a target analyte within the linear dynamic range of the instrument.

In the SW-846 6010C analysis for prep batch 455823, the MS/MSD recoveries are not applicable for Calcium, Magnesium and Sodium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Calcium and Sodium on ICP6, 05/25/11 at 1633. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 1739. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C analysis for prep batch 455827, the MS/MSD recoveries are not applicable for Calcium, Magnesium, and Sodium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Barium on ICP6, 05/25/11 at 1921. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 1949. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C Dissolved analysis for prep batch 456484, the MS/MSD recoveries are not applicable for Calcium, Magnesium, and Sodium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Sodium on ICP6, 05/20/11 at 2147. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 2215. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C analysis for prep batch 456553, the MS/MSD recoveries are not applicable for Calcium, Sodium, and Magnesium because the sample concentration is greater than four times the spike concentration. The method blank was analyzed for Sodium on ICP6, 05/20/11 at 2315. The data is reported with all other analytes on the form 3 from the run performed on ICP6, 05/24/11 at 2326. Only one schedule can be reported on a form 3 for a method blank.

In the SW-846 6010C analysis, the sodium concentration in several CCBs (IC6, 05/20/11; 2139, 2307, 0037) is greater than the LOD but less than the PQL. The concentrations are insignificant as compared to the concentration detected in the associated samples.

CONVENTIONALS

In the EPA 300.0 analysis, samples 21105060801 (MA02MW001D), 21105060802 (M114MW004), 21105060805 (M114MW002), 21105060807 (M114MW003), 21105060810 (MA01MW001), 21105060811 (MA01MW001-MS), 21105060812 (MA01MW001-MSD), 21105060815 (M114MW001), 21105060816 (M114MW001-DUP), 21105060818 (MAOMW004), 21105060819 (MAOMW003), 21105170901 (MAO1MW002) and 21105170902 (MWQ23) had to be diluted in order to bracket the concentration of the target analytes within the calibration range of the instrument.

In the EPA 353.2 analysis, samples 21105060801 (MA02MW001D), 21105060815 (M114MW001), and 21105060816 (M114MW001-DUP) had to be diluted in order to bracket the Nitrate + Nitrite and/or Nitrite concentrations within the calibration range of the instrument. The Nitrate is based on the difference between the Nitrate + Nitrite and the Nitrite.

In the SW-846 9012A analysis for prep batch 456439, the MS recovery is outside the control limits for Total Cyanide. All other batch QC is acceptable.

All samples analyzed for Hexavalent Chromium are filtered through a 0.45 micron filter as required by the method. The Hexavalent Chromium results for samples 21105060818 (MAOMW004) and 21105060819 (MAOMW003) are greater than the Total Chromium results. This may be attributed to an interference in the colorimetric procedure.

MISCELLANEOUS

An aliquot of samples 21105060802 (M114MW004) and 21105170902 (MWQ23) had to be filtered and preserved at the laboratory for dissolved metals.

Q Flag Application

Manual Integrations

Manual Integrations: 211050608

Lab Sample ID	Cust. Sample ID	Prod. Desc.	Compound	Comp. Name	
21105060801	MAO2MW001D	SW-846 8330	528-29-0	1,2-Dinitrobenzene	
21105170902	MWQ23	SW-846 8330	528-29-0	1,2-Dinitrobenzene	

Laboratory Endorsement

Sample analysis was performed in accordance with approved methodologies provided by the Environmental Protection Agency or other recognized agencies. The samples and their corresponding extracts will be maintained for a period of 30 days unless otherwise arranged. Following this retention period the samples will be disposed in accordance with GCAL's Standard Operating Procedures.

Common Abbreviations Utilized in this Report

ND	Indicates the result was Not Detected at the specified RDL
DO	Indicates the result was Diluted Out
MI	Indicates the result was subject to Matrix Interference
TNTC	Indicates the result was Too Numerous To Count
SUBC	Indicates the analysis was Sub-Contracted
FLD	Indicates the analysis was performed in the Field
PQL	Practical Quantitation Limit
MDL	Method Detection Limit
RDL	Reporting Detection Limit
00:00	Reported as a time equivalent to 12:00 AM

Reporting Flags Utilized in this Report

J	Indicates an estimated value
U	Indicates the compound was analyzed for but not detected
B	(ORGANICS) Indicates the analyte was detected in the associated Method Blank
B	(INORGANICS) Indicates the result is between the RDL and MDL

Sample receipt at GCAL is documented through the attached chain of custody. In accordance with NELAC, this report shall be reproduced only in full and with the written permission of GCAL. The results contained within this report relate only to the samples reported. The documented results are presented within this report.

This report pertains only to the samples listed in the Report Sample Summary and should be retained as a permanent record thereof. The results contained within this report are intended for the use of the client. Any unauthorized use of the information contained in this report is prohibited.

I certify that this data package is in compliance with the NELAC standard and terms and conditions of the contract and Statement of Work both technically and for completeness, for other than the conditions in the case narrative. Release of the data contained in this hardcopy data package and in the computer-readable data submitted has been authorized by the Quality Assurance Manager or his/her designee, as verified by the following signature.

Estimated uncertainty of measurement is available upon request. This report is in compliance with the DOD QSM as specified in the contract if applicable.

VOLATILE ORGANICS INSTRUMENT PERFORMANCE CHECK

BROMOFLUOROBENZENE (BFB)

Lab Name: GCAL Contract:

Lab Code: LA024 Case No.: SAS No.: SDG No.: 211050608

Lab File ID: 2110511/b2644 BFB Injection Date: 05/11/11

Instrument ID: MSV11 BFB Injection Time: 0631

GC Column: RTX-VMS-30 ID: .25 (mm)

Analytical Batch: 456078

m / e	ION ABUNDANCE CRITERIA	% Relative Abundance			
50	15.0 - 40.0% of mass 95	23.51	(	)	
75	30.0 - 60.0% of mass 95	53.3	(	)	
95	Base Peak, 100% relative abundance	100	(	)	
96	5.0 -9.0% of mass 95	6.59	(	)	
173	Less than 2.0% of mass 174	1.12	(1.36	)	1
174	50.0 - 120.0% of mass 95	82.81	(	)	
175	5.0 - 9.0% of mass 174	6.34	(7.66	)	1
176	95.0 - 101.0% of mass 174	80.2	(96.86	)	1
177	5.0 - 9.0% of mass 176	5.46	(6.81	)	2

1- Value is % mass 174

2- Value is % mass 176

THIS CHECK APPLIES TO THE FOLLOWING SAMPLES, MS, MSD, BLANKS, AND STANDARDS:

	SAMPLE NO.	LAB SAMPLE ID	LAB FILE ID	DATE ANALYZED	TIME ANALYZED

IS 3 ID: 1,4-Dichlorobenzene-d4

AREA UPPER LIMIT = +100% of internal standard area
AREA LOWER LIMIT = -50 % of internal standard area
RT UPPER LIMIT = +0.50 minutes of internal standard RT
RT LOWER LIMIT = -0.50 minutes of internal standard RT

Column used to flag internal standard values with an asterisk.
* Values outside of QC limits.

8A

VOLATILE INTERNAL STANDARD AREA AND RT SUMMARY

Lab Name: GCAL Contract:

Lab Code: LA024 Case No.: SAS No.: SDG No.: 211050608

Lab File ID (Standard): 2110501p/b2234 Date Analyzed: 05/01/11 Time: 1323

Instrument ID: MSV11 GC Column: RTX-VMS-30M ID: .25 (mm)

Analytical Batch: 456078 Heated Burge: (Y/N) N

Lab Code: LA024 | Case No.: | Contract:

Matrix: (soil / water) Water | SAS No.: | SDG No.: 211050608

Level: (low / med) | % Solids: | Lab Sample ID: 21105060812

Date Received: 05/10/11 | Time: 0850 | Date Collected: 05/09/11 | Time: 1416

Analyte	Concentration	Units	C	MDL	PQL	Method	Type
Aluminum (Dissolved)	4850	ug/L		60.0	200	SW-846 6010C Dissolved	P
Antimony (Dissolved)	518	ug/L		4.03	60.0	SW-846 6010C Dissolved	P
Arsenic (Dissolved)	518	ug/L		2.53	10.0	SW-846 6010C Dissolved	P
Barium (Dissolved)	496	ug/L		0.11	10.0	SW-846 6010C Dissolved	P
Beryllium (Dissolved)	495	ug/L		0.11	5.00	SW-846 6010C Dissolved	P
Cadmium (Dissolved)	483	ug/L		0.20	5.00	SW-846 6010C Dissolved	P
Calcium (Dissolved)	54000	ug/L		50.0	100	SW-846 6010C Dissolved	P
Chromium (Dissolved)	474	ug/L		1.00	10.0	SW-846 6010C Dissolved	P
Cobalt (Dissolved)	490	ug/L		1.00	10.0	SW-846 6010C Dissolved	P
Copper (Dissolved)	509	ug/L		1.37	10.0	SW-846 6010C Dissolved	P
Iron (Dissolved)	4870	ug/L		40.0	100	SW-846 6010C Dissolved	P
Lead (Dissolved)	478	ug/L		1.39	15.0	SW-846 6010C Dissolved	P
Magnesium (Dissolved)	53200	ug/L		50.0	100	SW-846 6010C Dissolved	P
Manganese (Dissolved)	488	ug/L		2.00	15.0	SW-846 6010C Dissolved	P
Mercury (Dissolved)	4.80	ug/L		0.081	0.20	SW-846 7470A Dissolved	AV
Molybdenum (Dissolved	510	ug/L		3.75	50.0	SW-846 6010C Dissolved	P
Nickel (Dissolved)	486	ug/L		0.96	40.0	SW-846 6010C Dissolved	P
Potassium (Dissolved)	17800	ug/L		100	500	SW-846 6010C Dissolved	P
Selenium (Dissolved)	514	ug/L		4.34	40.0	SW-846 6010C Dissolved	P
Silver (Dissolved)	491	ug/L		0.60	10.0	SW-846 6010C Dissolved	P
Sodium (Dissolved)	585000	ug/L		1000	5000	SW-846 6010C Dissolved	P
Thallium (Dissolved)	477	ug/L		1.75	20.0	SW-846 6010C Dissolved	P
Titanium (Dissolved)	486	ug/L		1.20	100	SW-846 6010C Dissolved	P
Vanadium (Dissolved)	553	ug/L		3.75	20.0	SW-846 6010C Dissolved	P
Zinc (Dissolved)	506	ug/L		2.72	20.0	SW-846 6010C Dissolved	P

RE: DoD Perchlorate

Dear Dana Merrill:

DHL Analytical received 12 sample(s) on 5/19/2011 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of DoD QSM Ver 4.2 and NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. This report shall not be reproduced except in full without the written approval of DHL Analytical, Inc. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas & DoD Laboratory Certification Number: T104704211-11-5 & DoD ELAP #ADE-1416 v2

Laboratory Data Package Signature Page

This data package consists of:

This signature page, the laboratory review checklist, and the following reportable data:

- R1 Field chain-of-custody documentation;
- R2 Sample identification cross-reference;
- R3 Test reports (analytical data sheets) for each environmental sample that includes:
  - a) Items consistent with NELAC 5.13
  - b) dilution factors,
  - c) preparation methods,
  - d) cleanup methods, and
  - e) if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate recovery data including:
  - a) Calculated recovery (%R), and
  - b) The laboratory's surrogate QC limits.
- R5 Test reports/summary forms for blank samples;
- R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  - a) LCS spiking amounts,
  - b) Calculated %R for each analyte, and
  - c) The laboratory's LCS QC limits.
- R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  - a) Samples associated with the MS/MSD clearly identified,
  - b) MS/MSD spiking amounts,
  - c) Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  - d) Calculated %Rs and relative percent differences (RPDs), and
  - e) The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  - a) the amount of analyte measured in the duplicate,
  - b) the calculated RPD, and
  - c) the laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limits (MQLs) for each analyte for each method and matrix;
- R10 Other problems or anomalies.

The Exception Report for every "No" or "Not Reviewed (NR)" item in laboratory review checklist.

Release Statement: I am responsible for the release of this laboratory data package. This data package has been reviewed by the laboratory and is complete and technically compliant with the requirements of the methods used, except where noted by the laboratory in the attached exception reports. By my signature below, I affirm to the best of my knowledge, all problems/anomalies, observed by the laboratory as having the potential to affect the quality of the data, have been identified by the laboratory in the Laboratory Review Checklist, and no information or data have been knowingly withheld that would affect the quality of the data.

Scott Schroeder – Project Manager
John DuPont – General / QA Manager

Laboratory Review Checklist: Reportable Data

Project Name: DoD Perchlorate	Date: 6/2/11
Reviewer Name: Carlos Castro	Laboratory Work Order: 1105178
Prep Batch Number(s): See Prep Dates Report	Run Batch: See Analytical Dates Report

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
R1	OI	**Chain-of-Custody (C-O-C)**					
		1) Did samples meet the laboratory's standard conditions of sample acceptability upon receipt?	X				R1-01
		2) Were all departures from standard conditions described in an exception report?			X		
R2	OI	**Sample and Quality Control (QC) Identification**					
		1) Are all field sample ID numbers cross-referenced to the laboratory ID numbers?	X				
		2) Are all laboratory ID numbers cross-referenced to the corresponding QC data?	X				
R3	OI	**Test Reports**					
		1) Were all samples prepared and analyzed within holding times?	X				
		2) Other than those results < MQL, were all other raw values bracketed by calibration standards?	X				
		3) Were calculations checked by a peer or supervisor?	X				
		4) Were all analyte identifications checked by a peer or supervisor?	X				
		5) Were sample quantitation limits reported for all analytes not detected?	X				
		6) Were all results for soil and sediment samples reported on a dry weight basis?			X		
		7) Were % moisture (or solids) reported for all soil and sediment samples?			X		
		8) If required for the project, TICs reported?			X		
R4	O	**Surrogate Recovery Data**					
		1) Were surrogates added prior to extraction?			X		
		2) Were surrogate percent recoveries in all samples within the laboratory QC limits?			X		
R5	OI	**Test Reports/Summary Forms for Blank Samples**					
		1) Were appropriate type(s) of blanks analyzed?	X				
		2) Were blanks analyzed at the appropriate frequency?	X				
		3) Where method blanks taken through the entire analytical process, including preparation and, if applicable, cleanup procedures?	X				
		4) Were blank concentrations < MQL?	X				
R6	OI	**Laboratory Control Samples (LCS):**					
		1) Were all COCs included in the LCS?	X				
		2) Was each LCS taken through the entire analytical procedure, including prep and cleanup steps?	X				
		3) Were LCSs analyzed at the required frequency?	X				
		4) Were LCS (and LCSD, if applicable) %Rs within the laboratory QC limits?	X				
		5) Does the detectability data document the laboratory's capability to detect the COCs at the MDL used to calculate the SQLs?	X				
		6) Was the LCSD RPD within QC limits (if applicable)?	X				
R7	OI	**Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Data**					
		1) Were the project/method specified analytes included in the MS and MSD?	X				
		2) Were MS/MSD analyzed at the appropriate frequency?	X				
		3) Were MS (and MSD, if applicable) %Rs within the laboratory QC limits?	X				
		4) Were MS/MSD RPDs within laboratory QC limits?	X				
R8	OI	**Analytical Duplicate Data**					
		1) Were appropriate analytical duplicates analyzed for each matrix?			X		
		2) Were analytical duplicates analyzed at the appropriate frequency?			X		
		3) Were RPDs or relative standard deviations within the laboratory QC limits?			X		
R9	OI	**Method Quantitation Limits (MQLs):**					
		1) Are the MQLs for each method analyte included in the laboratory data package?	X				
		2) Do the MQLs correspond to the concentration of the lowest non-zero calibration standard?	X				
		3) Are unadjusted MQLs included in the laboratory data package?	X				
R10	OI	**Other Problems/Anomalies**					
		1) Are all known problems/anomalies/special conditions noted in this LRC and ER?	X				R10-01
		2) Were all necessary corrective actions performed for the reported data?	X				
		3) Was applicable and available technology used to lower the SQL minimize the matrix interference affects on the sample results?	X				

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).
3 NA = Not applicable.
4 NR = Not Reviewed.
5 ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Laboratory Review Checklist (continued): Supporting Data

Project Name: DoD Perchlorate	Date: 6/2/11
Reviewer Name: Carlos Castro	Laboratory Work Order: 1105178

#[1]	A[2]	Description	Yes	No	NA[3]	NR[4]	ER#[5]
S1	OI	**Initial Calibration (ICAL)**					
		1) Were response factors and/or relative response factors for each analyte within QC limits?	X				
		2) Were percent RSDs or correlation coefficient criteria met?	X				
		3) Was the number of standards recommended in the method used for all analytes?	X				
		4) Were all points generated between the lowest and highest standard used to calculate the curve?	X				
		5) Are ICAL data available for all instruments used?	X				
		6) Has the initial calibration curve been verified using an appropriate second source standard?	X				
S2	OI	**Initial and Continuing calibration Verification (ICCV and CCV) and Continuing Calibration blank (CCB):**					
		1) Was the CCV analyzed at the method-required frequency?	X				
		2) Were percent differences for each analyte within the method-required QC limits?	X				
		3) Was the ICAL curve verified for each analyte?	X				
		4) Was the absolute value of the analyte concentration in the inorganic CCB < MDL?	X				
S3	O	**Mass Spectral Tuning:**					
		1) Was the appropriate compound for the method used for tuning?	X				
		2) Were ion abundance data within the method-required QC limits?	X				
S4	O	**Internal Standards (IS):**					
		1) Were IS area counts and retention times within the method-required QC limits?	X				
S5	OI	**Raw Data (NELAC section 1 appendix A glossary, and section 5.12)**					
		1) Were the raw data (for example, chromatograms, spectral data) reviewed by an analyst?	X				
		2) Were data associated with manual integrations flagged on the raw data?	X				S5-02
S6	O	**Dual Column Confirmation**					
		1) Did dual column confirmation results meet the method-required QC?			X		
S7	O	**Tentatively Identified Compounds (TICs):**					
		1) If TICs were requested, were the mass spectra and TIC data subject to appropriate checks?			X		
S8	I	**Interference Check Sample (ICS) Results:**					
		1) Were percent recoveries within method QC limits?			X		
S9	I	**Serial Dilutions, Post Digestion Spikes, and Method of Standard Additions**					
		1) Were percent differences, recoveries, and the linearity within the QC limits specified in the method?			X		
S10	OI	**Method Detection Limit (MDL) Studies**					
		1) Was a MDL study performed for each reported analyte?	X				
		2) Is the MDL either adjusted or supported by the analysis of DCSs?	X				
S11	OI	**Proficiency Test Reports:**					
		1) Was the lab's performance acceptable on the applicable proficiency tests or evaluation studies?	X				
S12	OI	**Standards Documentation**					
		1) Are all standards used in the analyses NIST-traceable or obtained from other appropriate sources?	X				
S13	OI	**Compound/Analyte Identification Procedures**					
		1) Are the procedures for compound/analyte identification documented?	X				
S14	OI	**Demonstration of Analyst Competency (DOC)**					
		1) Was DOC conducted consistent with NELAC Chapter 5C?	X				
		2) Is documentation of the analyst's competency up-to-date and on file?	X				
S15	OI	**Verification/Validation Documentation for Methods** (NELAC Chap 5)					
		1) Are all the methods used to generate the data documented, verified, and validated, where applicable?	X				
S16	OI	**Laboratory Standard Operating Procedures (SOPs):**					
		1) Are laboratory SOPs current and on file for each method performed?	X				

p

1 Items identified by the letter "R" should be included in the laboratory data package submitted to the TCEQ in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
2 O = organic analyses; I = inorganic analyses (and general chemistry, when applicable).
3 NA = Not applicable.
4 NR = Not Reviewed.

CLIENT: GCAL LAB
Project: DoD Perchlorate
Lab Order: 1105178

CASE NARRATIVE

This case narrative describes abnormalities and deviations that may affect the results and summarizes all known issues that need to be highlighted for the data user to assess the results. This case narrative and the report contents are compliant with DoD QSM Ver 4.2 and NELAC.

Samples were analyzed using the methods outlined in the following references:

Method SW6860 - Perchlorate Analysis (This parameter is not NELAC certified)

Exception Report R1-01

The samples were received on and log-in performed on 5/19/11. A total of 12 samples were received and all were analyzed. The samples arrived in good condition and were properly packaged.

Exception Report R10-01

For Perchlorate analysis several samples were prepared with the smaller volume of 25 ml due to the conductivity of the samples exceeding the MCT. The samples are: 21105060801, 21105060802, 21105060805, 21105060807, 21105060815 and 21105060816. Sample 21105060801 was further prepared with a smaller volume of 10 ml for final analysis because the Perchlorate concentration exeeded the upper calibration range.

Exception Report S5-02

For Perchlorate analysis, some samples and/or standards were manually integrated. Please refer to the table on page 10 of this report for the full list of samples, standards, and the compounds that were manually integrated.

A summary of project communication follows:

Request for quote was sent to DHL Analytical from the client, via email on 5/5/11 and the quote was sent to client via email on 5/5/11. Email for work approved by both parties on 5/18/11 with P.O number 11-0446.

Communication from John DuPont to Dana Merrill concerning the ERPIMS EDD via emails on 5/20/11, 5/31/11 and 6/1/11.

This sample delivery group arrived at DHL Analytical 5/19/11. Sample summary sent via email from Log-in to client on 5/19/11.

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: Trinity Analysis & Development Corp **Job** F82298

Site: Melrose Air Force Range, NM **Report Date:** 5/31/2011 8:13:13 AM

1 Sample was collected on 05/11/2011 and was received at Accutest SE on 05/12/2011 properly preserved, at 2.8 Deg. C and intact. The Sample received an Accutest job number of F82298. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section of this report.

Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

Metals by Method SW846 6010C

Matrix: AQ **Batch ID:** MP20592

- All samples were digested within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Samples F82099-1MS, F82099-1MSD, F82099-1PS, F82099-1SDL, F82099-1DUP were used as the QC samples for metals.
- Matrix Spike Recoverys for Iron, Magnesium are outside control limits. Spike recovery indicates possible matrix
- Matrix Spike Recovery for Calcium is outside control limits. Spike amount low relative to the sample amount. Refer to lab control or spike blank for recovery information.
- RPDs for Duplicate for Antimony, Cobalt, Copper, Lead, Selenium, Thallium, Vanadium are outside control limits for sample MP20592-D1. RPD acceptable due to low duplicate and sample concentrations.
- RPDs for Serial Dilution for Aluminum, Cobalt, Selenium, Thallium, Vanadium, Zinc, Manganese are outside control limits for sample MP20592-SD1. Percent difference acceptable due to low initial sample concentration (< 50 times IDL).
- MP20592-PS1 for Manganese: Spike recovery indicates matrix interference and/or outside control limits due to high level in sample relative to spike amount.
- MP20592-SD1 for Manganese: Serial dilution indicates possible matrix interference.

Metals by Method SW846 7470A

Matrix: AQ **Batch ID:** MP20614

- All samples were digested within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Samples F82144-15MS, F82144-15MSD, F82144-15SDL, F82144-15DUP were used as the QC samples for metals.
- RPD for Duplicate for Mercury is outside control limits for sample MP20614-D1. RPD acceptable due to low duplicate and sample concentrations.
- RPD for Serial Dilution for Mercury is outside control limits for sample MP20614-SD1. Percent difference acceptable due to low initial sample concentration (< 50 times IDL).

Wet Chemistry by Method EPA 300/SW846 9056A

Matrix: AQ **Batch ID:** GP16981

- All samples were prepped within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Samples F82290-1DUP, F82290-1MS were used as the QC samples for Chloride, Nitrogen, Nitrate, Nitrogen, Nitrite, Sulfate.
- Matrix Spike Recoverys for Chloride, Nitrogen, Nitrate, Nitrogen, Nitrite, Sulfate are outside control limits. Probable cause due to matrix interference.

Wet Chemistry by Method EPA 335.4/SW 9012B

Matrix: AQ **Batch ID:** GP17002

- All samples were prepped within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Samples F82309-2MS, F82309-2MSD, F82309-2DUP were used as the QC samples for Cyanide, Total.
- RPD for Duplicate for Cyanide, Total is outside control limits for sample GP17002-D1. RPD acceptable due to low duplicate and sample concentrations.

Wet Chemistry by Method SM19 2320B

Matrix: AQ **Batch ID:** GN44611

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Samples F82311-13DUP, F82311-13MS, F82311-13MSD were used as the QC samples for Alkalinity, Total as CaCO3.

Wet Chemistry by Method SM19 2540C

Matrix: AQ **Batch ID:** GN44520

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- RPD for Duplicate for Solids, Total Dissolved is outside control limits for sample GN44520-D1. High RPD due to possible sample nonhomogeneity.

Wet Chemistry by Method SW846 7196A

Matrix: AQ **Batch ID:** GN44502

- All method blanks for this batch meet method specific criteria.
- Samples F82298-1DUP, F82298-1MS were used as the QC samples for Chromium, Hexavalent.
- The following samples were run outside of holding time for method SW846 7196A: F82298-1. Sample received at the end of hold time and analyzed as soon as possible.

Accutest Laboratories Southeast (ALSE) certifies that this report meets the project requirements for analytical data produced for the samples as received at ALSE and as stated on the COC. ALSE certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the ALSE Quality Manual except as noted above. This report is to be used in its entirety. ALSE is not responsible for any assumptions of data quality if partial data packages are used.

- [ ] TRIP BLANK NOT PROVIDED
- [X] TRIP BLANK NOT ON COC
- [X] TRIP BLANK INTACT
- [ ] TRIP BLANK NOT INTACT
- [X] RECEIVED WATER TRIP BLANK
- [ ] RECEIVED SOIL TRIP BLANK

MISC. INFORMATION

NUMBER OF ENCORES ? 25-GRAM_____ 5-GRAM_____

NUMBER OF 5035 FIELD KITS ? _____

NUMBER OF LAB FILTERED METALS ? _____

TEMPERATURE INFORMATION

- [ ] IR THERM ID 1 CORR. FACTOR +.4
- [ ] OBSERVED TEMPS: 2.4
- [ ] CORRECTED TEMPS: 2.8

SAMPLE INFORMATION

- [ ] SAMPLE LABELS PRESENT ON ALL BOTTLES
- [ ] INCORRECT NUMBER OF CONTAINERS USED
- [ ] SAMPLE RECEIVED IMPROPERLY PRESERVED
- [ ] INSUFFICIENT VOLUME FOR ANALYSIS
- [ ] DATES/TIMES ON COC DO NOT MATCH SAMPLE LABEL
- [ ] ID'S ON COC DO NOT MATCH LABEL
- [ ] VOC VIALS HAVE HEADSPACE (MACRO BUBBLES)
- [ ] BOTTLES RECEIVED BUT ANALYSIS NOT REQUESTED
- [ ] NO BOTTLES RECEIVED FOR ANALYSIS REQUESTED
- [ ] UNCLEAR FILTERING OR COMPOSITING INSTRUCTIONS
- [ ] SAMPLE CONTAINER(S) RECEIVED BROKEN
- [ ] % SOLIDS JAR NOT RECEIVED
- [ ] 5035 FIELD KIT FROZEN WITHIN 48 HOUR'S
- [ ] RESIDUAL CHLORINE PRESENT

{APPICABLE TO EPA 600 SERIES OR NORTH CAROLINA ORGANICS}

Job Change Order: F82298_5/13/2011

Requested Date:	5/13/2011	**Received Date:**	5/12/2011
Account Name:	Trinity Analysis & Development	**Due Date:**	5/26/2011
Project Description:	Melrose Air Force Range, NM	**Deliverable:**	REDT1
CSR:	SB	**TAT (Days):**	14

Sample #:
F82298-all

Change: Project is Melrose in NM. Metals are MTAL, Where COC says TS= TDS, all per Jonathan K. at Trinity via phone.

Above Changes Jonathan K. at Trinity **Date:** 5/13/2011

To Client: This Change Order is confirmation of the revisions, previously discussed with the Accutest Client Service Representative.

QC Data Summaries

Includes the following where applicable:

- Instrument Runlogs
- Initial and Continuing Calibration Blanks
- Initial and Continuing Calibration Checks
- High and Low Check Standards
- Interfering Element Check Standards
- Method Blank Summaries
- Matrix Spike and Duplicate Summaries
- Blank Spike and Lab Control Sample Summaries
- Serial Dilution Summaries
