Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1113618

Client: Accutest Laboratories
Matrix: Water
ELMS Batch (HBN) #: 1182 (66508)

General Set Information: There were two field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 9.95mL aliquot of each sample, including standards, was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Pall 0.45µm Ion Chromatography Acrodiscs.

Holding Times: Holding times were met for all analyses.

Dilutions: No dilutions were necessary for high levels of perchlorate in any of the samples. The internal standard recoveries were low for samples 1113618001 and the 001 matrix spike. The sample and the MS/MSD were reanalyzed at 1 in 5 dilutions.

Method QC data: The method blank (LMB 219407) was less than 1/2 the CRDL. The recovery for LCS 219408 was within acceptable parameters.

MS/MSD Analysis: The matrix spike and matrix spike duplicate were performed on sample 1113618001 (Client ID: MWQ-22). The percent recoveries and the relative percent differences were within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): None were required for this set.

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 4.2, Table F-12. The ion ratio of m/z 83 to 85 often fails at levels near or below the Limit of Detection.

SAMPLE PREPARATION/ANALYSIS:
Water: All DCL sample #'s agreed with field ID #'s. Samples were prepared by TNB. 9.95mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent D: 95% ASTM Type II water(ALS)/ 5% ACN (BDH Lot 904304)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent C: 95% ACN (BDH Lot 904304)/ 5% ASTM Type II water(ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 10682. Dilutions of Working Standard Solution ID 10684 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 2/28/2011, sequence 28FEB11I.s
Offline Quantitation Method: CLO4OFF1.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89. Tuned: 1/6/2010 Tune Checked: 2/28/2011

Fragmentor: 210 Output Gain: 55 Injection Volume: 20µL
Column: KP-RPPX C8 separator, 250mm Mobile Phase: 10% Eluent C; 90% Eluent D
Flow Gradient: 0.65mL/min to 5min., to 0.3ml/min at 6min., hold to 16min., to 0.65ml/min at 17min. Run Time: 19.00 min.

QC DATA: A 2,000X dilution of QC Solution ID 10686 was used for LCS 219408; Target = 5.0µg/L. ASTM type II water was used for LMB 219407.

MS/MSD: MS/MSD was performed on sample 1113618001 (Client ID: MWQ-22). 5.0µl of Working Standard Solution Horizon ID 10683 was added to 10.0mL of sample preparation. Spike target = 5.0µg/L.

COMMENTS: 1) Results reported in µg/L. 2) All QC, Blank, CCV, and MS/MSD results were within method parameters. 3) Sample data can be viewed at two directories within the ALS system:\ALSLTWS013\DataReview\HBN# or throughNuGenesis\Tree\PrintData\LCMS\DefaultView. 4) The ISTD recovery and the 83:85 ion ratio failed for samples 1113618001 and 001MS. These samples (+ the MSD) were reanalyzed at 1 in 5 dilutions and reported.

Actual Lot Analysis

Perchlorate 1000 µg/mL

The total maximum uncertainty on the certified value(s) is ±2%. See reverse side of certificate for details.

In order to verify the concentrations, the final solution was checked against material traceable to the following NIST SRMs: Ind. Std.

RESULTS: This solution standard was certified for accuracy of the listed components via methodology traceable to primary or well characterized secondary standards.

This standard was prepared gravimetrically to contain the concentrations shown above. Balances, used in the preparation, are calibrated regularly using NIST-traceable weights. All glassware used in preparation is Class A.

We use the highest purity raw materials available, ASTM type I 18 megohm deionized water, and typically 99.999%+ starting materials to minimize impurity levels in the final solution. All solutions are filtered through a 0.2 µm filter prior to being bottled. All bottles are triple rinsed with deionized water prior to use.

Use good laboratory procedure when diluting this product. Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.

We certify the accuracy of this standard to be ± 0.5% of the stated value until the expiration date listed above, provided it is kept tightly capped and stored under normal laboratory conditions.

Case Narrative

Method: 6850
Analysis: Perchlorate
Analysis SOP: LC-MS-CLO4
ALS WO ID(s): 1113713

Client: Accutest Laboratories
Matrix: Water
ELMS Batch (HBN) #: 1182 (66508)

General Set Information: There were two field samples in these Work Orders. The samples were analyzed for perchlorate.

Method Summary: Each sample was prepared as noted below and analyzed using an Agilent 1100 LC/MSD system in select ion monitoring (SIM) mode at m/z 83 and 85, which corresponds to the loss of one oxygen atom from the perchlorate molecule. ChemStation software was used for instrument control and data analysis. The ion ratio of m/z 83 to 85 was used to positively identify the response peak as perchlorate. Quantitation was performed using the m/z 83 peak area. An internal standard of ^{18}O labeled perchlorate was added to each sample to establish the perchlorate peak retention time and used in quantitation.

Sample Preparation: A 9.95mL aliquot of each sample, including standards, was transferred into a 15-mL centrifuge tube. 50µL of an ^{18}O labeled perchlorate solution was added to each sample as an internal standard. The samples were then capped, vortexed, and filtered into autosampler vial using Pall 0.45µm Ion Chromatography Acrodiscs.

Holding Times: Holding times were met for all analyses.

Dilutions: No dilutions were necessary for high levels of perchlorate in any of the samples. The internal standard recoveries were low for samples 1113618001 and the 001 matrix spike. The sample and the MS/MSD were reanalyzed at 1 in 5 dilutions.

Method QC data: The method blank (LMB 219407) was less than 1/2 the CRDL. The recovery for LCS 219408 was within acceptable parameters.

MS/MSD Analysis: The matrix spike and matrix spike duplicate were performed on sample 1113618001 (Client ID: MWQ-22). The percent recoveries and the relative percent differences were within the performance limits.

Instrument QC: Instrument initial and continuing calibrations were performed in accordance with published procedures.

NC/CAR(s): None were required for this set.

Sample Calculation: Samples were reported in µg/L. Results were calculated in µg/L by the equation (A)x(B),

where: A = Analyte concentration from the standard curve (µg/L)
B = Dilution performed at time of analysis

Miscellaneous Comments: These samples were analyzed in accordance with the requirements found in the DOD QSM Version 4.2, Table F-12. The ion ratio of m/z 83 to 85 often fails at levels near or below the Limit of Detection.

SAMPLE PREPARATION/ANALYSIS:

Water: All DCL sample #'s agreed with field ID #'s. Samples were prepared by TNB. 9.95mL of each sample was pipetted into a 15-mL centrifuge tube, and 50µL of an oxygen-18 labeled perchlorate solution was added as an internal standard. The samples were capped, vortexed, and filtered with Phenex PES membrane 0.45µm Syringe filters prior to analysis.

REAGENTS: Eluent D: 95% ASTM Type II water(ALS)/ 5% ACN (BDH Lot 904304)/0.1% glacial acetic acid (JT-Baker Lot 04802).
Eluent C: 95% ACN (BDH Lot 904304)/ 5% ASTM Type II water(ALS)/0.1% glacial acetic acid (JT-Baker Lot 04802).

STANDARDS: Internal Standard Spiking Solution Horizon# 10682. Dilutions of Working Standard Solution ID 10684 used for CCV's, LODV's, RLVS and IPC.

CALIBRATION CURVE: Used curve from 2/28/2011, sequence 28FEB11I.s
Offline Quantitation Method: CLO4OFF1.M

INSTRUMENT CONDITIONS: Samples were analyzed with an Agilent 1100 LC/MSD system, in negative SIM mode, monitoring m/z 83, 85, and 89. Tuned: 1/6/2010 Tune Checked: 2/28/2011

Flow Gradient: 0.65mL/min to 5min., to 0.3ml/min at 6min., hold to 16min., to 0.65ml/min at 17min. Run Time: 19.00 min.

QC DATA: A 2,000X dilution of QC Solution ID 10686 was used for LCS 219408; Target = 5.0µg/L. ASTM type II water was used for LMB 219407.

MS/MSD: MS/MSD was performed on sample 1113618001 (Client ID: MWQ-22). 5.0µl of Working Standard Solution Horizon ID 10683 was added to 10.0mL of sample preparation.
Spike target = 5.0µg/L.

COMMENTS: 1) Results reported in µg/L. 2) All QC, Blank, CCV, and MS/MSD results were within method parameters. 3) Sample data can be viewed at two directories within the ALS system:\ALSLTWS013\DataReview\HBN# or throughNuGenesis\Tree\PrintData\LCMS\DefaultView. 4) The ISTD recovery and the 83:85 ion ratio failed for samples 1113618001 and 001MS. These samples (+ the MSD) were reanalyzed at 1 in 5 dilutions and reported.

Actual Lot Analysis

Perchlorate 1000 µg/mL

The total maximum uncertainty on the certified value(s) is ±2%. See reverse side of certificate for details.

In order to verify the concentrations, the final solution was checked against material traceable to the following NIST SRMs: Ind. Std.

RESULTS: This solution standard was certified for accuracy of the listed components via methodology traceable to primary or well characterized secondary standards.

This standard was prepared gravimetrically to contain the concentrations shown above. Balances, used in the preparation, are calibrated regularly using NIST-traceable weights. All glassware used in preparation is Class A.

We use the highest purity raw materials available, ASTM type I 18 megohm deionized water, and typically 99.999%+ starting materials to minimize impurity levels in the final solution. All solutions are filtered through a 0.2 µm filter prior to being bottled. All bottles are triple rinsed with deionized water prior to use.

Use good laboratory procedure when diluting this product. Shake bottle prior to use and do not pipette directly out of the bottle. Use only cleaned Class A volumetric glassware.

We certify the accuracy of this standard to be ± 0.5% of the stated value until the expiration date listed above, provided it is kept tightly capped and stored under normal laboratory conditions.

CASE NARRATIVE

Client: TRINITY Analysis & Development Corp. **Report:** 211092804

Gulf Coast Analytical Laboratories received and analyzed the sample(s) listed on the sample cross-reference page of this report. Receipt of the sample(s) is documented by the attached chain of custody. This applies only to the sample(s) listed in this report. No sample integrity or quality control exceptions were identified unless noted below.

Additional Flags:

Q- LCS/LCSD recovery and/or RPD was outside control limits/CCV did not meet acceptance criteria.

J - Indicates a positive result was obtained and the sample had a surrogate failure above the upper control limit or the sample had positive results and/or non-detects and had a surrogate recovery below the lower control limit.

VOLATILES MASS SPECTROMETRY

In the SW-846 8260B analysis for analytical batch 466398, the % Drift is outside ±20% for Chloroethane in the CCV. The recovery is high and this compound was not detected in the associated sample.

In the SW-846 8260B analysis for analytical batch 466441, the % Drift is outside ±20% for n-Butylbenezene in the CCV. The recovery is high and this compound was not detected in the associated sample.

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY

In the SW-846 8330 analysis of prep batch 466485, the MSD exhibited a recovery failure. All other batch QC is acceptable.

In the SW-846 8330 analysis, the recovery for the surrogate is below the lower control limit in samples 21109280410 (MWQ 23), 21109280412 (MA01 MW0002), 21110010505 (M114MW002), and 21110010506 (M114MW003). The first two samples were not re-extracted due to expiration of the holding time. The client was notified of the exception. Sample 21110010505 (M114MW002) was re-extracted and re-analyzed with a recovery of 37% (first extract recovery 61%) and sample 21110010506 (M114MW003) was re-extracted and re-analyzed with a recovery of 34% (first extract recovery 67%).

In the SW-846 8330 analysis, the recovery for 2,6-Dinitrotoluene is above the upper control limit in the ICV. This compound was not detected in the associated samples.

METALS

Several dissolved metal concentrations are greater than the total concentration of these analytes in several samples. This is attributed to separate aliquots of sample.

In the SW-846 6010C analysis, samples 21109280401 (MA01MW001), 21109280407 (MA02 MW001D) and 21109280408 (FD-1) had to be diluted in order to bracket the concentration of target analytes within the calibration range of the instrument.

In the SW-846 6010C analysis, a chemical or physical interference necessitated a dilution for sample 21110010501 (M114MW004), 21110010502 (M114MW001), 21110010505 (M114MW002) and 21110010506 (M114MW003). This is reflected in the elevated detection limits.

In the SW-846 6010C analysis for prep batch 466323, the MS/MSD recoveries and post-digestion spike recoveries are not applicable for Calcium, Magnesium, and Sodium because the sample concentration is greater than four times the spike concentration. Sodium was detected in the method blank at a concentration > ½ the RL. The concentration is acceptable at <RL for this common lab contaminant.

In the SW-846 6010C analysis for prep batch 466324, the MS/MSD recoveries and post-digestion spike recoveries are not applicable for Magnesium, Sodium and Calcium because the sample concentration is greater than four times the spike concentration. The method blank (992256) was re-analyzed for Calcium on ICP6 10/05/11 at 1342. The rerun data is reported on the Form 3 with the data from the original run because only one schedule can be entered in the data system for a method blank. Calcium was detected at concentration greater than the PQL in the method blank. The concentration is less than 10% of the concentration detected in the associated samples.

In the SW-846 6010C analysis for prep batch 466511, the MS and/or MSD recovery is outside the control limits for Arsenic, Selenium, and Potassium. The LCS recovery is within control limits. This indicates the analysis is in control and the sample is affected by matrix interference. A post-digestion spike was performed on the QC sample for this batch with a recovery of 123% for Arsenic, 109% for Potassium, and 124% for Selenium. The MS/MSD recoveries and post-digestion spike recoveries are not applicable for Magnesium, Sodium, and Calcium because the sample concentration is greater than four times the spike concentration.

In the SW-846 6010C analysis for prep batch 466510, the MS and/or MSD recovery is outside the control limits for Arsenic, Selenium, and Potassium. The LCS recovery is within control limits. This indicates the analysis is in control and the sample is affected by matrix interference. A post-digestion spike was performed on the QC sample for this batch with a recovery of 117% for Arsenic, 111% for Potassium, and 117% for Selenium. The MS/MSD recoveries and post-digestion spike recoveries are not applicable for Magnesium, Sodium, and Calcium because the sample concentration is greater than four times the spike concentration.

In the SW-846 7470A Dissolved and SW-846 7470A analysis for prep batch 466512, the MS and/or MSD recovery is outside the control limits for Mercury. The LCS recovery is within the control limits. This indicates the analysis is in control and the sample is affected by matrix interference.

In the SW-846 6010B analysis, Sodium was detected in a CCB (ICP6, 10/04/11 0023) at a concentration > LOD. The concentration is less than 10% of the concentration detected in the associated samples.

pCONVENTIONALS

In the EPA 300.0 analysis, samples 21109280401 (MA01MW001), 21109280402 (MA01MW003), 21109280403 (MA01MW003-MS), 21109280404 (MA01MW003-MSD), 21109280407 (MA02 MW001D), 21109280408 (FD-1), 21109280410 (MWQ-23), 21109280411 (MA01-MW004), 21109280412 (MA01-MW002), 21110010501 (M114MW004), 21110010502 (M114MW001), 21110010505 (M114MW002), and 21110010506 (M114MW003) had to be diluted in order to bracket the concentration of target analytes within the calibration range of the instrument.

In the EPA 353.2 analysis, samples 21109280407 (MA02 MW001D), 21109280408 (FD-1)21110010501 (M114MW004) had to be diluted in order to bracket the Nitrate + Nitrite and/or Nitrite concentrations within the calibration range of the instrument. The Nitrate is based on the difference between the Nitrate + Nitrite and the Nitrite. The dilution is reflected in the elevated reporting limit.

In the EPA 353.2 analysis for analytical batch 466506, the MS/MSD recovery was outside the control limits for Nitrate. The LCS recovery was within control limits. This indicates the analysis is in control and the sample is affected by a matrix interference.

The Sample/Duplicate RPD for Chromium VI for analytical batch 466230 is not applicable because the sample and/or duplicate concentration is less than five times the reporting limit.

Samples 21109280401 (MA01MW001), 21109280407 (MA02 MW001D), 21109280408 (FD-1), 21110010505 (M114MW002), were received with insufficient time to process the samples in receiving and start the Chromium VI analysis within the 24-hour holding time. Sample 21110010504 (EB-1) was received outside the 24-hour holding time for Chromium VI.

CASE NARRATIVE

This case narrative describes abnormalities and deviations that may affect the results and summarizes all known issues that need to be highlighted for the data user to assess the results. This case narrative and the report contents are compliant with DoD QSM Ver 4.2 and NELAC. The "U" flag , in the Analytical Report, indicates the results for that sample are nondetect.

Samples were analyzed using the methods outlined in the following references:

Method SW6860 - Perchlorate Analysis (Parameter is ELAP Accredited but not NELAC Certified)

Exception Report R1-01

The samples were received on and log-in performed on 10/5/11. A total of 5 samples were received and all were analyzed. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Perchlorate analysis performed on 10/11/11 (batch 48633) the matrix spike and matrix spike duplicate recoveries were above control limits. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits. No further corrective actions were taken.

A summary of project communication follows:

Request for quote was sent to DHL Analytical from the client, via email on 5/5/11 and the quote was sent to client via email on 5/5/11. Email for work approved by both parties on 5/18/11 with P.O number 11-0446.

Client sent samples in own containers.

This sample delivery group arrived at DHL Analytical 10/5/11.

CASE NARRATIVE

This case narrative describes abnormalities and deviations that may affect the results and summarizes all known issues that need to be highlighted for the data user to assess the results. This case narrative and the report contents are compliant with DoD QSM Ver 4.2 and NELAC. The "U" flag , in the Analytical Report, indicates the results for that sample are nondetect.

Samples were analyzed using the methods outlined in the following references:

Method SW6860 - Perchlorate Analysis Total and Filtered (Parameter is ELAP Accredited but not NELAC Certified)

Exception Report R1-01

The samples were received on and log-in performed on 10/5/2011. A total of 7 samples were received and all were analyzed. The samples arrived in good condition and were properly packaged.

Exception Report R7-03

For Filtered Perchlorate Analysis, batch 48633, the recovery of the Matrix Spike and Matrix Spike Duplicate (1110019-02 MS/MSD) was above the method control limits. These are flagged accordingly in the QC Summary Report. The associated LCS is within method control limits. No further corrective action was taken.

Exception Report R10-01

For Perchlorate Analysis, the results of total perchlorate for Sample 21109280408 were less than the results of filtered perchlorate. The difference is within the acceptable variation limits.

A summary of project communication follows:

THIS DOCUMENT MEETS DoD QSM 4.1 STANDARDS

The results relate to only the samples associated with the referenced SDG and the submitted data has been produced in accordance with laboratory procedures. The Laboratory's Technical Lab Director, Mr. Rick Davis, is responsible for the final data produced and reported. His signature is listed at the end of the Case Narrative within the Analytical Data Package. If applicable to this report package, details on report revisions and the information on subcontracted analysis are listed in the package Case Narrative. This report shall not be reproduced, except in full, without the written approval of Empirical Laboratories, LLC.

Sample Delivery Group Case Narrative

Receipt Information
The samples were received within the preservation guidelines for the associated methods. The information associated with sample receipt and the Sample Delivery Group (SDG) are included within section 4 of this package, which also provides information on the link between the client sample ID listed on the COC and laboratory's assigned unique sample ID or WorkOrder #. The sample is tracked through the laboratory for all analysis via the assigned WorkOrder #.

All samples that were received were analyzed and none of the samples were placed on hold without analyses. There were no subcontracted analyses for this SDG.

Changes to the Revision
This is an original submittal of the final report package.

Analytical Information
All samples were prepped (where applicable) and analyzed within the standard allowed holding times, unless noted within the exceptions listed below. The laboratory analyzed all samples within the program and method guidelines. The following information is provided specific to individual methods:

Chromatographic Flags for Manual Integration:
The following letters are used to denote manual integrations on the laboratory's raw data in association with chromatographic integrations:

A: The peak was manually integrated as it was not integrated in the original chromatogram.
B: The peak was manually integrated due to resolution or coelution issues in the original chromatogram.
C: The peak was manually integrated to correct the baseline from the original chromatogram.
D: The peak was manually integrated to identify the correct peak as the wrong peak was identified in the original chromatogram.
E: The peak was manually integrated to include the entire peak as the original chromatogram only integrated part of the peak.

SW6850:
No anomalies or deviations are noted.

Data Qualifiers

As applicable and where required, the following general qualifiers are associated with the sample results. Additional qualifiers will be specified within the reporting sections of the data package or within the body of the Case Narrative.

Analytical Report Terms and Qualifiers

MDL: The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The MDL is determined from analysis of a sample containing the analyte in a given matrix.

EQL: The estimated quantitation limit (EQL), also known as Reporting Limit **(RL),** is defined as the estimated concentration above which quantitative results can be obtained with a specific degree of confidence. Empirical Laboratories defines the EQL to be at or near the lowest standard of the calibration curve.

*: An exceeding quality control criteria is associated with the reported result.

B: The presence of a "B" to the right of an analytical value indicates that this compound was also detected in the method blank and the data should be interpreted with caution. One should consider the possibility that the correct sample result might be less than the reported result and, perhaps, zero.

D: When a sample (or sample extract) is rerun diluted because one of the compound concentrations exceeded the highest concentration range for the standard curve, all of the values obtained in the dilution run will be flagged with a "D".

E: The concentration for any compound found which exceeds the highest concentration level on the standard curve for that compound will be flagged with an "E". Usually the sample will be rerun at a dilution to quantitate the flagged compound.

H1: The result was analyzed outside of the EPA recommended holding time.

H2: The result was extracted outside of the EPA recommended holding time.

H3: The sample for this analyte was received outside of the EPA recommended holding time.

J: The presence of a "J" to the right of an analytical result indicates that the reported result is estimated. The mass spectral data pass the identification criteria showing that the compound is present, but the calculated result is less than the EQL. One should feel confident that the result is greater than zero and less than the EQL.

M: Indicates that the sample matrix interfered with the quantitation of the analyte. In dual column analysis the result is reported from the column with the lower concentration. In inorganics, it indicates that the parameters MDL/RL have been raised.

N: The MS/MSD accuracy and/or precision are outside criteria. The predigested spike recovery is not within control limits for the associated parameter.

P: The associated numerical value is an estimated quantity. There is greater than a 40% difference between the two GC columns for the detected concentrations. The higher of the two values is reported unless matrix interference is obvious or for HPLC analysis where the primary column is reported.

Q: The RPD and/or percent recovery exceeded limits in the associated Blank Spike and/or Blank Spike Duplicate.

S: The associated internal standard failed criteria.

U: The presence of a "U" indicates that the analyte was analyzed for but was not detected or the concentration of the analyte quantitated below the MDL.

X: The parameter shows a potential positive bias on a reported concentration due to an ICV or CCV exceeding the upper control limit on the high side.

Y: The parameter shows a potential negative bias on a reported concentration due to an ICV or CCV exceeding the lower control limit on the low side.

Z: The parameter shows lack of confirmation/detection, which may be due to a negative bias in the ICV or CCV which exceeds the lower control limit.

LIMS Definitions / Naming Conventions:
The following are general naming conventions that are used throughout the laboratory; however, on a method by method basis, there are additional QAQC items that are named in a consistent format.

BLK: LIMS assigns a unique identifier to the Method Blank by naming it as the letters BLK appended to the Batch ID. A Method Blank is an analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The Method Blank is used to assess for possible contamination during preparation and/or analysis steps. Method Blanks within a Batch or Analytical sequence will be appended with a numerical value beginning with 1 that will increase incrementally.

BS: LIMS assigns a unique identifier to the Blank Spike by naming it as the letters BS appended to the Batch ID. The Blank Spike or Lab Control Sample is a controlled analyte-free matrix, which is spiked with known and verified

concentrations of target analytes. Spiking concentrations can be referenced in the method SOP. The BS is used to evaluate the viability of analytes taken through the entire prep (when applicable) and analytical process. Blank Spikes within a Batch or Analytical sequence will be appended with a numerical value beginning with 1 that will increase incrementally. A duplicate Blank Spike will be designated as a BSD.

MS: The LIMS assigns each Client sample with a unique identifier. The Matrix Spike is designated with a MS at the end of the sample's unique identifier. The Matrix Spike sample is used to assess the effect of the sample matrix on the precision and accuracy of the results generated using the selected method. A duplicate Matrix Spike will be designated as a MSD.

IDs: The LIMS assigns each Client sample with a unique identifier. The letter "RE" may potentially be appended to the end of the LIMS Sample ID. And "**RE**" implies that the sample was either re-prepped, re-analyzed straight, or re-analyzed at a dilution. Subsequent re-analysis for the sample will be appended with a numerical value beginning with 1 that will increase incrementally. Eg: RE1, RE2, RE3, etc.

Statement of Data Authenticity:
I certify that, based upon my inquiry of those individuals immediately responsible for obtaining the information and to the best of my knowledge, the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, with the exception of the conditions detailed in this Case Narrative, as verified by my signature below. During absences, Ms. Marcia K. McGinnity is authorized to sign this Statement of Data Authenticity.

THIS DOCUMENT MEETS DoD QSM 4.1 STANDARDS

The results relate to only the samples associated with the referenced SDG and the submitted data has been produced in accordance with laboratory procedures. The Laboratory's Technical Lab Director, Mr. Rick Davis, is responsible for the final data produced and reported. His signature is listed at the end of the Case Narrative within the Analytical Data Package. If applicable to this report package, details on report revisions and the information on subcontracted analysis are listed in the package Case Narrative. This report shall not be reproduced, except in full, without the written approval of Empirical Laboratories, LLC.

Sample Delivery Group Case Narrative

Receipt Information
The samples were received within the preservation guidelines for the associated methods. The information associated with sample receipt and the Sample Delivery Group (SDG) are included within section 4 of this package, which also provides information on the link between the client sample ID listed on the COC and laboratory's assigned unique sample ID or WorkOrder #. The sample is tracked through the laboratory for all analysis via the assigned WorkOrder #.

All samples that were received were analyzed and none of the samples were placed on hold without analyses. There were no subcontracted analyses for this SDG.

Changes to the Revision
This is an original submittal of the final report package.

Analytical Information
All samples were prepped (where applicable) and analyzed within the standard allowed holding times, unless noted within the exceptions listed below. The laboratory analyzed all samples within the program and method guidelines. The following information is provided specific to individual methods:

Chromatographic Flags for Manual Integration:
The following letters are used to denote manual integrations on the laboratory's raw data in association with chromatographic integrations:

A: The peak was manually integrated as it was not integrated in the original chromatogram.
B: The peak was manually integrated due to resolution or coelution issues in the original chromatogram.
C: The peak was manually integrated to correct the baseline from the original chromatogram.
D: The peak was manually integrated to identify the correct peak as the wrong peak was identified in the original chromatogram.
E: The peak was manually integrated to include the entire peak as the original chromatogram only integrated part of the peak.

SW6850:
No anomalies or deviations are noted.

Data Qualifiers

As applicable and where required, the following general qualifiers are associated with the sample results. Additional qualifiers will be specified within the reporting sections of the data package or within the body of the Case Narrative.

Analytical Report Terms and Qualifiers

MDL: The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. The MDL is determined from analysis of a sample containing the analyte in a given matrix.

EQL: The estimated quantitation limit (EQL), also known as Reporting Limit **(RL),** is defined as the estimated concentration above which quantitative results can be obtained with a specific degree of confidence. Empirical Laboratories defines the EQL to be at or near the lowest standard of the calibration curve.

*****: An exceeding quality control criteria is associated with the reported result.

B: The presence of a "B" to the right of an analytical value indicates that this compound was also detected in the method blank and the data should be interpreted with caution. One should consider the possibility that the correct sample result might be less than the reported result and, perhaps, zero.

D: When a sample (or sample extract) is rerun diluted because one of the compound concentrations exceeded the highest concentration range for the standard curve, all of the values obtained in the dilution run will be flagged with a "D".

E: The concentration for any compound found which exceeds the highest concentration level on the standard curve for that compound will be flagged with an "E". Usually the sample will be rerun at a dilution to quantitate the flagged compound.

H1: The result was analyzed outside of the EPA recommended holding time.

H2: The result was extracted outside of the EPA recommended holding time.

H3: The sample for this analyte was received outside of the EPA recommended holding time.

J: The presence of a "J" to the right of an analytical result indicates that the reported result is estimated. The mass spectral data pass the identification criteria showing that the compound is present, but the calculated result is less than the EQL. One should feel confident that the result is greater than zero and less than the EQL.

M: Indicates that the sample matrix interfered with the quantitation of the analyte. In dual column analysis the result is reported from the column with the lower concentration. In inorganics, it indicates that the parameters MDL/RL have been raised.

N: The MS/MSD accuracy and/or precision are outside criteria. The predigested spike recovery is not within control limits for the associated parameter.

P: The associated numerical value is an estimated quantity. There is greater than a 40% difference between the two GC columns for the detected concentrations. The higher of the two values is reported unless matrix interference is obvious or for HPLC analysis where the primary column is reported.

Q: The RPD and/or percent recovery exceeded limits in the associated Blank Spike and/or Blank Spike Duplicate.

S: The associated internal standard failed criteria.

U: The presence of a "U" indicates that the analyte was analyzed for but was not detected or the concentration of the analyte quantitated below the MDL.

X: The parameter shows a potential positive bias on a reported concentration due to an ICV or CCV exceeding the upper control limit on the high side.

Y: The parameter shows a potential negative bias on a reported concentration due to an ICV or CCV exceeding the lower control limit on the low side.

Z: The parameter shows lack of confirmation/detection, which may be due to a negative bias in the ICV or CCV which exceeds the lower control limit.

LIMS Definitions / Naming Conventions:
The following are general naming conventions that are used throughout the laboratory; however, on a method by method basis, there are additional QAQC items that are named in a consistent format.

BLK: LIMS assigns a unique identifier to the Method Blank by naming it as the letters BLK appended to the Batch ID. A Method Blank is an analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The Method Blank is used to assess for possible contamination during preparation and/or analysis steps. Method Blanks within a Batch or Analytical sequence will be appended with a numerical value beginning with 1 that will increase incrementally.

BS: LIMS assigns a unique identifier to the Blank Spike by naming it as the letters BS appended to the Batch ID. The Blank Spike or Lab Control Sample is a controlled analyte-free matrix, which is spiked with known and verified

concentrations of target analytes. Spiking concentrations can be referenced in the method SOP. The BS is used to evaluate the viability of analytes taken through the entire prep (when applicable) and analytical process. Blank Spikes within a Batch or Analytical sequence will be appended with a numerical value beginning with 1 that will increase incrementally. A duplicate Blank Spike will be designated as a BSD.

MS: The LIMS assigns each Client sample with a unique identifier. The Matrix Spike is designated with a MS at the end of the sample's unique identifier. The Matrix Spike sample is used to assess the effect of the sample matrix on the precision and accuracy of the results generated using the selected method. A duplicate Matrix Spike will be designated as a MSD.

IDs: The LIMS assigns each Client sample with a unique identifier. The letter "RE" may potentially be appended to the end of the LIMS Sample ID. And "**RE**" implies that the sample was either re-prepped, re-analyzed straight, or re-analyzed at a dilution. Subsequent re-analysis for the sample will be appended with a numerical value beginning with 1 that will increase incrementally. Eg: RE1, RE2, RE3, etc.

Statement of Data Authenticity:
I certify that, based upon my inquiry of those individuals immediately responsible for obtaining the information and to the best of my knowledge, the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, with the exception of the conditions detailed in this Case Narrative, as verified by my signature below. During absences, Ms. Marcia K. McGinnity is authorized to sign this Statement of Data Authenticity.

Laboratory Technical Director / VP Operations
