RECEIVED

MAR 26 2015

Ms. Naomi Davidson
Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East Bldg 1
Santa Fe NM 87505-6063

**NMED
Hazardous Waste Bureau**

Dear Ms. Davidson,

The purpose of this letter is to present a summary of additional sampling at Solid Waste Management Unit (SWMU) 70. The seven soil borings that were completed in January 2015, as part of the 2010 Approved Work Plan for the site, indicate that three additional step-out borings are required in order to fully delineate nature and extent. Based on the analytical results of the January samples, the contractor is proposing to complete these step out borings and analyze only for Total Petroleum Hydrocarbons (TPH) and Benzene, Toluene, Ethyl-benzene, and Xylene (BTEX). In addition, data reviewed by the contractor identified a potential source area near the former Oil Water Separator (OWS) that has not been sampled since 1994. The contractor is proposing to determine vertical extent of this area by adding a boring between the two 1994 borings in this area. This sample will be analyzed for all contaminants identified in the 2010 work plan. The contractor's site summary letter is included. Please let me know if you have any questions and if this proposed sampling is acceptable. My number is (575) 784-0491.

Sincerely,

LAURA PETERS, RPM, AFCEC/CZO

RE: Additional Sampling Proposed at SWMU 70 (Air Force Site FL070)
Cannon Air Force Base (AFB), New Mexico

URS Group Inc., as a subcontractor to FPM Remediations, Inc., completed the approved sampling at SWMU 70 in January 2015 as outlined in the Work Plan for Final Closure of Solid Waste Management Units 70 and 71 at Cannon Air Force Base. This work plan was approved by NMED on July 6, 2010.

Upon receiving the analytical results for the January 2015 sampling event, URS reviewed the current and historical analytical data for soil samples collected from SWMU 70 to ensure the nature and extent of contamination had been adequately characterized. The goal of the sampling was to characterize the contamination and allow for a remedial system to be designed and installed to remediate contamination present in excess of the current NMED screening levels. This review has determined the current conditions have not adequately been characterized.

The purpose of this letter is to identify the boring locations needed to characterize the extent of contamination at the site and define the analytical requirements for the samples to be collected. The additional sampling proposed is considered to represent supplemental (step out) sampling to the existing approved work plan and not a separate work plan or report for review.

A summary of the history of the site, the results of historical investigations to date, and a discussion of the proposed sampling to adequately characterize SWMU 70 is as follows.

History

SWMU 70 is located north of Building 326 and consisted of a 50-gallon oil/water separator (OWS) compartment, a detached 220-gallon underground oil storage tank (UST), and a leach well (**Figure 1**). The OWS was constructed of steel and measured 1.5-foot by 2-foot and extended to 6 feet below ground surface (bgs). The UST was constructed of steel and was strapped to a 4-foot by 7-foot concrete pad constructed approximately 7 feet bgs. The leach well consisted of a 5-foot diameter by 5-foot deep gravel filled pit. The leach well was located approximately 10 feet to the north-northwest of the OWS on the north side of Building 326.

The system became operational in 1958. The OWS system was intended to recover petroleum products from wash water effluent from jet propellant (JP-4) fuel truck maintenance operations at Building 326. The recovered petroleum products were stored in the 220-gallon tank and the wash

- Sampling at VW and MPA are considered sufficient to delineate the vertical extent of contamination identified at soil borings 07001 and 07002 in the 1994 RFI. However, no additional sampling has been completed in close proximity to soil borings 07004 or 07005 from the 1994 RFI or in the location of the former oil/water separator. Based on the contamination identified at the former oil/water separator location, one additional boring is recommended to delineate the vertical extent of contamination at this location.

The samples collected in January 2015 were analyzed for VOCs, SVOCs, Pesticides, PCBs, TPHs, and metals. Based on the results of the sampling, no analytes were identified in excess of screening levels except TPHs. Vapor sampling has historically been completed at the site and analyzed for TPH and BTEX.

Based on the fact that three of the four borings proposed are step out locations to further refine the extent of contamination identified, the analyte list is proposed to be reduced to TPH and BTEX for these three locations.

The fourth location, at the location of the former oil/water separator between borings 07004 and 07005, is a potential source location. Soils from this boring will be analyzed for all contaminants of concern in accordance with the approved work plan.
