

P-K Tool & Manufacturing in Santa Teresa New Mexico own and operate a MAZAK CO2 optiplex 3015 metal working LASER which has a cooling system with a 150 gallon or so cooler which is also full of heavy metals and other toxic byproducts which they dump into the water drain behind the building. That water is dumped every 4 months or so. It also produces a soot like substance full of heavy metals and other toxic and hazardous substances which the company leaves in a 55 gallon drum and do not dispose of it at all, I am not sure but I believe they expect the soot to be carried out by air. They also have huge air compressors which they drain weekly of oils and coolants which are highly toxic and they also dump that down the drain behind the building. Spent oil is also dumped behind the building. There is huge oil spill marks that are clearly visible in the concrete behind the building. I do not know if the violations have been recorded but I do believe there are cameras in the buildings surrounding P-K Tool. Also there is a lot of welding going on without proper ventilation. They do have a vent system for show which is not even hooked up nor does it work.
