¹ THIS LISTING IS NOT ALL INCLUSIVE AND SPECIFICALLY DOES NOT INCLUDE MORTAR AMMUNITION.

² UNFUZED.

³ NO EXPLOSIVE FILLER GIVEN IN REFERENCE MATERIAL.

MARKINGS ON THE ABOVE MENTIONED ROUNDS

COMMON STEEL SHELLS ARE PAINTED YELLOW TO DENOTE HIGH EXPLOSIVE FILLER AND GRAY TO DENOTE GAS FILLER. SEMISTEEL PROJECTILES HAVE THE TOP PAINTED BLACK TO THE BOURELLET, WHILE ABOVE THE BOURELLET THEY ARE PAINTED YELLOW IF FILLED WITH HIGH EXPLOSIVE, OR GRAY IF FILLED WITH GAS. COMMON SHRAPNEL IS PAINTED RED.

COLOR CODING FOR GAS FILLED PROJECTILES

COLOR CODING BANDS WERE LOCATED BETWEEN THE ROTATING BAND AND THE BOURRELET AS FOLLOWS:

FILLER	1ST BAND	2ND BAND	3RD BAND	STENCIL
VN ¹	WHITE	NONE	NONE	SPECIAL GAS
CG ²	WHITE	WHITE	NONE	SPECIAL GAS
PS ³	WHITE	RED	NONE	SPECIAL GAS
HJ ¹	RED	RED	RED	SPECIAL GAS
BA ¹	RED	NONE	NONE	SPECIAL GAS
PG ¹	WHITE	RED	WHITE	SPECIAL GAS
NC ¹	WHITE	RED	YELLOW	SPECIAL GAS
WP	YELLOW	NONE	NONE	SMOKE
SMOKE SHELL	NONE	NONE	NONE	SMOKE
THERMIT ⁴	NONE	NONE	NONE	THERMIT
OTHER INCEND.	NONE	NONE	NONE	INCENDIARY
FM	YELLOW	YELLOW	NONE	SMOKE

ADDITIONALLY, FIXED AND SEMIFIXED AMMUNITION WILL HAVE A BLACK STRIPE .375" WIDE PAINTED ON THE BASE OF THE CARTRIDGE CASE (EXCLUDING THE PRIMER).

¹ AS OF THE DATE OF THIS WRITING, I COULD FIND NO DESCRIPTION OF SPECIFICALLY WHAT THESE GASES WERE. IF, IN FACT THEY WERE LOADED AT ALL, THEY WERE PROBABLY TOXIC OR INCAPACITATING.

² CG IS PHOSGENE, A TOXIC AGENT.

³ PS IS CHLORPICRIN, AN INCAPACITATING AGENT.

⁴ THERMIT IS THE OLD SPELLING OF THERMITE OR THERMATE.

CHEMICAL AGENTS

THE FOLLOWING CHEMICAL AGENTS WERE KNOWN TO HAVE BEEN PRODUCED BY THE U.S. FOR MILITARY USE. HOWEVER, SINCE THE U.S. WAS MAKING A SIGNIFICANT AMOUNT OF ORDNANCE FOR THEIR ALLIES PRIOR TO OUR ENTRY INTO THE WAR, SOME OF THESE AGENTS MAY NOT HAVE BEEN LOADED INTO U.S. AMMUNITION.

CHLORINE (CL)
 PHOSGENE (CG) ⁵
 CHLORPICRIN (PS)
 MUSTARD GAS (HS)
 LEWISITE (M-1)
 STANNIC TETRACHLORIDE

⁵ "Some 1,600 tons of phosgene were manufactured in the United States during the (First) World War. Of this, 420 tons were shipped overseas in bulk; 18,600 LP (Levins Projector) drums containing 279 tons of this agent were also shipped to France. Some of these drums were fired in battle being the only American gas in American munitions used during the (First) World War".

SHRAPNEL PROJECTILES

(SEE PAGE 13) Unlike modern canister projectiles that spread their payload immediately upon exiting the cannon, WW I shrapnel projectiles worked like those of the Civil War era; i.e., they were equipped with a time fuze and expelling charge. That allowed the projectile to get much closer to its intended target before ejecting the shrapnel balls. The resin and ball matrix was provided to assure that the balls stayed in place inside the projectile assuring ballistic accuracy.

POINT DETONATING FUZES

(SEE PAGES 14-16) Most of the U.S. inventory of artillery fuzes at the beginning of the war were of the base detonating type. These were screwed into the base of the projectile and were thus hidden from view. However, it was learned from the experience of the Allies that it was desirable to have point detonating fuzes. (In many cases they offered quicker action; i.e., detonated upon contact with the target or ground rather than slightly penetrating. In the case of ground burst, this allowed more lethal fragment or gas dispersion.)

COLOR-CODING ON SOME FUZES

Some point detonating fuzes were color coded as follows:

NONDELAY	WHITE HEAD
SHORT DELAY	BLACK HEAD
LONG DELAY	VIOLET HEAD
ADDITIONAL SAFETY FEATURES	GREEN HEAD

ARTILLERY ADAPTER-BOOSTERS

(SEE PAGE 17) Due to the many combinations of sizes and designs of projectiles and fuzes, fuze adapter-boosters were in common use. These adapter-boosters allowed for a fuze of small diameter to be used in a fuze cavity of larger diameter. They were similar in overall appearance to modern bomb adapter-boosters.

PRIMERS

There were two basic types of artillery primers in use - percussion and friction. The percussion primers were very similar in function and appearance to modern percussion primers. The friction primers were very different. One type of primer had a pull wire that extended out the base of the primer body. When inserted into the cannon, the wire was pulled to the rear igniting the primer composition. The other type of friction primer had a pull wire extending out the side. When inserted into the cannon, the gunner could stand out to the side of the piece when firing. This same type of primer was used in the Civil War

CARTRIDGE CASES

The basic form and function of artillery cartridge cases have remained practically unchanged since the 1890s. However, for some smaller caliber (75mm, for example) ammunition "it was formerly the rule to solder a brass diaphragm down on top of the powder charge." This practice was discontinued with ammunition produced in the later stages of World War I.

EXPLOSIVES

Explosives either in use, under consideration or development during WW I.

TNT
50-50 AMATOL
80-20 AMATOL
EXPLOSIVE "D"
60-40 SODATOL
TROJAN GRENADE POWDER
GRENITE
TROJAN MORTAR POWDER
TETRYL
MERCURY FULMINATE
NITROSTARCH
BLACK POWDER
ANILITE
CRESYLITE
DINITROBENZOL + TNT
DINITROBENZOL + TNA (TETRANITROANILINE)
CHLORATE OR PERCHLORATE EXPLOSIVES
METHYL TETRYL
NITRATED IVORY NUT

HAND AND RIFLE GRENADES

For all practical purposes the U.S. had no hand or rifle grenades for military use at the beginning of WW I. We did, however, have the experience of the allies to guide them, when in 1917, we took up the design of hand grenades for use by our troops.

There were five classifications of hand grenades and one classification of rifle grenades adopted (practically all based on French or English designs):

1. DEFENSIVE GRENADES. (SEE PAGE 18) The defensive grenade was the Mk II (virtually identical in appearance and operation to the "Pineapple" grenade of WW II fame), so called because that it had to be thrown from defensive positions to prevent the thrower from being a target of its fragments.

DUMMY HAND GRENADE. The dummy grenade is made of cast iron, and resembles the defensive grenade, Mk II, in size, weight and contour. It is used for practice and painted bright red.

2. **OFFENSIVE GRENADES.** (SEE PAGE 19) The offensive grenade was the Mk III (very similar in appearance and function to the Offensive grenade of WW II), so called because it could be thrown while on the offense since there was little chance of the thrower being injured by fragments.

3. **PHOSPHOROUS GRENADES.** The phosphorous grenade has a barrel shaped steel container about 3 1/2" long by 2 1/4" in diameter containing approximately four ounces of white phosphorous.

4. **GAS GRENADES.** (SEE PAGE 20) This grenade is similar in size and shape to the phosphorous grenade except that this grenade has two annular corrugations on the body near the bottom to serve as a distinguishing mark. It contains 12 1/4 ounces of stannic tetrachloride¹.

5. **INCENDIARY GRENADES.** (SEE PAGE 20) There were two types of these. One was the thermite grenade, Mk I. To ignite it, the cover was removed and the primer holder struck manually. After a five second delay, the thermite was ignited. It was intended to be used to seal breechblocks of captured weapons and burn captured supplies.

The second type was the Incendiary Grenade, Mk I, which used the same body and fuze parts as the offensive grenade except that it had an igniter of thermite mixes with solidified oil instead of a detonator. The top half of the grenade was filled with thermite while the lower half of the body was filled with solidified oil. Some records indicate that these were not produced in large quantities.

6. **V.B. RIFLE GRENADE, Mk I.** (SEE PAGE 21) This was a copy of the French design consisting of a cylindrical body approximately 2 1/2 inches long by 2 inches in diameter and a discharger. The discharger with grenade was fitted over the muzzle of the rifle. When a standard ball round was fired, the bullet passed through a hole in the body of the grenade hitting a striker which fired the primer igniting an 8 second delay fuze. The propellant gases escaping from the muzzle of the rifle then propelled the grenade from the discharger out to a maximum range of about 200 yards. (For trivia fans, the "V.B." stands for Vivens and Bessieres, two Frenchmen who invented this type of grenade.)

There was also a training version of this grenade and discharger that was inert.

¹ Stannic tetrachloride, also called tin tetrachloride, produces a noxious cloud of smoke.

GRENADE COLOR CODING

The bodies of live grenades are painted battleship gray while the bodies of practice grenades (no explosives) are painted red.

TRENCH MORTARS

Although there is a mortar listed in the table on page 2, there were no trench mortars in service with the U.S. Army at the beginning of WW I. However, there were five types adopted by the U.S. most of English design as shown in the table below. The literature of the day referred to the ammunition as "mortar bombs" or "shells".

<u>TYPE</u>	<u>SHELL WEIGHT</u>	<u>SHELL CHARGE</u>	<u>CHARACTERISTICS</u>
3" STOKES, Mk I	11 3/4 LBS.	HIGH EXPLOSIVE	AN INFANTRY WEAPON. MUZZLE LOADING SHELL AND PROPELLANT
4" STOKES, Mk I	15 LBS.	GAS, SMOKE, INCENDIARY, HIGH EXPLOSIVE	USED ONLY BY CHEMICAL WAR- FARE SERVICE. MUZZLE LOADING SHELL AND PROPELLANT.
6" TRENCH MORTAR, Mk I	52 LBS.	HIGH EXPLOSIVE	MUZZLE LOADING SHELL AND PROPELLANT
240-MM TRENCH MORTAR, Mk I	156 LBS.	HIGH EXPLOSIVE	MUZZLE LOADING SHELL, BREECH LOADING CARTRIDGE CASE.
11" SUTTON	205 LBS.		EXPERIMENTAL AS OF 1918. TO BE LOADED SAME AS 240-MM.

1. 3" STOKES MORTAR. (SEE PAGE 22) The ammunition is nominally 3" in diameter at the widest part and approximately 15" long (including fuze). The nose end is manufactured to accept a special fuze. The round may come with or without the fuze installed. At the forward and rear ends of the projectile there is a ring of slightly larger diameter than the rest of the body. These are bore-riding surfaces. At the rear is a cartridge container very similar to modern mortars. Up to three ballistite (a type of propellant) rings were installed depending upon the desired range.

2. The same fuze is used for both the 3" and 4" Stokes mortar. Somewhat hemispherical in shape, it is the Mk VI. It came with a "safety pin" installed that prevented the set back pellet from moving. Upon firing, the set back pellet was moved rearward freeing the safety fork to slide out to the side (this was a bore safety feature). Once the safety fork was removed the fuze was armed. The fuze was designed in such a way that it was to function irrespective of the position in which the shell strikes on impact.

NOTE: Not only were live rounds produced, but a practice shell made of malleable iron was also produced.

3. 4" STOKES MORTAR. Very similar in physical appearance as the 3" except proportionately larger.

4. 6" TRENCH MORTAR, Mk I. (SEE PAGE 24) "The shell or bomb, nominally 6 inches in diameter and 15 inches long, is made of gray iron with its front end threaded for an adapter, and the rear end fitted with steel vanes which serve to keep the bombs steady in flight. Steel wire is wrapped around the vanes to hold the powder bags in position. The rear ends of the vanes are strengthened by connecting vane braces of forged steel. The propelling charge consists of 1 ounce bags of guncotton yarn and similar bags of ballistite tucked between the vanes in the wire wrapping according to the number used with the range desired. Four guncotton bags and two ballistite bags constitute the maximum charge."

5. 240-mm TRENCH MORTAR. The shell or bomb, nominally 9 1/2" in diameter and 36" long, is somewhat similar in appearance to the 6" shell in that it is fin stabilized. However, it is very different in that the propelling charge is separate from the shell. The shell is loaded tail down from the muzzle while the propelling charge in a cartridge case is loaded from the muzzle. This round did not depend upon the inertia of a falling round striking a primer to fire. The firing mechanism was apparently activated after the round was loaded.

6. FUZE, MK VII. (SEE PAGE 25) This was used with the 6", 240-mm and Sutton Trench Mortars. It came in both a delay and nondelay model. Its notable feature is the safety screw and ring which must be manually removed prior to firing.

LIVENS PROJECTOR

(SEE PAGE 26) "The Livens Projector is a mortar of the simplest type, which is used to discharge gas and incendiary shells. A cartridge case containing a number of bags of powder is dropped into the bottom of the projector with suitable wire connections leading from the electric primer in the powder to the point of operation. The shell is placed in the mortar over the cartridge case, the top of which is shaped to fit the base of the shell. The shell is provided with a length of Bickford (black powder time) fuse, which is ignited when the shell leaves the projector, and a standard type of detonator. A bursting charge of TNT is generally used with the gas shell. Black powder is usually employed to secure the ignition of the incendiary materials in the incendiary shells." The handle shown in the diagram apparently was used for carrying only and was removed prior to firing.

The Livens projector shells were about 24 inches long by 8 inches in diameter.

AERIAL DROP BOMBS

AERIAL DROP BOMBS OF THE UNITED STATES ARMY AS OF NOVEMBER 19, 1918.

DESIGNATION	WEIGHT	DIAMETER	LENGTH	FIRING MECHANISM	
				NOSE	TAIL
DEMOLITION:					
MARK I	104	7 7/8	50	YES	YES
MARK II	22	4 3/4	28 1/4	NO	YES

MARK I	40	6	38 1/5	YES	YES
MARK II	46	6	37 1/5		
MARK III ¹	100	7 7/8	48 3/4	YES	YES

¹ Even though these bombs had been developed, as of the date of the above table they had not been authorized for use.

(SEE PAGE 26)

1. Generally, demolition (also called high capacity) bombs were of an aerodynamic, tear-drop shape with rear fins. (For ammunition trivia fans who might look at the Mk VI-A demolition and notice that it weighs 1,000 lbs.: No, the U.S. had not developed any aircraft at that time that were capable of carrying a bomb that heavy. However, the Italians had developed a three man bomber capable of carrying up to 1,700 lbs of bombs at upwards of 80 miles per hour.)

2. The Barlow Heavy Bomb was a very unusual concept. As loaded onto the aircraft it was the dimensions given in the table above. After being dropped from the aircraft, a compressed gas cylinder in the bomb released and caused an extension rod to be driven out the bomb's nose. This caused the bomb's overall length to increase to 15 feet. At the end of the extension was a firing pin and one round of .30 cal. rifle ammunition which was aimed toward the rear of the bomb. Upon hitting the ground the firing pin

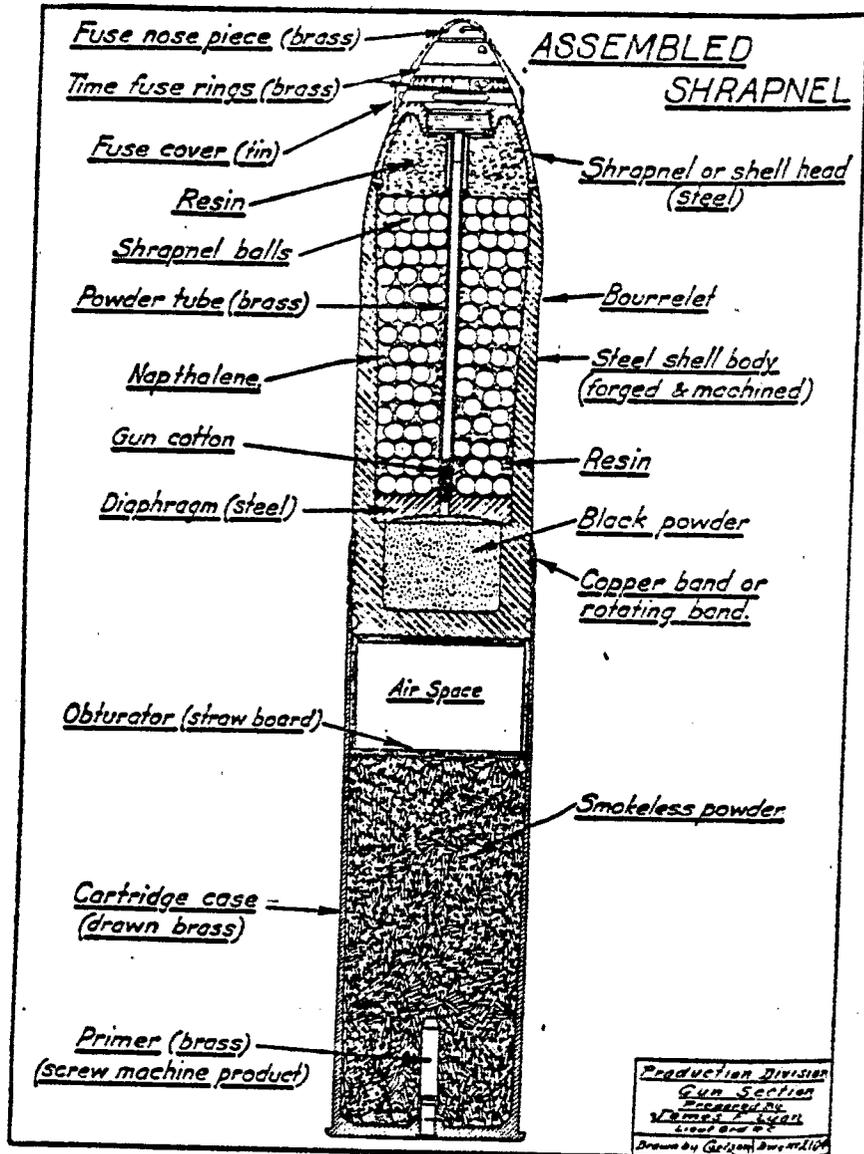

fired the rifle cartridge. The bullet passed upward through the hollow extension rod and hit a primer in the rear of the bomb causing it to detonate well above the ground. A total of only about 9,000 of these were produced.

3. Fragmentation bombs had a much higher body to filler weight ratio than did demolition bombs. These were, for the most part, adapted from rejected artillery projectile casings. The Mk I used a 6" projectile body, the Mk II a 75mm projectile body, the Mk II-A a 3" projectile body (this was the only one of the three to be put into large production), and the Mk III a 4.7" projectile body. Also they frequently had a short length of steel pipe inserted into the fuze well with a firing mechanism attached to the front of the pipe. This allowed detonation to occur above ground level.

4. There were two designs of incendiary bombs. First, the Mk I, was a "scatter type" bomb filled with 19 lbs of cotton waste balls soaked in turpentine or solid oil balls wrapped in burlap with a 1 1/2 lb. black powder charge to ignite and scatter them around.

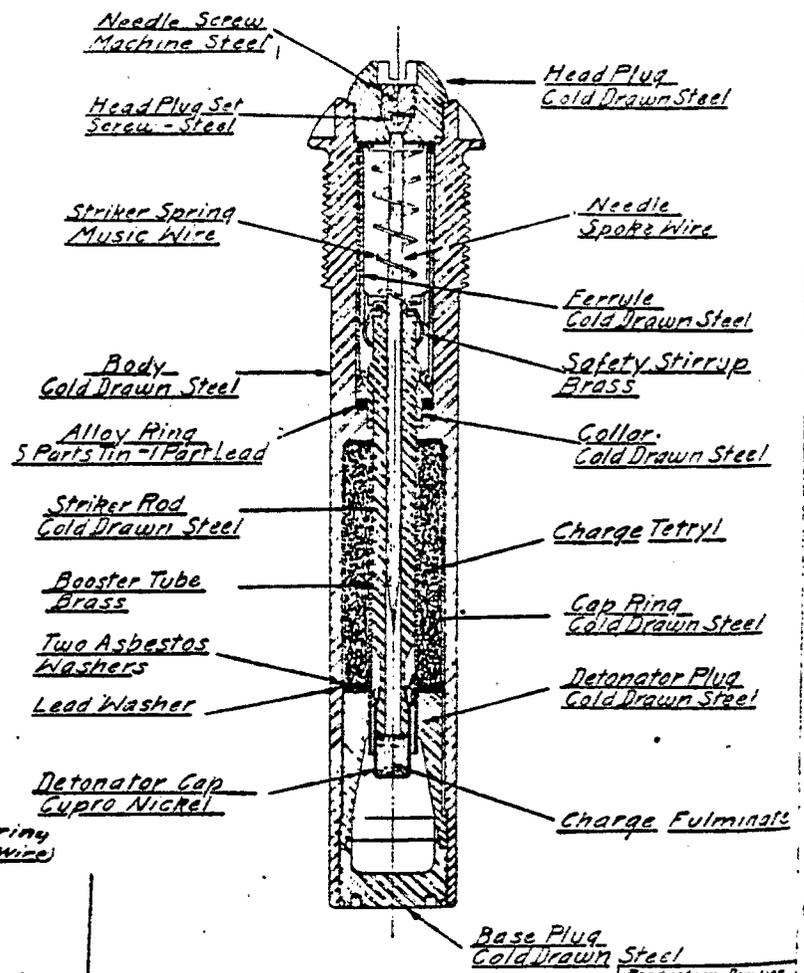

The other type of incendiary bomb, the Mk II, was called the "intensive type" because it was filled with solidified oil and thermite and tended to burn much more intensely.

PRACTICE BOMBS. "One of the interesting phases of the bomb manufacturing program grew out of the necessity for target practice for our aviators. for this work we built dummy bombs of terra cotta, costing about a dollar apiece. Instead of loading these bombs with explosive, we placed in each a small charge of phosphorous and a loaded paper shotgun shell, so that the bomb would eject a puff of smoke when it hits its object. The aviators could see the smoke puffs and thereby determine the accuracy of their aim."

COURSE OBJECTIVES

This course is designed to provide training to non-ordnance personnel in the general functioning of various types of ammunition, their safety features, and physical characteristics with the result being the ability to recognize and identify potentially hazardous ammunition and explosive items.

By the end of the course, the student will be able to:

1. Identify characteristics of both high and low explosives.
2. Identify various sources of ammunition information.
3. Interpret ammunition color coding.
4. Identify types of conventional ammunition by physical characteristics, markings and color coding.
5. Identify the different explosive hazard associated with each type of ammunition.
6. Implement safety procedures upon the discovery of hazardous ordnance.

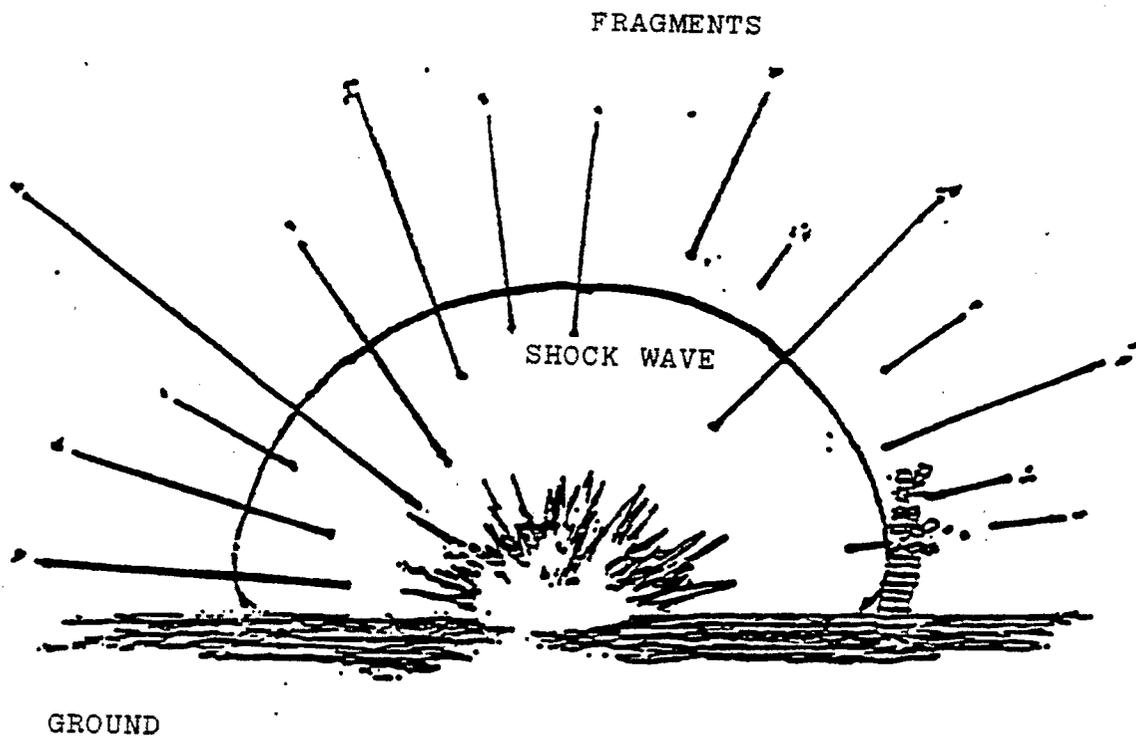

These results will be accomplished by use of this handout, lecture, viewgraphs and hands-on training aids.

EXPLOSIVES
PROPELLANTS
AND
CHEMICAL AGENTS

EXPLOSIVE - A MATERIAL THAT HAS THE POTENTIAL TO CHEMICALLY CHANGE FROM A SOLID TO A LARGE VOLUME OF HOT GASES VERY QUICKLY.

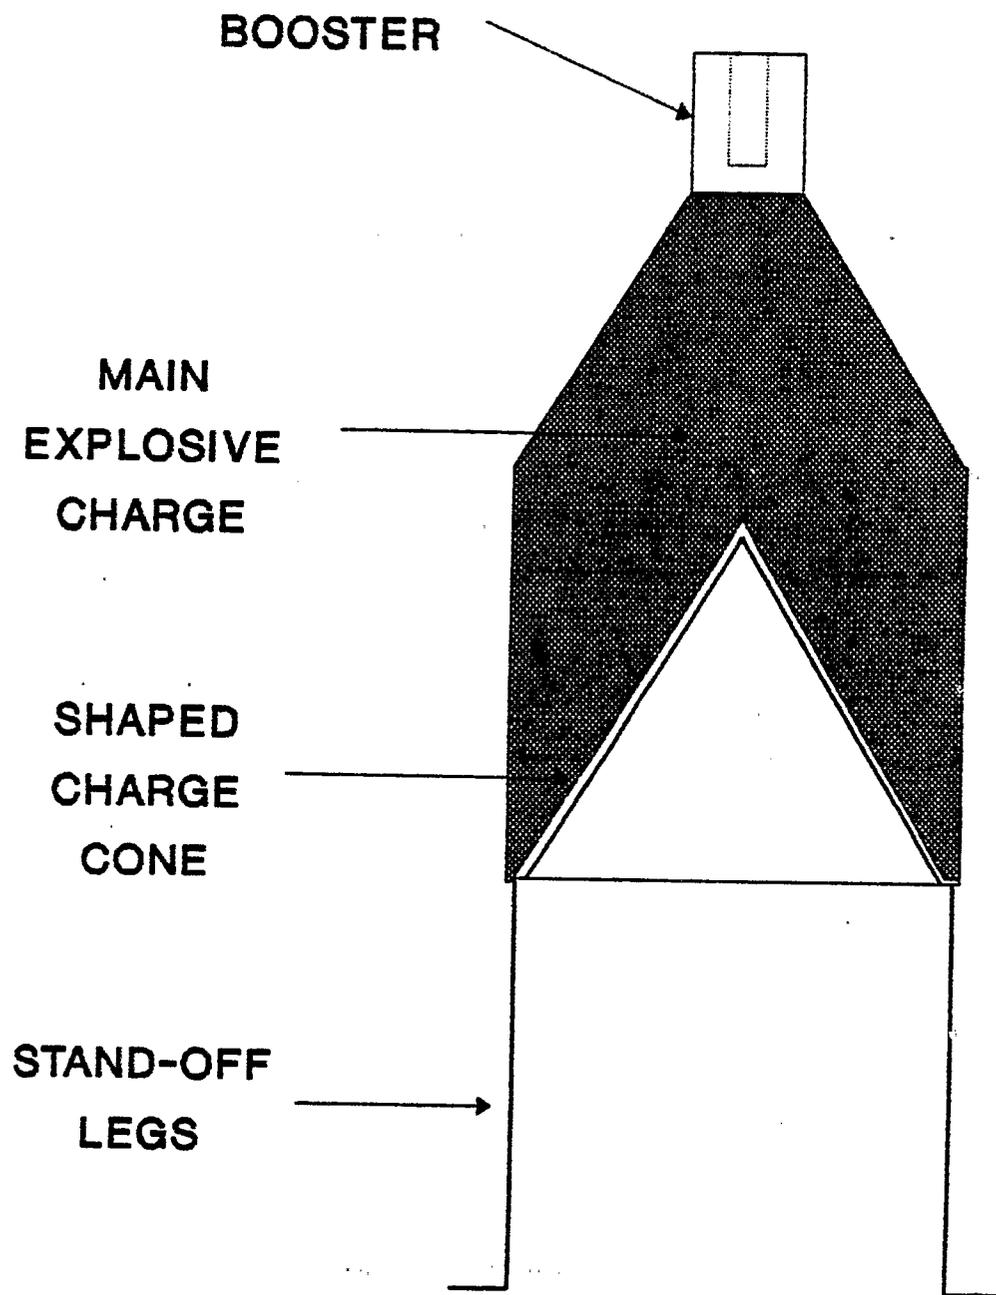

HIGH EXPLOSIVE - A MATERIAL THAT UNDERGOES THE CHEMICAL CHANGE AT A RATE FASTER THAN THE SPEED OF SOUND. EXAMPLES: TNT, EXPLOSIVE D, AMATOL, COMPOSITION B, MERCURY FULMINATE, ETC.

LOW EXPLOSIVE - A MATERIAL THAT UNDERGOES THE CHEMICAL CHANGE AT A RATE SLOWER THAN THE SPEED OF SOUND. EXAMPLES: BLACK POWDER, SMOKELESS POWDER, ROCKET PROPELLANT, ETC.

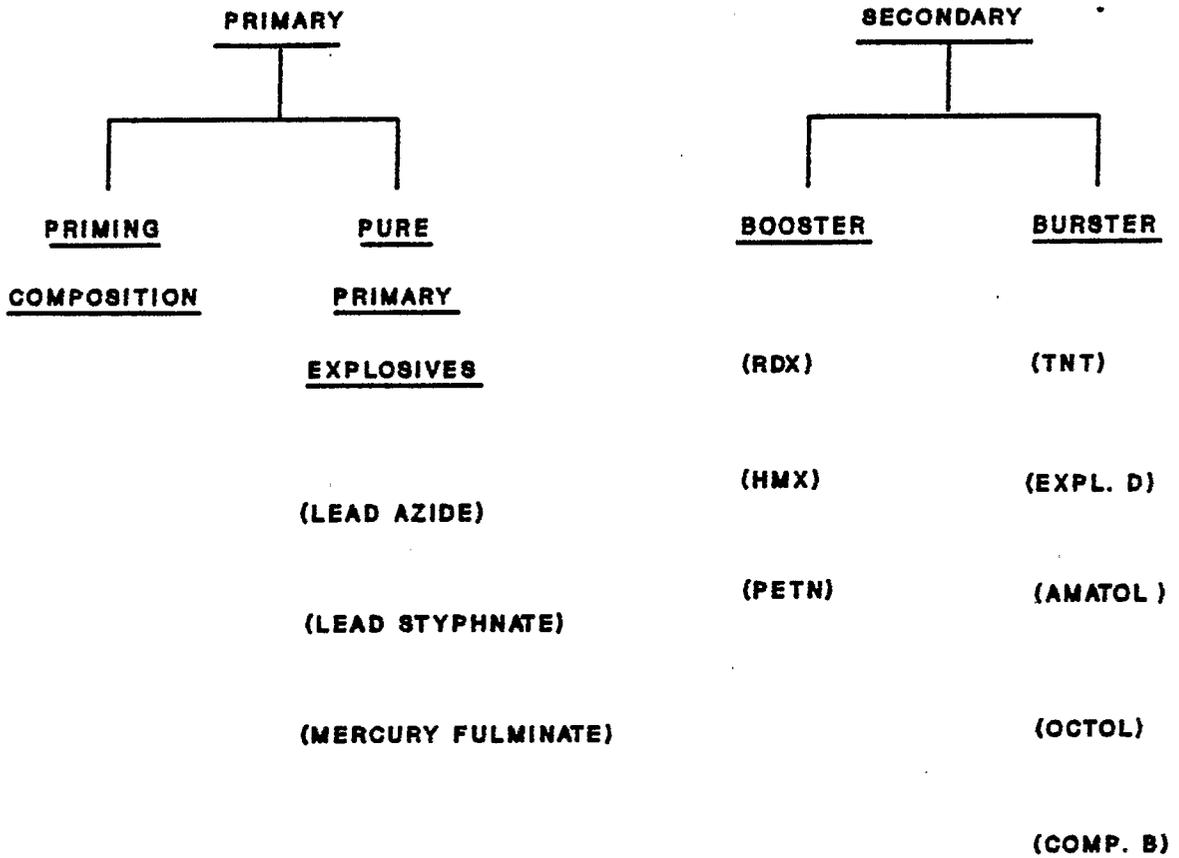

EFFECTS OF AN EXPLOSION

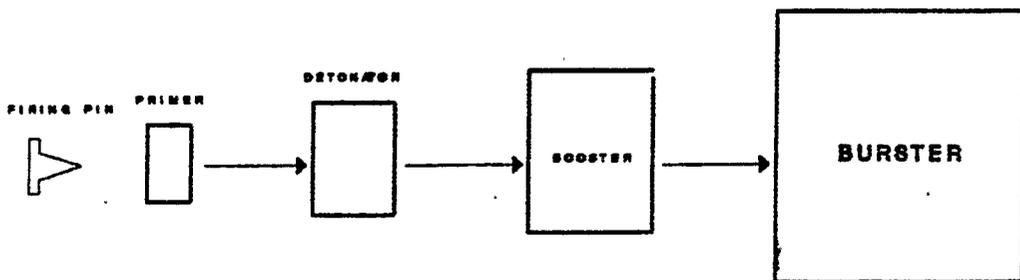

SHAPED CHARGE

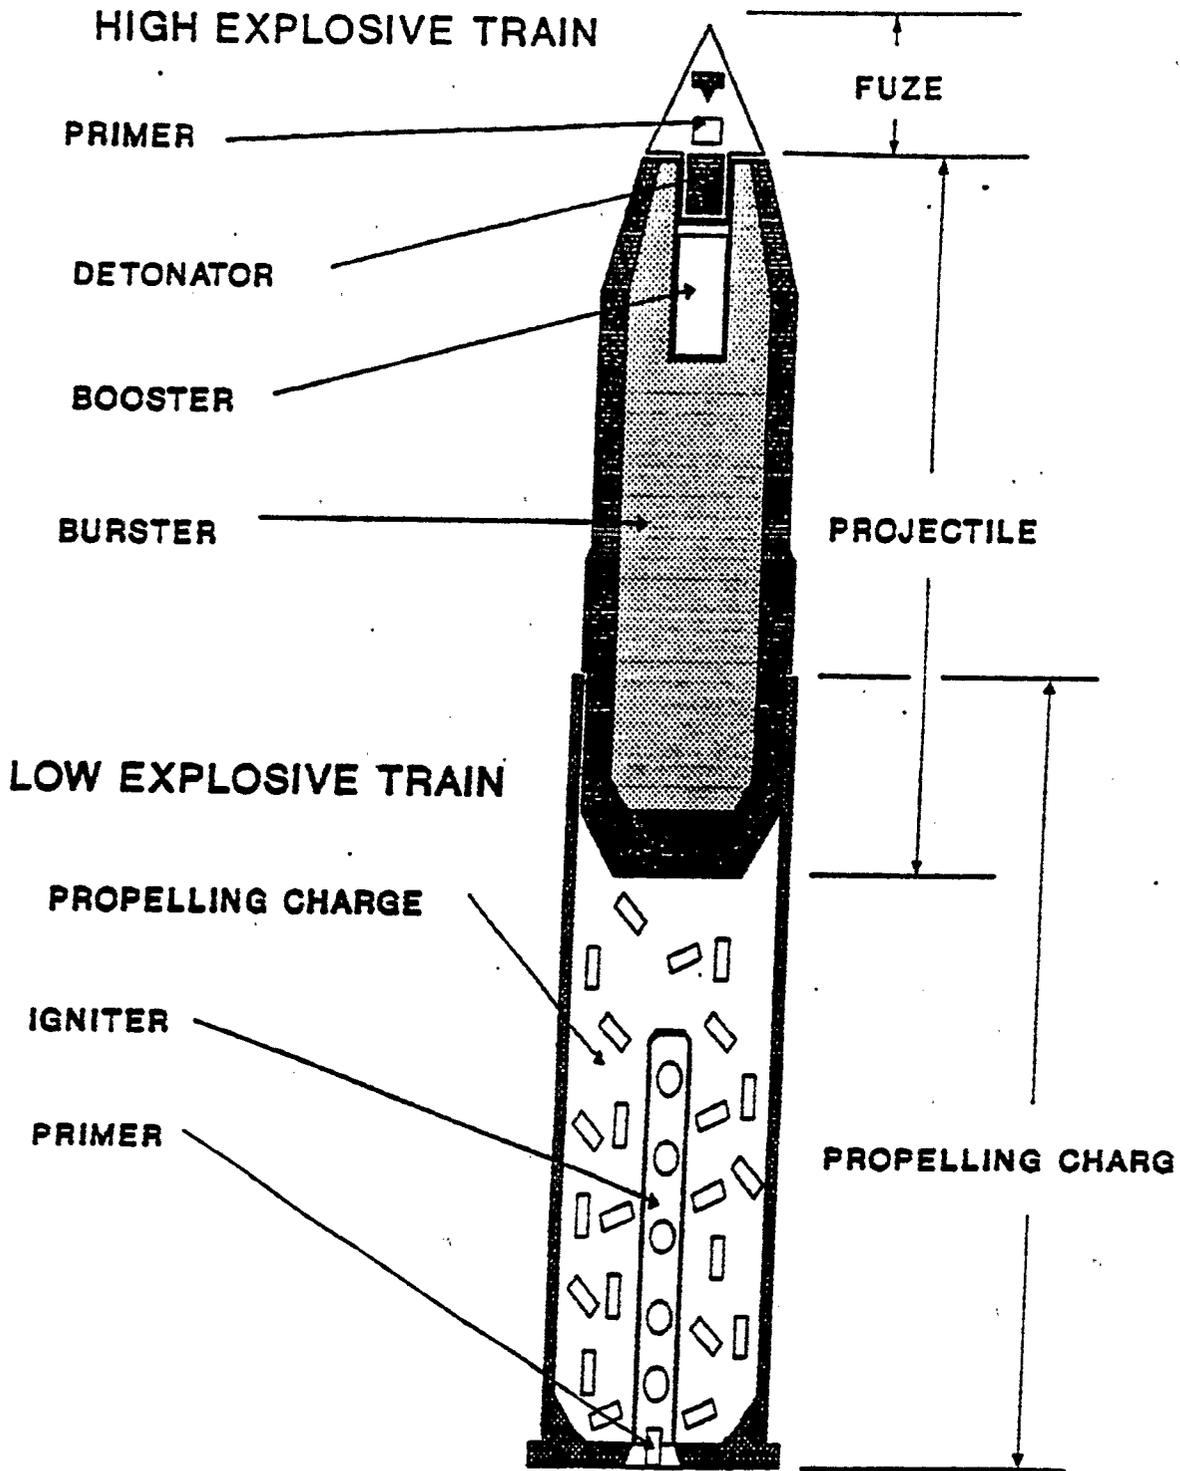

CLASSIFICATIONS OF HIGH EXPLOSIVES

HIGH EXPLOSIVE TRAIN

COMMONLY USED EXPLOSIVES¹

<u>NAME</u>	<u>DESCRIPTION</u>	<u>REMARKS</u>
BLACK POWDER	BROWN TO BLACK	MANUFACTURED IN GRAINS THAT RANGE IN SIZE FROM SMALLER THAN SALT GRAINS TO GRAINS AS LARGE AS SMALL PEBBLES. HIGHLY SENSITIVE TO IGNITION BY HEAT, FRICTION, FLAME, SPARK. WHEN WET, IT IS CORROSIVE TO MOST METALS.
TNT	LIGHT YELLOW TO BROWN OR GRAY	SLIGHTLY CORROSIVE WITH LEAD. USED IN BOMBS, GRENADES, DEMOLITION CHARGES, PROJECTILES. EXUDES AT ELEVATED TEMPERATURES. MODERATELY TOXIC BY SKIN ABSORPTION OR INHALATION.
EXPLOSIVE D	BRIGHT YELLOW TO ORANGE. ALSO CALLED AMMONIUM PICRATE.	RELATIVELY INSENSITIVE. HIGHLY TOXIC BY INHALATION, INGESTION, OR SKIN ABSORPTION.
AMATOL	LIGHT BROWN TO YELLOW. MIXTURE OF	SLIGHTLY HYGROSCOPIC. HAS CORROSIVE EFFECTS ON COPPER, BRONZE, LEAD, BRASS. HIGHLY TOXIC BY INHALATION, SKIN CONTACT, INGESTION.
COMPOSITION B	WHITE TO BROWNISH YELLOW TNT AND EXPLOSIVE D.	SLIGHTLY CORRODES COPPER, BRASS, CADMIUM, ZINC. USED IN BOMBS, PROJECTILES, GRENADES, SHAPED CHARGES.
OCTOL	LIGHT BROWN	USED IN BOMBS, PROJECTILES, SHAPED CHARGES.
RDX	WHITE. ALSO CALLED CYCLONITE.	SENSITIVE TO IMPACT AND FRICTION. SLIGHTLY CORROSIVE WITH COPPER, BRASS, MILD STEEL, CADMIUM. MODERATELY TOXIC BY INHALATION OR INGESTION.
HMX	WHITE. ALSO CALLED OCTOGEN.	SENSITIVE TO IMPACT AND FRICTION. SLIGHTLY TOXIC.
PETN	WHITE	SENSITIVE TO IMPACT. SLIGHTLY CORROSIVE TO BRASS, CADMIUM, ZINC. VERY SLIGHTLY TOXIC.

<u>NAME</u>	<u>DESCRIPTION</u>	<u>REMARKS</u>
LEAD AZIDE	WHITE TO LIGHT BROWN	VERY SENSITIVE TO IMPACT, FRICTION, SPARKS. CORROSIVE TO COPPER, ZINC. VERY SLIGHTLY TOXIC.
LEAD STYPHNATE	LIGHT ORANGE TO REDDISH BROWN	SAME AS LEAD AZIDE.
MERCURY FULMINATE	GRAYISH	VERY SENSITIVE TO IMPACT, FRICTION, SPARKS. CORROSIVE TO ALUMINUM, MAGNESIUM, COPPER, BRONZE, COPPER, ZINC, BRASS. HIGHLY TOXIC THROUGH SKIN ABSORPTION, INHALATION, INGESTION. SYMPTOMS RESEMBLE MERCURY POISONING.

¹ MANY DOZENS OF MATERIALS HAVE BEEN USED AS MILITARY EXPLOSIVES OVER THE YEARS. THIS IS ONLY A LISTING OF SOME OF THE MORE COMMONLY USED EXPLOSIVES THAT HAVE BEEN IN SERVICE. IT IS FAR FROM BEING A COMPREHENSIVE LISTING.

CHEMICAL AGENTS USED IN MUNITIONS

<u>SYMBOL</u>	<u>COMMON NAME</u>	<u>VISUAL IDENTIFICATION</u>	<u>ACTION¹</u>
GB	SARIN	COLORLESS LIQUID	NERVE AGENT - NON-PERSISTENT

CHAPTER 12

TOXICITY OF ENERGETIC MATERIALS

12-1. General. This section contains general information about toxicity of military explosives. All tables indicating quantity distance separations, minimum distances, etc., have been re-

moved from this manual. Applicable information may be found in DoD 6055.9-STD, Ammunition and Explosives Safety Standards.

12-2. Toxicity of United States Military Explosives.

effects of toxicity may vary from mild dermatitis or a headache to serious damage to internal organs.

a. Many explosives, because of their chemical structures, are somewhat toxic. To be acceptable, a military explosive must be of minimum toxicity. Careful attention must be paid to this feature because the

b. Table 12-1 is a concise presentation of the toxicological properties of selected United States military explosives.

Table 12-1 Toxicity of United States Military Explosives

Explosive	Health hazard	Protective measures
<i>Initiating explosives</i>		
Lead azide	Lead azide is not considered to be particularly toxic but inhalation of the dust should be avoided since this causes a headache and distention of the blood vessels.	Avoid inhalation. Tolerance level below 0.2 milligrams per cubic meter in air.
Mercury fulminate	Poisoning has symptoms of mercury poisoning. At low levels causes dermatitis and irritation of the mucous membranes.	Avoid all routes of exposure. Tolerance level below 0.01 milligrams per cubic meter in air.
<i>Boostering explosives</i>		
PETN	PETN is not unduly toxic since it is nearly insoluble in water and usually is handled while wet. It, therefore, cannot be absorbed through the skin and inhalation of the dust is improbable. Tests have shown that small doses of PETN cause decrease in blood pressure; larger doses cause dyspnea and convulsions.	
Tetryl	Moderately toxic by inhalation or ingestion. Tetryl has a strong coloring action on the human skin and can cause a dermatitis. Inhalation of tetryl dust has recognized toxic effects.	Avoid inhalation or ingestion. To minimize these effects, use cold cream containing 10 percent sodium perborate. Avoid inhalation. Tolerance level below 1.5 milligrams per cubic meter in air.

CHAPTER 13

DETECTION AND IDENTIFICATION OF ENERGETIC MATERIALS

13-1. Introduction. This chapter discusses the methods used to detect and identify energetic materials. Almost all of the analytical chemistry techniques are used. Normally, identification involves a series of tests, each providing a clue to the identity of the compound. In addition to the techniques discussed in this chapter, identifying information can be obtained from physical properties such as melting point, crystalline structure, density, physical state, color, and indices of refraction.

13-2. Wet Chemical Methods. When a test sample is treated with an appropriate reagent, a coloration is produced which is characteristic of the compound being tested. These reactions are known as color reactions and may help identify the sample. The compound which produces the color change is called the color reagent. Color reactions are used to some degree for preliminary identification and confirmation but have largely been replaced by the more modern instrumental techniques. Table 13-1 lists some of the common color reactions used to identify explosives.

Table 13-1. Color Tests

	Water Solution or Extract of Energetic Material			Solid of Energetic Material		
	Color of solution	Color of universal pH test	Color of precipitate with Nessler's reagent	Color effect of test with solution of-		
				Ethylenediamine	Diphenylamine	Thymol
TNT	(Insoluble)	-	-	Maroon	Colorless	-
Tetryl	(Insoluble)	-	-	Red	Blue	Green

Pentolite	None	-	(No ppt)	Maroon	Dirty green	Green
Black powder ³	None	No change	-	Maroon	Blue	Green

¹Color appears immediately.

²Sometimes explodes mildly (puffs) upon addition of sulfuric acid.

³Tests of dried water extract.

The tests are performed in the following manner.

a. *Test 1.* Place 0.05 gram of the explosive in a 5 milliliter beaker, add 2 to 3 milliliters of distilled water, and stir for 5 minutes.

(1) Observe color of liquid.

(2) Wet one end of a strip of universal pH indicator paper and note any change in color.

(3) Add a drop of Nessler's reagent and note the color of any precipitate formed. Prepare the reagent by dissolving five grams of potassium iodide in a minimum quantity of cold distilled water and adding a saturated aqueous solution of mercuric iodide until a faint precipitate is formed. Add 40 milliliters of 50-percent potassium hydroxide solution. After the solution has clarified by settling, dilute to 100 milliliters with distilled water, allow to settle, and decant.

b. *Test 2.* Place 0.05 gram of the unknown material in an indentation of a white porcelain spot-test plate. Add two or three drops of a 65 to 68 percent aqueous solution of ethylenediamine and stir. Note the color of the solution (not the solid).

c. *Test 3.* Place 0.05 gram of the unknown material in an indentation of a white porcelain spot-test plate and add three or four drops of a diphenylamine solution. Stir the mixture and, after one minute, note the color of the solution. Prepare the diphenylamine solution by dissolving one gram of diphenylamine in 100 milliliters of concentrated CP sulfuric acid.

d. *Test 4.* Place 0.05 gram of the unknown material in an indentation of a white porcelain spot-test plate. Add an equal amount of crystalline thymol and three drops of concentrated sulfuric acid. Stir the mixture and note its color after five minutes or more.

e. *Additional Tests.* If the unknown material is not identified completely by the tests in subparagraphs 13-2 a. through d. and data listed in table 13-1, tests should be performed to determine whether the material is one of those indicated in (1) through (14) below.

(1) RDX. Place several milligrams of the white, unknown material in a test tube and add about 200 milligrams of thymol and six drops (0.3 ml) of concentrated sulfuric acid. Warm the tube for five minutes at 100°C, and add 5 to 10 milliliters of ethanol. RDX produces a rich blue color. Under these conditions sugars and aldehydes give a brown color, and HMX gives a pale blue-green color. RDX can be further distinguished

from HMX by repeating the test at 150°C. Under these conditions RDX still gives a blue color, but HMX produces an olive color.

(2) Composition A-3. Place 0.1 gram of the material in a 10 milliliter beaker and add two or three drops of acetone. Warm the mixture and allow to stand for five minutes. Evaporate the acetone by gently warming on a steambath, cool, and add 2 milliliters of carbon tetrachloride. Cover the beaker and warm the contents, occasionally swirling the mixture. Cool the mixture and allow the undissolved material to settle. Decant the supernatant liquid into a 5 milliliter beaker, evaporate to dryness, and note if a waxy (not tarry) residue is obtained. Dry the undissolved material in the 10 milliliter beaker and test for RDX as described in (1) above.

(3) Composition B. Place 0.2 gram of the pale yellow to medium brown material in a 10 milliliter beaker and add 2 to 3 milliliters of chloroform. Cover the beaker. Warm and digest the mixture for 10 minutes with occasional swirling. Decant the supernatant liquid through a filter paper and evaporate the filtrate to dryness. Repeat digestion of the insoluble residue in the beaker with three more portions of chloroform discarding the decanted liquid in each case. Dry the insoluble residue by evaporating any adherent chloroform. If the original material was composition B, the residue from the chloroform solution consists of TNT and wax. Test the TNT and wax mixture with ethylenediamine and diphenylamine as described above. The insoluble residue obtained by extraction with chloroform consists of RDX. Test as described in (1) above.

(4) Composition C-3. Place 0.2 gram of the putty-like explosive in a 10 milliliter beaker and add 5 milliliters of benzene. Mix and digest for 10 minutes crushing any lumps present. Decant the supernatant liquid through a filter paper and evaporate the benzene with gentle heating. Note whether a dark, tarry residue remains. Wash the insoluble residue left by benzene extraction with two or three, 3 milliliter portions of a 2:1 ether-ethanol mixture and dry the washed residue. Test this as described under RDX in (1) above. To the decanted ether-ethanol washings, add 15 milliliters of distilled water and heat the mixture until all ether and alcohol are removed. If a white precipitate (nitrocellulose) is noted, catch the precipitate on a filter, wash with ethanol, dry by evaporation of the ethanol, and test for nitrocellulose as indicated in table 13-1.

HEADQUARTERS, DEPARTMENT OF THE ARMY

CARTRIDGE, 76-MILLIMETER: SMOKE, WP, M361A1 OR M361

AR199851

AR199850

Type Classification:

OBS MSR 11756003

Use:

This fixed ammunition is used in 76-mm guns for screening and spotting fire. The cartridge also has a slight incendiary effect.

Description:

The projectile body is a thin walled, forged steel casing. The point-detonating (PD) fuze projectile contains a white phosphorous (WP) filler and a combination one-piece aluminum burster casing and adapter. The burster casing houses a projectile-burster and burster initiator loaded with tetrytol. The brass or steel cartridge case assembled to the projectile

contains a single-base propellant and a percussion primer. A distinguishing characteristic of these rounds is the cartridge case-over-band construction. The specially designed rotating band has a crimping groove which permits the cartridge case to be assembled over the rotating band and rigidly crimped to it.

Functioning:

When the weapon is fired, the primer flashes igniting the propellant. Gases created by the burning propellant force the projectile from the gun barrel. On impact the burster initiator, activated by the PD fuze, detonates the burster charge. This ruptures the projectile casing and expels the white phosphorous filler. On contact with the air the white phosphorus ignites, creating a dense white smoke.

Difference Between Models:

Cartridge M361 is similar to Cartridge M361A1 except that the burster is contained in a two-piece steel casing and the adapter is a separate component. Also Model M361A1 includes a tracer assembly in the base of the projectile. See Tabulated Data for cartridge case and fuze differences.

Tabulated Data:

Complete round:

Type ----- Smoke WP
 Weight ----- 25.82 lbs.
 Length ----- 34.06 in.
 Cannon used with ----- M32, M48

Projectile:

Body material ----- Forged steel
 Color
 Old ----- Gray w/yellow
 band and yellow
 marking
 New ----- Light green w/
 yellow band and
 red marking

Filler and weight ----- WP - 1.38 lbs.
 Burster ----- M28 - 1.2 oz.
 tetrytol

Burster initiator ----- M2

Component:

Cartridge case ----- M361A1: M88B1
 M361: M88
 Propelling charge ----- M6, 3.64 lbs.
 Primer ----- M68, M58 percus-
 sion
 Fuze ----- PD: M521
 (M361A1)
 M48A3
 (M361)

Performance:

Maximum range ----- 14,594 meters
 (16,296 yds)
 Muzzle velocity ----- 713 mps (2,400
 fps)

Temperature Limits:

Firing:

Lower limit ----- 40°F
 Upper limit ----- + 125°F

Storage:

Lower limit ----- 80°F (for period
 not more than 3 days)
 Upper limit ----- + 125°F

* Packing ----- 1 round per fiber
 container; 2 con-
 tainers per wooden
 box

* Packing Box:

Weight ----- 86 lbs.
 Dimensions ----- 39-15/16 x 10-
 15/16 x 7-3/32
 in.
 Cube ----- 1.8 cu. ft.

* NOTE: See SC for complete packing data including NSN's.

Shipping and Storage Data:

Quantity - distance
 class ----- 5
 Storage
 compatibility ----- A
 DOT shipping
 class ----- A
 DOT designation ----- AMMUNITION FOR
 CANNON WITH
 SMOKE PROJEC-
 TILES
 DODAC ----- 1315-C128
 Drawing number ----- P85133

Limitations:

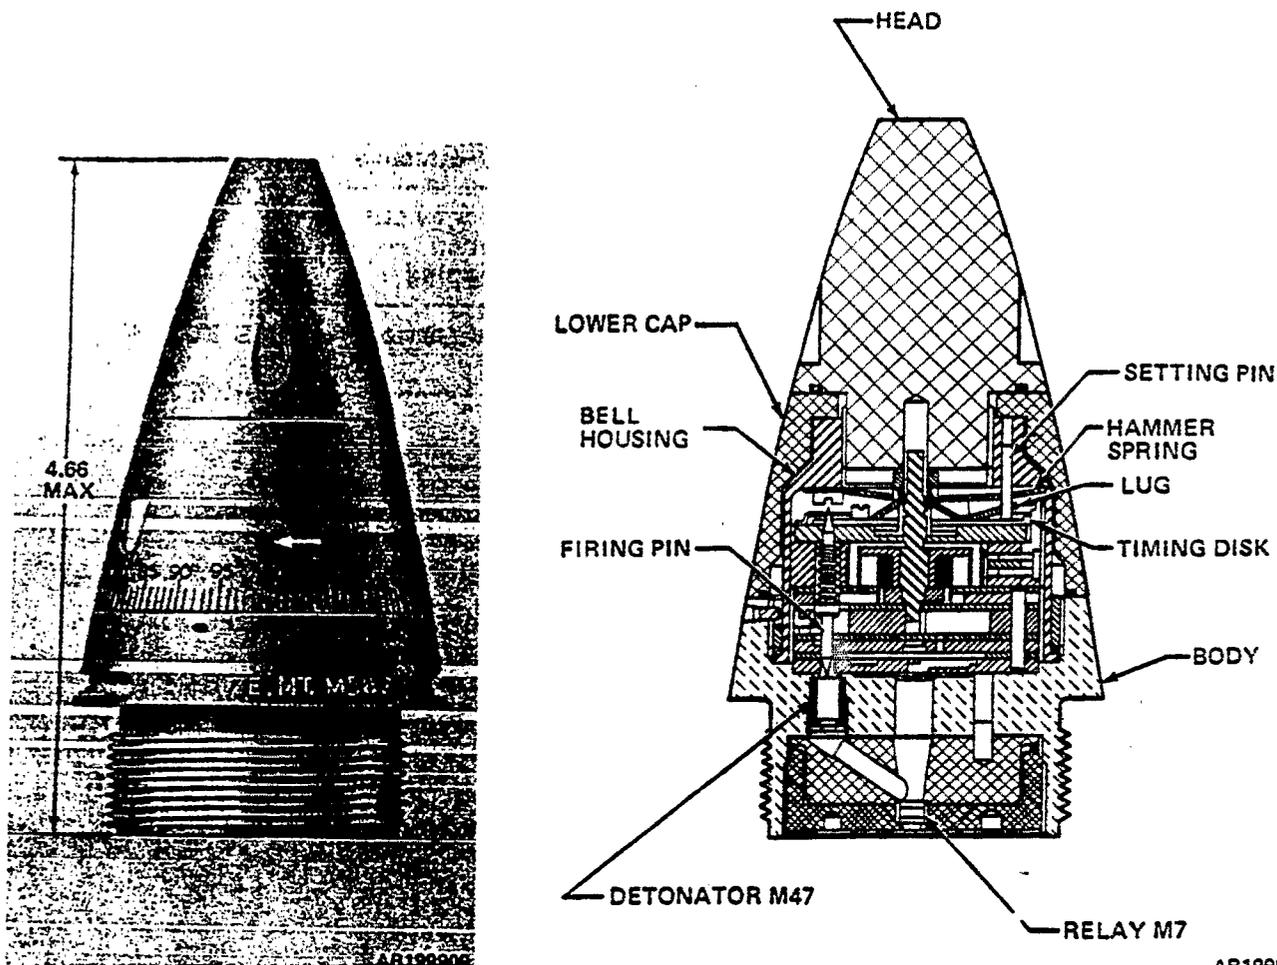

a. Since the burster in this ammunition is loaded with tetrytol, it is not to be stored or fired at temperatures exceeding + 125°F.

b. Store and transport rounds at temperatures below 111.4°F (melting point of WP). If impractical store rounds on bases, so that if WP melts it will resolidify with void space in the nose of the projectile. Erratic performance may occur if voids exist inside of WP filler.

FUZE, MECHANICAL TIME: M562

Type Classification:

Std AMCTC 267 dtd 1962

Use:

Fuze M562 is a mechanical time type used with 4.2-inch mortar illuminating cartridges.

Description:

The aluminum head is threaded into the bell housing under the lower cap. The rotatable lower cap has an exterior scale graduated in seconds from 0 to 100, plus a safety line stamped S. The movement is a spring-driven clockwork and escapement mechanism to provide the fuze functioning time desired.

The steel body of the fuze contains a detonator near the top and a relay in a retainer at the base. A fuze setting line and vernier scale are inscribed on the exterior.

Functioning:

When the lower cap is rotated to set the time, the timing disk of the movement is rotated also by means of a setting pin lodged in an upraised lug on the disk. When the cartridge is fired, setback causes a hammer spring to strike the upraised lug, releasing the disk from the setting pin. Centrifugal force releases the detents (not shown) holding the timing movement. When the timing disk has rotated to the preset time, a notch in the disk engages the firing arm. The firing arm slides

into the notch and turns, permitting the spring-loaded firing pin to strike the detonator and initiate the explosive train.

Tabulated Data:

Type ----- MT
Weight ----- 1.56 lbs.
Length:
 Visible ----- 3.76 in.
 Overall ----- 4.66 in.
Thread size ----- 2-12 UNS-1
Assembly Dwg. No. - 10520791

Temperature Limits:

Firing:
 Lower limit ---- -40 ° F
 Upper limit ---- +125 ° F
Storage:
 Lower limit ---- -80 ° F (for not more
 than 3 days)
 Upper limit ---- +160 ° F (for not more
 than 4hrs/day)

*Packing ----- 8 fuzes in metal container; 2 containers in wirebound box

*Packing Box:

Weight ----- 45.2 lbs.
Dimensions ----- 14-7/8 x 12-13/16 x
 9-1/4 in.
Cube ----- 1.0 cu. ft.

than DA. For moderate concentrations, the effects last about 30 minutes after an individual leaves the contaminated atmosphere. At a higher concentration, the effects may last up to several hours.

(24) *Protection required.* Protective mask.

(25) *Decontaminants.* None required in the field. Alkali solution or DS2 may be used for decontamination in enclosed places.

(26) *Persistency.* Short, because the compound is disseminated as an aerosol.

(27) *Use.* Although vomiting compounds are not authorized for military use, they are discussed in this manual to present a complete coverage of all potential chemicals for use in military operations.

3-10. Tear Producing Compounds

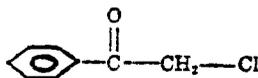

a. *General.* The tear compounds cause flow of tears and irritation of the skin. Since tear compounds produce only transient casualties, they are widely used for training, riot control, and for situations where long-term incapacitation is unacceptable. When used against poorly equipped guerrilla or revolutionary armies, they have proved extremely effective. When released indoors, they can cause serious illness or death. The principal tear compounds are discussed in b through g below.

b. *Chloroacetophenone (CN).*

(1) *Chemical name.* Chloroacetophenone.

(2) *Formula.*

(a) *Structural.*

(b) *Molecular.* $C_8H_7COCH_2Cl$.

(3) *Molecular weight.* 154.59.

(4) *Vapor density (compared to air).* 5.3.

(5) *Liquid density.* 1.187 at 58° C.

(6) *Solid density.* 1.318 at 20° C.

(7) *Melting point.* 54° C. pure, 46 to 48° C. plant purity.

(8) *Boiling point.* 248° C.

(9) *Vapor pressure.* 0.0026 mm Hg at 0° C.; 0.0041 mm Hg at 20° C.; 0.152 mm Hg at 51.7° C.

(10) *Volatility.* 2.36 mg/m³ at 0° C.; 34.3 mg/m³ at 20° C.; 1060 mg/m³ at 51.7° C.

(11) *Flash point.* High enough not to interfere with the military use of the compound.

(12) *Decomposition temperature.* Stable to boiling point.

(13) *Latent heat of vaporization.* 98 calories per gram. Like vomiting compounds, CN must be vaporized or dispersed by some means other than its own volatility.

(14) *Rate of hydrolysis.* Not readily hydrolyzed.

(15) *Hydrolysis products.* Hydrogen chloride and a hydroxyacetophenone.

(16) *Stability in storage.* Stable.

(17) *Action on metals or other materials.* Tarnishes steel slightly.

(18) *Odor.* Fragrant; similar to that of apple blossoms.

(19) *Median lethal dosage (LC₅₀).* 7,000 mg-min/m³, dispersed from solvent; 14,000 mg-min/m³, dispersed from No. 112 thermal grenade.

(20) *Median incapacitating dosage (IC₅₀).* 80 mg-min/m³.

(21) *Rate of detoxification.* Rapid; effects disappear in minutes. High concentrations may cause skin irritation which usually disappears within a few hours.

(22) *Skin and eye toxicity.* Irritating; not toxic in concentrations likely to be encountered in the field.

(23) *Rate of action.* Practically instantaneous.

(24) *Physiological action.* In addition to powerful lacrimatory effects, CN is an irritant to the upper respiratory passages. In higher concentrations, it is irritating to the skin and causes a burning and itching sensation, especially on moist parts of the body. High concentrations can cause blisters. The effects are similar to those of sunburn, are entirely harmless, and disappear in a few hours. Certain individuals experience nausea following exposure to CN.

(25) *Protection required.* Protective mask.

(26) *Decontaminants.* Aeration is sufficient in the field. In enclosed areas, soda ash solution or alcoholic caustic soda will decontaminate CN.

(27) *Persistency.* Short, because the compounds are disseminated as an aerosol.

(28) *Use.* Training and riot control.

c. *CNC.*

(1) *Chemical name.* None; solution of chloroacetophenone in chloroform.

(2) *Formula.*

(a) *Chloroform.* $CHCl_3$ (70 parts by weight).

(b) *CN.* $C_8H_7COCH_2Cl$ (30 parts by weight).

TECHNICAL MANUAL

UNITED STATES NAVY AMMUNITION

HISTORICAL AND FUNCTIONAL DATA

THIS PUBLICATION SUPERSEDES NAVORD OP 4 (VOLUME ONE ONLY)

FIFTH REVISION DATED 15 OCTOBER 1972

DISTRIBUTION STATEMENT E: DISTRIBUTION AUTHORIZED TO DOD COMPONENTS ONLY; CRITICAL TECHNOLOGY; DATE OF PUBLICATION. OTHER REQUESTS MUST BE REFERRED TO THE NAVAL SEA SYSTEMS COMMAND (SEA-0982).

WARNING: THIS DOCUMENT CONTAINS TECHNICAL DATA WHOSE EXPORT IS RESTRICTED BY THE ARMS EXPORT CONTROL ACT (TITLE 22, U.S.C. SEC. 2751 ET. SEQ.) OR EXECUTIVE ORDER 12470. VIOLATIONS OF THESE EXPORT LAWS ARE SUBJECT TO SEVERE CRIMINAL PENALTIES.

DESTRUCTION NOTICE: DESTROY BY ANY METHOD THAT WILL PREVENT DISCLOSURE OF CONTENTS OR RECONSTRUCTION OF THE DOCUMENT.

**PUBLISHED BY DIRECTION OF
COMMANDER, NAVAL SEA SYSTEMS COMMAND**

AMMUNITION
IDENTIFICATION
AND
COLOR CODING

THERE ARE SEVERAL AIDS IN DETERMINING WHETHER AN UNKNOWN ITEM IS A PIECE OF AMMUNITION. IF THE ITEM IN QUESTION IS NOT TOO DETERIORATED, RUSTED, DIRT COVERED, ETC., THESE ARE:

PHYSICAL CHARACTERISTICS SUCH AS SIZE AND SHAPE
CERTAIN AMMUNITION PECULIAR MARKINGS
COLOR CODING

THE PHYSICAL CHARACTERISTICS OF REPRESENTATIVE EXAMPLES OF AMMUNITION WILL BE COVERED IN LATER BLOCKS OF INSTRUCTION.

THIS BLOCK WILL FAMILIARIZE YOU WITH CERTAIN TYPES OF AMMUNITION MARKINGS AND COLOR CODES.

SMALL ARMS
AMMUNITION

SMALL ARMS AMMUNITION (SAA) IS THAT AMMUNITION USED IN PISTOLS, RIFLES, SHOTGUNS AND SOME MACHINE GUNS.

FOR PURPOSES THIS INTRODUCTION, SAA IS THAT AMMUNITION USED WITH WEAPONS HAVING A MUZZLE DIAMETER OF UP TO .50 CALIBER.

GENERAL STATEMENTS:

WITH FEW EXCEPTIONS, THE ONLY EXPLOSIVE MATERIAL THAT MAY BE EXPECTED TO BE FOUND IN SAA IS THE PRIMER AND GUN POWDER.

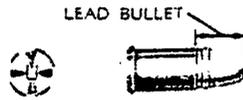

THE MOST SENSITIVE COMPONENT OF SAA IS THE PRIMER.

THERE ARE FEW, IF ANY, IDENTIFICATION MARKINGS ON SAA.

THE REASON FOR COLOR CODING SOME ROUNDS IS TO IDENTIFY THEIR USE RATHER THAN TO IDENTIFY THEIR CONTENTS

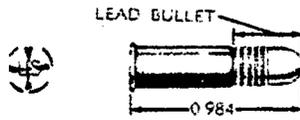

SAA COLOR CODING

ARTILLERY
AMMUNITION

ARTILLERY TYPE AMMUNITION USUALLY CONSISTS OF FOUR COMPONENTS: PRIMER, PROPELLING CHARGE, FUZE AND PROJECTILE. THESE HAVE BEEN MANUFACTURED, ISSUED AND STORED EITHER SEPARATELY, AS COMPONENTS, OR ASSEMBLED AS COMPLETE ROUNDS. GENERALLY, THE PRIMERS, FUZES AND PROPELLING CHARGES CONTAIN EXPLOSIVES. MOST PROJECTILES ALSO CONTAIN EXPLOSIVES; HOWEVER, THERE ARE SOME TYPES OF PROJECTILES THAT DO NOT CONTAIN ANY EXPLOSIVES. EXAMPLES OF THESE ARE PRACTICE PROJECTILES AND SOME TYPES OF ARMOR PIERCING PROJECTILES.

THE COLOR CODING INFORMATION GIVEN EARLIER APPLIES TO ARTILLERY TYPE AMMUNITION.

THE BEGINNING OF MODERN ARTILLERY DID NOT COME ABOUT UNTIL AFTER THE CIVIL WAR. MANY OF THE PRINCIPLES LAID DOWN IN THE LATE 19TH CENTURY REGARDING THEIR DESIGN, FUNCTION AND SAFETY ARE STILL IN USE.

GENERAL STATEMENTS:

FUZES HAVE ONE OR MORE SAFETY FEATURES BUILT INTO THEM.

PROPELLING CHARGES GENERALLY DETERIORATE IN CONTACT WITH MOISTURE.

HIGH EXPLOSIVES DO NOT ALWAYS DETERIORATE IN THE PRESENCE OF MOISTURE.

GENERAL TYPES OF ARTILLERY TYPE AMMUNITION

FIXED - THE PROJECTILE IS PERMANENTLY ATTACHED TO THE CARTRIDGE CASE AT THE TIME OF MANUFACTURE. THERE IS NO PROVISION TO ADJUST THE PROPELLING CHARGE.

SEMI-FIXED - THE PROJECTILE FITS SNUGLY INTO THE CARTRIDGE CASE, BUT IS NOT PERMANENTLY ATTACHED. THIS PERMITS ADJUSTMENT OF THE PROPELLING CHARGE.

SEPARATE LOADING - PROJECTILE, PROPELLING CHARGE AND PRIMER ARE SEPARATE COMPONENTS THAT MUST BE LOADED INTO THE CANNON INDIVIDUALLY.

SEPARATED - PROPELLING CHARGE AND PRIMER ARE PERMANENTLY FIXED INSIDE THE CARTRIDGE CASE. PROJECTILE AND CARTRIDGE CASE ARE LOADED IN TO THE CANNON INDIVIDUALLY.

COMMON TERMS ASSOCIATED WITH ARTILLERY TYPE AMMUNITION

AP - ARMOR PIERCING. THIS TYPE OF PROJECTILE MAY OR MAY NOT CONTAIN ANY EXPLOSIVES.

APC - ARMOR PIERCING CAPPED. THE HARD STEEL OF THE PROJECTILE HAS SOFT STEEL CAP. THIS TYPE OF PROJECTILE MAY OR MAY NOT CONTAIN ANY EXPLOSIVE.

APERS - ANTI-PERSONNEL. WHEN USED IN CONJUNCTION WITH ARTILLERY, THIS INDICATES THAT THE PROJECTILE CONTAINS FLESHETTES (NAILS) AND AN EXPLOSIVE CHARGE TO DISPERSE THEM.

APDS - ARMOR PIERCING DISCARDING SABOT. THIS TYPE OF PROJECTILE USUALLY CONTAINS LITTLE OR NO EXPLOSIVE.

BE - BASE EJECTING. THIS TYPE OF PROJECTILE CARRIES CARGO THAT IS EJECTED IN FLIGHT OUT THROUGH THE BASE.

CANISTER - THIS TYPE OF PROJECTILE CONTAINS FLESHETTES OR STEEL CUBES BUT DOES NOT CONTAIN ANY EXPLOSIVE.

DP - DUAL PURPOSE. THIS TYPE OF PROJECTILE CONTAINS A SHAPED CHARGE FOR USE AGAINST ARMOR. ALSO, THE PROJECTILE BODY IS DESIGNED TO FRAGMENT TO CAUSE INJURY TO PERSONNEL IN THE VICINITY.

DUMMY - THIS TYPE OF PROJECTILE IS USED FOR PRACTICE IN LOADING THE CANNON AND DOES NOT CONTAIN ANY EXPLOSIVE.

FUZE - A COMPONENT ADDED TO THE PROJECTILE THAT CAUSES THE PROJECTILE TO FUNCTION AT THE PROPER INSTANT.

HE - HIGH EXPLOSIVE. THIS INDICATES THAT THE PROJECTILE CONTAINS HIGH EXPLOSIVE. OTHER TYPES OF PROJECTILES MAY CONTAIN HIGH EXPLOSIVES ALSO.

HEAT - HIGH EXPLOSIVE ANTI-TANK. THIS TYPE OF PROJECTILE CONTAINS A SHAPED CHARGE.

HERA - HIGH EXPLOSIVE ROCKET ASSIST. THIS TYPE OF PROJECTILE CONTAINS A HIGH EXPLOSIVE BURSTING CHARGE AND A SMALL ROCKET MOTOR TO EXTEND ITS RANGE.

HVAP - HYPER-VELOCITY ARMOR PIERCING - THIS TYPE OF PROJECTILE CONTAINS LITTLE OR NO EXPLOSIVE.

HVTP - HYPER-VELOCITY TARGET PRACTICE. THIS TYPE OF PROJECTILE CONTAINS LITTLE OR NO EXPLOSIVE.

ILLUM - ILLUMINATING. THIS TYPE OF PROJECTILE CONTAINS SOME TYPE OF ILLUMINATING DEVICE, USUALLY A PARACHUTE SUSPENDED FLARE.

MP - MULTI-PURPOSE. SAME MEANING AS DUAL PURPOSE.

PRACTICE - THIS TYPE OF PROJECTILE IS USED FOR TARGET PRACTICE. IT MAY OR MAY NOT CONTAIN EXPLOSIVES.

RAP - ROCKET ASSISTED PROJECTILE. SEE HERA.

SABOT - A DEVICE ATTACHED TO A PROJECTILE TO ASSURE THAT IT RIDES DOWN THE BARREL OF THE CANNON PROPERLY. THE SABOT DOES NOT CONTAIN ANY EXPLOSIVE.

SHELL - PROJECTILE.

TP - TARGET PRACTICE. THIS TYPE OF PROJECTILE MAY OR MAY NOT CONTAIN ANY EXPLOSIVE.

TRACER - A SMALL PYROTECHNIC COMPOSITION INSTALLED IN THE BASE OF THE PROJECTILE THAT IGNITES UPON FIRING AND IS VISIBLE TO THE GUNNER. WHEN A TRACER IS INSTALLED IN A PROJECTILE, THE MARKINGS WILL HAVE "-T".

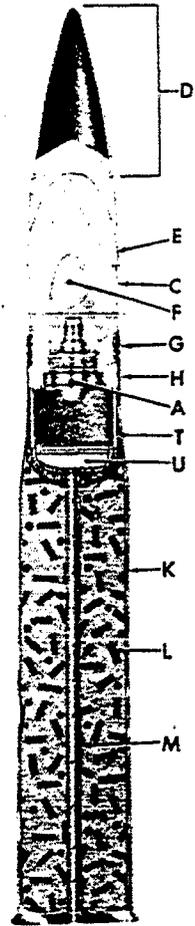

WP - WHITE PHOSPHOROUS. THIS TYPE OF PROJECTILE CONTAINS WHITE PHOSPHOROUS AS ITS MAIN FILLER. IT ALSO MAY CONTAIN EXPLOSIVES.

TERMS ASSOCIATED WITH CIVIL WAR ERA AMMUNITION

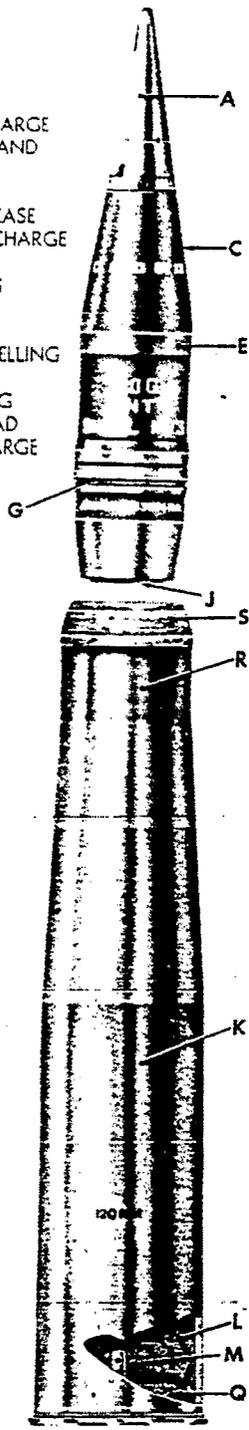

1. A SOLID ROUND BALL, COMMONLY KNOWN AS A "CANNONBALL", IS CALLED A "SOLID SHOT" OR JUST "SHOT". ALTHOUGH THEY CONTAINED NO EXPLOSIVE, THEY WERE EFFECTIVE AGAINST PERSONNEL AND MATERIAL. SINCE THE SHOT WAS PRONE TO RICOCHET, SOMEWHAT LIKE A FLAT ROCK DOES WHEN SKIMMED OVER WATER, THIS EFFECT WAS PERFECTED BY GUNNERS AGAINST BOTH GROUND TROOPS AND WARSHIPS.

2. HOLLOW SHOT. THIS WAS IDENTICAL TO SOLID SHOT EXCEPT THAT THE BALL WAS HOLLOW. THIS GAVE IT LIGHTER WEIGHT AND CONSEQUENTLY HIGHER VELOCITIES AND LONGER RANGES.
3. CASE SHOT. ALSO CALLED "SPHERICAL CASE", "BULLET SHELL", "SHRAPNEL SHELL", AND "SHRAPNEL". THIS TYPE OF PROJECTILE WAS A TIME FUZED, THIN WALLED PROJECTILE FILLED WITH RELATIVELY SMALL ROUND BULLETS, GENERALLY SET IN A MATRIX OF SULFUR, ASPHALT, ROSIN, OR SIMILAR COMPOSITION WITH A SMALL BURSTING CHARGE, SUFFICIENT ONLY TO BREAK OPEN THE CASING. BEING PRIMARILY A CARRIER OF THE BALLS, THIS TYPE OF PROJECTILE DID NOT DEPEND ON THE FRAGMENTATION OF THE OUTER CASING FOR EFFECT. WHEN THE PROJECTILE BROKE APART JUST IN FRONT OF OR OVER THE ENEMY, THE BALLS CONTINUED TO TRAVEL AT THE VELOCITY OF THE BALL. HOWEVER, BEING UNCONFINED, THEY WOULD SPREAD OUT.
4. COMMON SHELL. THIS WAS A HOLLOW CASING DESIGNED TO BREAK INTO MANY FRAGMENTS FROM A BURSTING CHARGE. THIS TYPE OF PROJECTILE EMPLOYED BLACK POWDER AS A BURSTING FUZE AND HAD AN IMPACT TYPE FUZE.
5. BLIND SHELL. THIS WAS SIMILAR TO THE COMMON SHELL EXCEPT THAT IT HAD THICKER WALLS AND NO EXTERIOR FUZE. THIS WAS USED AGAINST FORTIFICATIONS AND SHIPS. IT WAS INTENDED THAT THE PROJECTILE WOULD HIT ITS TARGET AND THE HEAT GENERATED BY FRICTION AS IT PASSED THROUGH IT WOULD BE SUFFICIENT TO SET OFF THE BLACK POWDER BURSTING CHARGE.
6. CANISTER. THIS USUALLY CONSISTED OF SPHERICAL BALLS CONTAINED IN A THIN CONTAINER. THE BALLS WERE PACKED IN THE CONTAINER, USUALLY A TINNED SHEET IRON CYLINDER OF LIGHT WEIGHT, IN SAWDUST. THE FRONT OF THE CANISTER WAS CLOSED BY A WOODEN OR LIGHT WEIGHT DISC WITH THE CYLINDRICAL END OF THE CANISTER CRIMPED OVER IT. THE REAR OF THE CANISTER CONTAINED A HEAVY IRON DISC SLIGHTLY LESS IN DIAMETER THAN THE BORE. WHEN FIRED, THE CANISTER WOULD BREAK OPEN BY THE ACTION OF AIR AND DISPERSE THE BALLS IN FRONT OF THE CANNON. THIS HAD THE EFFECT OF BEING A CANNON SIZED SHOTGUN.
7. GRAPE SHOT. THIS WAS SIMILAR TO CANISTER, EXCEPT THAT IT WAS USED IN LARGER CANNONS AND HAD NO METAL CYLINDER.
8. BOLT. THIS WAS A SOLID PROJECTILE, BUT FIRED FROM A RIFLED CANNON RATHER THAN A SMOOTHBORE. THEREFORE IT HAD A LONG, CYLINDRICAL BODY.

ROCKET AMMUNITION
AND
COMPONENTS

ROCKETS HAVE SEEN MILITARY USE FOR CENTURIES. THE U.S. HAS EMPLOYED ROCKETS FROM AS SMALL AS ABOUT AN INCH IN DIAMETER TO SEVERAL FEET IN DIAMETER.

GENERAL STATEMENTS:

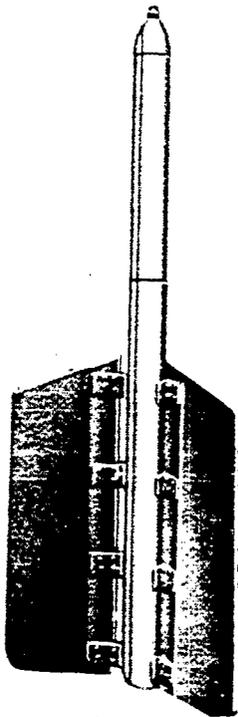

ROCKETS HAVE THREE MAIN COMPONENTS: A HEAD (OR IN MORE MODERN TERMS, A WARHEAD), A FUZE, AND A ROCKET MOTOR.

ROCKET MOTORS MAY BE IGNITED EITHER BY FLAME (OFTEN FROM A PRIMER) OR ELECTRICITY.

UNFIRED ROCKET MOTORS, ESPECIALLY WHEN ASSEMBLED TO HEADS, IF INADVERTANTLY IGNITED WILL TRY TO FLY.

ROCKETS MAY BE IDENTIFIED BY THE PRESENCE OF ONE OR MORE ROCKET MOTOR NOZZLES.

ROCKETS HAVE BEEN DEVELOPED TO CARRY ALL TYPES OF HEADS, FROM INERT, HIGH EXPLOSIVE, SMOKE, TOXIC CHEMICAL TO NUCLEAR.

HAND. RIFLE
AND 40 MM
GRENADES

ALTHOUGH PRIMITIVE TYPES OF GRENADES ARE REPORTED TO HAVE BEEN USED AS FAR BACK AS THE CIVIL WAR, THE MODERN MECHANICAL-TYPE FUZED GRENADES WERE FIRST USED ON 1904. THE U.S. PRODUCED ITS FIRST MODERN GRENADES FOR USE IN WORLD WAR I. WORLD WAR II SAW AN INCREASE IN BOTH THE NUMBERS AND TYPES OF GRENADES. AROUND THAT TIME RIFLE GRENADES ALSO CAME ON THE SCENE. WITH THE EXCEPTION OF A FEW FRAGMENTATION TYPE GRENADES, MOST OF THE HAND THROWN AND RIFLE PROJECTED GRENADES HAVE CHANGED RELATIVELY LITTLE SINCE THAT TIME. PROBABLY THE MOST SIGNIFICANT IMPROVEMENT HAS BEEN THE INTRODUCTION OF 40 MM GRENADE CARTRIDGES IN THE 1950'S AND LATER.

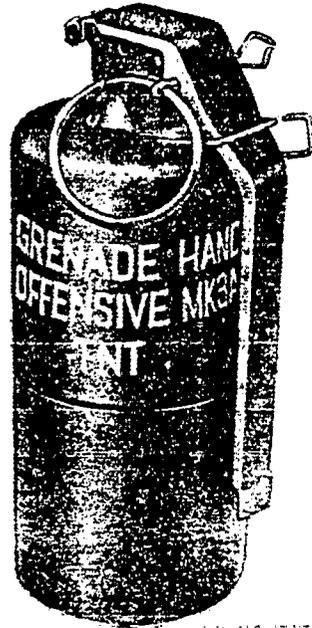

GENERAL STATEMENTS:

THE MAIN SAFETY FEATURE OF HAND THROWN GRENADES IS THE SAFETY PIN IN THE FUZE.

GRENADE MUNITIONS HAVE BOTH PRACTICE ROUNDS CONTAINING A PYROTECHNIC CHARGE AND TRAINING ROUNDS WITH NO EXPLOSIVES THAT APPEAR IDENTICAL TO SERVICE AMMUNITION.

LAND MINES

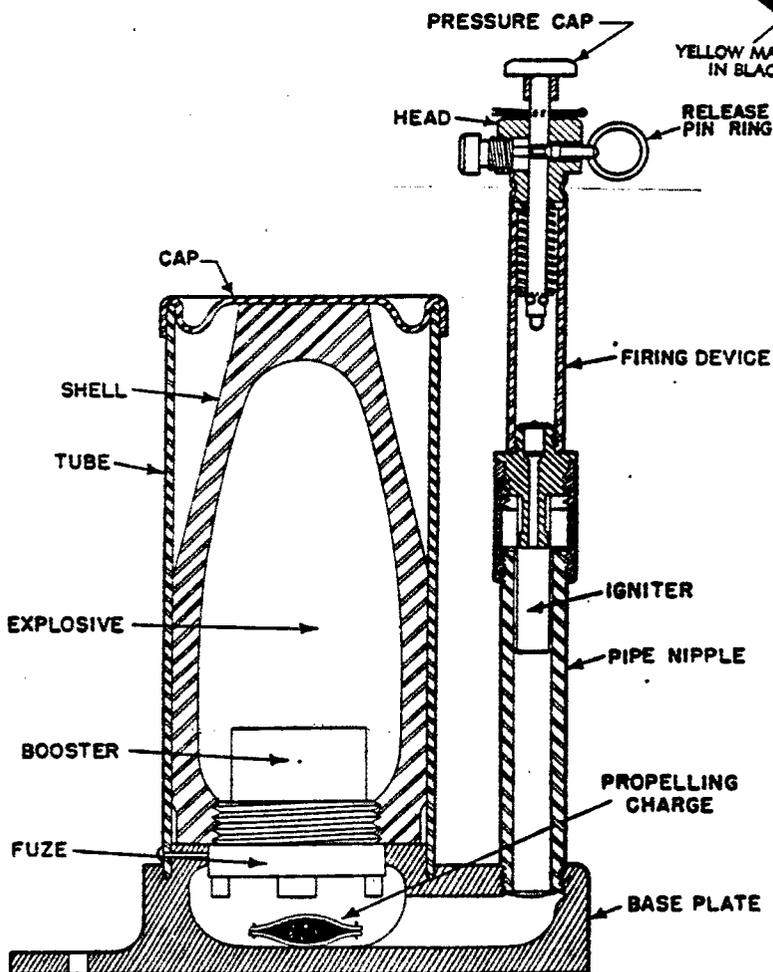

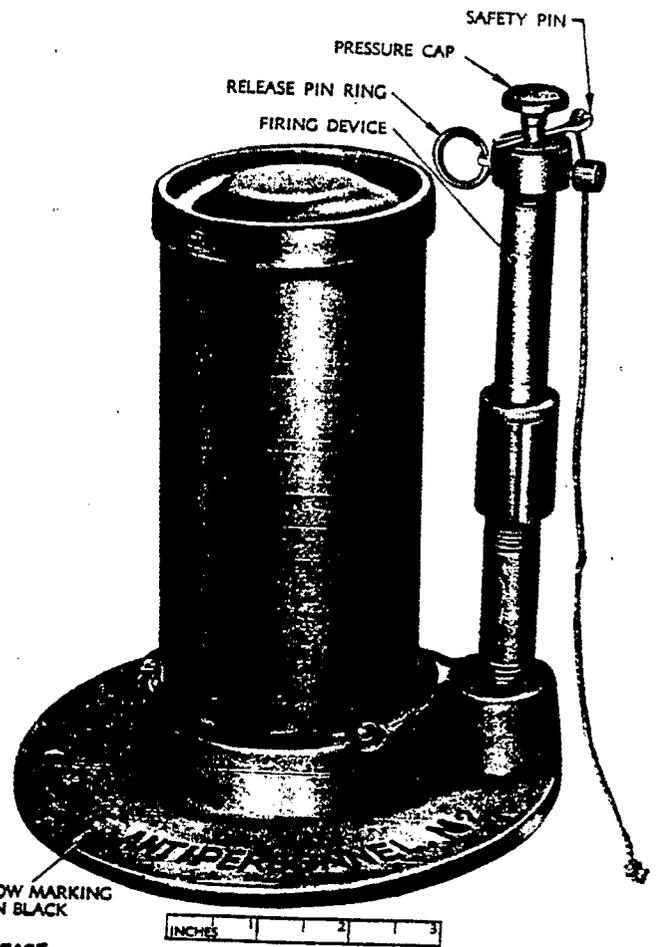

LAND MINES GENERALLY FALL INTO TWO CATEGORIES: ANTITANK (AT) AND ANTIPERSONNEL (AP). THE MINES WE WILL LOOK AT WERE EMPLOYED BY BURYING IN THE GROUND. ALTHOUGH THEY WERE INTENDED TO BE ACTIVATED BY A VEHICLE DRIVING OVER THEM OR SOMEONE STEPPING ON THEM, THERE WERE NUMEROUS SMALL DEVICES MADE THAT WOULD ALLOW MINES TO BE CONVERTED INTO BOOBY TRAPS AS WELL.

GENERAL STATEMENTS:

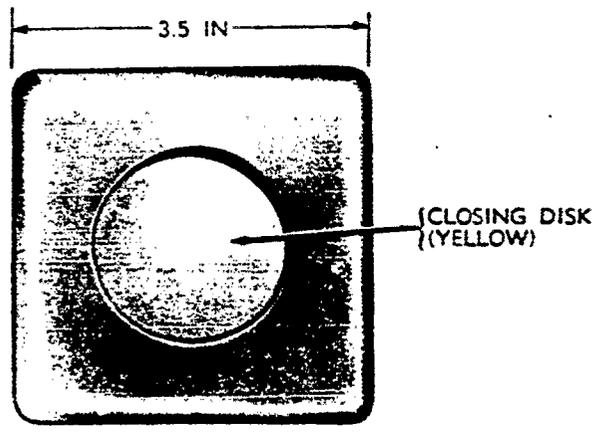

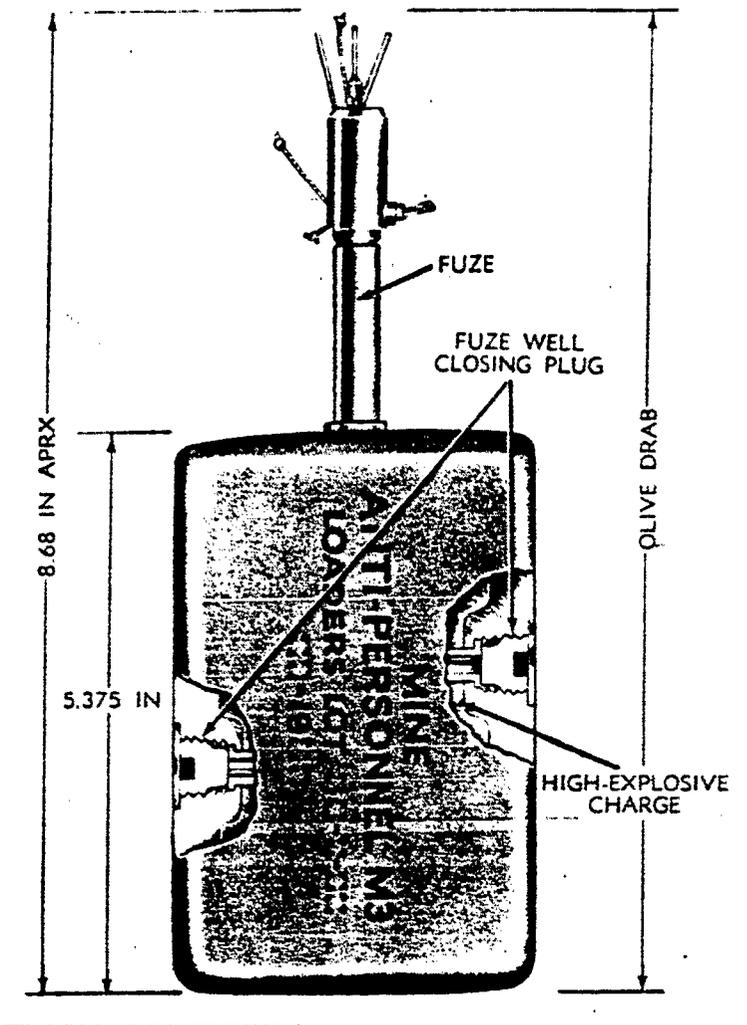

THE BUILT-IN SAFETY FEATURE ON MOST MINES WAS THAT SOME COMPONENT OF THEIR EXPLOSIVE TRAIN, TYPICALLY THE FUZE OR BOOSTER, WAS NOT INSTALLED UNTIL THEY WERE READY TO BE USED.

A SECOND SAFETY FEATURE THAT WAS FREQUENTLY EMPLOYED WAS THAT THE FUZE ALSO HAD SOME TYPE OF ADDITIONAL SAFETY DEVICE THAT MUST BE REMOVED OR MANIPULATED BEFORE THE MINE WAS ARMED.

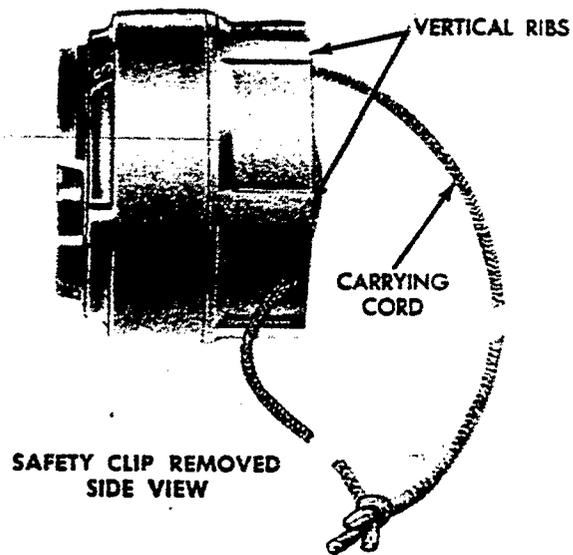

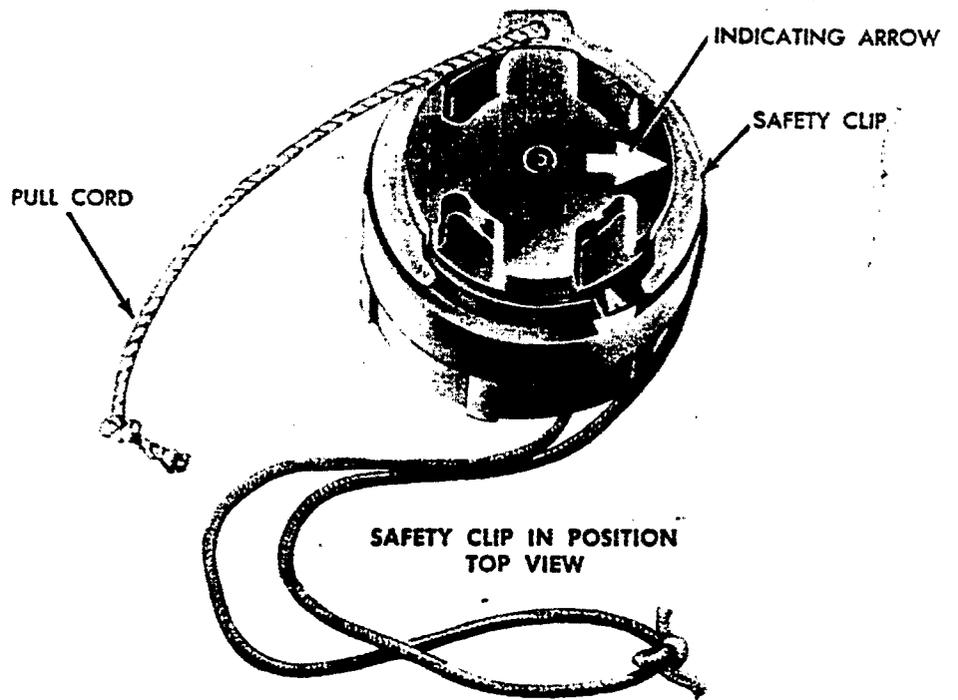

MOST U.S. LAND MINES WERE RELATIVELY SMALL, WEIGHING ONLY A FEW POUNDS, SO THAT THEY COULD BE CARRIED AND EMPLOYED BY ONE MAN.
