SUBJECT: Groundwater elevations, PCB's, Upgradient wells

-----

I spoke with Sharon Moore this morning. During the conversation several issues were covered.

1. Regarding the June 1990 IT report ("Background contamination Indicator Parameter Summary..."), there appears to be something odd about the groundwater elevation data on Figures 2-6 elevations.
2. Note that for MW-4 the elevation rises over four feet in 40 days between Figures 2 and 3. Note that S-2 appears downgradient of lagoon in figure 6. There may be some contamination in well MW-1. I was concerned about this possibility (letter to EPA, Swanton, January 1989) since the location for MW-4 is downgradient of a waste water ditch.
3. Sharon said she had petitioned TAC to include PCB's in all annual and semi-annual analyses.
