**Re: Revised Analytical Plan for Groundwater Assessment Monitoring  
Holloman Air Force Base, NM**

Dear Ellen:

Enclosed are two copies of the Analytical Plan, revised to include comments received from you verbally during the past week. We have added the following analytical parameters: halogenated volatile organics (EPA Method 8010), total cyanide, and total sulfide. In addition, dissolved organic carbon (DOC) will be measured at four monitor wells. Nonhalogenated volatile organics (EPA Method 8015) are not included per your request today. The methods established in this plan are intended to duplicate analytical requirements of EPA's oversight contractor (PRC, Albuquerque).

This groundwater sampling and analysis will be conducted in a manner which addresses all applicable comments on the Groundwater Assessment Monitoring Plan. Sharon Moore received EPA's written comments on that plan on 27 August. Therefore, a revised Assessment Monitoring Plan, addressing all EPA comments, will be submitted by 17 September 1991.

Ellen, please review the enclosed plan and issue an approval letter to Sharon Moore at your earliest convenience. Feel free to call me if you have any further questions.

Sincerely,

*Wallace Hise*
