Subject: Submittal of the 2013 Excavation of the Los Alamos Canyon Low-Head Weir

Dear Mr. Kieling:

Enclosed please find two hard copies with electronic files of the 2013 Excavation of the Los Alamos Canyon Low-Head Weir. The report addresses the analytical results and evaluation that support disposition of the sediment that was excavated from the basins behind the weir.

If you have any questions, please contact Steve Veenis at (505) 667-0013 (veenis@lanl.gov) or Cheryl Rodriguez at (505) 665-5330 (cheryl.rodriguez@nnsa.doe.gov).

Sincerely,

Jeff Mousseau, Associate Director
Environmental Programs
Los Alamos National Laboratory

Sincerely,

Peter Maggioro, Assistant Manager
Environmental Projects Office
Los Alamos Field Office

JM/PM/CD/SV:sm

Enclosures: Two hard copies with electronic files – 2013 Excavation of the Los Alamos Canyon Low-Head Weir (LA-UR-13-28493)

2013 Excavation of the Los Alamos Canyon Low-Head Weir

Prepared by the Environmental Programs Directorate

Los Alamos National Laboratory, operated by Los Alamos National Security, LLC, for the U.S. Department of Energy under Contract No. DE-AC52-06NA25396, has prepared this document. The public may copy and use this document without charge, provided that this notice and any statement of authorship are reproduced on all copies.

2013 EXCAVATION OF THE LOS ALAMOS CANYON LOW-HEAD WEIR

Excavation of the basins behind the Los Alamos Canyon low-head weir began on April 1, 2013, and was completed on May 6, 2013. The basins were excavated to maximize the sediment-retention capacity for the 2013 summer monsoon season. Much of the total available capacity had been lost as a result of sediment accumulation that followed the Las Conchas fire. An estimated 6000 yd³ (including postexcavation expansion) of sediment was removed from the three basins, transported approximately 0.5 mi up Los Alamos Canyon, and stockpiled at a former borrow pit (Figures 1 and 2). The borrow pit provides an ideal location for the disposition of the excavated sediment because of its available capacity and its isolation from potential storm water runoff. A layer of sediment approximately 6 in. thick was retained in the bottom of each basin to mitigate against potential infiltration into underlying bedrock (Figures 2 through 5).

Before excavation, samples were collected to characterize the material planned for excavation. Depth-integrated samples were collected for analysis to represent the mixed condition of excavated sediment. Sampling included collecting a significant component of finer-grained deposits that likely provide an upper bound of constituent concentrations. The data are provided on a CD and attached to this document.

A screening comparison was conducted to support decisions regarding disposition of the excavated sediment. The approach used for the analysis is consistent with the approach taken to evaluate the same type of sediment deposits behind the low-head weir structure in 2009 (LANL 2009, 105294).

The data were first compared with sediment background values (BVs) (LANL 1998, 059730) or detection limits (for organic chemicals), and those values that exceeded BVs and detected organic chemicals (chemicals of potential concern [COPCs]) were compared with the residential soil screening levels (SSLs)/screening action levels (SALs) (LANL 2012, 228852; NMED 2012, 219971) and minimum ecological screening levels (ESLs) (LANL 2012, 226667) (Table 1).

The following is a summary of the assessment:

- 51 analytes were detected.
 - ❖ For the 13 detected dioxin and furan congeners, the 2,3,7,8-tetrachlorodibenzodioxin–(TCDD-) equivalent concentration for mammals was calculated from the toxic equivalency factors referenced in NMED guidance (2012, 219971).
- 22 detected analytes were identified as COPCs.
- Maximum COPC concentrations were not greater than residential SSLs/SALs and therefore no potential unacceptable human health risks are present for the materials behind the low-head weir.
- Maximum concentrations of barium, copper, cyanide, lead, manganese, nickel, zinc, and TCDD were greater than the respective minimum ESLs.

COPCs with concentrations greater than the minimum ESLs were further evaluated to determine if they have the potential for causing ecological risk (chemicals of potential ecological concern [COPECs]). The approach taken in this assessment was to compare measured concentrations for a given COPEC with the lowest effect level ESLs (L-ESLs).

Table 2 lists the maximum concentrations of barium, copper, cyanide, lead, manganese, nickel, zinc, and TCDD. For comparison, the sediment and soil BVs as well as the minimum ESLs and L-ESLs are provided. In addition, the maximum concentrations measured in 2009 from the weir are presented as well as the maximum concentrations measured in postfire ash (samples collected after the Cerro Grande fire) (LANL 2004, 087390) because of the high ash content in the weir sediment.

The hazard quotient (HQ) is calculated by dividing the maximum concentration of each COPEC measured in 2013 by the minimum ESL or L-ESL. The HQs for the minimum ESLs are all greater than 1; the HQs for the minimum L-ESLs are less than 1 for copper, nickel, zinc, and TCDD; and the HQs for the minimum L-ESLs are slightly above 1 for barium, cyanide, lead, and manganese. The latter COPECs are discussed below.

- **Barium:** All detected concentrations are above the sediment BV but below the soil BV. The minimum ESL is below the sediment and soil BVs, and the L-ESL is below the soil BV. The maximum HQ based on the L-ESL is 1.1, and the mean HQ is 0.9. Higher concentrations were measured in postfire ash after the Cerro Grande fire (LANL 2004, 087390), indicating the ash is a source of barium in the weir. Therefore, there are no potential ecological risks from barium.
- **Cyanide:** Five of six detected concentrations are above the sediment BV, and all are above the soil BV. The minimum ESL is below the sediment and soil BVs, and the L-ESL is 0.18 mg/kg above the sediment BV. The maximum HQ based on the L-ESL is 1.4, and the mean HQ is 1.1; both are equivalent to 1. Therefore, there are no potential ecological risks from cyanide.
- **Lead:** All detected concentrations are above the sediment and soil BVs, but five of six concentrations are below the maximum soil background concentration. The minimum ESL is below the sediment and soil BVs, and the L-ESL is 8.3 mg/kg above the sediment BV and 5.7 mg/kg above the soil BV but the same as the maximum soil background concentration. The maximum HQ based on the L-ESL is 1.3, and the mean HQ is 1. Higher concentrations were measured in postfire ash after the Cerro Grande fire (LANL 2004, 087390), indicating the ash is a source of lead in the weir. Therefore, there are no potential ecological risks from lead.
- **Manganese:** All detected concentrations are above the sediment and soil BVs, but three of six concentrations are below the maximum soil background concentration. The minimum ESL is below the sediment and soil BVs, and the L-ESL is above the sediment and soil BVs but the same as the maximum soil background concentration. The maximum HQ based on the L-ESL is 1.2, and the mean HQ is 1. Higher concentrations were measured in postfire ash after the Cerro Grande fire (LANL 2004, 087390), indicating the ash is a source of manganese in the weir. Therefore, there are no potential ecological risks from manganese.

REFERENCES

The following list includes all documents cited in this report. Parenthetical information following each reference provides the author(s), publication date, and ER ID. This information is also included in text citations. ER IDs are assigned by the Environmental Programs Directorate's Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable, in the master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau and the Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.
