Water and dirt sample analysis

There has been some delay in the collection of the dirt and water samples from the drain exits of the sanitary and acid sewer lines. In order to have a clean and uncontaminated laboratory in which to carry on the operations it has been necessary to completely decontaminate and repaint room D-320. The painters have been delayed for several days in finishing their part of the job.

On, or before, July 1st, both water samples and dirt specimens from the ground immediately around the drain exit and water and dirt samples from Los Alamos and Pueblo Canyons will be collected and work begun on the determination of radioactive contaminants.
