Subject: LA-3 sediment sampling

To interested parties:

We are scheduled to collect our first round of sediment samples from reach LA-3 on Monday, July 7, possibly extending into Tuesday, July 8. We are being ambitious and attempting to address most of the expected uncertainties in this first sampling round, with luck allowing us to wrap up the reach in a smaller 2nd round. The plan is to collect ~40 samples total, mostly from a series of depth profiles: 3 profiles in "c3" (the unit with the highest field gamma readings), 2 profiles in "c2" (younger unit with lower gamma), and 2 in "f1" (post-lab overbank deposits presumably overlying pre-lab channel deposits). Each depth profile will have Cs (+Am) analyses on each sample, and one profile from c2 and one from c3 (the highest gamma profile) will also have Pu and Sr analyses on each sample. We are also planning ~6 "full-suite" analyses, one each from the highest gamma layer in the 5 c2 and c3 profiles, and one from the active channel sands.

Please feel free to contact me for any reason.

Steve
