RE: Paragon Workorder: 00-08-259

> Client Project Name: HRMB 2000 EPA Grant Client Project Number: 7.10.00-157 (SW)

Dear Mr. Dale:

Eight water samples were received from NMED DOE Oversite Bureau on May 4, 2000. The samples were scheduled for Manganese (pages 1-8) analysis. The results for this analysis are contained in the following reports.

Thank you for your confidence in Paragon Analytics, Inc. Should you have any questions, please call.

Sincerely,

Paragon Analytics, Inc.

Lance Steere

Senior Project Manager

LRS/mc

## MANGANESE CASE NARRATIVE

### **NMED DOE Oversight Bureau**

HRMB 200 EPA Grant -- 7.10.00-157 (SW)

### **Order Number - 0008259**

- 1. This report consists of 4 water samples for both total recoverable and dissolved manganese.
- 2. The samples were received cool and intact on 05/04/00 and 05/30/00 at a temperature of 17° Celsius.
- 3. The total recoverable samples had been preserved for the requested analyses. The dissolved samples had been filtered and preserved prior to receipt.
- 4. The samples were prepared for analysis based on SW-846, 3<sup>rd</sup> Edition procedures. For analysis by Trace ICP, the samples were digested following method 3005A and PAI SOP 806 Rev. 5.
- 5. The samples were analyzed following SW-846, 3<sup>rd</sup> Edition procedures.

  Analysis by Trace ICP followed method 6010B and PAI SOP 807 Rev. 4.

The relationship between intensity and concentration for each element is established using at least four standards, one of which is a blank solution. The equation which relates intensity to concentration is:

$$I = A_0 + (A_1 * c^n) + (A_2 * c^{2n})$$

where: I = intensity

c = concentration

 $A_0$  = offset coefficient

 $A_1$  = gain coefficient

 $A_2$  = curvature coefficient

n = exponent coefficient

During sample analysis concentrations are computed by the software and the results are printed in mg/L. The instrument software does not provide a printout which gives both intensity and concentration. The validity of the calibration equation is tested by analyzing the following solutions: a blank, a low level check solution with concentrations near the reporting limit, an Initial

Calibration Verification (ICV) standard from a 2<sup>nd</sup> source standard solution with concentrations near the middle of the analytical range, a Continuing Calibration Verification (CCV) standard with concentrations at two times those in the ICV, and a readback of the highest calibration standard.

These solutions provide verification that the calibration equations are functioning properly throughout the analytical range of the instrument. During sample analysis dilutions are made for analytes found at concentrations above the highest calibration standard. No results are taken from extrapolations beyond the highest standard.

- 6. All standards and solutions are NIST traceable and were used within their recommended shelf life.
- 7. The samples were prepared and analyzed within the established hold times.

All in house quality control procedures were followed, as described below.

- 8. General quality control procedures.
  - A preparation (method) blank and laboratory control sample were digested and analyzed with the samples in each digestion batch. There were not more than 20 samples in each digestion batch.
  - The preparation (method) blank results associated with each batch were below the reporting limits for the requested analyte. This indicates that no contaminants were introduced to the samples during the digestion procedure.
  - The laboratory control sample associated with each batch was within the acceptance limits with the exception of the LCS for samples -1 to -4. An unknown contamination of about 0.25 ppm occurred with this batch. The samples were either below the reporting limit or had a value much lower than the contamination level found in the LCS so it was determined that the contamination found in the LCS more than likely did not occur in the samples. A LCSD was performed with this batch. The LCSD was within the acceptance limits.
  - All initial and continuing calibration blanks associated with each batch were below the reporting limit for the requested analyte. This indicates a valid calibration and stable instrument conditions.
  - All initial and continuing calibration verifications associated with each batch were within the acceptance criteria for the requested analyte. This indicates a valid calibration and stable instrument conditions.
  - The interference check samples, and high standard readbacks associated with Method 6010B analyses were within acceptance criteria.
- 9. PAI sample IDs 0005050-1 and 0005141-1 were designated as the QC samples for these analyses.
  - A matrix spike and matrix spike duplicate were digested and analyzed with each batch. All acceptance criteria for accuracy were met.

- A sample duplicate and spike duplicate were digested and analyzed with each batch. All acceptance criteria for precision were met.
- A serial dilution was analyzed with each batch. All acceptance criteria were met.
- 10. Sample dilutions were not required for the requested analyses.

The data contained in the following report have been reviewed and approved by the personnel listed below:

#### **Inorganic Data Reporting Qualifiers**

The following qualifiers are used by the laboratory when reporting results of inorganic analyses.

- Result qualifier -- If the analyte was analyzed for but not detected a "U" is entered.
- QC qualifier -- Specified entries and their meanings are as follows:
  - E The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.
  - M Duplicate injection precision was not met.
  - N Spiked sample recovery not within control limits. A post spike is analyzed for all 6010B analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than 4 times the spike added concentration.
  - \* Duplicate analysis (relative percent difference) not within control limits.
