Danny,

I reviewed the *Summary of Pajarito Canyon Phase 1 Sediment Investigations* Report. I concur with the proposed phase 2 reaches and analytical suites. However, you should add reach TW-3E because of the contamination found in reaches TWSW-1E and TW-4W. This reach would also help identify a boundary of an area that may need remedial action (i.e., TWSW-1E). This reach should be analyzed for PAHs, americium-241, cesium-137, plutonium-239, and tritium. Let me know if you have any questions.

Darlene
