John,

Here is the well design we are following for the installation and completion of R-24. The design is almost exactly the same as we discussed and agreed to on Friday (8/26). The only thing that has changed is extending the filter pack upwards 2 feet to 813 feet to capture a high porosity zone detected via the Schlumberger logs. The crew should be completing backfill of the filter pack today and finish well backfilling by Thursday. Thanks and let me know if you have any questions.
