Mark,

NMED has reviewed the open-hole video log for core hole CdV-37-1(i) and concur that perched water is not present at the planned target depth of approximately 200 feet below ground surface. With this, NMED agrees that the core hole should be plugged and abandoned as soon as possible. In addition, please provide NMED with a descriptive statement illustrating the types of sealant material to be used and depth intervals for which they will be applied. To end, LANL must comply with the applicable New Mexico State Engineer Office requirements for Well Driller Licensing; Constructing, Repair and Plugging of Wells (19.27.4 NMAC). Please contact me if you have any questions concerning this correspondence. Thank you.
