Subject: Interesting observation - perched zone

Neelam and John, Friday afternoon the drilling crew at the Ponds hit perched water at a depth of ~ 145 ft. This was in a borehole located to the southeast of the Pond (south of the borehole that showed water on initial drilling during the late 90s). The water level was sounded at ~ 138 ft. The crew bailed the hole and took a sample (about 10 liters) - the water level seemed to maintain its elevation. Per the workplan, we are going to check if there is still water in the hole today; if so we will send a well design to you guys for approval, and then install a well. Thx Don
