#### SUMMARY OF CONTROL STATUS OF OPEN (NON-BLIND) QA SAMPLES RUN WITH THIS BATCH

There were no open (non-blind) Quality Control materials run with the samples reported above for one of the following reasons:

- \_\_\_\_ Only qualitative data requested
- \_\_\_\_\_ Only Blind QC samples run with this batch.
- \_\_\_\_ No QC samples run with this sample batch.
- \_\_\_\_\_ No QC samples for this constituent and matrix type available within EM-9

10 K

LOQ: Limit Of Quantitation TIC: Tentatively Identified Compound

Samples were extracted by liquid-liquid extraction method. Methylene chloride was used as the extraction solvent. Sample extracts were then concentrated to 1.0 ml final volume. Appropriate surrogate standards we added prior to extraction. Analysis was performed by capillary column GC/1. methods. Extraction and analysis methods are consistent with EPA SW-846 methods 3520 and 8270. Analytical column used was a J&W Scientific DB.625 30M by 0.25 mm ID, 0.5 micron film.

Both of the samples were found to contain HSL target compounds (see above). Non-target compounds were not identified or quantitated for this analysis.

Surrogate recoveries were within EPA criteria for all samples. Internal standard responses were within criteria for all analyses.

All analytical hold times were met for this request. If you have any questions regarding this data, please call either Anthony Lombardo or Laura Kelly at 667-5889.

8 1/9/92

#### SUMMARY OF CONTROL STATUS OF OPEN (NON-BLIND) QA SAMPLES RUN WITH THIS BATCH

There were no open (non-blind) Quality Control materials run with the samples reported above for one of the following reasons:

- \_\_\_\_\_ Only qualitative data requested
- \_\_\_\_ Only Blind QC samples run with this batch.
- \_\_\_\_\_ No QC samples run with this sample batch.
- \_\_\_\_\_ No QC samples for this constituent and matrix type available within EM-9

#### SUBJECT: RESULTS OF THE SOIL SAMPLING SURVEY CONDUCTED OVER RCRA FIRING SITE TA-36-8: TOTAL URANIUM OVER TA-36A

On May 14, 1993, I sent you a report describing the results of the soil survey conducted over two areas at firing site TA-36-8: (1) the detonation pad located approximately 100-yards east of building TA-36-8 (TA-36A), and (2) the detonation pad located on top of (bunker) building TA-36-8 (TA-36B) (Phil Fresquez, "Results of the Soil Sampling Survey Conducted Over Active RCRA Firing Site TA-36-8", Los Alamos National Laboratory memorandum EM-8:93-1315, to Tony Grieggs [May 14, 1993]).

In that memo, I indicated to you that the results for total uranium over TA-36A had not been received from EM-9 as of yet. Enclosed you will find the data.

In general, most of the soil samples collected over site TA-36A contained total uranium concentrations within or near background levels (i.e.,  $<3.4 \ \mu g/g$ ). Only one sample (36A-S-100) contained relatively high levels of total uranium--48  $\mu g/g$ . This particular sample was collected close to TA-36B; and, may have been contaminated from that site. As you recall, total uranium at TA-36B ranged in concentration from 2.4 to 98  $\mu g/g$ .

#### SUMMARY OF CONTROL STATUS OF OPEN (NON-BLIND) QC SAMPLES RUN WITH THIS BATCH

There were no open (non-blind) Quality Control materials run with the samples reported above for one of the following reasons:

- \_\_\_\_ Only qualitative data requested
- \_\_\_\_\_ Only Blind QC samples run with this sample batch.
- \_\_\_\_\_ No QC samples run with this sample batch.

\_\_\_\_ No QC samples for this constituent and matrix type available within EM-9

#### SUMMARY OF CONTROL STATUS OF BLIND QC SAMPLES RUN WITH THIS BATCH

| SAMPLE<br>NUM | ANALYTICAL<br>RESULT | ANALYTICAL<br>UNCERTAINTY | UNITS | QC<br>VALUE | QC<br>UNCERTAINTY | COMPLETION<br>DATE | COMMENT        |

No Sample Discrepancies Noted by Sample Management Section

ne control status of the preceeding data was evaluated using the standard statistical criteria set forth in 'Quality Assurance for Health and Environmental Chemistry: 1986,' LA-11114-MS, pp. 3-4.

# SUBJECT: SOIL SAMPLES (U)

· · · ·

Forty-five soil samples, and two water samples were received from EM -8 for explosive residue 1-1analysis. The predominant explosives of interest were: HMX, RDX, Tetryl, TNT, and 2,4-

Two quality control samples were analyzed along with the 47 environmental samples to verify the method. The average per cent recovery data is given in Table 1.

The detection limits (as shown in Table 2) were established by preparing a series of calibration standards with the concentration of analytes in solution that can be detected with a 95% certainty. TS:mmm
