Public Service Company of New Mexico
Person Generating Station
Groundwater Treatment System

Treatment Effectiveness Report
Second Quarter 1999

August 6, 1999

Report Prepared Pursuant to Requirements Contained in:

The Person Generating Station Corrective Action Directive (NMT 360010342)
and
The New Mexico Environment Department Discharge Plan, DP-1006

Table of Contents

Executive Summary

Contour maps of the three primary contaminants of concern, PCE, DCE, and TCA, are shown in Figures 7, 8, and 9, respectively. These contour maps indicate the areal extent of the groundwater plume and the associated contaminant concentrations within the plume.

Figure 7 indicates that the hot spot of higher concentration PCE that was shown in last October's contour map has been significantly reduced by the GTS. The DCE plume is essentially unchanged from last October's contour map. Figure 9 indicates that the areal extent of the TCA plume has been significantly reduced since last October.

The VEW, PSMW-16, and PSMW-26 have operated intermittently during the second quarter due to operational difficulties with the pumps and effluent lines.

I. Introduction

This report is prepared pursuant to requirements contained in the Person Generating Station Corrective Action Directive (NMT360010342) issued by the New Mexico Environment Department (NMED) Hazardous and Radioactive Materials Bureau, and requirements contained in Discharge Plan DP-1006 issued by the NMED Groundwater Protection and Remediation Bureau.

This report contains information on sampling results and operational activities at the Person Generating Station Groundwater Treatment System (GTS). The GTS is designed to extract volatile organic compound (VOC) contaminated groundwater, treat through an air stripper and granular activated carbon filter, and discharge the treated water to an irrigation pond at the UNM Championship Golf Course.

Figure 1 is a site map of the Person Generating Station vicinity and shows well locations and the location of the pipeline system.

II. Operational History

The GTS was started on Friday, January 27, 1995, with treated effluent being sent to the UNM Championship Golf Course.

During 1995, the GTS encountered periodic minor problems as well as a more serious problem with mineralization of the system components downstream from the air stripper. The GTS was kept off-line for most of the first quarter of 1996 while the mineralization problem was studied. After evaluation of various treatment methods, an acid treatment system was selected as the most feasible solution to the mineralization problem.

Installation of the acid treatment system began in early May 1996. In early April, construction activities were initiated to convert monitor wells PSMW-24, PSMW-25, and PSMW-26 (PSMW-24, 25, and 26) to extraction wells. The GTS resumed regular operation in mid-June 1996.

The Person Generating Station Discharge Plan, DP-1006, was amended and approved by the Groundwater Protection and Remediation Bureau in mid-June 1997. As part of the amended plan, the existing plan requirement for the sulfuric acid treatment system was replaced. Previously, acid addition to the effluent was restricted to 35 mg/l. The new requirement specifies adjustment of the acid treatment system to maintain an effluent pH range of 6.0 to 9.0. A pH probe and chart recorder were installed on the effluent discharge tank for daily monitoring of pH, and effluent samples are collected monthly for total sulfate analysis.

Operational difficulties with the pumps, valves, and effluent lines have resulted in intermittent operation of the VEW, PSMW-16, and PSMW-26 during the second quarter.

III. Groundwater Treatment Effectiveness

Figures 2, 3, and 4 show graphs of concentration of total chlorinated VOCs as measured at wells PSMW-16, VEW, and EW-1 over the operational period of the GTS. Figure 5 shows a graph of concentration of total chlorinated VOCs in the combined influent from wells PSMW-24, 25, and 26 over the operational period of the GTS. More detailed data for these wells are shown in Tables 1, 2, 3, and 4.

At PSMW-16 and EW-1, total chlorinated VOCs have continued to decrease during the second quarter. Total chlorinated VOCs increased slightly during the first month of the second quarter at the VEW. Samples were not collected from the VEW during May and June due to operational difficulties with the pump and effluent line. During the second quarter, total chlorinated VOCs have fluctuated slightly in the combined influent from PSMW-24, 25, and 26.

Laboratory reports for this quarter are contained in Appendix A.

IV. Operational Activities

Operational activities during the second quarter have included maintenance repairs to the pumps, valves and effluent lines on the VEW, PSMW-16, and PSMW-26.

V. Influent and Effluent Flow Volumes

Flow totalizing meters are present on each influent well line and on the effluent flow line. Table 5 below details flow volumes from each influent well and the effluent line. Differences between total influent and total effluent volumes may be attributed to water loss (evaporation) out the stack in the air stripper system and to differences, inaccuracies, and operational problems with the flow meters.

Table 5
Influent and Effluent Flow Volumes

Source	Meter Number	Start Reading	End Reading	Volume (Gallons)
Flow Volumes for April 1999:

Annual Cumulative Influent Total for 1998:				3,036,453
Annual Cumulative Effluent Total for 1998:				2,977,193

VI. Laboratory Analysis

A. Influent and Effluent Sampling for Chlorinated VOCs (8021 Analysis)

During the second quarter, influent and effluent sampling was conducted pursuant to the routine schedule outlined in DP-1006, i.e., once each month. Chlorinated VOC analysis of GTS influent and effluent (after GAC units) is shown graphically in Figure 6. More detailed data are shown in Table 6 below. Laboratory analytical data reports are contained in Appendix A. All influent and effluent sampling results indicate that the GTS has consistently removed chlorinated VOC contaminants in the 50 to 200 ppb range to levels below laboratory detection limits in the effluent sent to the golf course. Laboratory analysis of the water at a point after the air stripper and before the granular activated carbon treatment also show that at these influent concentrations and a flow rate of approximately 20 to 25 gpm, the air stripper alone is capable of treating the groundwater to concentrations consistently below or near laboratory detection limits for chlorinated VOCs.

Figure 6
Total VOCs GTS Influent vs. Effluent

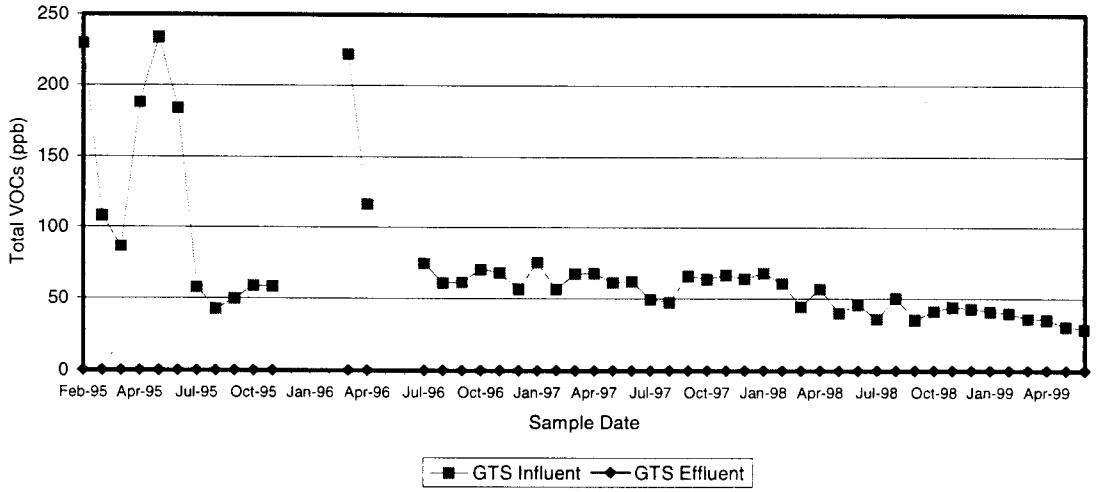

Table 6
Influent and Effluent VOC Concentrations

Sampling Date: 4/21/99	Lab Report Number: 904091		
VOC Compound	Influent (ppb)	Effluent After Air Stripper (ppb)	Effluent After GAC Unit (ppb)
1,1-Dichloroethane	1.7	< 0.3	< 0.3
1,1-Dichloroethene	10	< 0.2	< 0.2
Tetrachloroethene	22	< 0.5	< 0.5
1,1,1-Trichloroethane	1.5	< 1.0	< 1.0
TOTAL VOC'S	35.2	BDL	BDL

Sampling Date: 5/14/99	Lab Report Number: 905048		
VOC Compound	Influent (ppb)	Effluent After Air Stripper (ppb)	Effluent After GAC Unit (ppb)
1,1-Dichloroethane	1.5	< 0.3	< 0.3
1,1-Dichloroethene	8.8	< 0.2	< 0.2
Tetrachloroethene	19	< 0.5	< 0.5
1,1,1-Trichloroethane	1.3	< 1.0	< 1.0
TOTAL VOC'S	30.6	BDL	BDL

Sampling Date: 6/9/99	Lab Report Number: 906040		
VOC Compound	Influent (ppb)	Effluent After Air Stripper (ppb)	Effluent After GAC Unit (ppb)
1,1-Dichloroethane	1.2	< 0.3	< 0.3
1,1-Dichloroethene	8.4	< 0.2	< 0.2
Tetrachloroethene	19	0.9	< 0.5
TOTAL VOC'S	28.6	0.9	BDL

B. Effluent Sulfate Analysis and pH Monitoring

The June 1997 amendment to DP-1006 requires monthly sulfate analysis and daily pH monitoring of the GTS effluent. Table 7 presents the results of the second quarter sulfate analysis using EPA Method 375.4. The monthly minimum, maximum, and average pH readings for this quarter are shown in Table 8.

Table 7
GTS Effluent Sulfate Concentrations

Date	Lab Report Number	Sulfate (Mg/l)
4/21/99	904091	510
5/14/99	905048	400
6/9/99	906040	440

Table 8
Monthly pH Readings

Date	Minimum pH	Maximum pH	Average pH
4/99	6.9	7.0	7.0
5/99	6.0	7.4	7.0
6/99	6.4	7.4	7.0

C. Golf Course Pond Sampling

DP-1006 requires monthly sampling of the east and west ponds for 8021 (Halo) analysis during each month of operation. During the second quarter, the ponds were sampled three times pursuant to this requirement. No EPA Method 8021 (Halo) parameters were detected in the samples. Copies of the laboratory reports are contained in Appendix A.

VII. Groundwater Sampling

Under the RCRA permit, a network of groundwater monitoring wells are sampled on a twice per year schedule (normally in the spring and fall). Once sampling is complete and analytical results have been received, contour maps showing the areal extent and concentration of the contaminants in the groundwater are prepared. Contour maps for PCE, DCE, and TCA for the spring sampling event are shown in Figures 7, 8, and 9, respectively.
