Comments

*This waste stream represents 80ft3 of spent filter media currently stored in a High Integrity Container.

The typical waste material weights (kg/m3) are not available for this waste stream.

Typical activity (curies/m3) is unknown for these radionuclides.

TRANSURANIC WASTE BASELINE INVENTORY REPORT

(REVISION 3)

June 1996

NOTICE TO READERS

This document, Revision 3 of the Transuranic Waste Baseline Inventory Report (TWBIR), has been prepared to document the transuranic (TRU) waste inventory data to be used in the Sandia National Laboratories/New Mexico (SNL/NM) calculations for the Waste Isolation Pilot Plant's (WIPP's) performance assessment (PA). The TWBIR Revision 3, is comprised of previously published information found in Revision 2 of the TWBIR and supplemented with information and data that were specifically requested by the U.S. Department of Energy (DOE) Carlsbad Area Office (CAO) for the SNL/NM PA calculations.

The data contained in this document will also be used as the inventory basis for the WIPP Compliance Certification Application (CCA) to be submitted to the U.S. Environmental Protection Agency. The site information requested in the January 1996 data call has not been included in Revision 3. Future editions of the TWBIR will be identified by the year of data origin.

EXECUTIVE SUMMARY

The *Transuranic Waste Baseline Inventory Report* (TWBIR) establishes a methodology for grouping wastes of similar physical and chemical properties from across the U.S. Department of Energy (DOE) transuranic (TRU) waste system into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies.

The purpose of Revisions 0 and 1 of this report was to provide data to be included in the Sandia National Laboratories/New Mexico (SNL/NM) performance assessment (PA) processes for the Waste Isolation Pilot Plant (WIPP). Revision 2 of the document expanded the original purpose and was also intended to support the WIPP Land Withdrawal Act (LWA) requirement for providing the total DOE TRU waste inventory. The document included a chapter and an appendix that discussed the total DOE TRU waste inventory, including nondefense, commercial, polychlorinated biphenyls (PCB)-contaminated, and buried (predominately pre-1970) TRU wastes that are not planned to be disposed of at WIPP.

Revision 3 of the TWBIR is based on the TWBIR Revision 2 data which are supplemented by data in several memoranda issued during early calendar year (CY) 1996. These memoranda summarize additional data requested by the U. S. Department of Energy/Carlsbad Area Office (DOE/CAO) to support the SNL/NM PA modeling. The primary purpose of Revision 3 is to provide the summary data from TWBIR Revision 2 and the supplemental information used by SNL/NM in the development of the Compliance Certification Application (CCA) to be delivered to the Environmental Protection Agency (EPA), and to support the LWA (Public Law, 1992b). The supplemental information was generated from specific data requests to the TRU waste sites since the publication of Revision 2. The supplemental data discussed in detail in Chapter 3 and Appendices A and B are listed below:

- Radionuclide data in support of the Compliance Certification Application.
- Estimate of complexing agents in TRU solidified waste forms scheduled for disposal in WIPP.
- Estimate for SNL/NM PA calculations of nitrate, sulfate, and phosphate content in transuranic solidified wastes destined for disposal in WIPP.
- Estimate of cement content in TRU solidified waste forms scheduled for disposal in WIPP.

Revision 2 of the TWBIR included both the TRU waste that is allowed to be disposed of in WIPP and the DOE TRU waste that is not currently allowed to be disposed of in WIPP (Public Law, 1992b). Because the primary purpose of this Revision 3 TWBIR is to support the CCA and PA, it includes only the DOE TRU waste that is currently allowed to be disposed of in WIPP.

Revision 3 of the TWBIR is different from previous revisions in that it provides the TRU waste inventory information developed for Revision 2 along with supplemental data. It is necessary for the reader to be familiar with Revision 2 of the TWBIR to understand this TWBIR Revision 3 document. Much of the TWBIR Revision 2 information is referenced, rather than repeated, in this document, resulting in an abbreviated document. Revision 3 of the TWBIR consists of one volume having five chapters and four appendices. There is not a new electronic database for

TWBIR Revision 3 because the data in the Revision 2 database are unchanged; therefore new database diskettes are not being published with this document.

The WIPP anticipated (stored and projected) inventory of TRU waste is defined as the sum of retrievably stored waste plus currently projected TRU waste volumes. Current projections do not include waste generated as a result of future environmental restoration (ER) and decontamination and decommissioning (D&D) activities and have only been developed over a 25 year period, consequently the anticipated inventory for CH-TRU waste is not sufficient to fill the maximum CH-TRU disposal inventory for WIPP (calculated to be approximately 168,500 cubic meters or 5,950,000 cubic feet). Scaling has been developed as a means for SNL/NM to model the impacts of a full repository. Scaling has not been applied to the RH-TRU inventory since the sites have reported sufficient RH-TRU waste to fill the RH-TRU disposal inventory (approximately 7,080 cubic meters or 250,000 cubic feet).

The TWBIR also estimates the WIPP disposal inventory in terms of 12 waste material parameters and additional packaging materials that have been identified by SNL/NM as necessary for PA. The 12 waste material parameters and additional packaging materials are constituents of TRU waste and are input parameters for one or more PA models or are required to adequately describe the waste form.

The 12 waste material parameters and additional packaging materials are listed below:

Waste Material Parameters

- Iron-base metal/alloys
- Aluminum-base metal/alloys
- Other metal/alloys
- Other inorganic materials
- Vitrified
- Cellulosics
- Rubber
- Plastics
- Solidified inorganic material
- Solidified organic material
- Cement (solidified)
- Soils

Packaging Materials

- Steel
- Plastic
- Lead (for RH-TRU waste only)

The waste material parameters are expressed on a weight/volume (kilograms per cubic meter) basis. The occurrence of more than one waste material parameter at the maximum value within a waste stream is highly unlikely. If required by PA calculations, the sampling statistics must be controlled so that several waste material parameters do not get sampled all at their maximum value (weight/volume), thereby exceeding the average weight/volume.

Attached to this Executive Summary are several summary tables from the body of the TWBIR Revision 3 which are frequently requested by TWBIR users:

- Table ES-1. WIPP CH-TRU Waste Material Parameter Disposal Inventory
- Table ES-2. WIPP RH-TRU Waste Material Parameter Disposal Inventory
- Table ES-3. WIPP CH-TRU Waste Anticipated Inventory by Site

| Y90 | 4.07E-02 | 2.95E+01 |

¹Summary shows the ten radionuclides with the highest concentration in curies per cubic meter for both CH-TRU and RH-TRU waste. The list includes eleven radionuclides because the ten radionuclides with the highest concentration are different for CH-TRU and RH-TRU waste.

*This table is an update of Table ES-7, of TWBIR Revision 2, page ES-10 (DOE, 1995c).

1. INTRODUCTION

1.1 BACKGROUND

Transuranic (TRU) waste is defined as waste that is contaminated with alpha-emitting radionuclides with an atomic number greater than 92, with half-lives greater than 20 years, and concentrations of TRU isotopes greater than 100 nanocuries per gram of waste at the time of assay (DOE, 1988). TRU wastes are classified as either contact-handled (CH) waste or remote-handled (RH) waste, depending on the dose rate at the surface of the waste container. CH-TRU wastes are packaged TRU wastes with an external surface dose rate less than 200 millirems (mrem) per hour, while RH-TRU wastes are packaged TRU wastes with an external surface dose rate of 200 mrem or greater per hour (Public Law, 1992b). Unless otherwise indicated, for the purposes of this document, all references to TRU waste include TRU waste and mixed TRU waste (waste that contains both radioactive and hazardous components, as defined by the Atomic Energy Act [Public Law, 1954] and the Resource Conservation and Recovery Act [RCRA] as codified in Title 40 Code of Federal Regulations [CFR] Part 261.3 [EPA, 1980]).

The Waste Isolation Pilot Plant (WIPP) is a TRU waste management facility operated by the U.S. Department of Energy (DOE). The WIPP is currently identified as the permanent disposal site for TRU wastes (in retrievable storage or projected) generated at various DOE sites from defense-related activities of the United States government. The WIPP is scheduled to receive and dispose of TRU defense wastes from 8 major and additional minor DOE TRU waste sites (see Figure 1-1).

The DOE is committed to demonstrating compliance with all applicable regulations prior to permanent disposal of TRU defense wastes in the WIPP repository. These regulations are the environmental standards for management and disposal of TRU defense wastes as mandated in 40 CFR Part 191 (EPA, 1993) and Part 194 (EPA, 1996), and the RCRA regulations. Compliance demonstration through Sandia National Laboratories/New Mexico (SNL/NM) performance assessment (PA) calculations will be based on the inventory of existing and currently projected waste streams compiled in this document and the *Transuranic Waste Baseline Inventory Report* (TWBIR) Revision 2, as reported by the DOE TRU waste sites. Revision 3 of the TWBIR is different from previous revisions in that it provides the TRU waste inventory information developed for Revision 2 along with supplemental data. It is necessary for the reader to be familiar with Revision 2 of the TWBIR (DOE, 1995c) to understand TWBIR Revision 3.

1.2 PURPOSE

The purpose of the TWBIR is to document the total inventory of DOE TRU waste as defined by the DOE TRU waste sites. This document is based on the TWBIR Revision 2 data supplemented by several memoranda prepared during early calendar year (CY) 1996 that summarize additional data requested by the U. S. Department of Energy/Carlsbad Area Office (DOE/CAO) to support the SNL/NM PA modeling. The primary purpose of this document is to provide the summary data from TWBIR Revision 2 and the supplemental information used by SNL/NM for the development of the Compliance Certification Application (CCA) to be delivered to the Environmental Protection Agency (EPA), and to support the Land Withdrawal Act (LWA) (Public Law, 1992b). The supplemental information was generated from specific data requests

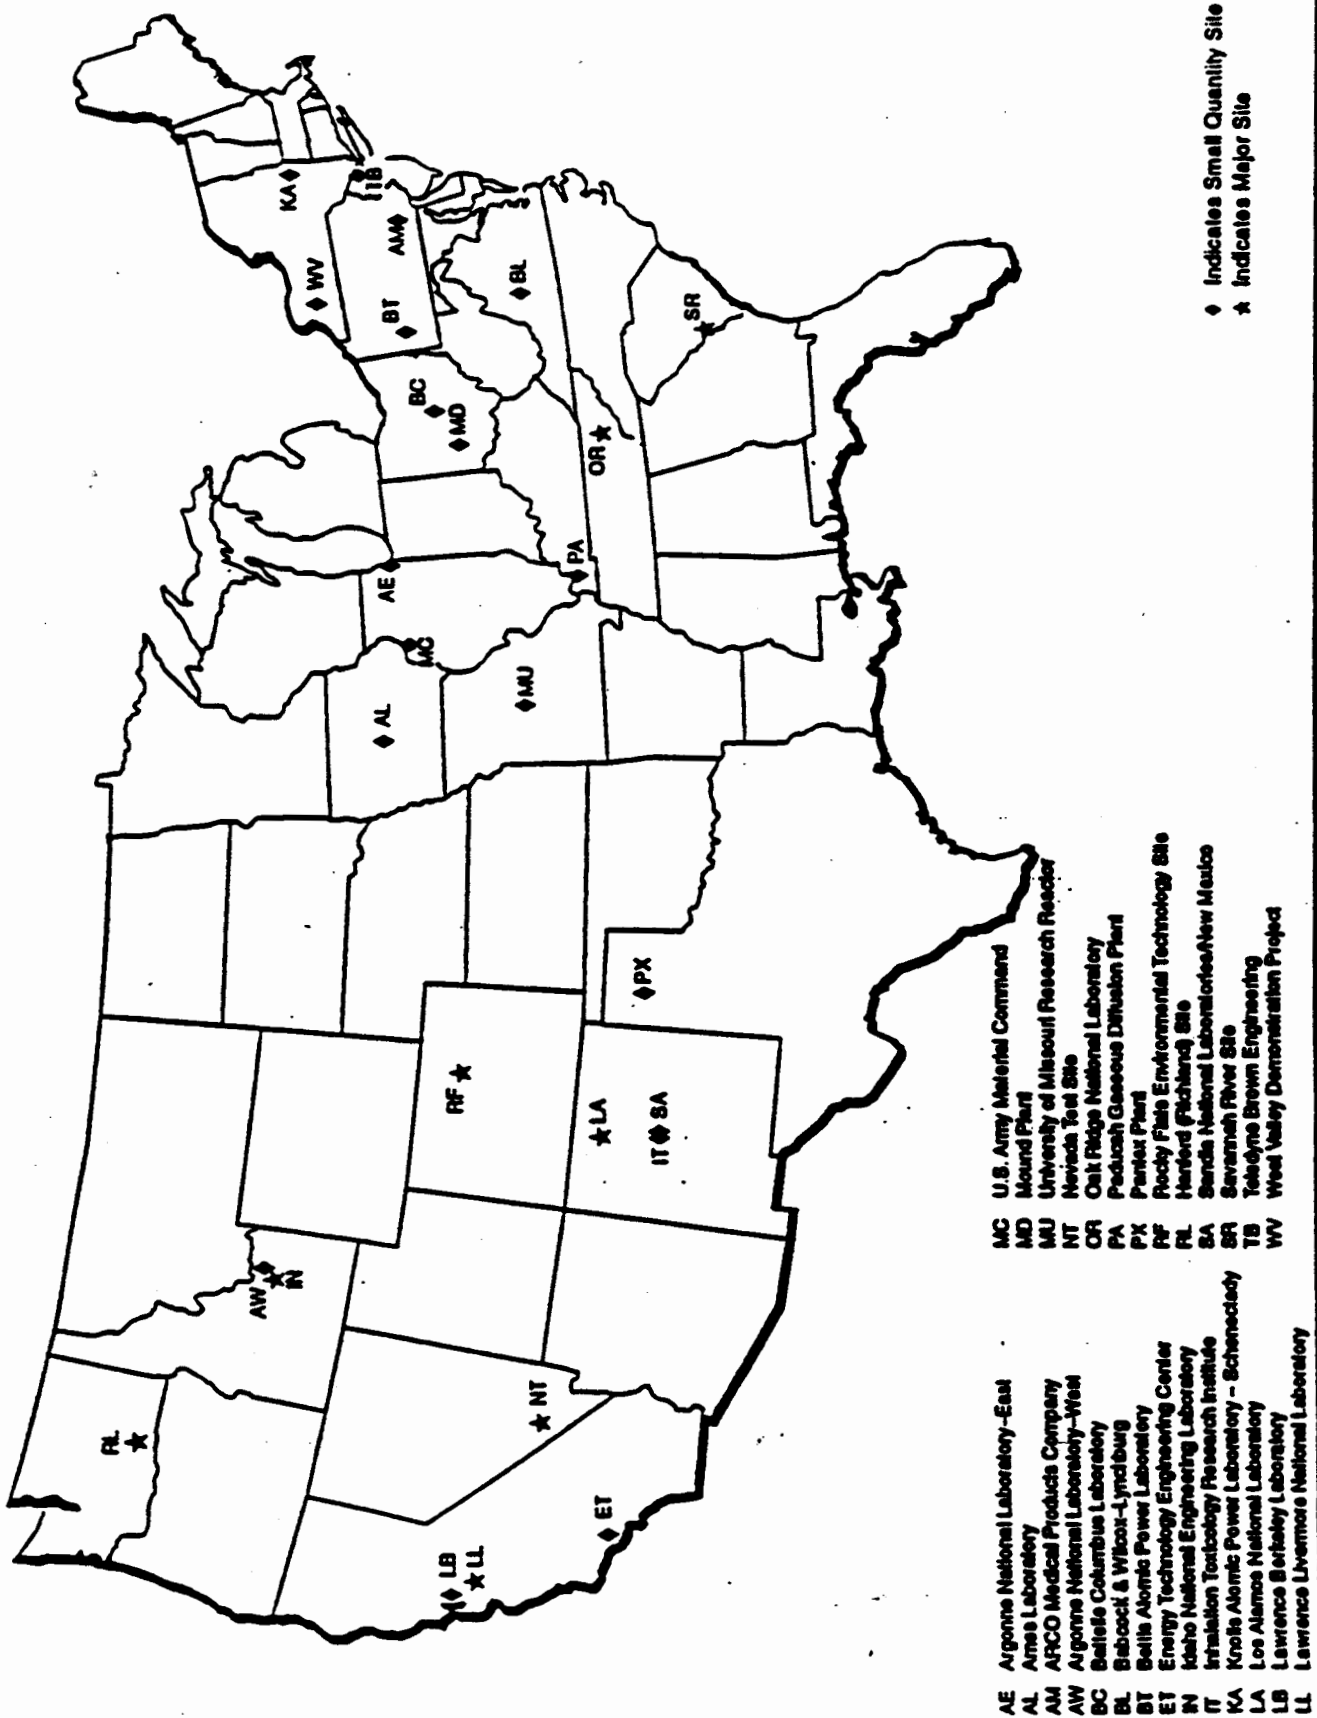

Figure 1-1. U.S. DOE Transuranic Waste Sites*

*This figure is identical to Figure 1-1 in TWBIR Revision 2, page 1-2 (DOE, 1995c).

to the TRU waste sites since the publication of Revision 2.

Revision 2 of the TWBIR included both the TRU waste that is allowed to be disposed of in WIPP and the DOE TRU waste that is not currently allowed to be disposed of in WIPP (Public Law, 1992b). Because the primary purpose of this Revision 3 TWBIR is to support the CCA and PA, it includes only the DOE TRU waste that is currently identified by the sites as being allowed to be disposed of in WIPP.

The TWBIR has been developed from the best available information and acceptable knowledge provided by the DOE TRU waste sites. In support of PA, the TWBIR describes a process for grouping individual waste streams with similar physical and chemical properties into waste profiles, based on their waste matrix code (WMC) (DOE, 1995a) assigned by the DOE TRU waste sites. The individual waste streams are also evaluated to estimate the occurrence and quantities of nonradioactive waste material parameters (WMPs) listed in Table 1-1 (e.g., cellulose, plastics, iron-base metal/alloys, etc.) that have been identified by SNL/NM as being potentially important to the performance of the WIPP repository. Waste profiles with similar WMCs are then combined across the DOE TRU waste system to provide estimated total volumes and total WMPs.

1.3 WASTE INVENTORY TERMINOLOGY

All terminology in this document is unchanged from the TWBIR Revision 2. A summary of terminology used in this document is provided in this section and in Chapter 5 (Glossary). A list of acronyms and abbreviations used are provided in the front of the document.

Stored Inventory – The part of the TRU inventory currently in retrievable storage at the time of the TWBIR Revision 2 data call for inventory information is known as "stored inventory" in this document. Retrievably stored waste includes waste stored since approximately 1970 in buildings or in berms with earthen cover and does not include any waste that was buried (predominately prior to 1970) (DOE, 1990).

As-Generated Waste – The chemical and physical status of waste when it is generated. The "as-generated" term applies to both stored and projected waste.

Projected Inventory – The part of the TRU waste inventory that has not been generated but is currently estimated to be generated at some time in the future by the TRU waste sites is known as "projected inventory."

Anticipated Inventory – For the TWBIR, this is the sum of the stored and projected inventories, calculated as:

$$\begin{array}{ccccc} \text{Stored} & & \text{Projected} & & \text{Anticipated} \\ \text{Inventory} & + & \text{Inventory} & = & \text{Inventory} \end{array}$$

Scaling – The process for adjusting, if needed, the projected inventory to the design limit (disposal inventory) of the WIPP repository is called "scaling."

$$\text{Stored Inventory} + \text{Projected Inventory (scaled as needed)} = \text{Disposal Inventory}$$

TABLE 1-1. TECHNICAL DATA NEEDS FOR PERFORMANCE ASSESSMENT WASTE MATERIAL PARAMETERS

| Waste Material Parameter | Input Variable in <u>Current</u> PA Models | |
|------------------------------------|--|----------------------------|
| | Gas Generation | Mechanical Characteristics |
| Iron-base metal/alloys | YES | YES |
| Aluminum-base metal/alloys | - | YES |
| Other metal/alloys | - | YES |
| Other inorganic materials | - | YES |
| Vitrified ¹ | - | YES |
| Cellulosics | YES | YES |
| Rubber | YES ² | YES |
| Plastics | YES ² | YES |
| Solidified inorganic material | - | YES |
| Solidified organic material | - | YES |
| Cement (solidified) ^{3,4} | YES | - |
| Soils ⁵ | - | YES |

¹ Waste material parameter corresponding to treatment, identified by some sites that plan to treat waste in the future.

² Only one-half of materials assumed to generate gas.

³ Percentage of material to generate gas is unknown at the present time.

⁴ Information on this waste material parameter is needed for non-PA scoping calculations for assessment of its importance.

⁵ May impact colloids.

Disposal Inventory – The inventory volume defined for WIPP emplacement to be used for PA calculations is the "disposal inventory." The LWA defines the total amount of TRU waste allowed for disposal in the WIPP as approximately 175,600 cubic meters (6,200,000 cubic feet) (Public Law, 1992b). The "Agreement for Consultation and Cooperation" (C&C Agreement) limits the RH-TRU inventory to approximately 7,080 cubic meters (250,000 cubic feet) (DOE and State of New Mexico, 1981). Therefore by difference, the CH-TRU inventory will be limited to approximately 168,500 cubic meters (5,950,000 cubic feet) if all of the RH-TRU allowance is filled.

Waste Matrix Code (WMC) - The WMCs were developed by DOE in response to the Federal Facilities Compliance Act (FFCA) (Public Law, 1992a) as a methodology to aid in categorizing mixed waste streams in the DOE system into a series of five-digit alphanumeric codes (e.g., S3100; Inorganic Process Residues) that represent different physical/chemical matrices (DOE, 1995a).

Final Waste Form - Final waste form of a waste stream refers to the expected physical and chemical form of that stream once the waste has been processed, treated, or repackaged (if necessary) and is ready for disposal. This consists of a series of WMCs that are grouped together. The use of the final waste form helps to group waste streams that are expected to have similar physical and chemical properties at the time of disposal. The final waste form applies to both stored and projected waste. An example of combining three waste streams which either contain particulates or are cemented particulate waste is presented below:

| | |
|---|-------------------------|
| WMC S3100 (inorganic process residues) | } Solidified Inorganics |
| WMC S3110 (inorganic particulates) | |
| WMC S3150 (solidified process residues) | |

Particulate waste may be immobilized prior to shipment to WIPP. If so, all three of these waste streams would be the same basic waste form when emplaced in WIPP and have similar physical and chemical properties. The final waste form for this example is solidified inorganics. Table 1-2 presents all anticipated WMCs for TRU waste and indicates the final waste form typically assigned to each WMC for the TWBIR. There are 11 final waste forms used in this TWBIR. The last two rows in Table 1-2, Excluded and Unknown Waste Streams, group WMCs that will not be accepted at WIPP until additional characterization and/or processing occurs to meet the WIPP Waste Acceptance Criteria (WAC) (DOE, 1996).

Waste Material Parameter - This is one (or more) nonradioactive waste constituent(s) that occurs in a TRU waste stream that is an input parameter into one or more PA models or is required to adequately describe the waste form. The waste material parameters and additional packaging materials that are reported in weight/volume (kg/m³) and included in the TWBIR are:

WASTE MATERIAL PARAMETERS

- Iron-base metal/alloys
- Aluminum-base metal/alloys
- Other metal/alloys
- Other inorganic materials
- Vitrified
- Cellulosics
- Rubber
- Plastics
- Solidified inorganic material
- Solidified organic material
- Cement (solidified)
- Soils

PACKAGING MATERIALS

- Steel
- Plastic
- Lead (for RH-TRU waste only);

WIPP Waste Profile - The WIPP waste profile represents a summary of TRU wastes at all DOE TRU waste sites that have an identical final waste form.

TABLE 1-2. WASTE MATRIX CODES AND THEIR ANTICIPATED FINAL WASTE FORM

| Final Waste Form | Waste Matrix Codes |

**TABLE 1-2. WASTE MATRIX CODES AND THEIR ANTICIPATED FINAL WASTE FORM
(CONTINUED)**

- ¹ Liquid waste streams are assumed to be solidified prior to being sent to WIPP.
- ² WMCs S3000, S3900, and L9000 are placed in "solidified inorganics," "salt," or "solidified organics," depending on the information provided by the TRU waste site.
- ³ Particulate waste streams are assumed to be solidified prior to being sent to WIPP.
- ⁴ WMCs X6000 and X6900 are placed in "solidified organics" or "solidified inorganics" depending on the information provided by the TRU waste site.
- ⁵ Liquid lab pack waste is assumed to be solidified prior to being sent to WIPP.
- ⁶ Solid lab packs are assumed to be solidified prior to being sent to WIPP.
- ⁷ WMC S5100 is placed in "uncategorized metal," "lead-cadmium metal," or "inorganic non-metal" depending on the information provided by the site.
- ⁸ Waste stream is assumed to be treated prior to being sent to WIPP.
- ⁹ WMC S5000 is placed in "uncategorized metal," "lead/cadmium metal," "inorganic non-metal," "combustible," "graphite," "heterogeneous," or "filter," depending on the information provided by the site.
- ¹⁰ WMC Z2100 is placed in "uncategorized metal" or "lead/cadmium metal" depending on the information provided by the site.
- ¹¹ WMCs X7400, X7410, X7420, and X7490 are assumed to be drained of liquid and contain only metal waste.
- ¹² These waste streams are excluded from disposal in WIPP at this time, e.g., PCB and elemental mercury.
- ¹³ If adequate information is provided by the TRU waste site, these WMCs are changed. If there is not enough information, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

1.4 METHODOLOGY FOR DEVELOPMENT OF DISPOSAL INVENTORY

Development of the WIPP TRU waste disposal inventory is accomplished by a series of steps starting with the individual waste stream profiles submitted by the TRU waste sites. These waste stream profiles are grouped together, based on similar physical and chemical properties, into common "WIPP waste profiles," which should facilitate discussions with regulatory agencies and stakeholders concerning the disposal waste inventory. The process of grouping similar waste streams is exemplified in Figure 1-2. The waste profiles also contain information on waste material parameters that could affect the performance of the WIPP repository and that may be direct inputs to the PA models.

The CH-TRU anticipated inventory consists of up to 11 overall CH-TRU WIPP final waste forms based on the physical and chemical properties of the waste streams. Because the volume of the CH-TRU anticipated inventory is not sufficient to fill the maximum calculated CH-TRU capacity of WIPP, scaling of the projected CH-TRU inventory is necessary to attain the maximum calculated WIPP CH-TRU disposal inventory of approximately 168,500 cubic meters (5.95 million cubic feet). The scaling factor for CH-TRU waste is computed as follows:

$$\frac{\text{maximum calculated CH-TRU inventory} - \text{stored CH-TRU inventory}}{\text{projected CH-TRU inventory}} = \text{CH-TRU scaling factor}$$

The WIPP disposal inventory is the inventory to be used in PA calculations. To calculate the disposal inventory by final waste form for CH-TRU waste, the **projected inventory** is multiplied by the scaling factor, added to the stored inventory for each final waste form, and summed together.

The RH-TRU anticipated inventory is greater than the WIPP C&C Agreement limit (DOE and State of New Mexico, 1981) of approximately 7,080 cubic meters. DOE will abide by the WIPP C&C Agreement for RH-TRU waste volumes and the LWA, which limits the curies of RH-TRU waste allowed in WIPP to 5.1 million curies (Public Law, 1992b). As stated earlier, one purpose of the TWBIR is to report the DOE TRU inventory in such a way that it will facilitate performance assessment by SNL/NM and support development of compliance applications to the appropriate regulatory agencies. Since this is not a WIPP load management document, the RH-TRU inventory has not been scaled back in this document to the regulatory limit. The RH-TRU inventory for WIPP will be averaged across all RH-TRU waste sites and reported as kilograms/cubic meter for the waste material parameters and curies/cubic meter for radionuclides.

1.5 DOCUMENT ORGANIZATION

The TWBIR Revision 3 is organized into chapters of text, figures, tables, and supporting appendices. The contents of remaining chapters in this document are summarized below:

- Chapter 2 provides a summary of the WIPP disposal inventory information previously presented in TWBIR Revision 2.
- Chapter 3 presents supplementary disposal inventory information.
- Chapter 4 provides the document references.

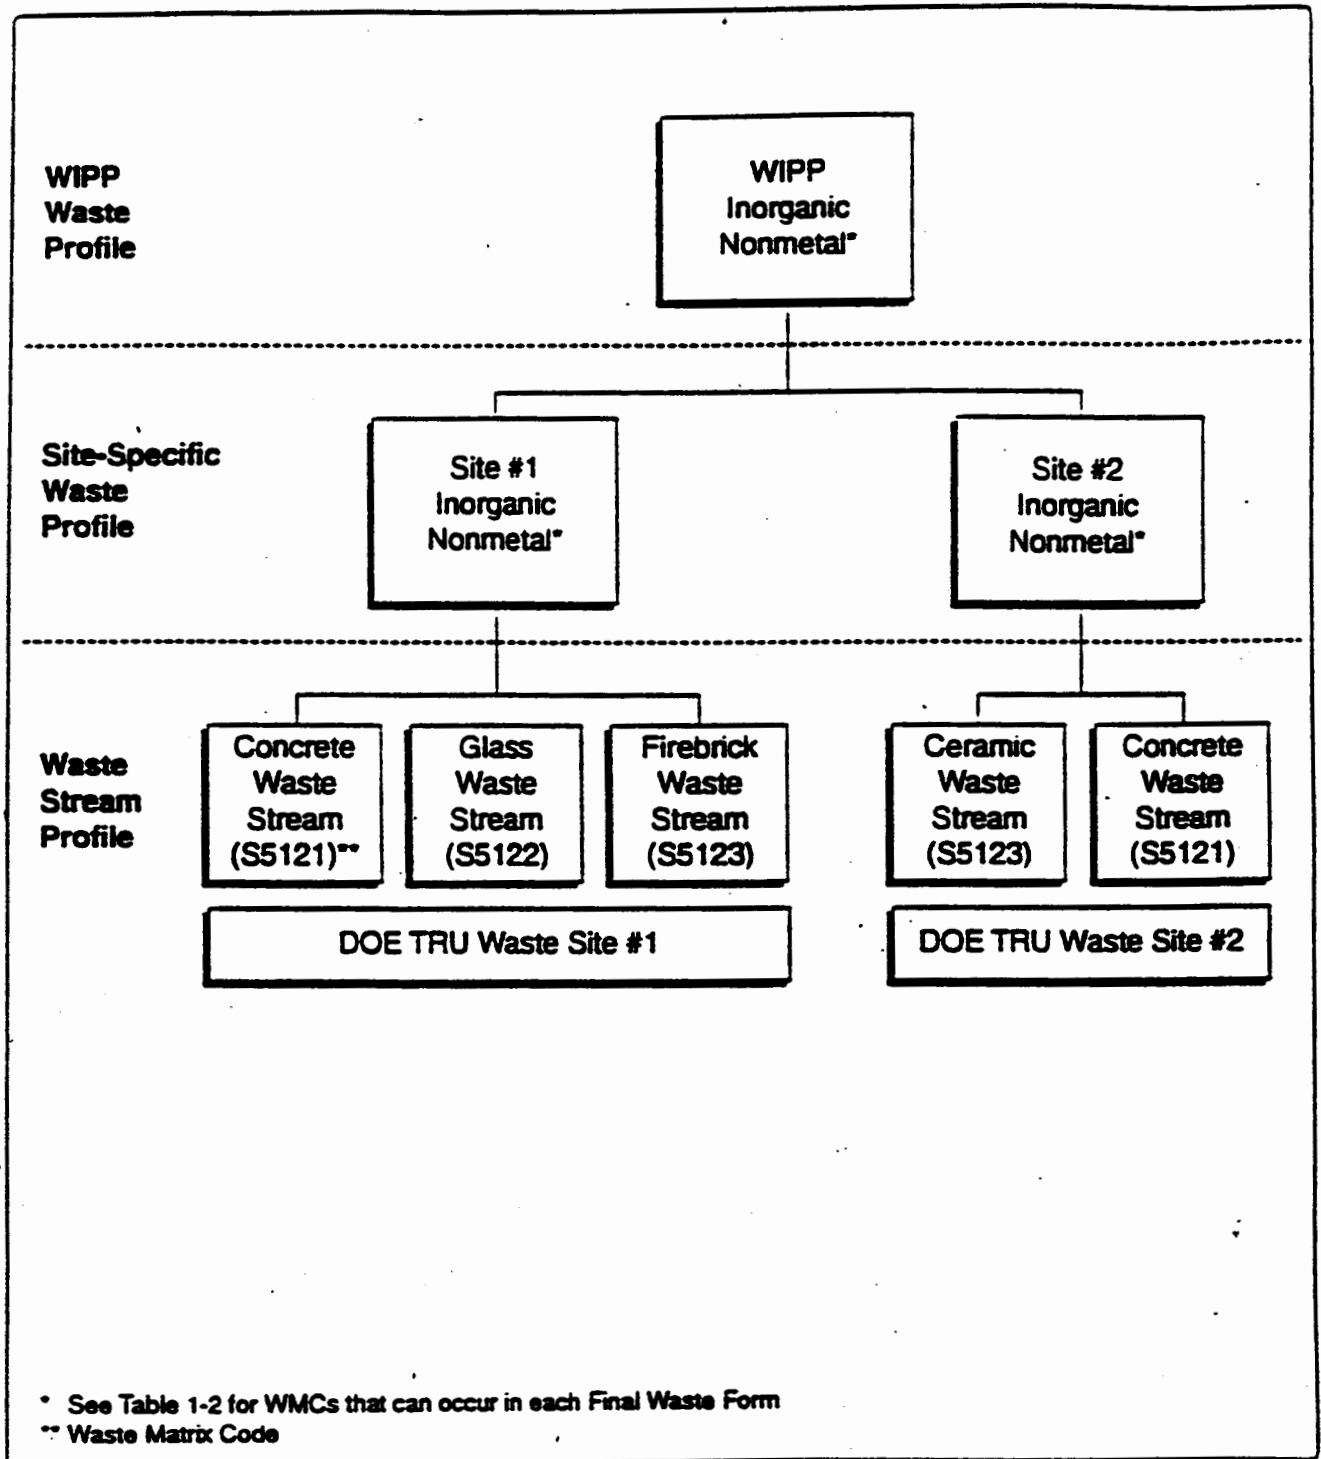

Figure 1-2. Schematic of Waste Stream Profile Methodology*

*This figure is identical to Figure 2-3 of TWBIR Revision 2, page 2-10 (DOE, 1995c).

- Chapter 5 provides a document glossary.
- Appendix A provides the SNL/NM memoranda requesting information to supplement the TWBIR Revision 2.
- Appendix B includes DOE and SNL/NM memoranda that provide information to supplement the TWBIR Revision 2.
- Appendix C provides the site-specific stored radionuclide inventories decayed to December 1995.
- Appendix D provides the correction received from SNL/NM for Cf-252 decayed inventory.

2. SUMMARY OF WIPP DISPOSAL INVENTORY INFORMATION

2.1 INTRODUCTION

The DOE TRU waste sites have assigned an overall final waste form to each waste stream based on the expected physical and chemical form of the waste after the sites process, treat, or repackage the waste (if necessary). Each site provides the stored and projected inventory for each waste stream. The TWBIR generates the WIPP TRU waste inventory by rolling-up the waste stream volumes that have the same final waste form within a site to generate site profiles (see TWBIR Revision 2 [DOE, 1995c] for waste stream and site-specific waste profiles). Then the site-level volumes with the same final waste form are rolled-up to generate the WIPP TRU waste inventory by final waste form (see TWBIR Revision 2 for detailed information on the roll-up methodology).

This chapter summarizes the WIPP-level information for the disposal inventory. The data provided in this chapter are identical to those provided in TWBIR Revision 2. These are the data used by SNL/NM in the WIPP performance assessment to demonstrate regulatory compliance. This chapter will include the following TWBIR Revision 2 information:

- WIPP disposal inventory volumes for each final waste form - taken from Table 3-1 (unchanged) in Section 3.2 of TWBIR Revision 2.
- WIPP disposal inventory waste material parameters - taken from Tables 3-2 and 3-3 (unchanged) in Section 3.3 of TWBIR Revision 2.
- Summary of WIPP anticipated inventory from each site - taken from Tables 4-1 and 4-2 (unchanged) in Chapter 4 of TWBIR Revision 2.

2.2 WIPP DISPOSAL INVENTORY VOLUMES FOR EACH FINAL WASTE FORM

The disposal inventory is defined by the LWA (Public Law, 1992b) and the WIPP C&C Agreement (DOE and the State of New Mexico, 1981) as follows: the maximum allowable WIPP capacity is approximately 175,600 cubic meters, of which RH-TRU disposal inventory is limited to approximately 7,080 cubic meters resulting in a calculated CH-TRU disposal inventory limit of approximately 168,500 cubic meters.

Using volumes for all the retrievably stored and projected defense TRU waste streams (including the mixed and nonmixed TRU waste volumes) a disposal inventory of TRU waste has been developed using the methodology described in Chapter 3 of Revision 2 of the TWBIR. This inventory is presented in Table 2-1 (by final waste forms) and depicts both the anticipated and disposal inventory volumes.

The anticipated CH-TRU inventory volumes are the sum of the stored and projected volumes. Scaling of the disposal inventory is for PA purposes to enable SNL/NM to model a capacity waste load based on currently anticipated profiles.

TABLE 2-1. TRANSURANIC WASTE DISPOSAL INVENTORY FOR WIPP*
Contact Handled Waste (Cubic Meters)

| Final Waste Forms | Stored Volumes | Projected Volumes | Anticipated Volumes | WIPP Disposal Volumes |
|--------------------------------|-----------------------|--------------------------|----------------------------|------------------------------|
| Combustible | 5.8E+03 | 4.6E+03 | 1.0E+04 | 1.4E+04 |
| Filter | 2.2E+02 | 5.1E+02 | 7.3E+02 | 1.2E+03 |
| Graphite | 5.1E+02 | 4.8E+01 | 5.6E+02 | 6.0E+02 |
| Heterogeneous | 2.7E+04 | 1.3E+04 | 4.0E+04 | 5.1E+04 |
| Inorganic Non-Metal | 3.1E+03 | 9.4E+02 | 4.1E+03 | 4.9E+03 |
| Lead/Cadmium Metal Waste | 3.5E+01 | 3.3E+02 | 3.7E+02 | 6.6E+02 |
| Salt Waste | 2.1E+01 | 3.3E+02 | 3.5E+02 | 6.4E+02 |
| Soils | 4.1E+02 | 6.0E+03 | 6.4E+03 | 1.2E+04 |
| Solidified Inorganics | 9.6E+03 | 4.5E+03 | 1.4E+04 | 1.8E+04 |
| Solidified Organics | 9.1E+02 | 7.5E+01 | 9.8E+02 | 1.1E+03 |
| Uncategorized Metal | 1.1E+04 | 2.3E+04 | 3.4E+04 | 5.4E+04 |
| Total CH Volumes | 5.8E+04 | 5.4E+04 | 1.1E+05 | 1.6E+05 |
| Remote Handled Waste | | | | |
| Combustible | 3.6E+01 | 4.9E+01 | 8.5E+01 | |
| Heterogeneous | 2.3E+03 | 5.5E+03 | 7.8E+03 | |
| Inorganic Non-Metal | 4.6E+01 | 2.1E+01 | 6.8E+01 | |
| Lead/Cadmium Metal Waste | 7.1E+00 | 6.7E+01 | 7.4E+01 | |
| Solidified Inorganics | 1.1E+03 | 2.3E+02 | 1.3E+03 | |
| Solidified Organics | 3.6E+00 | 0.0E+00 | 3.6E+00 | |
| Uncategorized Metal | 1.2E+02 | 1.7E+04 | 1.8E+04 | |
| Total RH Volumes | 3.6E+03 | 2.3E+04 | 2.7E+04 | |
| Total TRU Waste Volumes | 6.2E+04 | 7.7E+04 | 1.4E+05 | 1.7E+05 |

*This table is identical to Table 3-1 of TWBIR Revision 2, page 3-2 (DOE, 1995c).

Applying the formula given in Chapter 1:

$$\frac{\begin{array}{l} 1.685 \times 10^5 \text{ m}^3 \\ \text{(CH-TRU disposal inventory)} - \text{(stored inventory)} \end{array}}{5.4 \times 10^4 \text{ m}^3 \text{ (projected inventory)}} \approx 2.05 \text{ (scaling factor)}$$

- Multiply the CH-TRU waste projected inventory volumes by the scaling factor for all the final waste forms, and add the stored volumes (which results in the numbers in the "Disposal Inventory" column of Table 2-1).

The CH-TRU waste stream volume on a system-wide final waste form basis is increased by approximately 50 percent to account for the difference between the anticipated inventory and the maximum calculated WIPP CH-TRU disposal inventory.

The RH-TRU WIPP inventory has not been scaled. The RH-TRU anticipated inventory is greater than the amount of RH-TRU waste allowed in the WIPP by the C&C Agreement (DOE and the State of New Mexico, 1981). DOE is committed to abide by all agreements and laws regarding RH-TRU limitations. DOE and SNL/NM will evaluate this inventory to determine the disposal options for all DOE RH-TRU waste. This inventory has not been scaled back to the limit imposed by the C&C Agreement so that all available data are presented to DOE and SNL/NM to conduct modeling and other evaluations to determine the disposition of this waste.

2.3 ROLL-UP OF WIPP WASTE MATERIAL PARAMETERS BY FINAL WASTE FORM

The roll-ups of waste material parameters by final waste forms are developed from the volumes presented in the TWBIR Revision 2. The roll-ups by final waste forms require combining data from several waste streams. A weighted average value for the waste material parameters is calculated from the average densities provided by the TRU waste sites modified by the volume fractions and summed as follows:

$$\begin{array}{l} \text{Average Density} \\ \text{of waste material} \\ \text{parameter} \end{array} = \sum \text{Average Density}_i \times \frac{\text{(Volume TWBIR Stream}_i\text{)}}{\text{(Total Volume of Final Waste Form)}}$$

*where i is an index representing individual waste streams of the same final waste form

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the TWBIR Revision 2. The maximum density is chosen in a similar manner, except that the largest maximum density is chosen. Thus, the maximum and minimum values reported in Tables 2-2 and 2-3 are the absolute extreme values reported across the system, and in many cases they only apply to a very small volume of waste. If required, the user can use the data in the TWBIR Revision 2 database to calculate a "weighted average maximum" value to obtain a maximum value that may be more representative of the total inventory.

The waste material parameters that are inputs to the PA models are presented in Table 2-2 for CH-TRU waste and Table 2-3 for RH-TRU waste. These tables represent the waste material parameters for the WIPP disposal inventory.

2.4 SUMMARY OF WIPP ANTICIPATED INVENTORY FROM EACH SITE

Each WIPP waste stream from each TRU waste site is characterized in a waste stream profile in TWBIR Revision 2. Summary tables of CH-TRU and RH-TRU WIPP waste volumes by site are provided in Tables 2-4 and 2-5.

Table 2-2. WIPP CH-TRU Waste Material Parameter Disposal Inventory*

3. SUPPLEMENTAL DISPOSAL INVENTORY INFORMATION

3.1 INTRODUCTION

This chapter summarizes supplemental information about the WIPP disposal inventory that was requested by SNL/NM in support of WIPP PA either after the publication of Revision 2 of the TWBIR or that was not available from the TRU waste sites at the time of publication of Revision 2 of the TWBIR in December 1995 (DOE, 1995c). Appendices A-1 through A-3 are the three memoranda from SNL/NM requesting supplemental information about the WIPP TRU waste inventory.

The first memorandum from SNL/NM (dated November 6, 1995), entitled "CH and RH-TRU Waste Parameters Potentially Important in WIPP PA" (Appendix A-1), was included as Appendix B in Revision 2 of the TWBIR. This memorandum requested information on certain nonradioactive materials present in the TRU waste (nitrates, sulfates, phosphates, cement, and organic ligands), and also requested information on residues present at TRU waste sites other than Rocky Flats Environmental Technology Site (RFETS). The information on residues was provided in Revision 2 of the TWBIR. However, the remainder of the requested information had to be obtained from the sites after the publication of Revision 2 and is presented in this document.

The second and the third memoranda from SNL/NM (dated January 11 and January 30, 1996), both entitled "Information Needed from TWBIR (Revision 2/Addendum)" (Appendices A-2 and A-3), requested additional information about the WIPP disposal radionuclide inventory. This information is also presented in the main body of this document.

The supplemental information provided to SNL/NM in response to the memoranda referenced above is discussed in the following sections:

- Supplemental Radionuclide Information (Section 3.2)
- Supplemental Information for Other Constituents (Section 3.3)

3.2 SUPPLEMENTAL RADIONUCLIDE INFORMATION

In response to the memoranda requesting radionuclide information (Appendices A-2 and A-3), two sets of radionuclide information were provided in support of WIPP PA (Appendices B-1 and B-2). Appendix B-1 is an update of the WIPP disposal radionuclide inventory presented in Table 3-4 of Revision 2 of the TWBIR, while Appendix B-2 presents preliminary activity calculations for seven radionuclides on a waste stream basis. The memoranda reporting these supplemental data and the details of the methodology for calculations are included in Appendices B-1 and B-2. A summary of the information provided by DOE to SNL/NM and the major assumptions used in deriving portions of the data are presented in Sections 3.2.1 and 3.2.2.

3.2.1 Revised WIPP Disposal Radionuclide Inventory

A revised estimate of the WIPP disposal radionuclide inventory (i.e., Table 3-4 in TWBIR Revision 2) was not specifically requested by SNL/NM in the memoranda included in Appendices A-1 through A-3. However, after the publication of TWBIR Revision 2, new and updated

radionuclide information became available from four sites (Hanford, Oak Ridge National Laboratory [ORNL], RFETS, and Savannah River Site [SRS]). A review of the new information indicated that it may result in considerable changes to the WIPP disposal radionuclide inventory published in Revision 2 of the TWBIR. Therefore, the disposal radionuclide inventory was recalculated on the basis of the new information and the results provided to SNL/NM in a format identical to Table 3-4 in TWBIR Revision 2 (see Table 3-1). The methodology and the assumptions used for recalculation of the radionuclide inventory are identical to those described in TWBIR Revision 2, except that the new radionuclide information from the four sites was incorporated. The new information from the four sites is summarized below:

- Hanford Site reported corrections to the values for Cf-252, Cm-244, and Cm-245 from their earlier submittals for the Integrated Data Base (IDB) (DOE, 1995b).
- Preliminary sludge sampling data were obtained for the ORNL RH-TRU sludges, which showed that the primary uranium isotope present in these sludges is U-238 (not U-235, as reported in their previous IDB submittals). The uranium curies reported for RH-TRU waste in previous ORNL IDB submittals were redistributed based on the preliminary sludge sampling data. This corrected the previously high estimates of U-235 in the ORNL RH-TRU inventory.
- The RFETS provided undecayed yearly activity data for the radionuclides present in the RFETS residues, which enabled activity decay calculations for these radionuclides. This was not provided for in TWBIR Revision 2; therefore the radionuclide activity from these residues could not be decayed.
- The SRS provided a break-up of radionuclide activity data for SRS waste between on-site and off-site waste (i.e., waste from other sites that was shipped to SRS for storage in the early 1970s). The activity from the off-site waste was included in the WIPP disposal radionuclide inventory but excluded from any extrapolations for SRS projected waste under the assumption that there would be no future accumulation of off-site Pu-238 dominant waste at SRS.

Based on the above information, Table 3-1 provides the revised WIPP disposal radionuclide inventory estimated in curies per cubic meter and total curies for each radionuclide for both CH-TRU and RH-TRU waste. The revised stored radionuclide inventory for each site in decayed curies is provided in Appendix C for both CH-TRU and RH-TRU waste. Appendix C includes the effect of all corrections, additions, or revisions to the site radionuclide inventories used to develop Table 3-1 and is an update of Appendix D in TWBIR Revision 2. All numbers in Appendix C are decayed to December 1995 using the Oak Ridge Isotope Generation and Depletion Code (ORIGEN 2) (Croff, 1980; 1983).

Based on the total curies shown in Table 3-1, it is estimated that approximately 98.9 percent of the total CH-TRU curies is contributed by Pu-238, Pu-239, Pu-240, Pu-241, and Am-241. In contrast, approximately 96.5 percent of the total RH-TRU curies is contributed by Cs-137, Sr-90, Ba-137m, Pu-241, and Y-90. Thus, the remaining radionuclides contribute a very small fraction of the total curies for the repository.

In comparison to TWBIR Revision 2, the most significant change in the revised disposal radionuclide inventory shown in Table 3-1 is the decrease in the estimated concentration of Pu-

¹Decayed to December 1995.

²Total curies estimated by assuming a volume of 168,500 cubic meters for CH-TRU waste and 7,080 cubic meters for RH-TRU waste.

³The values for Cf252 and Cm248 are different from the values reported in Attachment A in Appendix B-1 because these incorporate the corrections received from SNL/NM for these isotopes (see Appendix D) after Appendix B-1 was finalized.

*This table is an update of Table 3-4, of TWBIR Revision 2, pages 3-30 through 3-36 (DOE, 1995c)

238 for the CH-TRU waste in the repository. This is primarily due to the exclusion of the SRS off-site waste from any future extrapolations. Since this off-site waste has a high concentration of Pu-238, excluding it from the extrapolations decreases the amount of Pu-238 in the projected portion of the inventory. It should be noted that this off-site waste is included in the stored waste portion of the disposal radionuclide inventory. The decrease in the Pu-238 also causes a decrease in the total estimated curies for CH-TRU waste in the repository.

Based on the data corrections from Hanford Site to the Cm-244 and Cm-245 inventories, the estimated concentration of Cm-244 has increased, while that of Cm-245 has decreased. Similarly, based on the correction to the reported value of Cf-252 from the Hanford Site, the revised concentration of Cf-252 has decreased significantly from the values estimated in Revision 2 of the TWBIR. The effect of decaying the activity from the RFETS residues has resulted in a minor decrease in the estimated concentration of Pu-241. Since Pu-241 decays to Am-241, the decrease in the Pu-241 concentration is also accompanied by a corresponding increase in the concentration of Am-241.

The major change for the RH-TRU waste from TWBIR Revision 2 is the decrease in the estimated concentration of U-235 and an increase in the concentration of U-238. Both are a result of the preliminary sludge sampling data from ORNL mentioned earlier.

3.2.2 Activity Calculations for Waste Streams

As documented in the SNL/NM memoranda in Appendices A-2 and A-3, data on radionuclide activity on a waste stream basis was requested for 21 radionuclides. However, the request was subsequently limited to seven radionuclides by SNL/NM WIPP PA staff (Am-241, Cm-244, Pu-238, Pu-239, Pu-240, Pu-241, and U-234). Appendix B-2 presents the results provided to SNL/NM by DOE/CAO in response to this data request.

Since many sites did not have the ability to provide radionuclide data on a detailed waste stream basis for every waste stream in TWBIR Revision 2, the radionuclide activities for many individual waste streams (especially for projected waste) were not reported by the sites for TWBIR Revision 2. Therefore, the radionuclide activity data for the WIPP disposal inventory cannot be directly obtained on a waste stream basis by running queries on the TWBIR Revision 2 database. Due to the unavailability of detailed radionuclide data on a waste stream basis for many waste streams, the WIPP disposal radionuclide inventory presented in all revisions of the TWBIR has always been developed on the basis of the site-level radionuclide inventories reported by the sites in the IDB.

For the sake of consistency with the revised WIPP disposal radionuclide inventory in Attachment A of Appendix B-1 (which is also based on the site-level IDB data), assumptions were required in order to estimate the waste stream radionuclide activities presented in Appendix B-2. These assumptions can be found in Appendix B-2 and are not reproduced here. Thus, it should be noted that the data in Appendix B-2 are *derived* on the basis of assumptions and not directly obtainable from the TWBIR Revision 2 database. Because of the unavailability of the radionuclide data on a waste stream basis, some of the waste streams from small sites are not included in the activity table in Appendix B-2. Efforts are currently underway to ensure that the sites will be able to provide radionuclide data on a waste stream basis for most waste streams in future updates of the TWBIR so that radionuclide activity data for the WIPP disposal inventory can be directly obtained from the TWBIR database.

3.3 SUPPLEMENTAL INFORMATION FOR OTHER CONSTITUENTS

SNL/NM and DOE/CAO requested supplemental information on several constituents in TRU waste (see Appendix A-1) that were not able to be estimated based on the information reported by the TRU waste sites in Revision 2 of the TWBIR (DOE, 1995c). The information requested can be divided into three general categories which were requested on solidified waste forms destined for disposal in WIPP:

- Complexing Agents
- Nitrate, Sulfate, and Phosphate
- Cement

The TWBIR team worked with those major sites that generate/store most of the solidified waste forms: Los Alamos National Laboratory (LANL), RFETS/INEL, and ORNL. A summary of the results of these supplemental information requests is provided in Section 3.3.1, 3.3.2 and 3.3.3 and the memoranda reporting the data are located in Appendices B-3 through B-7. The detailed methodology for calculating the estimates of these physical/chemical constituents are provided in each memorandum in these Appendices.

3.3.1 Estimate of Complexing Agents in Transuranic Solidified Waste Forms Scheduled for Disposal in WIPP

The information on complexing agents in the waste was provided in a series of three memoranda to DOE/CAO. The initial memorandum, entitled "Preliminary Estimate of Complexing Agents in TRU Waste Forms Scheduled for Disposal in WIPP," provided in Appendix B-3, represents the earliest estimate of complexing agents in the TRU Waste. The Appendix B-3 memorandum was superseded by the second estimate, entitled "Current Estimate of Complexing Agents in Transuranic Solidified Waste Forms Scheduled for Disposal in WIPP," provided in Appendix B-4. After the Appendix B-4 memorandum was issued, preliminary information from the January 1996 data submittal from INEL was received. The data submittal indicated that over 90% of the stored waste at INEL would be vitrified, a process that should destroy complexing agents in TRU waste. Based on the preliminary data from INEL, the estimated amount of complexing agents due to RFETS waste stored at INEL could be reduced from that reported in Appendix B-4. A synopsis of the INEL information is reported in the third memorandum that estimates complexing agents in the waste, entitled "Revision of Current Estimate of Complexing Agents in Transuranic Solidified Waste Forms Scheduled for Disposal in WIPP," provided in Appendix B-5.

Table 3-2 provides a summary of the anticipated mass (in kilograms) of complexing agents in TRU waste reported by RFETS/INEL, LANL, and Hanford. The estimates in Table 3-2 include the anticipated reduction in mass of complexing agents reported from RFETS/INEL based on the preliminary data for proposed vitrification of waste at INEL (Appendix B-5). In addition to the mass of complexing agents reported in Table 3-2, ORNL has provided an estimate of total organic carbon (TOC) in their RH-TRU sludges (Table 3-3). ORNL does not have any analytical data to quantitatively estimate which organic chemicals are responsible for the TOC content of the sludges. However, ORNL has provided a list of chemicals, summarized in Table 3-3, that could contribute to the TOC value reported (see Table 1 in Appendix B-4). It is estimated that most of the TOC in the tanks is not associated with complexing agents, but that has not been verified at this time. As a conservatism, PA calculations can assume that any complexing agents listed in Table 3-3 could form the bulk of the TOC in the ORNL RH-TRU tanks.

Table 3-2. Estimates of Complexing Agents in Transuranic Waste from RFETS, INEL, LANL, and Hanford*

| Compound | Low Estimate (kg) | Recommended Estimate (kg) | High Estimate (kg) |
|---|-------------------|---------------------------|--------------------|
| Ascorbic Acid | 18 | 30 | 34 |
| Acetic Acid | 27 | 44 | 50 |
| Sodium Acetate | 141 | 282 | 333 |
| Citric Acid | 1110 | 1120 | 1130 |
| Sodium Citrate | 51 | 102 | 120 |
| Oxalic Acid | 13700 | 13700 | 13700 |
| EDTA | 3 | 6 | 7 |
| 8-Hydroxyquinoline | 6 | 12 | 14 |
| Tributyl Phosphate | 102 | 111 | 115 |
| 1,10 Phenanthroline | 0.03 | 0.06 | 0.07 |
| Dihexyl-n,n-diethyl carbamoylmethyl phosphonate | 9 | 18 | 22 |

* Refer to Appendices B-4 and B-5 for methodology of calculated estimates.

Table 3-3. Estimate of Total Organic Carbon (TOC) in ORNL Transuranic Sludge Tanks and Possible Complexing Agents that can Contribute to TOC.

| |
|--|
| Total Organic Carbon in ORNL Transuranic Sludge = 3691 kg |
|--|

Possible Complexing Agents and Other Organic Compounds* in ORNL RH-TRU Sludges:

Acetic Acid
Acetone
Adogen-364-HP (~ triluarylamine)
Carbon tetrachloride
Deodorized mineral spirits (Amsco)
2,5-di-tert-butylhydroquinone (DBHQ)
Diethylbenzene (DEB)
Diethylenetriaminepentaacetic acid (DPTA)
Di (2-ethylhexyl) phosphoric acid (HDEHP)
Di-isopropylbenzene (DIPB)
Ethanol
Ether
Ethylenediaminetetraacetic acid (EDTA)
2-ethyl-1-hexanol
 α -hydroxyisobutyric acid
Isopropanol
Methanol
n-dodecane
n-paraffin (NPH)
Oxalic Acid
Thenoyltrifluoroacetone (TTA)
Tributylphosphate (TBP)
Trichloroethylene (TCE)
Xylene

*Adapted from Table 1 in Appendix B-4.

3.3.2 Estimate of Nitrate, Sulfate, and Phosphate Content in Transuranic Solidified Wastes for Disposal in WIPP

Estimates of nitrate and sulfate in solidified TRU final waste forms were provided in the memorandum entitled "Preliminary Estimate for SNL/NM Performance Assessment Calculations of Nitrate, Sulfate, and Phosphate in Transuranic Solidified Wastes Destined for Disposal in WIPP," provided in Appendix B-6. In that memorandum, it is estimated that densities for the overall disposal inventory are as follows: 9.2 kilograms/cubic meter for nitrate and 3.6 kilograms/cubic meter for sulfate. No estimate of phosphate was reported due to lack of sufficient information.

3.3.3 Estimate of Cement in TRU Solidified Waste Forms for Disposal in WIPP

An estimate of cement (portland-based) in solidified TRU final waste forms was calculated in the memorandum entitled "Estimate of Cement Content in TRU Solidified Waste Forms Scheduled for Disposal in WIPP," provided in Appendix B-7. The estimated density of cement over the entire disposal inventory is 48.6 kilogram/cubic meter. This estimate includes both CH-TRU and RH-TRU final waste forms. The portland cement reported is both reacted and unreacted cement in the waste. There are no data available to estimate the percentage of reacted versus unreacted cement in the waste.

5. GLOSSARY

40 CFR Part 191, Protection of Environment. EPA: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and Transuranic Radioactive Wastes – The EPA's environmental standards for the storage (Subpart A) and disposal (Subpart B) of spent nuclear fuel, and high-level and TRU radioactive wastes. This is the primary post-closure standard that applies to WIPP.

Anticipated Inventory – The sum of the stored and projected inventories, as defined in this document.

As-Generated Waste – The chemical and physical status of waste when it is generated.

Buried Waste – TRU waste buried in shallow trenches prior to the 1970 Atomic Energy Commission policy that required TRU waste to be retrievably stored.

Code of Federal Regulations (CFR) – (1) A codification of the general and permanent rules published in the **Federal Register** by the department and agencies of the federal government. The CFR is divided into 50 titles that represent broad areas subject to federal regulation. It is issued quarterly and revised annually. (2) All federal regulations in force are published annually in codified form in the CFR.

Contact-Handled (CH) TRU Waste – Packaged TRU wastes with an external surface dose rate of less than 200 mrem per hour.

Defense Waste – (1) Radioactive waste from any activity performed in whole or in part in support of DOE atomic energy defense activities; excludes waste under purview of the Nuclear Regulatory Commission or generated by the commercial nuclear power industry. (2) Nuclear waste derived mostly from the manufacture of nuclear weapons, weapons-related research programs, the operation of naval reactors, and the decontamination of nuclear weapons production facilities.

Department of Energy Site – A DOE-owned or -controlled tract used for DOE operations. Either a tract owned by DOE or a tract leased or otherwise made available to the federal government under terms that afford to DOE rights of access and control substantially equal to those that DOE would possess if it were the holder of the fee (or pertinent interest therein) as agent of and on behalf of the government. One or more DOE operations/program activities are carried out within the boundaries of the described tract.

Disposal – Emplacement of waste in a manner that assures isolation from the biosphere for the foreseeable future with no intent of retrieval and that requires deliberate action to regain access to the waste. For example, disposal of wastes in a mined geologic repository occurs when all of the shafts to the repository area are backfilled and sealed.

Disposal Inventory – The inventory volume defined for WIPP emplacement to be used for PA calculations is the "disposal inventory." The LWA defines the total amount of TRU waste allowed in the WIPP as 6,200,000 cubic feet (approximately 176,000 cubic meters) (Public Law, 1992b). The "Agreement for Consultation and Cooperation" (C&C Agreement) limits the RH-TRU inventory to 250,000 cubic feet (approximately 7,080 cubic meters) (DOE and State of New

Mexico, 1981). Therefore by difference, the CH-TRU inventory is limited to 5,950,000 cubic feet (approximately 168,500 cubic meters).

Final Waste Form – Consists of a series of WMCs that for PA purposes have similar physical and chemical properties.

Integrated Data Base (IDB) – The latest version of the IDB, the *Integrated Data Base for [1995]: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1995b).

Land Withdrawal Act - The 1992 legislation passed by the U.S. Congress withdrawing the surface land and underlying minerals at the WIPP site from public use, transferring the property from the DOI to the DOE, and enabling the start of the WIPP Test Phase. The LWA sets prerequisites to be met before the start of the Test Phase, such as the repromulgation by EPA of 40 CFR 191 and the concurrence of EPA with the Test Phase Plan (Public Law, 1992b).

Mixed TRU Waste – TRU waste that contains both radioactive and hazardous components as defined by the Atomic Energy Act and the RCRA as codified in 40 CFR Parts 261.3 (EPA, 1980).

Newly Generated Wastes – See Projected Inventory.

Performance Assessment (PA) – (1) A systematic analysis of the potential risks posed by waste management systems to the public and environment and a comparison of those risks to established performance objectives. (2) An analysis that (a) identifies the processes and events that might affect the disposal system, (b) examines the effects of these processes and events on the performance of the disposal system, and (c) estimates the cumulative releases of radionuclides, considering the associated uncertainties, caused by all significant processes and events. These estimates shall be incorporated into an overall probability distribution of cumulative release to the extent practicable. (3) A term used to denote all activities (qualitative and quantitative) carried out to (a) determine the long-term ability of a site/facility to effectively isolate the waste and ensure the long-term health and safety of the public and (b) provide the basis for demonstrating regulatory compliance.

Projected Inventory – That part of the inventory that has not been generated but is estimated to be generated at some time in the future by the TRU waste generator/storage sites. The estimated timeframe may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Radioactive – Term used to refer to an unstable atomic nucleus that decays with the spontaneous emission of ionizing radiation (also see "radionuclide").

Radionuclide – (1) A species of atom having an unstable nucleus, that is subject to spontaneous decay or disintegration and usually accompanied by the emission of ionizing radiation. (2) Any nuclide that emits radiation. A nuclide is a species of atom characterized by the constitution of its nucleus and hence by the number of protons, the number of neutron, and the energy content.

Remote-Handled (RH) TRU Waste – Packaged TRU wastes with an external surface dose rate equal to or exceeding 200 mrem per hour.

Resource Conservation and Recovery Act (RCRA) – (1) Establishes a system for controlling hazardous waste from generation to disposal. (2) A Federal law passed in 1976, and amended under the HSWA of 1984, that established a structure to track and regulate hazardous wastes from the time of generation to disposal. The law requires safe and secure procedures to be used in treating, handling, transporting, storing, and disposing of hazardous substances. RCRA is designed to prevent new uncontrolled hazardous waste sites. The law also regulates the disposal of solid waste that may not be considered hazardous. (3) Specifically, Subtitle D of RCRA governs the management of solid waste. (Note: 40 CFR Parts 260-272 are the regulations for complying with RCRA with respect to hazardous waste and hazardous waste treatment, storage, and disposal facilities.)

Scaling – The process for adjusting the anticipated inventory to equal the maximum authorized disposal inventory of the WIPP repository for the purposes of WIPP performance assessment modeling.

Stored Inventory – That part of the TRU waste inventory currently in retrievable storage as of the time of the last data call for inventory information. Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and does not include any waste that was buried prior to 1970. Stored inventory can be in the "as-generated" form or "final waste form."

Transuranic – Pertaining to elements that have atomic numbers greater than 92, including neptunium, plutonium, americium, and curium; all are radioactive, are not naturally occurring, and are members of the actinide group.

Transuranic (TRU) Waste – (1) Waste containing alpha-emitting radionuclides with an atomic number greater than 92 and half-lives greater than 20 years, at concentrations of TRU isotopes greater than 100 nanocuries per gram of waste. **This core definition appears in modified form in various relevant documents as follows:** (a) For purposes of management, DOE Order 5820.2A: (i) considers TRU waste, as defined above, "without regard to source or form" (*The proposed revision to the Order [DOE Order 5820.2A Major Issues for Revision, May 6, 1992] contemplates removing this clause*); (ii) allows head of field elements to determine that wastes containing other alpha-emitting radionuclides must be managed as TRU waste; and (iii) adds "at time of assay," implying both that the classification of a waste as TRU waste is to be made based on an assay, and that such classification can be superseded only by another assay. (b) For purposes of setting standards for management and disposal, 40 CFR 191.02(i) adds "except for: (i) high-level wastes; (ii) wastes that the DOE has determined, with the concurrence of the EPA Administrator, do not need the degree of isolation required by this part; or (iii) wastes that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61." (2) Waste materials contaminated with U-233 (and its daughter products), with certain isotopes of plutonium, or with other nuclides with atomic numbers greater than 92. In order to be classified as TRU waste, the long-lived alpha activity from subject isotopes must exceed 100 nanocuries per gram of waste material independent of the level of beta-gamma activity. These wastes are produced primarily from reprocessing spent fuel and from the use of plutonium in the fabrication of nuclear weapons. (3) Wastes that are contaminated with radioactive elements heavier than uranium, thus the name trans-(or beyond) uranic.

Waste Acceptance Criteria (WAC) – The criteria used to determine if waste packages are acceptable. For the purposes of this document, WAC refers to WIPP WAC.

Waste Form – The physical form of the waste such as sludges, combustibles, metals, etc.

TRU Waste Sites – The 8 major DOE facilities and several smaller sites throughout the U.S. that generate and store TRU waste.

Waste Isolation Pilot Plant (WIPP) – (1) The project authorized under Section 213 of the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (Public Law, 1979) to demonstrate the safe and environmentally sound disposal of radioactive waste materials generated by atomic energy defense activities. (2) A research and development facility located near Carlsbad, New Mexico to be used to demonstrate a practical, long-term solution to a complex problem: the safe disposal in deep geologic repositories of TRU waste resulting from DOE activities.

Waste Material Parameter – A waste material that occurs in TRU waste that is an input parameter into one (or more) current PA model(s) or is required to adequately describe the waste form.

Waste Matrix Code (WMC) – A DOE-developed coding system for grouping waste streams that have similar matrix constituents, especially for treatment objectives. This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. An example of a WMC for "heterogeneous waste" is 5400 (DOE, 1995a).

Waste Stream – A flow of waste materials with specific definable characteristics that remain the same throughout the life of the process generating the waste stream.

Waste Stream Profile – A description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of the important information about a particular waste stream.

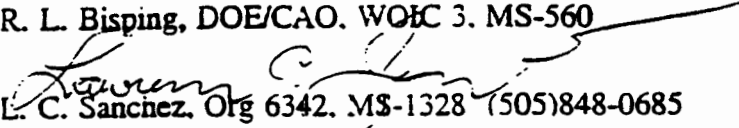

WIPP Waste Profile – Represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical Final Waste Form.

subject : CH and RH-TRU Waste Parameters Potentially Important in WIPP PA

A) Requested PA Data From TWBIR

Below you will find an updated list of waste material parameters that have been identified as being potentially important to the performance analysis of the WIPP repository. It is requested that these parameters be supplied in Rev. 2 of the Transuranic Waste Baseline Inventory Report (TWBIR). Itemized below you will find the two categories of requested waste parameter data.

1) Non-radioactive Materials

The non-radioactive materials are those which influence gas generation potential and those that are needed for mechanical models which predict waste consolidation and shear strength properties. The list of the non-radioactive materials is shown in Table 1.

2) Radionuclide

At this time there are no new requests for additional radionuclide inventory data beyond those previously reported in Rev. 1 of the TWBIR. If there are significant inventory increases in radionuclides due to special circumstances (such as inclusion of residues to the TRU inventory), sufficient footnote explanations should be supplied.

Table 1. Justification of TWBIR Nonradioactive Waste Parameters.

| Waste Parameter | Input Variable in Current PA Models | | Input Variable in PA Models Under Development | Input Variable in Possible Future PA Models |
|--------------------------------------|-------------------------------------|----------------------------|---|---|
| | Gas Generation | Mechanical Characteristics | | |
| Iron-Based Metals and Alloys | X | X | X | X |
| Aluminum-Based Metals and Alloys (a) | | X | X | |
| Other Metals | | X | | ? |
| Other Inorganics | | X | | ? |
| Cellulosics | X | X | X | X |
| Plastics | ½ (b) | X | X (d) | X |
| Rubbers | ½ (b) | X | X (e) | X |
| Solidified Inorganics | | X | X | X |
| Solidified Organics Matrix | | X | X | X |
| Soils (c) | | X | ? | ? |

(a) Future model for PA does not include aluminum.

(b) Only one-half of material is assumed to generate gas.

(c) May impact colloids.

(d) As is.

(e) Percentage of material to generate gas is unknown at the present time.

B) Special Request Non-PA Items

Also wanted at this time is additional information for several waste material characteristics. Although these characteristics have not been identified as waste material parameters to be used for WIPP PA, they are needed for non-PA scoping calculations to assess their influence on PA. Since these items are not currently PA parameters, inventory estimates of these characteristics as "additional information" in the TWBIR or supplied outside of the TWBIR via written correspondence. Below you will find an itemized list of these special request items.

1) Non-radioactive Materials

Additional information is needed on the five waste material characteristics (see Table 2): 1) vitrified wastes, 2) nitrates (NO_3^-), 3) sulfates (SO_4^{2-}), 4) phosphorus, and 5) cement. Of these waste parameters, the last four are needed for the gas generation modeling. The nitrates and the sulfates are involved in the denitrification and sulfate reduction processes which breakup the cellulose, while the phosphorus is a nutrient for biodecay of cellulose. The estimate of the mass quantities of cement in the waste inventory should include both the cement that is contained in the waste as cement itself (due to D&D activities, etc..) and the cement found in various sludges. Cement consumes CO_2 due to its content of $Ca(OH)_2$. The estimates for this non-radioactive waste constituent need only be "best estimates" at this present time so that non-PA scoping calculations can be made to determine their importance on overall repository performance. (Do not generate upper-bound estimates that are overly conservative.)

2) Residues

"Best estimates" are needed for residues, in addition to those already identified at the Rocky Flats Plant (RFP), that have the possibility of being changed from a resource category to a TRU waste category.

3) Organic Ligands (Chelating Agents)

"Best estimates", from currently available information, are needed for major water-soluble organic ligands which are under consideration for the actinide source term (see Table 3). If it is not possible to obtain data from major waste generating sites then supply guidance on how a first-order estimate may be made (from existing information such as process knowledge etc..) so that non-PA scoping calculations can be performed to identify if the presence of these ligands would have any significant impacts. (Do not generate estimates that are overly conservative.) Requested data is for final form "process-level" quantities used in production only for the key sites. If information on the "process-level" values does not exist at the key sites, then "laboratory-scale" values should be used in the requested assessment of the inventory. Should it be determined that more detailed information on organic ligands will be needed, you will be given a specific written request at a future time. This effort should be performed in parallel with the TWBIR. Technical data should be supplied in memorandum form by the end of February 1996 with supporting documentation by the end of March 1996.

**Table 2. Justification of Special Request Non-PA
Non-Radioactive Waste Materials. (a)**

| Waste Parameter | Input Variable in Current PA Models | | Input Variable in PA Models Under Development | Input Variable in Possible Future PA Models |
|---------------------|--|-------------------------------|--|--|
| | Gas Generation | Mechanical Characteristics | | |
| Vitrified (b) | | X | ? | ? |
| Nitrates (NO_3) | X (c) | | X | ? |
| Sulfates (SO_4) | X (c) | | X | ? |
| Phosphorus | X (c) | | X | ? |
| Cement (d) | X | | X | ? |

- (a) Information on these additional waste materials are needed for non-PA scoping calculations for assessment of their importance. These waste characteristics can be reported at the "best estimate" level.
- (b) New waste parameter corresponding to treatment, identified by some of the sites, to be anticipated in the future.
- (c) Input variable is of concern when predicting the rates of microbial action and is used in currently existing reaction path model, which will not become a baseline PA model.
- (d) Any concrete or cement (including dry portland cement) that contains calcium oxide.

**Table 3. Justification of Special Request For Info
On Organic Complexing Agents. (a)**

| Ligand (b) | Discussion (c) |
|--|---|
| 1) Total Complexants | The most valuable information at this time is a "best estimate" of the total amount of water soluble complexing agents (ligands) in the TRU waste matrix. |
| 2) Citrate | Preliminary information indicates that citrate (citric acid) may be the largest used ligand at TRU waste generating sites. Hence, inventory quantities are very important. |
| 3) Lactate | This is an important ligand that is produced by bacteria as part of its own metabolism. What is requested here is a "best estimate" of the quantity of lactate that actually exists in the TRU waste matrix (not just an initial amount supplied as part of a waste stream). However, if this information cannot be developed, then supply information on the initial amount. |
| 4) Oxalate | This is an important ligand that is produced by bacteria as part of its own metabolism. What is requested here is a "best estimate" of the quantity of oxalate that actually exists in the TRU waste matrix (not just an initial amount supplied as part of a waste stream). However, if this information cannot be developed, then supply information on the initial amount. |
| 5) EDTA | This ligand (ethylenediaminetetraacetic acid) is also of major importance due to its common use as a cleaning solvent. |
| <p>(a) Information on these additional waste materials are needed for non-PA scoping calculations for assessment of their importance. The presence of these complexing agents are important for the actinide source term, with respect to increasing the solubility of radionuclides.</p> <p>(b) These items are ranked in the order of their importance in the actinide source term.</p> <p>(c) Also supply any available information that TRU waste generation sites may have on the degradation or decay rates of ligands in current (and expected) waste matrixes if possible. In cases where no information is available, supply guidance on estimating first-order quantities.</p> | |

subject : Information Needed from TWBIR (Rev. 2/Addendum)

I have read Paul Drez's memo [Ref. DEA-1] about the Rev. 2 of the TWBIR [Ref. BIR-1]. When updated values are available, please send me a memo with the WIPP-scale values (CH & RH waste material parameters - Tables 3-2 & 3-3 and CH & RH disposal radionuclide inventory data - Table 3-4). [Note - because the anticipated volume of RH waste is much greater than the WIPP disposal volume, the proper volume that should be used to determine the average waste material parameters should be a "truncated volume", i.e., the truncated volume is equal to the existing stored waste plus only the necessary amount of projected waste necessary to reach the WIPP disposal volume limit.] When regenerating Table 3-4, please add extra columns which also display the "total curies" (in addition to the data displaying the curie volumetric densities) for both CH & RH radionuclides. The volumes to be used for these conversions are: 1) $6.2E+06$ cu.ft. = $175,584$ cu.m. for CH-TRU waste and 2) $0.25E+06$ cu.ft. = $7,080$ cu.m. [the unit conversions for volume were done with the factor 1.0 cu.ft. = $2.832E-02$ cu.m. taken from Ref. SNL-1].

5.95E+06
65 1-12-96

167,504.

65 1-12-96

A second request, which should be documented in a separate memo, is that CH & RH activity loading tables be generated on a per-waste stream basis. The format for the data should look as close to that shown in Table 1 below. It is also needed that the information be made into an ASCII file and placed on a 3.5" diskette (IBM formatted). There are three versions of this table that are needed: 1) values corresponding to stored waste only, 2) values corresponding to projected waste only, and 3) values corresponding to WIPP disposal volume [Note - remember to use the truncated volumes for the RH waste].

subject : **Information Needed from TWBIR (Rev. 2/Addendum)**

With regards to the two requests previously made (Ref. LCS-1), the first is no longer needed and an update is needed for the second.

Since the data in the TWBIR (Ref. BIR-1) for projected waste material parameters and radionuclide inventory is based on data for stored waste (Ref. SC-1), the first request for data values to be volume averaged using truncated volume is not necessary (i.e., it would yield the same values).

For the second request from Ref. LCS-1, it has been identified that not all the radionuclide data in the TWBIR are incorporated in the radionuclide activity loading tables which are used for the human intrusion calculations (Refs. SNL-1 & JG-1). Instead, an abbreviated list of 21 radionuclides is all that should be used to generate the curie loading table (see Table 1 of Ref. LCS-1). The list of the 21 radionuclides (for both CH and RH) are shown in Table 1 below (this list is based on Table I of Appendix of Ref. EPA-1). Also, since the projected waste data is based on stored data, values generated are needed only for WIPP disposal volumes (data separated for stored and projected data would have yielded the same values).

DATE: June 4, 1996
REPLY TO: CAO:NTP:RLB:96-1174
ATTN OF:

SUBJECT: Revised Radionuclide Data in Support of the Compliance Certification Application

TO: Les E. Shephard, Director, Nuclear Waste Management Programs Center, SNL/NM

Please find attached the revised WIPP disposal radionuclide inventory which was previously transmitted to your staff for their use. This inventory has been recalculated on the basis of new radionuclide information recently available from four TRU waste sites: the Hanford site (Hanford), the Oak Ridge National Laboratory (ORNL), the Rocky Flats Environmental Technology Site (RFETS), and the Savannah River Site (SRS). The revised WIPP disposal radionuclide inventory is provided in Attachment A in a format similar to Table.3-4 of Revision 2 of the Transuranic Waste Baseline Inventory Report (TWBIR).

The values in Attachment A were originally based on the extrapolation of the results of preliminary radionuclide decay calculations that were completed by Sandia National Laboratories (SNL) staff on April 8. These preliminary calculations have recently completed the formal quality assurance/quality control (QA/QC) review process by the SNL QA/QC group, and an approved version of these calculations was obtained on Tuesday, April 17. The QA/QC review process produced some changes in the preliminary values, and these changes have been incorporated in Attachment A.

Since the WIPP Performance Assessment (PA) group at SNL required the revised data as soon as possible in support of the Compliance Certification Application (CCA), Attachment A is being supplied as the most current update until the publication of Revision 3 and should be used by the WIPP PA in support of the CCA. As agreed with the SNL WIPP (PA) staff during the videoconference meeting on March 3, 1996, the revised data shown in Attachment A are based on the final waste form volumes published in Revision 2 of the TWBIR. The information in Attachment A will be included in the TWBIR, Rev. 3, as well as that previously supplied on complexing agents, cement content, and nitrate/sulfate/phosphate content, which will be included as an appendix to the TWBIR.

In summary, the revised data in Attachment A incorporates the effect of the following information received from four sites during the past two months:

- Corrections to the values for Cf-252, Cm-244, and Cm-245 reported in earlier Hanford submittals for the IDB.

Printed on recycled paper

June 4, 1996

- Preliminary sludge sampling data from ORNL for the RH-TRU sludges showing the distribution of different uranium isotopes in the sludge: this enabled the redistribution of the uranium curies from previous Oak Ridge IDB submittals and corrected the previously high estimates of U-235.
- Break-up of radionuclide data for SRS waste between on-site and off-site waste (i.e., waste from Los Alamos and Mound that was shipped to SRS for storage in the early 1970s); this enabled more realistic extrapolation of the amount of Pu-238 and Pu-239 in SRS waste.

A description of the step-by-step methodology used to incorporate the new information from the four sites and to develop the revised inventory is provided in Attachment B.

If you have any questions concerning the enclosed information, please contact Mr. Russ Bisping of my staff at (505) 234-7446.

ATTACHMENT - B

This attachment summarizes the major changes to the undecayed radionuclide data based on the new information obtained from four sites since the publication of Rev. 2 of the TWBIR. It also summarizes the methodology used to develop the revised WIPP disposal radionuclide inventories shown in Attachment A.

Major Changes in Data

The major changes to the undecayed radionuclide data from the four TRU waste sites (Hanford, Oak Ridge, Rocky Flats, and Savannah River) are summarized below for each site:

- **Changes to the Hanford Data** - There were a few errors in the undecayed curies reported by the Hanford site for Cf-252, Cm-244, and Cm-245 in their previous IDB site submittals for CH-TRU waste. The corrected estimates of yearly activity for these radionuclides that were provided by the Hanford site have been used for the revised radionuclide inventory calculations. The previous and revised undecayed activity values are shown in Table B-1.
- **Changes to the Oak Ridge Data** - In previous IDB submittals, Oak Ridge reported a very conservative (high) inventory for U-235 in the Oak Ridge RH-TRU waste due to the absence of any sampling data. Recently available mass spectrometry analytical data for the evaporator feed tank sludges at Oak Ridge have provided new distributions of the different uranium isotopes in the RH-TRU sludges showing that the primary uranium isotope by mass is U-238 (not U-235). Since the original IDB data are reported in terms of curies (i.e., not on a mass basis), the TWBIR team used the mass spectrometry data to develop new yearly estimates of activities for each uranium isotope. The previous and revised undecayed activities for uranium isotopes in Oak Ridge RH-TRU waste are shown in Table B-2.
- **Changes to the RFETS residues data** - The RFETS residues were not included in any of the previous IDB submittals because they were not categorized as waste. Therefore, no break-ups were available for the yearly undecayed activity contributed by each radionuclide in the residues and consequently, no radionuclide decay calculations could be performed for the residues in Rev. 2 of the TWBIR. Based on recent estimates provided by RFETS, it was possible to divide the total undecayed curies for each radionuclide present in the residues into yearly activities. The yearly break-up of undecayed curies from each of these radionuclides is shown in Table B-3.
- **Changes to the SRS data** - In previous IDB submittals, SRS had reported the total yearly undecayed curies contributed by each radionuclide in SRS CH-TRU waste and therefore no information was available from the IDB regarding the contribution from off-site waste stored at SRS versus on-site waste that was generated at SRS. Based on recent information available from SRS regarding the on-site versus off-site break-up,

the TWBIR team has divided the total yearly undecayed activities reported in previous SRS IDB submittals into yearly undecayed activities from on-site and off-site waste. The original IDB data and the break-ups are shown in Table B-4.

These new estimates of undecayed radionuclide activities for the four sites and unchanged data for all other sites were provided to SNL staff to perform radionuclide activity decay calculations. The undecayed activity data were decayed by SNL staff to the end of 1995 using the code ORIGEN2. The new decayed radionuclide inventory received from SNL staff has been used to develop the revised WIPP disposal radionuclide inventory shown in Attachment A.

Summary of the Methodology

The methodology used for development of the revised radionuclide inventory is the same as that described in Section 3.6 on pages 3-27 through 3-29 of Revision 2 of the TWBIR with the following exceptions:

- Decayed curies have been used for the RFETS residues (instead of the undecayed curies used in Rev. 2 of the TWBIR)
- Unlike Rev. 2 of the TWBIR, the estimated concentration of U-235 in RH-TRU waste in Attachment A is well within transportation limits for Pu-239 FGE and therefore does not require any adjustments.
- The curies and volumes contributed by TRU waste generated off-site but stored at SRS have been excluded from the process of estimating radionuclide activities for SRS waste to be generated in the future. Only the data for waste that has been generated and stored at SRS since 1970 has been used for this estimation. The curies contributed by the off-site waste stored at SRS are added to the WIPP radionuclide inventory (in a manner similar to the RFETS residues) but they are not included in any data extrapolation for future SRS waste.

APPENDIX B - 2

Department of Energy

Carlsbad Area Office
P. O. Box 3090
Carlsbad, New Mexico 88221

June 12, 1996

To: Dr. Les E. Shephard, Director, SNL

Subject: Preliminary Activities for Selected Radionuclides for CH-TRU Waste Streams

The following information from the Transuranic (TRU) Waste Baseline Inventory Report (TWBIR) team was requested during a meeting with SNL representatives on April 23, 1996. The TWBIR team was requested to calculate the radionuclide activity (total curies) for seven radionuclides (Am-241, Cm-244, Pu-238, Pu-239, Pu-240, Pu-241, and U-234) on a waste stream basis for contact-handled (CH)-TRU waste to be disposed of at the WIPP.

During this meeting, it was agreed that since the radionuclide data used by SNL WIPP PA were based on the site-level radionuclide data from the Integrated Data Base (IDB), the waste stream radionuclide data in curies per cubic meter provided by the DOE sites in Revision 2 of the Transuranic Waste Baseline Inventory Report (TWBIR) would be normalized to the extent necessary for consistency with the IDB data. This letter summarizes the methodology for normalization of the waste stream radionuclide data from the TWBIR Rev. 2 and subsequent scale-up of the normalized data to obtain estimates of the total curies of each of the seven selected radionuclides on a waste stream basis. The results of these calculations are presented in Table 1. Please note that the results in Table 1 are not directly obtainable from the TWBIR database; but all of the data in Table 1 are derived from TWBIR Rev. 2 on the basis of the methodology and assumptions discussed later in this memorandum.

Methodology for Normalization of the Waste Stream Radionuclide Data

The waste stream radionuclide data provided by the sites in TWBIR Rev. 2 were first normalized to be consistent with the site-wide values reported for CH-TRU waste in the IDB using the following step-by-step approach:

- Extraction of Volume and Activity Data from the TWBIR Rev. 2 Database - For each CH-TRU waste stream, the stored and projected final waste form volumes as well as activities in curies per cubic meter (Ci/m³) reported by the sites for the seven selected radionuclides were obtained from the database. All RH-TRU waste streams, non-WIPP waste streams, and waste streams for which no data were reported by the site were excluded.

CAO:NTP:RLB 96-1199

- **Estimation of Undecayed Total Activity for Each Radionuclide at Each Site** - The Ci/m³ value reported for each radionuclide for each waste stream was multiplied by the stored waste volume to obtain the total undecayed activity of each radionuclide for each waste stream. Next, the total undecayed activity for a given radionuclide (e.g., Pu-238) for all waste streams at a given site were added together to obtain the total undecayed activity for each radionuclide at each site.
- **Comparison with IDB Values and Normalization** - The total undecayed activity estimated above for a given radionuclide at a given site were compared with the values reported for the same radionuclide by the same site in their IDB submittal. Based on this comparison, a normalization factor (NF) was developed for each radionuclide at each site as follows:

$$NF = \frac{\text{Total curies reported by the site in the IDB}}{\text{Total curies estimated from TWBIR Rev. 2 waste stream data}}$$

The NFs calculated in this fashion are shown in Table 2. The total activity for each radionuclide for each waste stream was then multiplied by the normalization factor to obtain the total normalized undecayed stored curies on a waste stream basis.

- **Estimation of Decayed Activities** - For each radionuclide at each site, a ratio of the activity decayed to the end of 1995 to the undecayed activity for each of seven selected radionuclides was calculated based on the ORIGEN2 activity decay calculations performed by SNL staff in support of the development of the WIPP disposal radionuclide inventory for the Compliance Certification Application (CCA). The total normalized undecayed stored curies were then multiplied by this calculated ratio to estimate the decayed curies of each radionuclide that are present in the stored volume of each waste stream. Subsequently, the curies from the stored volume were multiplied by the ratio of the projected to the stored volume to obtain the estimated curies for the projected volume of each waste stream.

Methodology for Scale-up of Waste Stream Decayed Activity to WIPP Repository Volume

This step involves scale-up of the estimated decayed activity for each radionuclide present in the stored volume of each waste stream to the WIPP disposal volume for CH-TRU waste, which is 168,500 m³. Since the total WIPP activity for CH-TRU waste for each radionuclide has already been estimated in an earlier memorandum prepared in support of the CCA, it was assumed that the total WIPP activity in curies for each of the seven radionuclides would be equal, for the sake of consistency, to the values reported in the earlier memorandum. For each

radionuclide, a scale-up factor for activity was calculated as follows:

$$SF_a = \frac{\text{Total WIPP Activity from CCA memo} - \text{Total Estimated Activity for Stored Volume (all waste streams)}}{\text{Total Estimated Activity for Projected Volume (for all waste streams)}}$$

These SF_a 's are shown in Table 3. The estimated activity in curies for the projected volume for each radionuclide for each waste stream was then multiplied by the appropriate scale-up factor derived above, and the result added to the corresponding estimated stored activity in curies to obtain the "Scaled Curies" at a WIPP level for the waste stream. These are the values reported in Table 1.

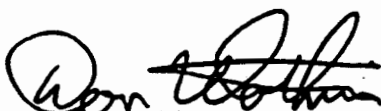

Methodology for Scale-up of Waste Stream Volumes to WIPP Repository Volume

The summation of the total stored and projected volumes for all CH-TRU waste streams is less than the WIPP disposal capacity for CH-TRU waste (i.e., 168,500 m³). However, since the WIPP PA modeling is based on the effect of a full repository (i.e., 168,500 m³ for CH-TRU waste), it is necessary to scale-up the total volume of each waste stream in order to be consistent with the WIPP PA assumptions. This step involves the scale-up of the total volume of each waste stream to the WIPP disposal capacity for CH-TRU waste. A scale-up factor for volume (common to all waste streams) was calculated as follows:

$$SF_v = \frac{\text{WIPP Capacity for CH-TRU Waste (168,500 m}^3\text{)} - \text{Total Stored Volume (all waste streams)}}{\text{Total Projected Volume (for all waste streams)}}$$

This factor is shown in Table 4. The projected volume for each waste stream was then multiplied by the scale-up factor derived above, and the result added to the corresponding stored volume to obtain the "Scaled Volume" at a WIPP level for each waste stream. These are the values reported in Table 1.

If you have any questions concerning the enclosed information, please contact Mr. Russ Bisping of my staff at (505) 234-7446.

DATE: MAR 15 1996
REPLY TO: CAO:NTP:RLB 96-0687
ATTN OF:
SUBJECT: Preliminary Estimate of Complexing Agents in TRU Solidified Waste Forms Scheduled for Disposal in WIPP
TO: Les E. Shephard, Director, SNL/NM

Attached is a copy of the report containing the preliminary estimates of complexing agents in transuranic (TRU) solidified waste forms scheduled for disposal in the Waste Isolation Pilot Plant (WIPP). This information was requested from the Transuranic (TRU) Waste Baseline Inventory Report (TWBIR) team in support of the Performance Assessment (PA) being conducted by Sandia National Laboratory (SNL). Information has been received from the Rocky Flats Environmental Technology Site (RFETS), the Los Alamos National Laboratory (LANL), and the Oak Ridge National Laboratory (ORNL) on potential complexing agents in their solidified waste forms.

The original scope of this request was to ask the TRU waste generator/storage sites about potential "aqueous-soluble chelating agents" in their solidified waste forms. As this subject was researched, two things were realized. First, in lieu of the term "chelating agent," the term "complexing agent" should be used. "Chelating agents" are a subset of "complexing agents" and as such a more complete assessment would cover the presence of potential "complexing agents." Secondly, it was recognized that "aqueous-soluble" is a relative concept in that essentially everything is "aqueous-soluble" at some concentration level. Therefore, the data provided here are for all complexing agents reported by the sites. These data will allow SNL personnel to determine the cutoff of solubility where certain compounds are no longer considered to be of interest for PA calculations.

The final report at the end of March will contain the necessary attached documentation, references, and elaborated text summaries.

If you have any questions concerning the attached information, please contact Mr. Russ Bisping of my staff at (505) 234-7446.

Complexing Agents Site Summaries

ORNL

ORNL has provided a list of organic compounds which contain some aqueous-soluble compounds that are apparent complexing agents. A copy of the list of all compounds reported by ORNL to the BIR team is attached for completeness (Table 1). The list in Table 1 is from an ORNL report on low-level waste, but the same compounds are anticipated to occur in the TRU waste based on process history. ORNL cannot quantify these compounds in their solidified wastes, but have provided an estimate of Total Organic Carbon (TOC) for each TRU waste tank (Table 2). The sum of the TOC from all the transuranic RH-TRU tanks is approximately 3691 kg. It is anticipated that most of the TOC in the tanks is not associated with complexing agents, but that has not been verified at this time. As a conservatism, SNL/NM can assume that any complexing agents listed in Table 1 could form the bulk of the TOC in the ORNL RH-TRU tanks.

LANL

Los Alamos National Laboratory has provided estimates of four complexing agents that are anticipated to occur in their TRU solidified waste streams and as materials used in decontamination and spill clean-up operations (that would occur with the debris wastes). The quantities of these compounds are listed in Table 3.

RFETS/INEL

The information provided by RFETS will also be used to estimate the amount of complexing agents in the RFETS retrievable waste (post 1970) at Idaho National Engineering Laboratory (INEL). Attached is a listing of chemicals from RFETS that was provided to the BIR team as a basis for potential complexing agents in TRU waste scheduled for shipment to and disposal in WIPP. This same list was originally put together as part of the documentation requested by the State of Nevada to document that less than 1% "complexing" agents occur in RFETS solidified low-level "saltcrete" waste that would be shipped to NTS for disposal.

The list was provided as a yearly estimate of complexing agents used on site at RFETS. It is conservative to assume that all of these complexing agents would reside in the TRU waste. Based on the authors understanding at this time, the inventory of RFETS complexing agents is across the entire site, so this should include material expected to occur in the debris wastes (this will be verified for the final version of this memo). The mass of complexing agents reported in Table 3 for RFETS results from multiplying the yearly estimates (in kilograms) by 20 years of production at RFETS (1970-1989), which includes RFETS waste in storage at INEL.

Table 1. Organic chemicals used regularly in the TPP (7920) and TURF (7930) and subsequently discharged to the ORNL LLLW system

| Chemical | Approximate Annual Usage |

United States Government

Department of Energy

memorandum

Carlsbad Area Office
Carlsbad, New Mexico 88221

DATE: March 29, 1996

REPLY TO
ATTN OF: NTP:DW:96-1111

SUBJECT: Current Estimate of Complexing Agents in Transuranic Solidified Waste Forms Scheduled for Disposal in WIPP

TO: Les E. Shephard, Director, SNL/NM

Attached is a copy of the report containing the preliminary estimates of complexing agents in transuranic (TRU) solidified waste forms scheduled for disposal in the Waste Isolation Pilot Plant (WIPP). This information was requested from the TRU Waste Baseline Inventory Report (TWBIR) team in support of the Performance Assessment (PA) being conducted by Sandia National Laboratory (SNL) and is based on input from the following TRU waste sites: Rocky Flats Environmental Technology Site (RFETS), Los Alamos National Laboratory (LANL), Oak Ridge National Laboratory (ORNL), Savannah River Site (SRS), Hanford Operations (Hanford), and Lawrence Livermore National Laboratory (LLNL).

The complexing agent inventories provided in this letter are in response to a Sandia National Laboratory (SNL) request for information from the U. S. Department of Energy (DOE) Carlsbad Area Office (CAO). A copy of the original request for this complexing agent information is contained in Appendix B of Revision 2 of the TWBIR (DOE/CAO-95-1121, December 1995). The documents attached represent the final information requested for this input to the Performance Assessment (PA) and satisfy the commitment on this subject contained in the March 15, 1996, memorandum (CAO:NTP:RLB 96-0687) to respond to SNL before the end of March. It should be specifically noted that all waste inventory volumes quoted are derived from Rev. 2 of the TWBIR.

Tables 1 and 2 provide a summary of Total Organic Carbon (TOC) in the remote-handled (RH)-TRU sludges from ORNL and a list of possible complexing agents that may contribute to the TOC in the sludges. Table 3 provides a summary of specific complexing agents that may be present in the TRU waste for SNL use.

Table 4 summarizes the volume of stored and projected TRU waste that contributes to the estimate of complexing agents in the waste. For contact handled (CH)-TRU waste, greater than 94% of TRU stored and projected final waste forms, greater than 98% of the Solidified Organic final waste forms, and greater than 92% of the Solidified Inorganic final waste forms contribute to the complexing agent estimate. For RH-TRU waste, greater than 86% of TRU stored and projected final waste forms, 100% of the Solidified Organic final waste forms, and 100% of the Solidified Inorganic final waste forms contribute to the complexing agent estimate.

SITE SUMMARY

BACKGROUND

Information has been received from all sites that were requested to provide data on potential complexing agents in their solidified waste forms: Rocky Flats Environmental Technology Site (RFETS), Los Alamos National Laboratory (LANL), and Oak Ridge National Laboratory (ORNL). Several transuranic (TRU) waste sites which either generate no solidified waste forms or small quantities have also responded. A copy of the Carlsbad Area Office (CAO) memorandum requesting the complexing agent information from the sites is included (Attachment 1).

The term "complexing agent" is being used in lieu of "chelating agents" in this memo, since chelating agents usually have a certain structure (chelating comes from the Greek work "chele" for claw, as in a crab) and are considered a subset of complexing agents. That is, the acetate ion will "complex" with some metals and increase their solubility but does not have the structure that would label it as a chelating agent. A "commonly" known chelating agent is EDTA (ethylenediaminetetraacetic acid), which contains functional (acetate) anion groups arranged in parallel which resemble a "claw"-like structure for complexing the cations. EDTA has two claw structures at either end of the molecule.

The original scope of this task was to ask the TRU waste sites about "aqueous-soluble" complexing agents in their solidified waste forms. As this task was researched, the authors realized that the term "aqueous-soluble" is only a relative term, since everything is aqueous-soluble at some concentration level. Therefore, every potential chemical compound that has been reported from the TRU waste sites is included and the task of selecting aqueous-soluble compounds is left to the Sandia National Laboratory (SNL) personnel in charge of Performance Assessment (PA) calculations.

TRU WASTE SITE RESPONSES

Oak Ridge National Laboratory (ORNL)

ORNL has provided a list of organic compounds that contain some aqueous-soluble compounds that are apparent complexing agents. A copy of the list of all compounds reported by ORNL to the TRU Waste Baseline Inventory Report (TWBIR) team is attached for completeness (Table 1). The list in Table 1 is from an ORNL report on low-level waste (Kaiser, 1988), but the same compounds are anticipated to occur in the TRU waste based on process history (but not necessarily at the same concentrations). ORNL cannot quantify these compounds in their remote-handled (RH)-TRU solidified wastes, but have provided an estimate of Total Organic Carbon (TOC) for each RH-TRU waste tank (Table 2). The sum of the TOC from all the RH-TRU tanks is approximately 3691 kg. It is anticipated that most of the TOC in the tanks is not

associated with complexing agents, but that has not been verified at this time. As a conservatism, SNL can assume that any complexing agents listed in Table 1 could form the bulk of the TOC in the ORNL RH-TRU tanks.

Los Alamos National Laboratory (LANL)

LANL has provided estimates of four complexing agents that are anticipated to occur in their TRU solidified waste streams and as materials used in decontamination and spill clean-up operations (that would occur with the debris wastes) (Attachment 2). The quantities of these compounds are summarized in Table 3.

Rocky Flats Environmental Technology Site (RFETS/INEL)

The information provided by RFETS has been used to estimate the amount of complexing agents in the RFETS retrievable waste (post 1970) at Idaho National Engineering Laboratory (INEL). Attached is a listing of chemicals from RFETS that was provided to the TWBIR team as a basis for potential complexing agents in TRU waste scheduled for shipment to and disposal in WIPP (Table 3). This same list was originally put together as part of the documentation requested by the State of Nevada to document that less than 1% "complexing" agents occur in RFETS solidified low-level "saltcrete" waste that would be shipped to the Nevada Test Site (NTS) for disposal (Attachment 3).

The list was provided as a yearly estimate of complexing agents used on site at RFETS. It is conservative to assume that all of these complexing agents would reside in the TRU waste. The inventory of complexing agents is the best estimate for all TRU waste generated across the entire RFETS site, which includes debris wastes. The mass of complexing agents reported in Table 3 for RFETS are arrived at by multiplying the yearly estimates (in kilograms) by 20 years of production at RFETS (1970-1989), which includes RFETS waste in storage at INEL. The yearly estimates can be found in Attachment 3.

Savannah River Site (SRS)

The SRS has provided information (see letter included as Attachment 4) on three complexing agents used on site in connection with their operations: tributyl phosphate (TBP), tri-octyl phosphine oxide (TOPO), and tri-iso octylamine (TiOA). As discussed in the SRS letter, none of these compounds are expected to be found in SRS TRU waste.

Hanford Operations

Hanford Operations has provided a listing from their database of potential chemicals in their TRU waste. The only chemical that appears on the list that might act as a chelating agent in aqueous solutions and has a reportable quantity associated with the waste is tributyl phosphate (TBP). TBP is reported under three different spellings with a total of 92.5 kg. This value is

summarized in Table 3. The entire list of chemicals and the associated quantities (in kg) reported by Hanford are included in Attachment 5.

Lawrence Livermore National Laboratory (LLNL)

LLNL submitted the letter included as Attachment 6 which documents that no chelating agents occur in the LLNL TRU waste streams.

ESTIMATED VOLUME OF TRU WASTE INCLUDED IN COMPLEXING AGENT MEMO

Column 2 of Table 4 contains a list of the total TRU waste destined for disposal in WIPP (stored plus projected to 2022). Column 3 estimates the volume of waste from each major site that has contributed to the estimate of complexing agents in TRU waste. Columns 4 and 5 provide the same data for Solidified Organics and Solidified Inorganics final waste forms. The two rows labeled "PERCENTAGE" provide an estimate of the percentage of waste for which the TRU waste sites have provided data used in estimating the complexing agents in the waste. It should be specifically noted that all waste inventory volumes quoted are derived from Rev. 2 of the TWBIR (DOE, 1995).

REPLY TO
ATTN OF: CAO:NTP:PLB 96-0605

SUBJECT: Additional Transuranic (TRU) Waste Data Request for Sandia National Laboratories' Waste Isolation Pilot Plan (WIPP) Performance Assessment

TO: Distribution

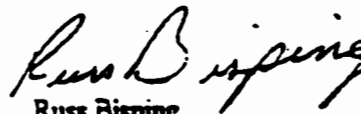

We have been informed by representatives from Sandia National Laboratories (SNL) working on WIPP Performance Assessment (PA) that they require more information on certain TRU waste-related parameters in order to assess their influence on WIPP PA (see attached copy of relevant pages from SNL memo).

Data for most of these parameters have already been received from the sites either through responses to the Baseline Inventory Report (BIR), Revision 2, questionnaire or by discussions with site representatives. However, since the request from SNL for data on water soluble organic ligands (i.e., chelating agents) was not received in time for inclusion in the BIR Rev. 2 data call, WIPP PA still needs data for this parameter. As per the SNL memo, the data are needed by the end of February 1996, and therefore it is being addressed through this request separately from the upcoming BIR Rev. 3 data call.

As documented in the SNL memo, WIPP PA would like to have "best estimates" that are realistic and not overly conservative. Consequently, all sites that have existing data on chelating agents present in their waste are requested to submit the best available information to the BIR technical staff by February 26, 1996. The details on the nature of the information being requested by WIPP PA are being provided in Table 3 of the attachment.

A representative from SNL WIPP PA will be available at the upcoming BIR, Revision 3, Data Call Meeting to be held in Concord, California, on January 10, 1996. We anticipate that a brief presentation will be made at this meeting by WIPP PA staff explaining the importance of the data followed by any questions from site representatives. If you have any questions/clarifications regarding this matter, please be ready to discuss these at the upcoming meeting in Concord with the SNL WIPP PA representative.

Thank you for your continued cooperation.

Russ Bisping
Waste Certification Manager

B) Special Request Non-PA Items

Also wanted at this time is additional information for several waste material characteristics. Although these characteristics have not been identified as waste material parameters to be used for WTPP PA, they are needed for non-PA scoring calculations to assess their influence on PA. Since these items are not currently PA parameters, inventory estimates of these characteristics as "additional information" in the TWBIR or supplied outside of the TWBIR via written correspondence. Below you will find an annotated list of these special request items.

1) Non-radiolactive Materials

Additional information is needed on the five waste material characteristics (see Table 2): 1) verified waste, 2) nitrate (NO_3^-), 3) sulfates (SO_4^{2-}), 4) phosphorus, and 5) cement. Of these waste parameters, the last four are needed for the gas generation modeling. The nitrates and the sulfates are involved in the denitrification and sulfate reduction processes which breaking the cellulose, while the phosphorus is a nutrient for bioactivity of cellulose. The estimate of the mass quantities of cement in the waste inventory should include both the cement that is contained in the waste as cement itself (due to D&D activities, etc.) and the cement found in various sludges. Cement consumes CO_2 due to its content of $Ca(OH)_2$. The estimates for this non-radiolactive waste constituent need only be "best estimates" at this present time so that non-PA scoring calculations can be made to determine their importance on overall repository performance. (Do not generate upper-bound estimates that are overly conservative.)

2) Residues

"Best estimates" are needed for residues, in addition to those already identified at the Rocky Flats Plant (RFP), that have the possibility of being changed from a resource category to a TRU waste category.

3) Organic Ligands (Chelating Agents)

"Best estimates", from currently available information, are needed for major water-soluble organic ligands which are under consideration for the residue sources area (see Table 3). If it is not possible to obtain data from major waste generating sites then supply guidance on how a first-order estimate may be made (from existing information such as process knowledge etc.) so that non-PA scoring calculations can be performed to identify if the presence of these ligands would have any significant impacts. (Do not generate estimates that are overly conservative.) Requested data is for final form "process-level" quantities used in production only for the key sites. If information on the "process-level" values does not exist at the key sites, then "laboratory-scale" values should be used in the requested assessment of the inventory. Should it be determined that more detailed information on organic ligands will be needed, you will be given a specific written request at a future time. This effort should be performed in parallel with the TWBIR. Technical data should be supplied in memorandum form by the end of February 1996 with supporting documentation by the end of March 1996.

**Table 3. Justification of Special Request For Info
On Organic Complexing Agents. (a)**

| Ligand (b) | Discussion (c) |
|--|---|
| 1) Total Complexants | The most valuable information at this time is a "best estimate" of the total amount of water soluble complexing agents (ligands) in the TRU waste matrix. |
| 2) Citrate | Preliminary information indicates that citrate (citric acid) may be the largest used ligand at TRU waste generating sites. Hence, inventory quantities are very important. |
| 3) Lactate | This is an important ligand that is produced by bacteria as part of its own metabolism. What is requested here is a "best estimate" of the quantity of lactate that actually exists in the TRU waste matrix (not just an initial amount supplied as part of a waste stream). However, if this information cannot be developed, then supply information on the initial amount. |
| 4) Oxalate | This is an important ligand that is produced by bacteria as part of its own metabolism. What is requested here is a "best estimate" of the quantity of oxalate that actually exists in the TRU waste matrix (not just an initial amount supplied as part of a waste stream). However, if this information cannot be developed, then supply information on the initial amount. |
| 5) EDTA | This ligand (ethylenediaminetetraacetic acid) is also of major importance due to its common use as a cleaning solvent. |
| <p>(a) Information on these additional waste materials are needed for non-PA scoping calculations for assessment of their importance. The presence of these complexing agents are important for the actinide source term, with respect to increasing the solubility of radionuclides.</p> <p>(b) These items are ranked in the order of their importance in the actinide source term.</p> <p>(c) Also supply any available information that TRU waste generation sites may have on the degradation or decay rates of ligands in current (and expected) waste matrices if possible. In cases where no information is available, supply guidance on estimating first-order quantities.</p> | |

SUBJECT: CHELATING AGENTS IN LANL WASTE

I am certain that I have not captured all chelating agents, but I believe that I have identified and quantified roughly the important materials. The chelators are found in three waste streams:

- 1) Cemented evaporator bottoms from TA-55
- 2) Cemented sludge from the TA-50 Pretreatment Plant and dewatered sludge from the TA-50 Liquid Waste Treatment Plant
- 3) Combustible waste from TA-55

The three streams are summarized below.

It should be noted that waste generation data and analyses exist over the time frame of 1980 through 1995 or shorter intervals to support the estimated values. In some cases, quantitative data is almost nonexistent and the results are qualitative at best. Like Rocky Flats, plutonium processing at LANL attempts to avoid chelating agents which can interfere with recovery operations. From your list of compounds of interest, I am unaware of any significant usage of lactate or EDTA, so they have been eliminated from detailed consideration. I have added ascorbate which has been used as a reducing agent in HCl solutions, but not in nitric acid which attacks and decomposes ascorbate. One of the above streams is not an immobilized stream, but I believe that it is an important contributor of a soluble chelating agent in the form of citrate. If this information is extraneous to your purposes, just ignore it.

Cemented evaporator bottoms from TA-55. The evaporator bottoms are derived from nitric acid solutions some of which (27%) contain oxalate resulting from the precipitation of plutonium oxalate. Because of the pervasive usage of oxalate, it is contained at lower concentrations even in those solutions that do not arise from filtering an oxalate precipitate. Those numbers are based on analytical results. In addition the drums contain on the average, 3.2 liters of analytical solution residues. Those solutions contribute a negligible additional quantity of oxalate and small quantities of ascorbate, citrate and acetate. We have semi-quantitative values from the analytical organization for those chelators, based on the quantities used in the analytical processes that give rise to the residues. We know that 28 liters of solution went into a drum of cemented waste on the average from 1980 through June of 1988. Since that time, the average has been 43 liters of solution. In addition we have information regarding the number of drums generated from May, 1987 through April, 1995. The drum numbers and alternate cemented forms

for the remaining years are estimated. The totals based on those data and estimates are shown here.

| | | | |
|-----------|---------|-----------------|--------|
| oxalate | 1600 kg | 90.04 / 88.04 | = 1.02 |
| ascorbate | 7 kg | 176.14 / 175.14 | = 1.00 |
| citrate | 0.5 kg | 192.14 / 191.14 | = 1.00 |
| acetate | 10 kg | 60.05 / 59.05 | = 1.02 |

Cemented sludge from the TA-50 Pretreatment Plant and dewatered sludge from the TA-50 Liquid Waste Treatment Plant. Based on experience at the liquid waste treatment plant with upsets in the treatment process due to the presence of chelators in the waste stream, it has been assumed that TA-55 is the only significant source of chelating agents in the sludge generated at that facility. Three waste lines carry liquids from TA-55 to TA-50. The industrial waste line is thought to be reasonably free of chelating agents. The evaporator distillate in the process acid waste line is unlikely to contain significant quantities of chelators because the distillation process creates a sharp reduction in the content of nonvolatile solution species.

The process caustic waste line solution is dominated by oxalate filtrates in hydrochloric acid that have been subjected to caustic treatment and filtration. Under the conditions of that treatment the oxalate and ascorbate (used historically) are soluble and follow the solution to TA-50 for a ferrofloculation treatment. The solution is used to neutralize the nitric acid distillate. Because there is an excess of nitric acid, the neutralization is completed with the addition of stock sodium hydroxide. I have assumed that the short term excess of nitric acid decomposes the ascorbate leaving only the oxalate. I have estimated the oxalate concentration in the hydroxide filtrate at 0.075 moles/liter. If this number drives the calculation then we should sample the solution in the caustic holding tank at TA-50 and get a representative value.

Volumes of caustic solution generated by TA-55 were available for the years 1983 and 1986 through 1992. Volumes for all other years were estimated. I am assuming that the oxalate will appear in the sludges due to the low solubility of calcium oxalate and because the floculations have relatively high concentrations of calcium. In addition magnesium and aluminum oxalates are insoluble in a caustic environment. The oxalate precipitates will be found in the cemented sludge, whenever generated, and in the dewatered sludge from the early and middle 80's. These oxalates will also be found in the cement-filled corrugated metal pipe (CMP) waste stream generated at DP site when plutonium operations were located there. The total of oxalate in those waste streams is 11,800 kg. = 12070

Combustible waste from TA-55. The combustible waste stream contains rags that were used in decontamination and spill clean-up operations. In spill clean-up the rags from the first pass are nearly always TRU waste as measured on our MEGAS assay instrument. The rags are dampened with a solution labeled "versene". Versene is a name for EDTA. In the very early days of the laboratory versene solution may have contained EDTA, but it had been changed to sodium citrate solution by the time I arrived in 1969. Drums of combustible waste do not usually contain only decontamination rags and often contain no

March 12, 1996

such rags. However our waste management personnel apparently used a unique identifier over about a four year period (1987 to 1991) for the decontamination rags. Each item also had a net disposal weight associated with it. Thus I was able to get a handle on the weight of decon rags generated in that time frame. The rags were discarded not dripping but distinctly damp. I dampened some cheesecloth, weighing before and after, to estimate the weight of solution contained in the rags. Knowing the weight of solution and the concentration of the citrate, I was able to calculate a weight of citrate in the discarded rags. In May, 1991 the usage of citrate for decontamination was restricted to certain matrices. I was able to locate records for versene solution preparation from 1989 into early 1991 and then again for the past year so I could understand usage before and after 1991. From that I have estimated the usage for the remaining years. With that information, I have estimated that the citrate contained in the combustible waste stream from 1971 to 2033 will be 1100 kg.

Albuquerque, New Mexico 87106-3345

Dear Mr. Teak:

**FY96 TRANSURANIC WASTE BASELINE INVENTORY REPORT (TWBIR):
RESPONSE TO THE TWBIR MEETING MINUTES REGARDING CHELATING
AGENTS AND CONCRETE STABILIZATION (U)**

The Savannah River Site (SRS) has reviewed its waste practices to determine whether chelating agents are present in retrievably stored TRU waste. SRS also has reviewed these practices to determine whether concrete has been used to solidify/stabilize TRU waste. These reviews revealed that SRS TRU waste streams do not currently contain chelating agents/complexants nor has SRS used concrete to solidify/stabilize TRU waste.

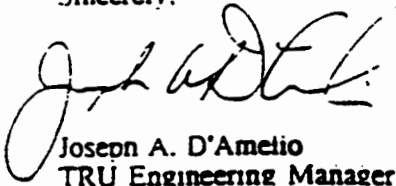

The Separations processes and the analytical/research laboratories at SRS have used chelating agents in the separation of plutonium from irradiated uranium and other materials. For example, tri-butyl phosphate (TBP) is the complexing agent used in SRS's PUREX process and many other laboratory processes. Also, agents such as tri-octyl phosphine oxide (TOPO) and tri-iso octylamine (TIOA) have been used or investigated through the years. However, none of these chelating agents/complexants has entered SRS TRU waste. The complexants are dissolved in organic solvents for use as liquid/liquid extractants in the separation process. These solvents are recycled until depleted and then discarded to SRS's solvent waste tanks in the Waste Disposal Facility. This means that SRS organic liquid streams have not entered the production lines (e.g., HB and FB-Lines) where most of SRS TRU waste is generated. Further, a small amount of liquid TBP containing TRU nuclides is generated by SRS laboratories. This laboratory waste is discarded to liquid waste streams, which are eventually disposed in SRS's High Level Waste Tanks. So, none of these liquid streams that contain complexants have entered SRS solid TRU waste streams.

SRS has not used concrete to solidify/stabilize TRU waste. The processes that generate slurries, which require stabilization, do not contain TRU radionuclides (e.g., plating of depleted uranium). For other processes that generate slurries, the waste is disposed in SRS's High Level Waste Tanks. Even the Low Level Waste (LLW) sludge generated by SRS's Effluent Treatment Facility (ETF) is disposed in the High Level Waste Tanks and is eventually

ted to SRS's Saltstone Facility or the Defense Waste Processing Facility (DWPF). Finally, SRS does not expect to generate TRU waste containing chelating agents nor anticipate using concrete to solidify/stabilize TRU waste in the near-future.

Please direct your questions to L. Williams (803) 557-6759

RE: Additional TRU Waste Data Request for Sandia National Laboratories' Waste Isolation Pilot Plant Performance Assessment

References: 1) Memorandum, Russ Blasing, DOE/CAO to Distribution, same subject, dated January 5, 1996.

2) Trip Report, F. M. Coony to K. L. Hladak, January 15, 1996

The Reference 1 memo requests additional data on waste soluble organic ligands (i.e. chelating agents) from the generating sites by February 28, 1996.

Hanford's approach for responding to the additional data request is presented in the Reference 2 trip report. The first item of this approach is to provide SNL through CTAC, a list of all hazardous constituents, and their quantities, that have been reported in solid TRU waste at Hanford since 1987, the date of the By-Product Rule.

The list of hazardous constituents and their quantities, from Hanford's record container tracking system, are presented in Table 2. The chemical names have been truncated to 30 characters. Hanford can provide complete names if needed. In some cases, the constituent is listed more than once because the constituent is spelled differently in the container tracking system. A quantity of 0.00 kg means typically that the constituent has been identified solely because it is a listed hazardous waste under RCRA. In these cases, the quantity is either absent or minimal.

Please evaluate the list of constituents, and indicate, in the space provided for each constituent, if the constituent is a soluble organic ligand. The suggested nomenclature is the following:

- N/A (meaning not soluble organic ligand)
- C (meaning citrate)
- L (meaning lactate)
- OX (meaning oxalate)
- EDTA (meaning ethylenediaminetetraacetic acids)

Please indicate any other relevant information by footnotes.

To meet the requested due date, please provide a response to me (by fax) no later than February 5, 1996. Please copy CTAC on the response.

If you have any questions, please contact Mike Coony at 509-376-9774 or Mark Kerns at 509-372-2383.

WASTE CERTIFICATION PROGRAM

WCP96-055

March 7, 1996

Jim Teak
Advanced Sciences Incorporated
6739 Academy Road NE
Albuquerque, NM 87109

Dear Jim,

This is in response to the CAO request concerning the presence of organic ligands (chelating agents) in TRU waste. I have consulted with Joe Magana, a chemist working in LLNL's Plutonium Facility. He tells me that there are no chelating agents in LLNL's TRU waste.

Sincerely yours,

A handwritten signature in cursive script that reads "Kem Hainebach".

Kem Hainebach, Ph. D.
Waste Certification Engineer

APPENDIX B - 5

memorandum

Carlsbad Area Office
Carlsbad, New Mexico 88221

DATE: June 26, 1996
REPLY TO
ATTN OF: CAO:NTP:DW 96-1528
SUBJECT: Revision of Current Estimate of Complexing Agents in Transuranic Solidified Waste Forms Scheduled for Disposal in WIPP
TO: Dr. Les E. Shephard, Director, Nuclear Waste Management Programs Center, SNL

The mass of potential complexing agents in transuranic (TRU) waste generated at the Rocky Flats Environmental Technology Site (RFETS) and currently stored at RFETS and Idaho National Engineering Laboratory (INEL) was previously estimated in our March 29, 1996 memorandum, CAO:NTP:DW 96-1111, (Subject: "Current Estimate of Complexing Agents in Transuranic Solidified Waste Forms Scheduled for Disposal in WIPP"). Per our May 3, 1996 discussion, this information has been revised based on assumed or anticipated activities to be performed on the waste prior to final waste form generation.

The assumed or anticipated activities upon which these revisions were made are based on the preliminary submittal by INEL for Revision 3 of the TRU Waste Baseline Inventory Report (TWBIR). From this submittal, a very high percentage of INEL waste will be thermally treated and most complexing agents should therefore be destroyed by the treatment. A methodology is presented for estimating the amount of complexing agents that will be destroyed by the proposed thermal treatment at INEL. Using Ethylene Diamine Tetraacetic Acid (EDTA) as an example, the original estimate of 23 kg in RFETS waste (stored at INEL and RFETS) has been reduced to a recommended value of 5.9 kg with a high range estimate of 6.9 kg and a low range estimate of 2.9 kg. All other complexing agents reported from RFETS (including that in storage at INEL) in the previous letter should also be reduced by the same methodology.

The original inventory estimates provided in the above referenced letter were based on the following information contained in the original transmittal:

- Estimates provided by the TRU waste sites on the amount of anticipated complexing agents in TRU waste which are summarized in Tables 1, 2, and 3 from TRU waste site memoranda in Attachments 1 through 6.
- Volumes from Revision 2 of the Transuranic Waste Baseline Inventory Report (TWBIR) used in Table 4.

In Revision 2 of the TWBIR, the volumes used for waste stored at the INEL were assumed to be unprocessed through any type of treatment (i.e., thermal) that would destroy potential

Printed on recycled paper

complexing agents. There was a small percentage of RFETS waste (~33%) stored at INEL scheduled for processing by thermal treatment in the TWBIR, Revision 2. Because these percentages of waste scheduled for thermal treatment were low, no credit was assumed in the original letter for the destruction of potential complexing agents occurring in RFETS TRU waste stored at INEL. This assumption also provided a conservative estimate of the potential complexing agents in TRU waste.

However, the INEL preliminary submittal received for Revision 3 of the TWBIR contains a much higher percentage of waste that will be processed thermally prior to shipment to WIPP for disposal. This much higher percentage of RFETS TRU waste that will be thermally processed will make a significant impact on the calculated amounts of potential complexing agents in TRU waste.

As stated in the original letter, most of the complexing agents were expected in the solidified waste forms, particularly in the solidified inorganic waste forms, since Sandia National Laboratory/New Mexico (SNL/NM) was only requesting information on "aqueous-soluble" complexing agents.

The RFETS estimate (Attachment 3 of the original letter) included all known sources (as of the time frame of the RFETS memo) of complexing agents regardless of what waste forms the chemicals occurred in the waste. Discussions with RFETS indicate the most likely occurrences of complexing agents in the waste would be:

Solidified Lab Waste> Solidified Inorganic Sludges> Debris Wastes

Based on the above relative occurrence for complexing agents, three estimates of the effects of extensive planned thermal treatment of RFETS waste at INEL can be made to modify the mass of chelating agents estimated in the original letter.

Tables AD-1, AD-2, and AD-3 summarize the calculations of the amount of decrease of complexing agents for RFETS in storage at INEL using EDTA as an example:

ASSUMPTIONS

- As stated in the original letter, RFETS was in production for 20 years (1971-1990) during which retrievably stored (post 1970) production waste would have been generated. Buried waste is not part of the WIPP inventory in the TWBIR.
- RFETS stopped shipments of waste to INEL initially in October 1988, then shipped additional quantities of waste from March to August 1989.

- Assuming that RFETS essentially caught up on their backlog of waste during the second shipping period and a modest lag of 2 months from date of closure to actual shipping, effectively provides the beginning of July 1989 as the date for TRU waste accumulation at RFETS.
- Therefore, it is assumed that 18 months (1.5 years) of production waste still exists at RFETS in storage and 18.5 years of post 1970 production waste is in storage at INEL.

CALCULATIONS

As shown in Table AD-1 (for Solidified Lab waste - Content Codes 004 and 113), using EDTA as an example:

- 347.7 m³ of CH-TRU waste is in storage at INEL.
- 280.1 m³ will be vitrified, and
- 67.5 m³ will be set aside for direct shipment to WIPP (including 0.33 m³ for macroencapsulation)
- Therefore, 80.58% will be vitrified
- RFETS provided an EDTA generation rate of 1.15 kg/year (Attachment 3 of Original Complexing Agent Memo)
- 1.15 kg/year x 18.5 years = 21.3 kg EDTA at INEL in storage
- 1.15 kg/year x 18.5 years generation in storage at INEL x 80.58% vitrification of waste = 17.1 kg of EDTA destroyed by vitrification
- Therefore, 4.1 kg of EDTA (21.3 minus 17.1 kg) will be left in the untreated waste at INEL scheduled for shipment and disposal in WIPP
- The total EDTA in RFETS waste (both in storage at INEL and RFETS) = 4.1 kg (untreated waste at INEL) + 1.15 kg/year x 1.5 years (in storage at RFETS) = 5.9 kg

Since Content Codes 004 and 113 are the waste forms most likely to have the complexing agents, 5.9 kg of EDTA is the RECOMMENDED VALUE for performance assessment.

Dr. Les E. Shephard

- 4 -

June 26, 1996

Using similar methodology in Tables AD-2 and AD-3, estimates of EDTA (after treatment at INEL) are 6.9 kg (assuming the distribution of treatment for all inorganic solidified waste forms - 75.68% treated) and 2.9 kg (assuming the distribution of treatment for all RFETS waste in storage at INEL - 94.44% treated).

The value of 5.9 kg of EDTA is the recommended value, since Content Codes 004 and 113 are the waste forms expected to contain the majority of the complexing agents. The other two values, 6.9 kg for inorganic solidified waste and 2.9 kg for all treated RFETS waste, should be considered lower and upper bounds on this analysis. In particular, the 2.9 kg is a nonconservative estimate because INEL is planning to vitrify almost all their debris waste, particularly the organic debris waste, which may contain some EDTA from wipeup of spills, but is expected to be the least contributor to the overall complexing agents in the waste.

All other complexing agents from RFETS should be reduced by the same percentages for those values reported in Table 3 of the original complexing agent letter.

If you have any questions concerning the attached information, please contact Mr. Russ Bisping or my staff at (505) 234-7446.

SUBJECT: Preliminary Estimate for SNL/NM Performance Assessment Calculations of Nitrate, Sulfate, and Phosphate Content in Transuranic Solidified Wastes Destined for Disposal in WIPP

TO: Dr. Les Shephard, SNL/NM

Attached is a copy of the report containing the preliminary estimates for the nitrate, sulfate, and phosphate contents in solidified transuranic (TRU) wastes destined for the Waste Isolation Pilot Plant (WIPP). This information was requested by your staff from the Transuranic (TRU) Waste Baseline Inventory Report (TWBIR) team in support of the Performance Assessment efforts.

Briefly, the enclosed document provides estimates of the average density and total mass of nitrate and sulfate in TRU waste to be disposed of at the WIPP. These values have been estimated based on data obtained from the TRU waste generator/storage sites during the TWBIR preparation process. From these data, the average densities scaled over the entire WIPP disposal inventory are 9.2 kg/m^3 for nitrate and 3.6 kg/m^3 for sulfate. The total masses scaled over the entire WIPP disposal inventory are $1.6\text{E}+06 \text{ kg}$ for nitrate and $6.3\text{E}+05 \text{ kg}$ for sulfate. These densities and masses are for combined CH and RH TRU waste inventories. No value for phosphate has been proposed due to the lack of sufficient information. Trace quantities of inorganic phosphate might be expected in some of the sludges and solidification agents, but no supporting analytical data are available to support a specific value. This is discussed in the enclosed report.

If you have any questions concerning the attached information, please contact Mr. Russ Bisping of my staff at (505) 234-7446.

Preliminary Estimates of Nitrate, Sulfate, and Phosphate Content in Transuranic Solidified Wastes

I. INTRODUCTION

This report provides preliminary estimates of the amount of nitrate, sulfate, and phosphate expected to be in the transuranic (TRU) inventory that will be transported to and disposal of at the Waste Isolation Pilot Plant (WIPP) (Appendix B: DOE, 1995). Tables 1 and 2 of this report provide the volumetric basis for the nitrate and sulphate estimates, and Tables 3, 4, and 5 provide the calculational methodology. No quantifiable sources of phosphate have been identified in the Inorganic Solidified final waste forms at present. Trace quantities might be expected in some of the sludges and solidification agents, but no data currently exist to support this.

II. BACKGROUND

These **PRELIMINARY** estimates are made based on the following:

- Values presented are those expected for the final waste forms to be disposed of at WIPP.
- Information has been requested from sites based on Solidified Inorganic and Solidified Organic waste forms only, and is the best available data from the TRU waste generator/storage sites:
 - The main source of nitrate is anticipated to be from the Solidified Inorganic waste forms, which in most cases, are sludges produced from the neutralization/solidification of nitric acid-based solutions used at the TRU waste generator/storage sites. Nitrates are very soluble in aqueous solutions and generally do not produce precipitates in the sludges. The nitrates are generally thought to be present as ions sorbed on precipitates or as interstitial solution, trapped in the precipitated sludges prior to solidification.
 - Minor amounts of nitrate, as evaporites, are anticipated in the debris waste forms that will be acceptable for WIPP disposal, but insufficient data are available to estimate the amount of such TRU waste at this time.
 - The main sources of sulfates are anticipated to be: 1) chemicals (e.g. iron sulfates) added to the inorganic solutions at the time of flocculation and precipitation of sludges, and 2) the use of Envirostone [a gypsum (CaSO_4) based solidification material] for solidification of inorganic and/or organic solutions/sludges at some TRU waste generator/storage sites.

No quantifiable sources of phosphate have been identified in the Solidified Inorganic final waste forms at present. Trace quantities might be expected in some of the sludges and solidification agents, but no supporting analytical data are available. The quantities of inorganic phosphate are anticipated to be low in inorganic sludges based on process histories at TRU waste sites.

Analytical data in Attachment 2 provide only "less than 0.0025" weight percent values for phosphate, which are similar to the 0.001 weight percent estimate provided by LANL in Attachment 1. These values are too low to make any reliable estimate of phosphate in TRU waste, but indicate that the quantities will be very small, compared with the nitrate and sulfate values reported. The phosphate value of "40%" reported on page A2-7 is an analytical error. Based on process knowledge and the lack of cations to support such a large value of phosphate in that particular analysis, no such value is possible.

III. GENERAL VOLUME CALCULATIONS

A. Nitrate

1. Nitrate Assumptions

The amount of nitrate is estimated on the basis of the volumes of Solidified Inorganics, which are calculated as explained below:

- Table 1 lists (in Column 2) the final waste form volumes of Solidified Inorganics for Contact-Handled (CH) TRU and Remote Handled (RH) TRU from Figures 3-9 and 3-16 of Revision 2 of the TWBIR (DOE, 1995) for the anticipated WIPP inventory (stored plus projected volumes until 2022).
- Footnotes in Columns 3 and 4 indicate why certain volumes of waste have been eliminated from further consideration in the calculations:
 - Footnote 1 eliminates those volumes of chemically precipitated Solidified Inorganics for which no nitrate estimates in the waste are available. An estimate of the nitrate contribution from these Solidified Inorganics will be accounted for in the scaling process.
 - Footnote 2 eliminates the volume of Solidified Inorganics from SRS from further consideration because it is a "vitrified" waste form which should not contain any significant amount of nitrates due to the thermal treatment proposed for that waste form.

- Footnote 3 eliminates from further consideration those volumes of Solidified Inorganics which represent non-precipitated particulates (e.g., incinerator ash, graphite fines, etc.) which have been cemented to meet the WIPP WAC; nitrates are not expected to be present in these particulates.
- Rocky Flats Environmental Technology Site (RFETS) and Los Alamos National Laboratory (LANL) have provided analytical data/estimates for nitrate in Solidified Inorganics. The RFETS data has been used also for the RFETS waste stored at INEL.

2. Nitrate Mass Calculations

Table 3 contains in Column 1 a list of those waste streams that contain the volume of waste from each TRU waste generator/storage site listed in Column 4 of Table 1. The additional data provided are:

- Column 2 lists the Item Description Codes (IDCs) for waste streams produced at RFETS and/or stored at INEL. The RF111 designation is for Content Code 111 from RFETS, where the IDC is not specified.
- Column 3 lists the stored + projected volume for each waste stream.
- Column 4 lists the sum of the waste material parameters (WMP) for each waste stream from the individual Waste Stream Profiles in Revision 2 of the TWBIR. Exceptions to this rule are listed in footnotes in Table 3.
- Column 5 lists the mass of the waste for each waste stream which is the product of multiplying Columns 3 and 4.
- Column 6 lists the values of nitrate used for each waste stream. The sources of these values are:
 - For RFETS, the nitrate values are from Appendix I of Revision 2 of the TWBIR. The 8% values for IDC 001 has also been applied to IDCs 002 and 007 at both RFETS and INEL. All these IDCs represent "older" methods of solidification where the sludges contain portland cement mainly as a sorbent interlayered with sludge which did not contain diatomaceous earth (see Clements, 1982 for drawings).

The 4% value listed in Appendix I of the TWBIR for IDC 807 represents a "newer" method of solidification where diatomaceous earth is used as a vacuum filtration agent and portland cement is mixed with the resulting sludge to form a "monolithic" solidified final waste form. The dilution with diatomaceous earth and additional portland cement lowers the overall nitrate value of the final waste form.

- For waste stream IN-W315.601, Clements (1982) indicates that the waste stream is made up of approximately 60% NaNO_3 and 30% KNO_3 (assumed weight percents). This calculates as 62% nitrate.
- Attachment 1 represents a memo from LANL that provides estimates for nitrates in the waste streams. Note that the Envirostone process only accounts for a small percentage of stored volume for 3 of the waste streams. The values quoted in Column 6 are based on the small percentage of Envirostone solidification agent in the overall waste streams.
- Column 7 represents the mass of nitrates in kg which is the product of multiplying Columns 5 and 6.

B. Sulfate

1. Sulfate Assumptions

- To determine the amount of solidified wastes that need to be considered for calculating the sulfate content of the WIPP inventory (Table 2), the volume of Solidified Organics must be added to the volume of Solidified Inorganics from Table 1:
 - The Solidified Organics from Figures 3-10 and 3-17 of Revision 2 of the TWBIR (DOE, 1995) have been added to Table 1 (above) to produce Table 2
 - LANL has used an Envirostone (gypsum-based) process for solidification of inorganic sludges in the past (approximately 9% of 4888 m³ in storage at LANL) but plan to eliminate the process in the future and only use portland-based cement for solidification (as was used in the past prior to usage of the Envirostone)

- Since the mid 1980's, RFETS has used an Envirostone solidification process for their organic sludges. Therefore, some of their waste in storage and projected contain large amounts of sulfate, as well as some Solidified Organics in storage at INEL.
- LLNL is the only other TRU waste site known to be using Envirostone for the solidification of organic liquids/sludges (approximately 7 m³ stored/projected).

2. Sulfate Mass Calculations

The sulfate calculations presents in Table 4 follow the same format as the nitrate calculations in Table 3. The origin of the values used for sulfate in the RFETS, INEL, LLNL, and LANL waste streams are summarized below:

- **RFETS/INEL**

- The 0.11 % sulfate value is an average of the three analyses marked "7412 Sludge" in Attachment 2 which are applied to IDCs 001 and 002, and at half that value for IDCs 800 and 803 (as explained in the nitrate section).
- The sulfate value of 0.02 % is derived from the Attachment 2 analysis marked "374 Waste Sludge - Dried Sludge". This value is used for IDC 007 and at half value for IDC 807.
- The sulfate value (25.1 %) for the Envirostone solidification of organic sludges (IDC 801) is derived from an average value in Attachment 3, which represents guidelines for mixing constituents together for IDC 801 and IDC 700 (at INEL only in storage).

- **LANL**

- The values for sulfate quoted in Column 7 are derived from data provided in Attachment 1. As with the nitrate calculations, the percentage of waste in each waste stream solidified by Envirostone versus portland cement is used to calculate the overall sulfate value for each waste stream.

- **LLNL**

- No value for sulfate was requested from LLNL for their one Solidified Organic waste stream. The same value for Envirostone-solidified waste at RFETS (25.1 %) was assumed for the LLNL waste stream.

IV. SUMMARY CALCULATIONS

Table 5 presents the summary calculations for determining the density (kg/m^3) of nitrate and sulfate in the overall WIPP inventory and scaling of the density to take into account those chemically precipitated waste streams for which data was not available. SNL/NM should use the scaled densities for their calculations. The last column in Table 5 provides the estimated mass of nitrate and sulfate if the design capacity of WIPP for CH-TRU and RH-TRU are fully utilized based on the scaled densities for nitrate and sulfate.

¹ Eliminates those volumes of chemically precipitated solidified inorganics for which no nitrate estimates in the waste are available. An estimate of the nitrate contribution from these solidified inorganics will be accounted for in the scaling process.

² Eliminates the volume of Solidified Inorganics from SRS from further consideration because it is a "vitrified" waste form which should not contain any significant amount of nitrates due to the thermal treatment proposed for that waste form.

³ Eliminates from further consideration those volumes of Solidified Inorganics which represent non-precipitated particulates (e.g., incinerator ash, graphite fines, etc.) which have been cemented to meet the WIPP WAC and nitrates are not expected to be present in the particulates.

* INEL did not report waste material parameters for this waste stream. The value for this IDC at RFETS was assumed.

** Sulfate value for LLNL Solidified Organics was assumed to be the same as for RFETS Solidified Organics (IDC 801).

TABLE 5. NITRATE/SULFATE DENSITY CALCULATIONS

| Constituent | Volume Solidified Waste (m3) | Mass Solidified Waste (kg) | Mass Constituent (kg) | Anticipated Waste Volume (m3) | WIPP Average Density of Constituents (kg/m3) | % Sludge Used in Calculations (%) | WIPP Average Scaled Density of Constituents (kg/m3) | Total Mass of Constituent for WIPP Design Capacity (kg) |
|-------------|------------------------------|----------------------------|-----------------------|-------------------------------|--|-----------------------------------|---|---|
| Footnotes | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| Nitrate | 10815.76 | 11265484 | 941245.9 | 1.19E+05 | 7.91 | 85.6 | 9.24 | 1.62E+06 |
| Sulfate | 10933.74 | 11364875 | 342993.8 | 1.19E+05 | 2.88 | 80 | 3.60 | 6.33E+05 |

1. "Total TRU" Volumes for Tables 3 and 4.
2. "Total TRU" Mass from Tables 3 and 4.
3. "Total TRU" Nitrate/Sulfate from Tables 3 and 4.
4. Anticipated Volume of CH-and RH-TRU Waste (stored + projected to 2022) from Table 3-1 in Rev. 2 of TWBIR. RH-TRU anticipated volume is limited to 7080 m3, the design capacity of WIPP.
5. "Mass of Constituent" column divided by "Anticipated Waste Volume" column.
6. Calculated from Table 1 "Total TRU" data. Nitrate = subtract 10815.76 from 13647 to yield particulate waste (2831.24). Subtract 2831.24 from 15459.01 to get total chemically precipitated waste (12627.77). Divide 10815.76 by 12627.77 and multiply by 100%. Sulfate is calculated in a similar manner.
7. Divide "Density of Constituent" by "% Sludge Used in Calculations."
8. Multiply "Scaled Density of Constituent" by 175,600 m3 (design capacity of WIPP).

TELEPHONE CONFERENCE SUMMARY

Parties: Paul Drez, DEA/CTAC
 Davis Christenson, LANL

For Solidified Inorganics waste stream LA-T006; LA-W003; LA-W006;
 and LA-M002 assume the following composition for final waste
 form:

Envirostone-based solidified waste forms:

Nitrate 8.2%
 Sulfate 38.5%
 Phosphate 0.001%

Portland Cement-based solidified waste forms:

Nitrate 8.8%
 Sulfate 1.4%
 Phosphate 0.001%

LA-M002 has only used portland cement; the other three have use
 portland cement until 1985 and then Envirostone:

| WS# | Stored Wasted | | Projected Waste | |
|---------|---------------|-------------|-----------------|-------------|
| | Portland | Envirostone | Portland | Envirostone |
| LA-T006 | 84.5% | 15.5% | 100% | 0% |
| LA-W006 | 54.65% | 45.35% | 100% | 0% |
| LA-W003 | 84.5% | 15.5% | 100% | 0% |
| LA-M002 | 100% | 0% | 100% | 0% |

ANALYTICAL REPORT

| | | | |
|-------------------------------|--------------------|---|----------------------|
| To C.T. Hewitt 374 File | Account No. 371 | Date 7-24-81 | Lab. No. M81-1109 |
| Reported by | | Approved <u>A.M. Miller</u> A.M. Miller | |

Sample Description

374 Waste Sludge - Dried sludge

Analysis Results

A characterization of the 374 waste sludge was requested. The analysis of a composited sample is given. All results are in %.

| | |
|------------------|------|
| Ca | 11 |
| Mg | 3.8 |
| Si | 5.8 |
| Al | 0.4 |
| Cr | 0.12 |
| Fe | 0.9 |
| K | 0.25 |
| Na | 0.8 |
| C | 13 |
| S | 0.36 |
| SO ₄ | 0.02 |
| Cl | 1.3 |
| F | 0.5 |
| PO ₄ | 40 |
| NO ₃ | 6.6 |
| CO ₃ | 0.04 |
| HCO ₃ | 0.33 |

The cations greater than 1% were determined by A² and those less than 1% by emission spectroscopy. The anions, except for HCO₃, CO₃, and NO₃, were determined on a nitric acid leach of the sludge. Eighteen percent of the sludge was soluble in water, and 36% soluble in nitric acid.

ENGINEERING PARAMETERS FOR ROCKY FLATS WASTE FORMS

This information is for the attention of W. C. Rask.

Attached are the engineering parameters for Rocky Flats waste forms that were requested in the letter from J. B. Tollison to distribution, dated March 1, 1988. Information is included for all thirteen Rocky Flats waste forms, which will be transported in the TRUPACT-II container.

If you have questions regarding the enclosed information, contact Jim Alexander at (303) 966-7585 or Jeff Faynter at (303) 966-5252. With your approval please forward to DOE/AL, Waste Transportation.

APPENDIX B - 7

memorandum

Carlsbad Area Office
Carlsbad, New Mexico 88221

DATE: April 4, 1996
REPLY TO
ATTN OF: CAO:NTP:DW:96-1126
SUBJECT: Estimate of Cement Content in TRU Solidified Waste Forms Scheduled for Disposal in WIPP
TO: Les Shephard, Director, SNL

Attached is a summary of the best estimate of portland cement in stored and projected volumes of solidified waste streams listed in Revision 2 of the Transuranic (TRU) Waste Baseline Inventory Report (TWBIR). This information was requested from the TWBIR team in support of the Performance Assessment team.

These values have been scaled (similar to the methodology used for waste material parameters in the TWBIR) to the full volume of the Waste Isolation Pilot Plant (WIPP) repository. The total estimated weight of portland cement in these scaled solidified waste forms is $8.54\text{E}+06$ kg. Dividing this value by $6.2\text{E}+06$ ft³ ($\sim 175,600$ m³), the maximum capacity of WIPP, yields a portland cement density in the overall combined contact-handled (CH) and remote-handled (RH) transuranic (TRU) waste of 48.6 kg/m³. The portland cement reported is both reacted and unreacted cement in the waste. There are no data available to estimate the percentage of reacted versus unreacted cement.

The basic methodology was to perform a sort of the Revision 2 database that supports the TWBIR for all Solidified Inorganic and Solidified Organic waste streams. This sort resulted in 221 waste streams. Some waste streams were eliminated from further consideration for the following reasons:

- Data about most Rocky Flats waste streams (both residue and nonresidue waste streams) are for waste in current form only and not in final form. The item description code (IDC) for many particulate waste streams will change to final form because the waste is in a cemented final form. A total of 91 current-form RF TRU waste streams were eliminated because of this constraint. (the final form of these waste streams, however, is included in the portland cement estimate.)
- The Solidified Inorganic waste streams listed from Savannah River Site are all vitrified and therefore do not contain any portland cement. A total of 20 waste streams were eliminated because of this constraint.

Calculation Summary

At the bottom of Table I the total kilograms of portland cement is summarized for CH-TRU and RH-TRU waste for both stored plus projected waste (in "Total kg" column) and projected only waste (in "Projected kg" column). The TOTAL SCALED portland cement is calculated as follows:

CH-TRU "Total kg" + 2.05 * CH-TRU "Projected kg" + RH-TRU "Total Kg" = TOTAL SCALED kg of portland cement, or

$$5.28\text{E}+06 + 2.05(1.34\text{E}+06) + 5.05\text{E}+05 = 8.54\text{E}+06 \text{ kg portland cement}$$

The total density of portland cement is calculated as follows:

$$8.54\text{E}+06 \text{ kg} / 175,600 \text{ m}^3 = 48.6 \text{ kg/ m}^3 \text{ portland cement}$$

Table 1. Estimate of Portland Cement in TRU Waste for Disposal in the WIPP

| Waste Stream | Waste Description | Solidification | Cement (kg/m ³) | Stored (m ³) | Projected (m ³) | Total kg | Projected kg |
|--------------|---|----------------|-----------------------------|--------------------------|-----------------------------|----------|--------------|
| 1 | Oil waste, does not contain any portland cement | | | | | | |
| 2 | Encapsulated metal waste, does not contain any portland cement | | | | | | |
| 3 | Assume RF-MTD806 for final form cement density | | | | | | |
| 4 | Orco (clay) is used as sorbent not portland cement | | | | | | |
| 5 | Is portland cement for this waste stream in the BIR occurs in the 'Other Inorganic Material' | | | | | | |
| 6 | Only 61% of the solidification agent reported as cement in the TWBIR is portland cement | | | | | | |
| 7 | Atomaceous earth is used as the sorbent in this waste stream | | | | | | |
| 8 | Diaster of Paris used as solidification agent | | | | | | |
| 9 | Vermiculite used as sorbent in this waste stream | | | | | | |
| 10 | Basis for portland cement are values reported in TWBIR supplemented with information provided by LANL | | | | | | |
| 11 | For previous WIPP memo on nitrate, sulfate, and phosphate | | | | | | |
| 12 | Solidification agent is Envirostone (a gypsum-based process) that does not contain portland cement | | | | | | |
| 13 | Solidification agent is a calcium-silicate process that does not use portland cement | | | | | | |
| 14 | Oil Dri is used as sorbent | | | | | | |
| 15 | Solidified organics is paint, contains no portland cement | | | | | | |
| 16 | Solidification agent/sorbent is conwed pads (plastic fiber absorbent) +/- vermiculite | | | | | | |
| 17 | CB containing waste, excluded from current WIPP inventory | | | | | | |

¹Argonne National Laboratory-East, Argonne National Laboratory-West, and Teledyne Brown Engineering are not included because no data were received. Data from Sandia National Laboratory-Albuquerque are reported under RH-TRU waste because although the final waste form is expected to be CH-TRU waste, the stored waste is remotely handled at the site.

¹Argonne National Laboratory-East, Argonne National Laboratory-West, and Teledyne Brown Engineering are not included because no data were received. Data from Sandia National Laboratory-Albuquerque are reported under RH-TRU waste because although the final waste form is expected to be CH-TRU waste, the stored waste is remotely handled at the site.

subject : Correction for Cf252 Decayed Inventory

Per a request from the TWBIR Team [CH-1], a detailed check was made on the data that was used to perform decay calculations for the stored Cf252 inventory from the Hanford site [SNL-1]. The result of the data check was that the undecayed Cf252 stored CH-TRU inventory for the year 1982 should be 1.08E-03 Ci. The value that was erroneously used for the decay calculations was 1.08E+03 Ci. This means that the Cf252 and its principal decay daughters (Cm248 and Pu240) are overestimated (see Table 1). The WIPP disposal radionuclide inventory in the electronic database should be adjusted to correct these errors. Since Cf252 has a half-life less than 20 yr and the buildup (ingrowth) activities of Cm248 and Pu240 are very small, they have a negligible effect on the EPA Unit calculations (i.e., activity loading) – they represent a change in the calculated EPA Unit of less than one part in a million (see Table 4 of Ref. SNL-3). Thus, it is not necessary for SNL WIPP PA CCA calculations to re-adjust the activity loading values presented in Refs. CCA-2 and CCA-3.

| Table 1. Activity Calculations Performed With Analytical Solution to BATEMAN Equation (a) | | | | |
|---|----------------------|----------------------------|--|--------------------------------------|
| Nuclide | | | Solution Using Analytical Solution to Bateman Equation, Decayed to the Year 1995 | |
| ID (b) | Decay Mode (c) | Half- Life [sec] (d) | Existing Inventory [Curies] (e) | Correct Inventory [Curies] (f) |
| Cf252 | α, γ, SF | 8.3250E+07 | 3.5482E+01 (g) | 3.5482E-05 |
| Cm248 | α, SF | 1.0700E+13 | 8.1266E-03 (h) | 8.1266E-09 |
| Pu240 | α, γ, SF | 2.0630E+11 | 8.2980E-06 (i) | 8.2980E-12 |

- (a) Calculations correspond only to the 1982 inventory of stored Cf252 at Hanford for CH-TRU. These values indicated that the decay calculations of Ref. SNL-1 overestimated the inventory (on a WIPP-Scale basis) of Cf252 (and to an lesser extent for the first two daughters of Cf252, namely - Cm248 and Pu240). The calculations presented here correspond to 1.08E+03 Ci for the "Existing Inventory" and 1.08E-03 Ci for the "Correct Inventory" at year = 1982 for the undecayed stored Hanford CH-TRU. The Existing Inventory value was that value used in Ref. SNL-1. Activity values presented here for Cm248 and Pu240 correspond only to ingrowth activities from Cf252 only.

Exceptional Service in the National Interest

- (b) Radionuclides are Cf252 and its first two daughters (these are incorporated into the WIPP PA database to yield Ref. CCA-2).
- (c) Decay mode information taken from Ref. GE-1.
- (d) Half-life values are those incorporated in ORIGEN2, see Ref. SNL-2.
- (e) "Existing Inventory" values correspond to 1982 Hanford CH-TRU inventory (originating from Cf252) decayed to the base year of 1995. The undecayed Cf252 inventory was $1.08\text{E}+03$. Decay calculations were performed using Ref. KA-1b.
- (f) "Correct Inventory" values correspond to 1982 Hanford CH-TRU inventory (originating from Cf252) decayed to the base year of 1995. The undecayed Cf252 inventory was $1.08\text{E}+03$. Decay calculations were performed using Ref. KA-1b.
- (g) Using this value in the TWBID resulted in a total decayed WIPP-Scale stored Cf252 inventory of 36.1 Ci [Ref. CH-2] (98.3 % of this value was from the incorrect value from the 1982 Hanford inventory). Thus, correcting the undecayed 1982 Hanford value for Cf252 will result in a substantial lowering of the stored and projected inventory of Cf252. Since Cf252 has a half-life less than 20 yr, it does not contribute to the EPA Unit value and does not effect WIPP PA CCA calculations.
- (h) Using this ingrowth value in the TWBID resulted in a total decayed WIPP-Scale stored Cm248 inventory of $3.35\text{E}+02$ Ci [Ref. CH-2] (24.3 % of this value was from the incorrect value from the 1982 Hanford inventory). Thus, correcting the undecayed 1982 Hanford value for Cf252 will result in a substantial lowering of the stored and projected inventory of Cm248. Since the total activity change due to the ingrowth of Cm248 from Cf252 is very small it has a negligible contribution to the EPA Unit (see Table 4 of Ref. SNL-3) and does not affect PA calculations.
- (i) Using this ingrowth value in the TWBID resulted in a total decayed WIPP-Scale stored Cm248 inventory of $6.87\text{E}+04$ Ci [Ref. CH-2] (less than $2.0\text{E}+08$ % of this value was from the incorrect value from the 1982 Hanford inventory). Thus, correcting the undecayed 1982 Hanford value for Cf252 will result in a negligible lowering of the stored and projected inventory of Pu240 (or any further decay daughters from Cf252). Since the total activity change due to the ingrowth of Pu240 from Cf252 is very small it has a negligible contribution to the EPA Unit (see Table 4 of Ref. SNL-3) and does not affect PA calculations.

CERTIFIED MAIL - RETURN RECEIPT REQUESTED

November 2, 1995

Mr. George Dials, Manager
Carlsbad Area Office
Department of Energy
P. O. Box 3090
Carlsbad, New Mexico 88221

Dear Mr. Dials:

**RE: Waste Isolation Pilot Plant (WIPP) Part B Application: Request
for Information, Chapters A, B, and C**

The New Mexico Environment Department (NMED) has completed its technical review of the Part B WIPP permit application Chapters A (Part A Application), B (Facility Description), and C (Waste Analysis Plan).

In general, Chapters B and C of the permit application lack necessary and important detailed information required for the development of the draft permit. In particular, the Waste Analysis Plan presented as Chapter C of the WIPP Part B permit application, Revision 5, is critical to the development of the draft permit and seriously lacks necessary detail. Our concerns relative to Chapters A, B, and C are articulated in both General and Specific Comments presented in the attached documents. The General Comments for Chapter C also identify those Specific Comments that support the General Comment being discussed.

As stated at the October 26 meeting with DOE/WID representatives on these chapters, a response submission on or before November 9, 1995, is preferred. Submit your responses on a WordPerfect 5.2 floppy reflecting the changes requested to the various pages and sections only (unless the information requested indicated an entire new document or chapter). Indicate all changes with strikeout and redline notation, and include a paper copy of same.

If you believe additional meetings or conference calls are required to discuss the requested information, especially considering the volume of information requested, please do not hesitate to call before the November 9 meeting. Also, if you choose not to submit

Mr. George Dials
Page 2
November 2, 1995

an early response, the request for information detailed in this letter and any other outstanding issues remaining on December 12, 1995, will be addressed in the form of a Notice of Deficiency (NOD).

Thank you for your cooperation in this permitting process. If you have any questions, please contact Mr. Steve Zappe of my staff at (505) 827-4308.

Sincerely,

Barbara Hoditschek, RCRA Permits Program Manager
Hazardous and Radioactive Materials Bureau

WIPP File - Red '95

- aged at
9. Chapter C, C-1 Facility Description, Section C-1b, Facility Description, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-9, Lines 8-11.

The permit application implies that 20 NMAC 4.1 Subpart VIII, §268.2(g) requires visual inspection to determine whether a waste is considered to be debris. However, the permit application also indicates that visual inspection will not be conducted for all drums suspected of containing debris wastes, implying that this regulatory requirement will not be met. Revise the permit application to clarify the regulatory requirement for visual examination.

10. Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-9, Lines 24-28.

The permit application indicates that a waste summary category for "special wastes" has been designated. However, Table C-1 indicates only one unique waste stream falls under this category (RF-W028), which could also be included under summary category group S5000, debris waste. Revise the permit application to provide more detail regarding why this grouping is necessary, including more detail regarding specific anticipated waste streams.

11. Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Pages C-10 to C-11.

The permit application presents an abbreviated discussion of hazardous constituents present within WIPP waste, indicating that these have been determined, primarily, through the use of acceptable knowledge (process knowledge). This would imply that summary analytical data are not available. 20 NMAC 4.1, Subpart IX 270.14(b) requires "chemical and physical analyses of the hazardous waste and hazardous debris to be handled at the facility. At a minimum, these analyses shall contain all the information which must be known to treat, store, or dispose of the waste properly in accordance with Part 264 of this chapter." While it is understood that the applicant believes acceptable knowledge can be used to characterize waste, confirmation that the processes identified indeed contain the identified hazardous waste is required. Revise the permit application to include summary tables presenting waste analyses information acquired to date. Prepare these tables in a format that can be readily compared with Table C-1, so that a summary understanding of available waste analyses information for each waste stream unique ID can be achieved. Reference additional documentation for any detailed or backup information as necessary.

12. Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-11, Lines 9-10.

The permit application states that "headspace-gas volatile organic compounds (VOC) concentrations resulting in emissions not protective of human health and the environment" will not be accepted. This criteria is very vague, and does not state the specific concentration values or other limitations that must be met to meet this standard. Revise the permit application to include the specific information that is required to meet this demonstration. This is particularly important, since this information is critical to determining whether the WIPP can meet performance standards established for Subpart X units described in 20 NMAC 4.1 Subpart V, Part 264.601. The WIPP Waste Acceptance Criteria, December, 1991 (WIPP-DOE-069) provides requirements for compliance with RCRA relative to headspace gas analyses, including flammability assessments, but these values were developed in response to conditional Test Phase No Migration requirements. Revise the permit application to indicate whether DOE intends to maintain these criteria during the operational phase.

COMMENTS: TABLES AND FIGURES

106. Chapter C, Table C-1, Pages C-33 through C-72.

Refer to Attachment A for detailed commentary regarding table contents. Also revise the table to address the following:

- Footnote d indicates that reactive, ignitable, or corrosive characteristics were previously identified for some Table C-1 waste streams, but these are no longer identified with the waste stream. Revise the permit application to address, on a unique waste stream (facility specific) basis, why this has occurred.
- Footnote e indicates that EPA hazardous waste codes were not reported by the generator at this time. Is this because generator sites have not completed their process knowledge analysis, or because the generator sites did not believe hazardous wastes were present? Clarify why the codes were not reported at this time.

107. Chapter C, Table C-2, pages C-73 through C-74.

Several chemicals are listed as not being Hazardous Constituents (20 NMAC 4.1, Subpart II, Appendix VIII) when in fact they are. Revise Table C-2 to indicate the following chemicals are listed in Appendix VIII: 2-Ethoxyethanol, Isobutanol, 1,2-Dichloroethane, and 1,1,1-Trichloroethane.

108. Chapter C, Table C-3, Page C-75.

This table indicates that the majority of screening mechanisms to ensure reactive wastes are not included in WIPP TRU-mixed waste are based upon process knowledge, and goes on to indicate that Appendix C1 shows most of the reactions will not occur. However, numerous questions have been raised regarding the contents of Appendix C1, including whether the incompatibilities identified by the comparison process are indeed resolved by the indicated methods, particularly when the incompatibility assessment indicates that additional test information is required. Further, the potential for explosive conditions to develop in the subsurface has not been addressed (See General Comment No.2). After addressing text commentary on these issues, revise Table C-3 accordingly.

109. Chapter C, Table C-4, Pages C-77 through C-79.

Table C-4 indicates that the purpose of RTR or visual examination is to verify waste matrix, but the purpose should also include verification of process knowledge (which is not necessarily inherent when verifying waste matrix). Additionally, this table states that RTR or visual examination will take place for CH TRU-mixed stored homogenous solids and soils and gravel waste, while Figures C-1 and C-2 indicate that all drums of retrievably stored waste will undergo RTR. Also, a purpose of headspace gas analyses - particularly TIC identification - is to identify hazardous constituents within the waste and to use this information to confirm process knowledge. It is also unclear whether determining "total quantities" of constituents includes the determination of the presence of individual metals, SVOCs, etc. Revise the permit application to address these issues.

110. Chapter C, Tables C-2, C-5 and C-6, Pages C-73, C-74, C-80, C-81 and C-82.

DOE has listed 33 organic (when counting xylenes and cresols as one each) and nine inorganic parameters of interest in Table C-2. Table C-5 presents a summary of hazardous waste characterization requirements for TRU mixed waste. Under the heading of Headspace Gases, DOE has listed 14 flammable VOCs and seven non-flammable VOCs (a total of 21 constituents). Revise the permit application to explain why

DEC 20 1995

**Mr. Benito Garcia
New Mexico Environmental Department
Hazardous & Radioactive Materials Bureau
P.O. Box 26110
Santa Fe, N.M. 87502**

Dear Mr. Garcia:

Please find enclosed the response to your comments on Chapters C and G of the Waste Isolation Pilot Plant Resource Conservation and Recovery Act (RCRA) Part B application. We received your comments on these chapters on November 3, 1995, and December 1, 1995, respectively.

Our responses are transmitted to you in draft format and also contain the redline/strikeout version of the text in both hard copy and on floppy disk in accordance with your request. Additionally, to facilitate your review of our responses, Steve Zappe of your staff has authorized us to provide our responses directly to A. T. Kearney, Inc.

This transmittal completes our draft responses to your technical review comments. We will submit in final redline/strikeout form, on January 17, 1996, all revisions made in response to your comments to our RCRA Part B application. As I indicated in previous transmittal letters, we anticipate meeting with you and your technical staff to discuss our responses to your comments on January 8 and 9, 1996. We will be coordinating this meeting with your staff in the near future..

If you have any questions, please do not hesitate to contact me at (505) 234-7486 or Craig Snider at (505) 234-7452.

Sincerely,

James A. McFadden

The application has been modified to clarify the DOE's interpretation of this regulation. A paragraph has been added to Section C-1b to read: "Due to the presence of radioactive constituents in the waste and the safety of hazards involved in opening waste containers, the DOE has opted to use radiography as a visual examination of waste form (visual inspection as it is referred to in this regulation). For these reasons, RTR will be used on 100% of stored waste containers to determine the physical composition of debris mixtures. The percentage of debris in mixtures of newly-generated waste will be determined by visual examination during packaging."

10. Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-9, Lines 24-28.

The permit application indicates that a waste summary category for "special wastes" has been designated. However, Table C-1 indicates only one unique waste stream falls under this category (RF-W028), which could also be included under summary category group S5000, debris waste. Revise the permit application to provide more detail regarding why this grouping is necessary, including more detail regarding specific anticipated waste streams.

RESPONSE

The summary category for Special Waste (S7000) has been deleted from the application, and the waste stream that was included in that summary category will be reassigned to a new summary category prior to acceptance at the WIPP.

The application has been modified throughout to delete all references to Special Waste as a summary category.

11. Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Pages C-10 to C-11.

The permit application presents an abbreviated discussion of hazardous constituents present within WIPP waste, indicating that these have been determined, primarily, through the use of acceptable knowledge (process knowledge). This would imply that summary analytical data are not available. 20 NMAC 4.1, Subpart IX 270.14(b) requires "chemical and physical analyses of the hazardous waste and hazardous debris to be handled at the facility. At a minimum, these analyses shall contain all the information which must be known to treat, store, or dispose of the waste properly in accordance with Part 264 of this chapter." While it is understood that the applicant believes acceptable knowledge can be used to characterize waste, confirmation that the processes identified indeed contain the identified hazardous waste is required. Revise the permit application to include summary tables presenting waste analyses information acquired to date. Prepare these tables in a format that can be readily compared with Table C-1, so that a summary understanding of available waste

analyses information for each waste stream unique ID can be achieved. Reference additional documentation for any detailed or backup information as necessary.

RESPONSE

Acceptable knowledge will be confirmed using headspace gas analysis, radiography, and visual examination. For F-listed waste, acceptable knowledge is the primary source of waste characterization information since the assignment of an F-listed code cannot be done through sampling and analysis. However, the results of headspace gas analysis will be used to verify F-listed codes.

The application has been modified in the text to clarify the use of other analyses to verify acceptable knowledge, and discussions of acceptable knowledge have been added to Section C-4 and Appendix C9.

12. Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-11, Lines 9-10.

The permit application states that "headspace-gas volatile organic compounds (VOC) concentrations resulting in emissions not protective of human health and the environment" will not be accepted. This criteria is very vague, and does not state the specific concentration values or other limitations that must be met to meet this standard. Revise the permit application to include the specific information that is required to meet this demonstration. This is particularly important, since this information is critical to determining whether the WIPP can meet performance standards established for Subpart X units described in 20 NMAC 4.1 Subpart V, Part 264.601. The WIPP Waste Acceptance Criteria, December, 1991 (WIPP-DOE-069) provides requirements for compliance with RCRA relative to headspace gas analyses, including flammability assessments, but these values were developed in response to conditional Test Phase No Migration requirements. Revise the permit application to indicate whether DOE intends to maintain these criteria during the operational phase.

RESPONSE

The limitations that must be met in order to be protective of human health and the environment have been provided in Table C-5. These limits were derived from the results of the risk assessment, provided in Appendix D9, and will ensure compliance with the environmental performance standards. Appendix D9 includes calculations used to derive the numbers in Table C-5.

COMMENTS: TABLES AND FIGURES

106. Chapter C, Table C-1, Pages C-33 through C-72.

Refer to Attachment A for detailed commentary regarding table contents. Also revise the table to address the following:

- Footnote d indicates that reactive, ignitable, or corrosive characteristics were previously identified for some Table C-1 waste streams, but these are no longer identified with the waste stream. Revise the permit application to address, on a unique waste stream (facility specific) basis, why this has occurred.
- Footnote e indicates that EPA hazardous waste codes were not reported by the generator at this time. Is this because generator sites have not completed their process knowledge analysis, or because the generator sites did not believe hazardous wastes were present? Clarify why the codes were not reported at this time.

RESPONSE

Refer to Attachment A for detailed responses to Table C-1 comments.

- The generator sites report all materials that comprise a waste stream. However, the final form of the waste stream is such that reactive, ignitable, or corrosive characteristics are removed. For example, acids are neutralized in cement sludges. As stated in Chapter C of the Part B Permit, wastes possessing reactive, ignitable, or corrosive characteristics are not permitted at WIPP. Footnote d on Table C-1 is simply a reminder that if the waste possesses the above characteristics, it will not be accepted at WIPP unless treated to remove these characteristics.
- Footnote e does reflect incomplete process knowledge at this time. The content of these waste streams will be updated as information becomes available in future revisions of the WTWBIR. Table C-1 reflects the most complete information available at this time.

.....

107. Chapter C, Table C-2, pages C-73 through C-74.

Several chemicals are listed as not being Hazardous Constituents (20 NMAC 4.1, Subpart II, Appendix VIII) when in fact they are. Revise Table C-2 to indicate the following chemicals are listed in Appendix VIII: 2-Ethoxyethanol, Isobutanol, 1,2-Dichloroethane, and 1,1,1-Trichloroethane.

CERTIFIED MAIL - RETURN RECEIPT REQUESTED

March 14, 1996

Mr. George Dials, Manager
Carlsbad Area Office
Department of Energy
P. O. Box 3090
Carlsbad, New Mexico 88221

Mr. Joe Epstein, General Manager
Westinghouse Electric Corporation
P.O. Box 2078
Carlsbad, New Mexico 88220

Dear Messrs. Dials and Epstein:

**RE: Notice of Deficiency (NOD) - Technical Adequacy Review of WIPP RCRA
Part B Permit Application Revision 5.2, January 17, 1996.
EPA ID No. NM4890139088**

The Hazardous and Radioactive Materials Bureau (HRMB) of the New Mexico Environment Department (NMED) has reviewed, for technical adequacy, the January 17, 1996 joint disposal permit application from the U.S. Department of Energy (DOE) and Westinghouse for the Waste Isolation Pilot Plant (WIPP). This application is required under the Resource Conservation and Recovery Act (RCRA), as incorporated within the New Mexico Hazardous Waste Management Regulations, 20 NMAC 4.1. The current application describes disposal of transuranic mixed waste in underground hazardous waste management units (HWMUs) and storage of transuranic mixed waste at surface container storage HWMUs.

After reviewing the permit application, HRMB has found the application to be technically deficient. The enclosed attachment lists the requested information necessary for HRMB to begin preparation of a draft permit. The attachment contains numerous requests for specific information from most chapters of the application. Listed below are the general areas of significant deficiency which must be addressed:

1. **Waste characterization:**
 - clarify contact-handled waste characterization procedures
 - provide extensive, detailed information on remote-handled waste characterization procedures

2. **Risk assessment:**

- re-evaluate the point of compliance based on maximally exposed individuals or populations at risk
- assess the impacts of a major RCRA constituent release at the point of compliance
- provide more specific information describing ground control and geomechanical monitoring programs

3. **Monitoring plans:**

- provide plans for monitoring potential air releases of RCRA constituents during disposal operations
- provide plans for monitoring potential groundwater releases of RCRA constituents during post-closure
- ensure both air and groundwater monitoring programs include provisions to establish background levels of RCRA constituents to be disposed at WIPP;

4. **Closure plans:**

- clarify some aspects of the closure plan, such as contingency closure
- submit final shaft seal designs

Submit the information listed in the attachment to HRMB within thirty (30) days of receipt of this NOD. Failure to submit the information within this designated time may result in the issuance of a compliance order with associated fines. We understand some information listed in this NOD may require more than 30 days to develop. For this reason, HRMB will consider a petition to extend the deadline for portions of the required information if you provide a written justification and expected submittal date for each portion.

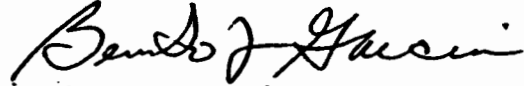

Also included as an enclosure are comments on the "Transuranic Waste Characterization Sampling and Analysis Methods Manual". Although this document was not submitted with the permit application, HRMB has identified concerns within the Methods Manual which must be addressed before it becomes acceptable as a reference or appendix to the permit application. HRMB believes this revised Methods Manual should be adopted by reference into the application.

Mr. Michael McFadden, in a letter from DOE on January 25, 1996, requested an opportunity to meet with HRMB to discuss responses to earlier requests for information on the application. HRMB response of February 8, 1996 suggested that such a meeting would be better suited after the NOD was issued. HRMB would welcome a request from DOE and Westinghouse for further meetings to clarify the NOD on the application.

Messrs. Dials and Epstein
Page 3
March 14, 1996

If you have any questions about this NOD, please contact Ms. Barbara Hoditschek, Mr. Steve Zappe, or me at (505) 827-1561.

Sincerely,

Benito J. Garcia
Chief, Hazardous & Radioactive Materials Bureau

WIPP File - Red '95

stream batch and waste stream lot. The permit application implies in Section C5 that full characterization of an entire waste stream will be accomplished prior to filling out of the Waste Profile Form. However, this is not presented in Section C-1. Revise the permit application to clarify whether a Waste Profile Form will be prepared for a subset of a given waste stream before full headspace gas and radiographic characterization of the entire waste stream. If this is the case, revise the permit application to indicate how the number of drums deemed sufficient to fill out a Waste Profile Form is determined.

5. **Chapter C, C-1 Facility Description, Section C-1b, Identification Of TRU Mixed Waste Managed at the WIPP Facility, Page C-11, Lines 40-43, Page C-12 Lines 1-33.** The permit application includes brief summaries of the waste summary categories proposed for acceptance at WIPP. However, these discussions are too general and must include more detailed discussion of waste within these categories, including waste parameters, waste streams and anticipated hazardous waste, as well as examples of hazardous constituents. Specific attention must be paid to the hazardous waste potentially present within each Waste Summary Category. Revise the text of the permit application to include this information.
- 6.* **Chapter C, C-1 Facility Description, Section C-1b, Identification Of TRU Mixed Waste Managed at the WIPP Facility, Page C-12, Lines 35-43, Page C-13, Lines 1-2.** Radiography is incorrectly equated to visual examination, but the application elsewhere clearly delineates between the two activities. Both are forms of visual inspection, as referred to in the regulations. Revise this section of the application to use these terms in a precise manner, and include their definitions in the glossary.
- 7.* **Chapter C, C-1 Facility Description, Section C-1b, Identification Of TRU Mixed Waste Managed at the WIPP Facility, Page C-15, Lines 6-7.** Free liquids are acceptable at WIPP in the form of residual liquids within containers. Revise this section to state that liquid waste is unacceptable for management at WIPP.
8. **Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-15, Lines 15-16.** The permit application states that "headspace-gas volatile organic compounds (VOC) concentrations resulting in emissions not protective of human health and the environment" will not be accepted. The permit application does not indicate, in this location, where these values are presented within the permit application. Table C-5 appears to present this information, but the table does not indicate where, within the permit application, the background calculations are included to derive the information presented in this table. Revise this section of the permit application to reference Table C-5, and include a reference in Table C-5 as to where supporting calculations are included. Also refer to comments on Table C-5 and Appendix D9.
- 9.* **Chapter C, Section C-1d, Description of HWMUs, Page C-22, Lines 16-19.** This section incorrectly implies only one surface HWMU has been designated. Revise this section to be consistent with the description of all container storage HWMUs described in Section B-1b(1) and Section D-1a(1).
10. **Chapter C, Section C-2b, Criteria and Rationale for Parameter Selection, Page C-24, Lines 12-14.** The permit application states "Documented acceptable knowledge will be used to determine the types and quantities of listed and toxicity characteristic waste that cannot be directly sampled for total metals or total organics." However, a detailed discussion and supporting documentation are not provided to justify the use of acceptable knowledge for

**WIPP PART B PERMIT APPLICATION REVIEW
WASTE ANALYSIS PLAN**

APPENDIX C1

GENERAL COMMENTS

- 1.* Provide the cross reference to Appendix C11 for the WIPP Generator/Storage Site Waste Screening and Acceptance Audit Program.
2. The permit application compatibility assessment does not address a number of waste streams presented on Table C-2. Revise the compatibility portion of the permit application to provide justification of this exclusion, particularly those waste streams identified with "d" and "e" superscripts on Table C-2, which presumably provide information helpful to the exclusion. Additionally, waste streams RL-M007, RL-M017, and IN-W291 are discussed on Table C-2 but are not addressed within Appendix C1 and do not have any potential designators that could explain the waste stream's exclusion from Appendix C1. Revise the permit application to address the omissions of these waste streams from the compatibility assessment.
2. Revision 5.0 of the permit application included numerous references to test information that was to provide insight to the compatibility assessments. However, all references to these tests have been removed from Revision 5.2 of the permit application. Omission of these data do not answer the question as to whether the planned tests provided data to support the compatibility assessment. Revise the permit application to specifically discuss the tests which would provide information important to the compatibility assessment.

* - New NOD Comment

RECEIPT

I acknowledge receipt of the following materials from the U.S. Department of Energy:

5 copies of Revision 6 of DOE/WPP 91-005 entitled "Resource Conservation and Recovery Act Part B Permit Application" for the Waste Isolation Pilot Plant

5 copies of "Responses to New Mexico Environment Department Notice of Deficiency Dated March 14, 1996"

Disks containing the revised permit application (Redline/Strikeout and Final)

Signed:

Bert J. Garcia

for the New Mexico Environment Department

Date:

4/12/96

Response

This statement was not removed just relocated to Section C-1b. The paragraph states: "The DOE will only allow generators to ship those waste streams with EPA Hazardous Waste Codes listed on Part A of this application. Characterization of all waste streams will be performed as required by this WAP. If during the characterization process, new hazardous waste codes are identified, those waste cannot be accepted for disposal at the WIPP facility until a permit modification has been submitted and approved. Similar waste streams at other generator sites will be examined more closely to ensure that the newly identified codes do not apply. If other waste streams also require a new hazardous waste code, shipment of these waste streams will also cease until a permit modification has been submitted and approved. Approval will be based on the physical and chemical properties of the waste."

4. **Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-10, Lines 22-28.** The WAP indicates in this section that each waste stream will be accompanied by a waste profile form, but does not indicate whether each waste stream within each shipment will have the form, or if the form will be presented once for each waste stream. Also, it is not clear whether each waste stream batch or waste stream lot will have a unique waste profile form. Revise the permit application to indicate that the Waste Profile Form will be provided once for a given site-specific waste stream, that the Waste Profile Form will be provided with each shipment of a given waste stream, and/or that the Waste Profile Form will be provided for each waste stream batch and waste stream lot. The permit application implies in Section C5 that full characterization of an entire waste stream will be accomplished prior to filling out of the Waste Profile Form. However, this is not presented in Section C-1. Revise the permit application to clarify whether a Waste Profile Form will be prepared for a subset of a given waste stream before full headspace gas and radiographic characterization of the entire waste stream. If this is the case, revise the permit application to indicate how the number of drums deemed sufficient to fill out a Waste Profile Form is determined.

Response

The Waste Stream Profile Forms will be transmitted once for each waste stream. For a waste stream that is generated after the Waste Stream Profile Form is submitted and approved, waste characterization activities will continue in order to verify that the waste stream is consistent with the initial characterization.

The number of waste containers deemed sufficient to fill out a Waste Stream Profile Form is based on the variability of the waste stream. This technique is addressed in Appendix C6.

A paragraph has been added to Section C-1b to read: "For waste streams that are continually generated, a Waste Stream Profile Form may be submitted once the waste stream has been characterized, per the QAPP, based on the variability of the waste stream (as shown in Appendix C6). Characterization activities will continue in order to verify the consistency with the initial characterization and the Waste Stream Profile Form. If there are discrepancies, the waste will be redefined to a separate waste stream and a new Waste Stream Profile Form will be submitted."

5. **Chapter C, C-1 Facility Description, Section C-1b, Identification Of TRU Mixed Waste Managed at the WIPP Facility, Page C-11, Lines 40-43, Page C-12 Lines 1-33.** The permit application includes brief summaries of the waste summary categories proposed for acceptance at WIPP. However, these discussions are too general and must include more detailed discussion of waste within these categories, including waste parameters, waste streams and anticipated hazardous waste, as well as examples of hazardous constituents. Specific attention must be paid to the hazardous waste potentially present within each Waste Summary Category. Revise the text of the permit application to include this information.

Response

Table C-2 includes a breakdown of the Waste Summary Category Groups into waste streams and the EPA hazardous waste codes associated with those waste streams. This information is extracted from the WIPP Transuranic Waste Baseline Inventory Report (Rev.1). The WTWBIR is a projected summary of the waste at the generator/storage sites, and all waste will be characterized to the requirements of the WAP before it is sent to the WIPP for disposal. At this time, the WTWBIR, and this Table C-2, are all of the information available linking Waste Summary Category Groups to EPA hazardous waste codes. A reference to Table C-2 has been added into the discussion on the Summary Category Groups. Also, a sentence has been added to the end of each Summary Category Group description to indicate whether toxic metals, spent solvents or both types of waste are expected to be present in the Summary Category Group.

6. **Chapter C, C-1 Facility Description, Section C-1b, Identification Of TRU Mixed Waste Managed at the WIPP Facility, Page C-12, Lines 35-43, Page C-13, Lines 1-2.** Radiography is incorrectly equated to visual examination, but the application elsewhere clearly delineates between the two activities. Both are forms of visual inspection, as referred to in the regulations. Revise this section of the application to use these terms in a precise manner, and include their definitions in the glossary.

Response

The waste is "examined" using radiography and visual examination. Waste containers are visually "inspected" for damage. The text has been revised to read: "...the DOE will use radiography as a form of nondestructive examination of the waste form in place of visual examination of the waste form." "Visual inspection" and "visual examination" have been added to the glossary.

7. **Chapter C, C-1 Facility Description, Section C-1b, Identification Of TRU Mixed Waste Managed at the WIPP Facility, Page C-15, Lines 6-7.** Free liquids are acceptable at WIPP in the form of residual liquids within containers. Revise this section to state that liquid waste is unacceptable for management at WIPP.

Response

Section C-1b has been revised to read: "•Liquid wastes (all waste must meet the WAC criteria regarding liquid content)."

8. **Chapter C, C-1 Facility Description, Section C-1b, Identification of TRU Mixed Waste Managed at the WIPP Facility, Page C-15, Lines 15-16.** The permit application states that "headspace-gas volatile organic compounds (VOC) concentrations resulting in emissions not protective of human health and the environment" will not be accepted. The permit application does not indicate, in this location, where these values are presented within the permit application. Table C-5 appears to present this information, but the table does not indicate where, within the permit application, the background calculations are included to derive the information presented in this table. Revise this section of the permit application to reference Table C-5, and include a reference in Table C-5 as to where supporting calculations are included. Also refer to comments on Table C-5 and Appendix D9.

Response

A footnote was added to Table C-5 to reference Appendix D9 for the calculations to support the values in the table. A reference to Table C-5 was added to the bullet for "headspace-gas volatile organic compounds (VOC) concentrations resulting in emissions not protective of human health and the environment."

**WIPP PART B PERMIT APPLICATION REVIEW
WASTE ANALYSIS PLAN**

APPENDIX C2

GENERAL COMMENTS

1. Revision 5.0 of the permit application included analyses for methane, ethane, propane, and hydrogen. While these are not hazardous constituents but are instead ignitable wastes prohibited by the WAC and this WAP, inclusion of them in headspace gas analyses is important because generation of said gases could occur in-situ due to biodegradation and corrosion; differentiation between original drum contents and gas generation following waste emplacement could be important. Revise the permit application to include these data.

Response

Continuous venting of waste containers is required to preclude the buildup of flammable gases due to gas generating mechanisms in the containers. Such venting has proven to be effective at generator sites for many years. Sampling containers once they are emplaced is not feasible. The application does address monitoring for flammable gas buildup in the underground (F-4g) and the accumulation of flammable gases behind panel closures (I-1e(1)). The inclusion of flammable gas analysis results is not relevant to this permit application.

2. The permit application does not include correlations of hazardous wastes versus waste matrix code groups. Although it is recognized that the specific list of waste within each group could be extensive (based upon information within Table C-2), it is important to include this information so that a comparison of headspace gas information with identified hazardous waste codes can be accomplished. Revise the permit application to include this information within Appendix C2.

Response

The headspace gas analysis results were not used to assign the hazardous waste codes for each waste stream listed in Table C-2. The information in Table C-2 was taken from the WTWBIR which was not based on waste characterization information. Waste characterization activities will be conducted independent of the information contained in the WTWBIR. When characterization of a waste stream is complete, the waste stream will be presented for approval to the WIPP on a Waste Stream Profile Form. At this time correlations between headspace gas analysis results and the assigned EPA hazardous waste codes will be made. Approval of a waste stream for disposal at the WIPP facility will be based solely on the information supplied on and with the Waste Stream Profile Form, not on the information contained in the WTWBIR. Also, all of the waste containers presented in Appendix C2 are not necessarily from certifiable waste streams. For these reasons, the information to correlate Appendix C2 to Table C-2 is not relevant to this application.

3. The permit application does not indicate how analytes with the "E" or "J" designator were handled if a dilution analyses were not available. Further, the permit application does not indicate why multiple analyses are available for some drums but not for others. Additionally, the permit application does not specifically state how the weighting factors for Waste Matrix Code Groups were derived. Revise the permit application in Appendix C2 to address these concerns.

Response

The data presented in Appendix C2 were compiled to calculate the weighted average concentrations

| Letter, March 12, 1999, to Chris Wentz from Keith A. Klein | 2668 |
|---|------|

1 A. Uh-huh.

2 Q. If you could continue with your testimony.

3 A. 20 NMAC 4.1.900, incorporating 40 CFR 270.14(b)(2),
4 requires that a permit application for a hazardous waste
5 management facility such as WIPP contain, and this is a
6 quote which was just handed out:

7 "Chemical and physical analysis of
8 the hazardous waste and hazardous debris
9 to be handled at the facility. At a
10 minimum, these analyses shall contain
11 all the information which must be known
12 to treat, store or dispose of the wastes
13 properly in accordance with Part 264 of
14 this chapter."

15 This statement indicates that the chemical and
16 physical analysis of waste is to be included in the permit
17 application. Typically, land disposal facilities such as
18 WIPP include some detailed representative chemical and
19 physical analyses in the permit applications, and this may
20 be provided by the generator sites.

21 (Discussion off the record with reporter.)

22 In addition -- I must apologize. I tendency is
23 to read when I try to slow down, so I apologize for that.

24 In addition, 20 NMAC 4.1.900, incorporating
25 270.14(b)(3) requires that a permit application for a

1 hazardous facility such as WIPP contain a copy of the waste
2 analysis plan. At the waste disposal facilities such as
3 WIPP this plan usually includes, just in general terms,
4 enough activities to ensure that that waste is
5 characterized, and there are several components to that
6 waste analysis plan.

7 But additionally, as required in 264.13(a)(4),
8 pertinent to offsite disposal facilities, the permittees
9 must inspect and, as necessary, analyze each hazardous waste
10 movement received at the facility to determine whether that
11 waste matches what the generator sites have told them it is.
12 This type of analysis is called "confirmatory analysis" or
13 "fingerprint analysis," and the waste analysis plan should
14 include provisions for fingerprint analysis.

15 Q. Did the permit application for WIPP include this
16 information?

17 A. No, not directly. The permit application did not
18 include provision for WIPP site fingerprint analysis onsite
19 and included only Table C-2 and some discussion in the text
20 regarding the general waste information. However, the
21 permit application did include a detailed process by which
22 the required, detailed, representative chemical and physical
23 analysis would be attained, and this process, as described
24 in the waste analysis plan, also included activities to
25 check the waste once the initial waste characterization was

1 achieved, which is somewhat analogous to fingerprint
2 analysis -- or is analogous. Take away the word "somewhat."

3 Q. And how would the permittees acquire this
4 information?

5 A. The permittees require their generator storage
6 sites to acquire this information and to provide it to them
7 and require them to follow the processes specifically in the
8 waste analysis plan.

9 Q. And how did the permittees propose to ensure that
10 the process was appropriately implemented at generator
11 storage sites?

12 A. Well, the permittees proposed to audit the
13 generator storage sites to ensure that the sites are
14 characterizing the waste in accordance with the waste
15 analysis plan.

16 Q. Could you provide a description of the audit
17 program included in the permit application?

18 A. Yes. To help with this, we've prepared a little
19 handout that is -- we've got a flowchart. It's very, very,
20 simplistic, but it shows a few things. Again, this is a
21 very simplistic flowchart, and it's provided just as
22 information to help with the testimony I'm going to give.

23 It shows, basically, the general audit process
24 with elements that were included in the permit application
25 in regular type, and those imposed conditions by NMED -- and

**NEW MEXICO ENVIRONMENT DEPARTMENT'S
DIRECT TESTIMONY REGARDING REGULATORY
PROCESS AND IMPOSED CONDITIONS**

AUDIT REQUIREMENT

I. INTRODUCTION

In the revised draft permit, the New Mexico Environment Department (NMED) imposed a condition requiring the Applicants to audit generator/storage sites (Sites). The audits are required in order to demonstrate that the Sites have implemented and complied with the applicable portions of the Waste Analysis Plan (WAP) during waste characterization for waste destined for disposal at WIPP. NMED may observe the audits to ensure that the Applicants have properly implemented the WAP and audited compliance with the WAP at the Sites. Further, the Applicants must obtain NMED's approval of the final audit report for a Site before the Applicants can manage, store, or dispose of waste at WIPP from that Site.

Because the Applicants do not intend to conduct waste characterization at WIPP, NMED must implement an oversight process, such as audits, to ensure that the Permittees comply with the applicable portions of the WAP. The detailed audit-related permit conditions are necessary because the Applicants' proposed audit program, while recognizing the need for Site audits, was technically inadequate, and did not provide for NMED participation, review, and approval. For instance, the Applicants proposed to share information with NMED, but did not allow NMED to observe the audits. Critically, the Applicants did not propose for NMED to approve the audit, even though the Applicants relied on the audit process to provide information which should have been contained in the Application.

II. REGULATORY ANALYSIS

NMED regulations at 20 NMAC 4.1.900 (incorporating 40 CFR §270.14(b)(2)) requires a permit application to contain:

Chemical and physical analyses of the hazardous waste and hazardous debris to be handled at the facility. At a minimum, these analyses shall contain all the information which must be known to treat, store, or dispose of the wastes properly in accordance with Part 264 of this chapter.

In addition, 20 NMAC 4.1.900 (incorporating 40 CFR §270.14(b)(3)) requires a permit application to contain "[a] copy of the waste analysis plan required by §264.13(b) and, if applicable §264.13(c)."

Revision 6.4 of the Application did not contain a detailed and representative chemical and physical analysis of waste streams to be disposed at WIPP. Typically, proposed Subpart X facilities, such as WIPP, submit applications containing detailed chemical and physical analyses provided by generator sites, as well as detailed waste analysis plans for implementation by the facilities to ensure that the

generator sites properly characterized the wastes. In addition, the permit applications typically contain provisions for periodic waste analyses by the facilities to confirm the waste characterization by generator sites. These analyses, called on-site confirmatory or fingerprint analyses, are required to determine the accuracy of hazardous waste manifests. See 40 CFR 264.13(a)(4). However, the Applicants proposed no such analyses, arguing that multiple sampling of waste containers raised radiological health concerns. In the place of fingerprint analyses, the Applicants proposed to “review” waste characterization information prepared by the generator sites.

While the regulations indicate that permit applications must include chemical and physical analyses, they also state that the disposal facility must obtain these analyses prior to waste disposal. See 40 CFR 264.13(a). In recognition of the unique features of WIPP and the inclusion of general waste information in the permit application (Table C-2, Revision 6.0 of the permit application), NMED concluded that the provision of detailed and representative chemical and physical analyses could be obtained through implementation of the WAP at generator Sites, as confirmed by audits conducted by the Applicants with NMED oversight. As a result, the only method to ensure compliance with the WAP is to audit the generator Sites. Similarly, NMED must be able to approve the audits, because such approval is the only way for NMED to ensure that WIPP is enforcing the WAP at the generator Sites.

Disposal facilities are required to obtain all waste characterization information which must be known to treat, store or dispose hazardous waste. See 40 CFR 264.13. According to EPA guidance, this requirement includes verification of the integrity of the waste characterization information provided by generator Sites through Site visits and/or confirmatory analysis of split samples. Because the Applicants do not intend to analyze split samples, the only way for WIPP to verify the integrity of waste characterization information (e.g., acceptable knowledge) is through Site audits. EPA guidance also states that disposal facilities which rely on acceptable knowledge must become “thoroughly familiar with the generator’s processes to ensure integrity of the acceptable knowledge data”. By requiring acceptable knowledge audits in the context of the overall audit program, NMED ensures that the Applicants examine Site procedures for acquiring acceptable knowledge information and determine that the Sites have correctly used acceptable knowledge to characterize waste.

The EPA intended the WAP to include requirements specifying “the level of analysis to be performed on the waste managed at facilities, the minimum frequency with which these analyses were to be repeated, and the properties of the waste which were to be determined to verify the identity of each truckload, shipment, or batch of hazardous waste managed at facilities”. 45 FR 33179. For off-site facilities, the WAP also was intended to present “procedures used to determine the identity of incoming waste,” including sampling methodologies, test methods, and analysis parameters. Id. at 33180.

NMED reviewed the Applicants’ proposed WAP in light of the EPA requirements, as well as the unique, site-specific factors relating to the management of mixed waste, which contains radioactive material imposing special health concerns at WIPP. Although the Applicants did not submit a detailed, representative waste analysis or propose on-site verification of waste analysis, they did submit a

MISSION STATEMENT: TO PROMOTE THE HIGHEST QUALITY OF LIFE THROUGHOUT THE STATE BY PROVIDING A SAFE, CLEAN, AND PROTECTIVE ENVIRONMENT.

Ground Water Quality Bureau

UPDATED WASTEWATER REUSE POLICY PROTECTS RESOURCES

Already in use at golf courses and other sites around the state, irrigation with treated wastewater helps preserve New Mexico's potable water resources. A policy recently updated by NMED's Ground Water Quality Bureau will better promote this use while protecting human health.

The policy establishes strong health requirements including limits on ponding and spraying as well as mandatory posting of bilingual notices identifying application areas.

Under the new policy reclaimed wastewater, which is treated and disinfected, has uses including dust suppression at construction sites, snow-making,

RIO CHAMA

and irrigation. These uses lessen demands on our limited freshwater resources.

This policy is the product of an NMED organized group that included representatives of the Department of Health, Municipal League and industry.

2003 EMPLOYEES OF THE YEAR

In honor of their exemplary service and record of high performance, the following NMED employees are the Department's Employees of the Year for 2003. To carry this new tradition forward, a new Employee Recognition Committee is being formed to select employees of the quarter and year in the future as well as to coordinate Department-wide events and celebrations. Each Division will have a representative on the Employee Recognition Committee. Administrative leave will be granted along with each award and for participating on the committee. Employees of the year get three days off, quarterly award winners get two days off and committee members get one day off.

NMED's 2003 Employees of the Year are:

Lucy Dunn, Field Operations Division. From her office in Las Cruces Lucy developed the Access budgeting system used by many bureaus and has been responsible for the acquisition and disbursement of computer software. She prepared the Field Operations Division Newsletter and has effectively coordinated and improved information Technology services in the field offices.

Kevin Koch, Environmental Protection Division. Kevin was called to military duty for several months last year, leaving behind a two-month-old son and four-year-old daughter. When he returned to his job at OHSB, he quickly realized we were behind in meeting our goals for Consultation. Kevin jumped in with both feet and brought the Consultation Section up to speed. Kevin has worked hard to expand the Partnership Agreements and Voluntary Protection Programs we have between industries in New Mexico and the Department. Kevin has also worked hard on putting forth the Hispanic Initiative for the OHSB.

Connie Marquez, Administrative Services Division. Connie is always willing to assist bureaus and go the extra mile to ensure effective human resource management. She managed the Personnel Services Bureau smoothly during the transition from Cliff Hawley to Judy Bentley. She is always competent and friendly.

CONTINUED ON PAGE 6

MESSAGE FROM THE SECRETARY

Welcome to the "new" NMED.

For the last few months, myself, Deputy Secretary Derrith Watchman-Moore and the senior staff team as well as the bureau chiefs and district managers have met several times to discuss the future direction of this agency. We have talked a lot about the Department's three guiding principles of **environmental holism, diversity and a high performance workforce**, as well as uncovering tangible accomplishments that can help get us closer to these goals.

I'm happy to say that the newsletter you are holding in your hand or eyeballing on your screen realizes one of these accomplishments. There are more to come including a revamped employee recognition program and an orientation for all Department employees, old and new, about NMED's mission, goals and procedures. I hope that these efforts will help us work together to achieve our common goals.

NMED is the most diverse agency in state government with responsibility for everything from a Portales Dairy Queen to Los Alamos National Laboratory. This breadth and the quality of our work in all these areas are reflected in the Department's accomplishments for 2003 included in this issue.

Taken singularly, each one of these accomplishments is very impressive. Taken as a whole, these accomplishments lay a great foundation for the future. Let's build on that foundation this year and show New Mexico that they ain't seen nothing yet!

Sincerely,

Ron Curry
CABINET SECRETARY

Thank you to the following contributing writers for their submittals:

Ruth Ann Greuling— Solid Waste Bureau

Julie Arvidson— Surface Water Quality
Andy Berger— Air Quality Bureau
Mike Taylor— Radiation Protection Bureau
Michelle Vattano— Pollution Prevention

On average,
Americans
throw away
20,000 televi-
sions, 150,000
tons of packag-
ing materials,
and 43,000 tons
of food per
day.

NMED Accomplishments

NMED has enjoyed many successes in the past year. These include:

WIPP High Level Waste: Following the Governor's October 28, 2003 directive to prohibit reclassified high-level waste at WIPP, NMED issued an agency-initiated permit modification. This modification looks to prevent any reclassified high-level waste from being sent to WIPP. This move came after attempts by DOE to reclassify radioactive sludge currently stored at Hanford. NMED's modification prevents reclassified high-level waste from being sent to WIPP without asserting authority over the radioactive nature of the waste, reducing the likelihood that DOE will be able to mount a successful legal challenge to the permit modification.

Regional Haze: The Environmental Improvement Board (EIB) approved the Department's proposed Regional Haze State Implementation Plan and all associated regulations including a new Smoke Management Plan for the state. By doing this we became only the second state in the country to take meaningful steps to combat regional haze. The plan complies with section 309 of the Federal Regional Haze Rule and has been determined by EPA to demonstrate reasonable progress towards returning visibility in New Mexico's national parks and wilderness areas to natural background conditions by 2064. In conjunction with this, the board approved the Department's proposal for a new Open Burning regulation that will ban the burning of dioxin emitting household refuse beginning in June of next year.

Continued on page 4

SOLID WASTE BUREAU

Interested in Waste Reduction?

Let's Get STARTed

NMED with assistance from General Services Department is helping state government recommit to recycling and waste reduction. This initiative is over the State Agency Recycling Team (START). START is comprised of coordinators from each state agency and is administered by the Solid Waste Bureau. Cindy Pash, Bureau Chief, notes there is particular focus on waste reduction. "The Runnels building has an office paper recycling program, yet each employee still generates a ton each year of trash that is not recycled. Simple things we can do such as double-sided copying and using scrap paper for draft documents add up to big results."

To make it easy for people to participate, a waste reduction checklist is on the back of employee calendars. START's goal is to incorporate waste reduction and recycling into the culture of state government. "We want this program to blend with the way we work—to become second nature, a state of mind," she adds.

START has been meeting to develop individual agency plans. "I am pleased with the results so far," says E. Gifford Stack, manager of outreach for the Solid Waste Bureau. "State government is the largest waste generator, a major consumer, and a prodigious generator. We can set an example for our state. The ideas, tools, and techniques to make a difference for New Mexico."

For information on START, contact Ruth Ann Gifford, Solid Waste Bureau, 827-0129

Radiation Protection Bureau

January is Radon Awareness Month

The U.S. Environmental Protection Agency's has designated January as Radon Awareness Month. Radon is believed to be the second leading cause of lung cancer in the country and the leading cause among nonsmokers. The National Academy of Sciences estimates that 15,000 Americans die annually from radon-related lung cancer. The New Mexico Environment Department will be conducting special activities this January in recognition of Radon Awareness Month. This includes distribution of **FREE** radon test kits.

Radon is a naturally occurring radioactive gas that is tasteless, odorless and colorless. It is found in virtually every type of soil or rock. The gas travels through the ground and is quickly diluted when released into the atmosphere. If it enters a building through openings in the foundation floor or walls, however, it decays into Radon "daughters", which can be inhaled. Poor ventilation and smoke from cigarettes or wood fires are known to contribute to the problem. Prolonged exposure increases a person's risk of contracting lung cancer.

There is no way to predict whether homes have elevated radon levels. Testing is the only way to find out. The NMED Radiation Control Bureau is working with organizations to ensure that technical assistance and informational materials are accessible statewide.

Kits can be obtained by contacting the Indoor Radon Outreach Program Coordinator, **Michael Taylor** at (505) 827-1093, or via e-mail at michael_taylor@nmed.state.nm.us. Kits include free postage to mail the device to an out-of-state lab and prepaid fee for having it analyzed. Following the directions in each kit, the results of the test analysis are returned directly to the homeowner's address.

What is a watershed?

- * Watersheds are natural boundaries. They are the areas that drain to water bodies, including lakes, rivers, wetlands, streams, and the surrounding landscape. Ground water recharge areas are also considered.

Continued from page 2

Late Night Retail Study: The OSHA Bureau completed the first ever study of violence in late night retail stores in New Mexico. The study showed that in the metro areas analyzed there were 16 murders and 27 kidnappings over the last five years. Following the study, the bureau held town hall meetings around the state and drafted regulations to protect convenience store workers from this violence. These regulations will fight crime and lead better protection for store workers and customers at night.

Water Infrastructure Loans and Grants: Through our Construction Programs Bureau, NMED helped fund and administer 333 water infrastructure projects in 2003, 144 of these were new projects added in the last year. With state aid, these projects received \$16.5 million in 2003. These dollars have a huge impact on the state's rural and economically disadvantaged areas. For example, because of these grants and low interest loans residents of southern colonias, Albuquerque's South Valley and the Village of Jemez Springs are on their way to having safer drinking water and waste water treatment plants that do not pollute our rivers.

LANL Impaired Waters: Despite opposition from Los Alamos National Laboratory, we were able to include seven polluted waterways that emanate from lab property on our "impaired waters" list. This will allow us to begin the process of setting pollution limits and cleaning up these tributaries of the Rio Grande. It marks the first time anywhere in the country that a DOE facility's waters have been listed. This sets an important precedent for the state's power to demand the clean up of other polluted areas controlled by the DOE; areas whose protection is vital to the health of our state's environment and citizens. The state's impaired waters list includes nearly 200 streams and rivers around the state in need of environmental protection. By attempting to stop NMED over their seven, LANL had prevented work from getting started on any of them.

Rio Puerco Restoration: During 2003 staff and financial resources were focused on watershed restoration efforts in the heavily impacted Rio Puerco Watershed, the largest tributary to the Rio Grande in New Mexico. NMED's SWQB funded several Clean Water Act Section 319 projects resulting in technical assessment and design of

restoration strategies, and a \$500,000 Joint Powers Agreement to address stream restoration, erosion control and public safety issues on Bureau of Land Management property in Sandoval County, near Cuba. The project leverages over \$3.5 million in state and federal highway and bridge construction that contributes directly to the restoration effort. Additional NMDOT and Sandoval County contributions provide the needed matching funds component for the federal grant. This project is an excellent example of a collaborative effort between Tribal interests, local stakeholders, the SWQB and the Rio Puerco Management Committee. These efforts will not only improve the environment along the river but also make sure water supplies from Elephant Butte remain protected.

Source Water Assessment and Drinking Water Protection: NMED Drinking Water Bureau provided a full accounting to EPA for the failure of the last administration to complete the necessary Source Water Assessments with a 1.3 million dollar grant in 2001. There were less than 30 source water assessments completed at the end of calendar year 2002. There are now over 700 source water assessment reports that have been completed. DWB also established an Enforcement Program for the first time and issued close to 40 enforcement actions that will help protect users of the state's 1,400 public drinking water systems.

Liquid Waste Regulation: The Department is in the process of tackling the number one polluter of New Mexico's groundwater, improperly functioning septic tanks. A diverse committee was appointed by Secretary Curry to completely re-write the liquid waste regulations. Committee members include NMED staff, industry representatives, and university professors. After several months of meetings, the re-write process is almost finished. The new draft regulations are being presented for legal review, records review and will be made available to the public for comment early in 2004. A policy to address the proliferation of conventional septic tanks being installed on lots smaller than the ¾ acre minimum, as currently allowed by "Grandfather" provisions in the regulations, was issued. The policy, authorized by Liquid Waste Regulation 20.7.3.200.A.6 NMAC, requires additional scrutiny of permit applications for small lots and may require that an advanced system be installed to protect vulnerable bodies of water. This issue is especially important in rural New Mexico where most of the state's 200,000 septic tanks are located.

Radiation Detection at Ports-of-Entry: NMED negotiated a grant commitment from the U.S. Department of Homeland Security in the amount of \$200K, for installation of radiation detection portal monitors at the Gallup and Anthony Ports-of-Entry. These two detection systems will have the capability to monitor for gamma and special nuclear material shipments. The two systems will provide a security infrastructure to guard against illicit trafficking of nuclear materials into the State.

Acute Disease Response: An Acute Disease Response Team (ADRT) was successfully implemented in District 3, Las Cruces and is now planned for development in the remaining Districts. ADRT is made up of key staff from District Field Office and Department of Health staff in coordination with the Food Program staff and DOH office of Epidemiology. The basic premise is that rapid, coordinated investigative response to food borne illness outbreaks can help limit the number of people getting ill while providing valuable lessons on how to prevent recurrences.

AIR QUALITY BUREAU

New Plan Will Improve Visibility in New Mexico's National Park and Wilderness Areas

NMED's Air Quality Bureau is now moving forward with implementation of a recently approved plan to improve visibility in New Mexico's National Parks and Wilderness Areas. The multifaceted plan, adopted by the Environmental Improvement Board at its November 2003 meeting, addresses visibility impairment by instituting measures to lower emissions of pollutants that contribute to the formation of "regional haze." Implementation of the plan initiates a regional program to restore visibility in national parks and wilderness areas to "natural" conditions by the year 2064. The plan includes requirements for sources of sulfur dioxide (such as coal-fired power plants, refineries, natural gas plants, and copper smelters) and smoke management.

Visibility impairment in the form of regional haze is created when light is absorbed or scattered by air pollution – gases and particles in the atmosphere.

Haze is considered regional because pollutants from a wide variety of sources create it across large geographic areas. Sources such as vehicles, forest fires, and industrial sources emit haze-forming pollutants including sulfates, nitrates, and particulate matter.

The regional haze plan is New Mexico's answer to the federal Regional Haze Rule, a major effort announced in 1999 by the U.S. Environmental Protection Agency (EPA) for improvement of visibility in 156 national parks and wilderness areas known as Class I areas. The 9 Class I areas in New Mexico are Bandelier National Monument, Bosque del Apache National Wildlife Refuge, Carlsbad Caverns National Park, and the Gila, Pecos, Salt Creek, San Pedro Parks, Wheeler Peak, and White Mountain Wilderness Areas. The ultimate goal of the EPA's visibility protection regulations is a return to natural visibility conditions in Class I areas by 2064. Depending on circumstances, natural conditions can mean visibility ranging up to a few hundred miles. The Regional Haze Rule requires states, in coordination with federal agencies and other stakeholders, to develop and implement air quality protection plans to reduce the pollution that causes visibility impairment.

For more information about the regional haze plan, go to the Air Quality Bureau's Regional Haze Web page at: <http://www.nmenv.state.nm.us/aqb/Regional-Haze.html>

Surface Water Quality Bureau

New Program and Project Will Help Protect Wetlands

The Surface Water Quality Bureau (SWQB) is implementing a new wetlands program and partnering with the Carson National Forest on a wetland project. Two assistance grants from the Environmental Protection Agency are funding the program and the project.

Wetlands are areas where water covers the soil year round or at differing times during the growing season of the year. They hold diverse species of water-loving plants, bugs and fish and also support terrestrial species. Streamside or floodplain situated wetlands act as a natural sponge slowing the velocity of water to decrease erosion and reduce flood damage. They also act as a natural filtration system against nutrients and other pollutants.

The goals of the SWQB wetlands program are to protect and enhance New Mexico's remaining wetlands and riparian areas by increasing self-sustaining and naturally functioning wetlands.

The SWQB is also involved in the Stewart Meadows Wetland Waterfowl Habitat Partnership Project. The objective of this project is to create and improve 25-50 acres of wetland habitat for migratory waterfowl in north central New Mexico.

The SWQB wetlands program and the Stewart Meadows project facilitate the reduction of nonpoint source pollution in watersheds in New Mexico.

POLLUTION PREVENTION

HAPPY NEW YEAR FROM POLLUTION PREVENTION (P2)

Another year has begun and some of us are taking on New Year's resolutions for 2004. Your resolution might be to exercise more, work harder, or maybe just to get along better with others. But why not do something different in 2004, something that will benefit you and your family, saving you money and helping protect the environment at the same time? Let's resolve to waste less and conserve more. During the winter months we spend more time inside our homes – reading, eating, watching television or accomplishing indoor projects. With more time inside and the cold winds blowing, we tend to use more energy. Here are some ideas for the winter months to help you cut costs and reduce energy.

- Turn lights off when a room is not being used or trade your current bulbs for energy saving light bulbs – they last 12 times longer than a standard bulb and will help decrease your electric bill.
- Reduce your junk mail intake (see New Mexico Recycling Coalition NMRC www.nmrecycle.org website for instructions)
- Evaluate your transportation usage – carpool to work or take care of all your errands in one trip, if possible.
- Check with PNM www.pnm.com for instructions on how to cut your heating expenses.
- Examine the windows and doors in your home to make sure they are airtight.
- Turn off your computer and lights in your office when you leave work
- Dispose of Anti-Freeze Properly (it is dangerous 100% of the time to animals and children)
- Draw at dusk... close your curtains as the days get chillier. Closing your curtains at dusk will stop heat escaping through windows.

The following is a list of trainings you can look forward to from the Pollution Prevention Program in the coming months. Contact Michelle Vatanno at 827-0677 for more information.

January

Pollution Prevention workshop (Santa Fe)

February

Regulatory Integration workshop (Albuquerque)

Green Zia Application Writing workshop

Green Zia Criteria workshop

April

John Montgomery, Water and Waste Management Division.

John is recognized for his exemplary effort this past year in preparing the department for the upcoming triennial review of surface water quality standards. His efforts at working with stakeholders have resulted in a significant narrowing of hearing issues, which has reduced the department and commission's time spent in hearing and associated hearing costs. John has also established excellent professional and productive working relationships with outside parties in an attempt to fully understand various stakeholder's views and is highly respected as a source of information on water quality standards. John's thorough understanding of the issues has also led to innovative solutions to long-lingering problems.

WHATS NEW IN IT

The NMED theme teams recommended the NMED Intranet (some of you may know this as DWS) be updated and made more useful. As a result of the theme team recommendation, an ad hoc advisory team consisting of representatives from personnel, administrative services, IT staff and bureaus is being convened to identify specific improvements. Their vision for a new and improved Intranet will be implemented by the NMED webmaster. Please send ideas for improvement to: lynn_harris@state.nm.us.

**Subject: REQUEST FOR CLASS 3 PERMIT MODIFICATION TO THE HAZARDOUS
WASTE FACILITY PERMIT, PERMIT NUMBER NM4890139088—TSDF,
IMPLEMENTING SECTION 311 OF PUBLIC LAW 108-137**

Dear Mr. Zappe:

The purpose of this letter is to submit a request for a Class 3 permit modification to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (HWFP), Number: NM4890139088—TSDF. The U.S. Department of Energy, Carlsbad, Field Office (CBFO) and Washington TRU Solutions LLC are submitting this request. The proposed changes in the Permit Modification Request (PMR) do not compromise worker safety, human health, or the environment.

The Permittees are submitting this PMR in accordance with 20.41.900 New Mexico Administrative Code (NMAC) incorporating Title 40 Code of Federal Regulations (40 CFR) § 270.42(d) and are requesting this modification be processed as a Class 3 Permit Modification in accordance with 20.4.1.900 NMAC incorporating 40 CFR § 270.42(c).

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

To facilitate your review, the Permittees are also including revised versions of four technical papers that had been provided to the National Academy of Sciences and reviewed by the New Mexico Environment Department.

If you have any questions regarding this transmittal, please contact Mr. Kerry Watson at (505) 234-7357 or Mr. Jody Plum at (505) 234-7462.

Sincerely,

Dr. Inés Triay, Manager
Carlsbad Field Office

S. D. Warren, General Manager
Washington TRU Solutions LLC

RE: Request for Permit Modification to the Hazardous Waste Facility Permit, Permit Number NM4890139088-TSDF, Waste Characterization Updates and other Process Improvements

Dear Mr. Zappe:

The purpose of this letter is to submit a request for a Class 2 permit modification to the Waste Isolation Pilot Plant (WIPP) Hazardous Waste Facility Permit (HWFP), Number: NM4890139088-TSDF. This request is being submitted by the U.S. Department of Energy, Carlsbad Field Office (CBFO) and Westinghouse TRU Solutions LLC. The proposed changes in this Permit Modification Request (PMR) do not compromise worker safety, human health, or the environment. The modification includes the following items:

- Item 1: Add U134 as a New Hazardous Waste Number;
- Item 2: Characterizing Repackaged Homogeneous Solids as Retrievably Stored Waste with Regard to Solids Sampling (Control Charting);
- Item 3: Classified Information Recordkeeping and Audit Requirements; and
- Item 4: Addition of HalfPACTs; and
- Item 5: Use of Radiography for Newly Generated Waste (Visual Verification).

The permittees are submitting this PMR in accordance with 20.4.1.900 NMAC incorporating 40 CFR 270.42(b) for Class 2 permit modifications.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and imprisonment for knowing violations.

Sincerely,

Dr. Inés Triay, CBFO Manager
U.S. Department of Energy

J. L. Lee, General Manager
Westinghouse TRU Solutions, LLC

Overview of the Permit Modification Request

This PMR is being submitted by the U.S. Department of Energy (DOE), Carlsbad Field Office (CBFO) and Westinghouse TRU Solutions LLC (WTS), collectively referred to as the Permittees, in accordance with the WIPP HWFP, Condition I.B.1 (20.4.1.900 New Mexico Administrative Code (NMAC) incorporating 40 Code of Federal Regulations (CFR) §270.42(b)). This PMR is necessary to allow generator/storage sites the ability to ship non-corrosive waste which carries the U134 hazardous waste number to WIPP for disposal. This change does not reduce the ability of the Permittees to provide continued protection to human health or the environment.

The requested modification to the WIPP HWFP and related supporting documents are provided in this PMR. The proposed modification to the text of the WIPP HWFP has been identified using a double underline and a revision bar in the right hand margin for added information, and a ~~strikeout~~ font for deleted information. All direct quotations are indicated by italicized text. The following information specifically addresses how compliance has been achieved with the WIPP HWFP requirement, Permit Condition I.B.1 for submission of this Class 2 PMR.

1. **20.4.1.900 NMAC (incorporating 40 CFR §270.42(b)(1)(i)), requires the applicant to describe the exact change to be made to the permit conditions and supporting documents referenced by the permit.**

This modification contains a single proposed change that will allow the addition of the hazardous waste number U134. The exact, proposed text changes are found in Attachment A of this PMR, while changes to the Part A application are found in Attachment B.

2. **20.4.1.900 NMAC (incorporating 40 CFR §270.42(b)(1)(ii)), requires the applicant to identify that the modification is a Class 2 modification.**

The proposed modification is classified as a Class 2 permit modification.

3. **20.4.1.900 NMAC (incorporating 40 CFR §270.42(b)(1)(iii)), requires the applicant to explain why the modification is needed.**

The Idaho National Engineering and Environmental Laboratory (INEEL) has requested the addition of a hazardous waste number to the existing WIPP HWFP. This new number is required to allow disposal of transuranic (TRU) mixed waste with the hazardous waste number U134 at WIPP.

4. **20.4.1.900 NMAC (Incorporating 40 CFR §270.42 (b)(1)(iv)), requires the applicant to provide the applicable information required by 40 CFR §§270.13 through 270.21, 270.62 and 270.63.**

The regulatory crosswalk describes those portions of the WIPP HWFP that are affected by this PMR. Where applicable, regulatory citations in this modification reference Title 20, Chapter 4, Part 1, NMAC, revised June 14, 2000, incorporating the CFR, Title 40 (40 CFR Parts 264 and 270). 40 CFR §§270.16 through 270.22, 270.62, 270.63 and 270.66 are not applicable at WIPP. Consequently, they are not listed in the regulatory crosswalk table. 40 CFR §270.23 is applicable to the WIPP Hazardous Waste Disposal Units (HWDUs). This modification does not impact the conditions associated with the HWDUs.

5. **20.4.1.900 NMAC (Incorporating 40 CFR §270.11(d)(1) and 40 CFR §270.30(k)), requires any person signing under paragraph a and b must certify the document in accordance with 20.4.1.900 NMAC.**

The transmittal letter for this PMR contains the signed certification statement in accordance with Module I.F of the WIPP HWFP.

Item 1

Add Additional Waste Number

Description:

Add an additional hazardous waste number (U134, hydrofluoric acid) to the existing WIPP HWFP. This additional number will not require any additional or different management practices at the WIPP facility but will require sufficient testing or acceptable knowledge (AK) at the generator/storage site to ensure that the waste meets the Treatment, Storage, and Disposal Facility (TSDF) Waste Acceptance Criteria (WAC) as currently specified in the WIPP HWFP.

Basis:

The INEEL has requested the addition of a hazardous waste number to the existing WIPP HWFP. This additional number is required to allow disposal of mixed waste with the U134 hazardous waste number at WIPP.

The Permittees previously submitted a request to New Mexico Environment Department (NMED) to add the U134 hazardous waste number. NMED rejected this request in a letter dated July 6, 2001. NMED later stated that there was insufficient information supplied with the request to ensure that any waste which carried the U134 hazardous waste number had been sufficiently characterized to show that the waste met the WIPP TSDF-WAC for compatibility.

Waste assigned this waste number will not exhibit the characteristic of corrosivity. In Appendix C1 of the WIPP HWFP Application, compatibility was assessed using the document entitled *A Method for Determining the Compatibility of Hazardous Wastes*². This report indicated that hydrofluoric acid is classified into Reactivity Group Numbers 1 and 15. Reactivity Group Number 15 was evaluated within the application. Reactivity Group Number 1 no longer applies since the characteristic of corrosivity no longer exists.

Because the hydrofluoric acid has been complexed/neutralized and is no longer detectable in the waste stream and since a sufficient testing or AK of the waste will be made prior to shipment, compatibility is not an issue as demonstrated by the compatibility analysis study shown in Appendix C1 of the WIPP permit application¹. The compatibility analysis utilizes an approach described in the U.S. Environmental Protection Agency Document, *A Method for Determining the Compatibility of Hazardous Wastes*². This study failed to identify any compatibility issues with hydrofluoric acid waste streams from the INEEL evaluated in the Appendix C1 study as shown below:

¹ "Chemical Compatibility Analysis of Waste Forms and Container Materials", WIPP Resource Conservation and Recovery Act Part B Permit Application, Appendix C1, DOE/WIPP 91-005, Revision 6

² Hatayama, H.K., J.J. Chen, E.R. deVera, R.D. Stephens, and D.L. Storm, "A Method For Determining the Compatibility of Hazardous Waste", April, 1980, EPA 600/2-80-076, U.S. Environmental Protection Agency, Cincinnati, Ohio

...interactions between compounds present in trace quantities (<1 percent by weight) and compounds present in concentrations ≤ 1 percent by weight do not pose an incompatibility problem for the following reasons:...

- The waste is either solidified and immobilized (solidified materials) or present in bulk form as a solid (solid materials). In almost all cases, any possible reactions take place before the waste is generated in its final form....

All potential incompatibilities between trace, minor, and dominant compounds have been analyzed on a case-by-case basis for each waste stream reported in Table C-2 (Chapter C). Some chemicals listed as being present in the waste have reacted prior to placement in a waste container. For example, a site listing a caustic (Group 10) and an acid (Group 1) in its waste has only the neutralized product present in an immobilized form. Further reactions of this type do not occur once the waste is neutralized in its final form. An additional constraint on the chemicals and materials that can be present within each waste stream code is their gas generation potential due to radiolysis.

The addition of hazardous waste code U134 will not require any additional or different management practices from those currently in place at the WIPP facility. Furthermore, the addition of this number will not adversely impact the performance of the waste repository and its ability to protect human health or the environment.

Discussion:

The addition of the U134 hazardous waste number is necessary for disposal of INEEL waste from operations, maintenance, and construction activities that carries the U134 hazardous waste number. INEEL currently has approximately 100 cubic meters of transuranic debris (such as personal protective equipment (PPE), analytical tools, clothing, equipment, decontamination media, contaminated job wastes, and High Efficiency Particulate Air filters) contaminated with waste that has been assigned the U134 code due to the Resource Conservation and Recovery Act (RCRA) mixture and derived from rules.

Hazardous Waste Number

U134 is a listed hazardous waste number for unused or off-specification hydrofluoric acid (HF). It is necessary that this hazardous waste number be assigned to waste at the Idaho Nuclear Technology and Engineering Center (INTEC) due to the past practice in the analytical lab of discarding the unused portion of samples collected to verify the quality of HF received in tanker trucks. The total volume of the unused portion of the samples was approximately 2.5 liters of HF. Laboratory personnel neutralized and complexed the HF with excess aluminum nitrate to form a non-corrosive aluminum fluoride complex in a nitric acid matrix and discharged the mixture into the liquid waste storage tanks. Debris associated with this process will also carry the U134 number.

The RCRA derived from rule, as specified in 20.4.1.200 NMAC (incorporating 40 CFR §261.3(c)(2)(i)), requires that any waste that is derived from the treatment of a listed waste is also a listed waste. Even though the concentration of hydrofluoric acid is below detectable limits and even though the toxicity and corrosivity characteristics are no longer

applicable to this waste stream, the U134 hazardous waste number must be assigned to all waste, waste residues, contaminated equipment, and debris associated with the waste.

The WIPP HWFP also requires that treated waste must retain the original listed hazardous waste numbers that applied to the original untreated waste. Section B-3d of the WIPP HWFP states that "Treated waste shall be considered newly generated waste, and shall retain the original waste stream's listed hazardous waste code designation."

Waste Form

Debris waste from INTEC will meet the WAC for WIPP. The specific treatment for the waste will comply with the current WIPP permit and associated WAC. The final packaged waste will not be corrosive as defined by 20.4.1.200 NMAC (incorporating 40 CFR §261.22) because the INEEL will be required to show through acceptable knowledge or testing and analysis (visual inspection or similar testing) that the debris waste form does not contain liquid waste. Information will be placed in the Characterization Information Summary (Section B3-12b(1)) to ensure that this requirement is met and that the final waste form meets the WIPP TSDF-WAC.

Corrosivity is defined by the NMED in 20.4.1. 200 NMAC (incorporating 40 CFR §261.22) as follows: "It is aqueous and has a pH less than or equal to 2 or greater than or equal to 12.5, as determined by a pH meter using Method 9040 in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods", EPA Publication SW-846, as incorporated by reference in §260.11 of this chapter. It is a liquid and corrodes steel (SAE 1020) at a rate greater than 6.35 mm (0.250 inch) per year at a test temperature of 55°C (130°F) as determined by the test method....."

The WIPP HWFP (Section B-3c) requires that 100 percent of all containers undergo radiography or visual examination to verify that the TSDF-WAC and the WIPP HWFP prohibitions on liquids are met. Thus, the waste carrying the U134 hazardous waste number cannot meet the regulatory definition of a corrosive material, because the definition of corrosivity requires that the material being examined is liquid. Because all waste containers undergo radiography or visual examination, to verify the absence of liquid waste, no corrosive waste will be shipped to the WIPP facility.

b.1. Attachment B3, Section B3-12b(1)Waste Stream Profile Form and Characterization Information Summary

The Characterization Information Summary includes the following elements:

1. Data reconciliation with DQOs
2. Cross-reference of container identification numbers to each Batch Data Report

3. Headspace gas summary data listing the identification numbers of samples used in the statistical reduction, the maximum, mean, standard deviation, UCL_{90} , RTL, and associated EPA hazardous waste codes that must be applied to the waste stream.
4. TIC listing and evaluation, and verification that AK was confirmed.
5. RTR and VE summary to document prohibited items are not present and to confirm AK.
6. AK summary including waste stream name, waste stream number, point of generation, waste stream volume, generation dates, TRUCON codes, TWBIR information, generating processes, RCRA determinations, and radionuclide information.
7. Certification through acceptable knowledge or testing and/or analysis that any waste assigned the hazardous waste number of U134 (hydrofluoric acid) no longer exhibits the characteristic of corrosivity. This is confirmed by assuring that no liquid waste is present.

After approval of a Waste Stream Profile Form and the Associated Characterization Information Summary by the Permittees, the generator/storage site are required to maintain a cross reference of container identification numbers to each Batch Data Report.

c.1. Attachment O, Part A Application

A revised Part A Application is included in Attachment B. [Note: A signed copy of the revised Part A Permit Application will be provided to NMED following approval of the PMR.]

**RE: FINAL DETERMINATION, CLASS 2 MODIFICATION REQUESTS
WIPP HAZARDOUS WASTE FACILITY PERMIT
EPA I.D. NUMBER NM4890139088**

Dear Dr. Triay and Mr. Lee:

The New Mexico Environment Department (NMED) hereby approves, with changes, certain Class 2 permit modification requests to the WIPP Hazardous Waste Facility Permit as submitted to the Hazardous Waste Bureau (HWB) in the following documents:

- Request for Class Determination and Permit Modification (Data Management), Letter Dated 6/27/02, Rec'd 6/28/02
- Request for Class Determination and Permit Modification (Waste Containers), Letter Dated 6/27/02, Rec'd 6/28/02
- Request for Class 2 Permit Modification (Waste Characterization Update), Letter Dated 6/27/02, Rec'd 6/28/02

The following items were included in these three submittals:

1. Improving Data Management to Streamline the Disposal of Transuranic Waste
2. Characterizing Repackaged Homogenous Solids as Retrievably Stored Waste
3. Use of Radiography for Newly Generated Waste

Dr. Inés Triay
Mr. John Lee
November 25, 2002
Page 2

4. Addition of HalfPACT Shipping Container
5. Addition of a New Hazardous Waste Number
6. Record Keeping and Auditing for Classified Information
7. Addition of New Waste Containers

In these submittals, the Permittees requested class determinations for Items 1 and 7. On July 22, 2002, NMED issued a Notice of Class Determination, identifying Item 1 as a Class 3 modification and Item 7 as a Class 2 modification. While all Items were subject to the same public comment period, NMED is only issuing a determination today on Items 2 through 7. The Class 3 modification will be addressed under a separate administrative action at a later date.

The remaining Class 2 modifications were processed by NMED in accordance with the requirements specified in 204.1.900 NMAC (incorporating 40 CFR §270.42(b)). These Class 2 modifications were subject to an initial sixty (60) day public comment period, which ran from July 3 through September 3, 2002. On August 8, 2002, NMED extended the public comment period by thirty (30) days until October 3, 2002. NMED received written comments from forty individuals and organizations during this time.

NMED hereby approves Items 2 through 7 with changes based upon consideration of all public comment. The approved modifications are incorporated in the following attachment:

- Attachment 1 contains the redline/strikeout pages of the modified permit to help the reader rapidly identify each modification. Language deleted from the permit is ~~stricken out~~. Language added to the permit is highlighted in redline. Due to the extensive nature of the modifications requested by the Permittees, specific language changes imposed by NMED are not distinguished from language changes proposed in the modification request.

Also enclosed is a CD-ROM containing the modified files in WordPerfect 8 redline/strikeout format. An electronic version of the modified permit with markings removed is available for download from the NMED WIPP Information Page at <http://www.nmenv.state.nm.us/wipp/download.html>.

For purposes of version control, please note that NMED has established the date of these modified pages and attachments as November 25, 2002. The effective date of the permit modification approval is your date of receipt of this letter.

NMED will provide full response to all public comments under separate cover.

HAZARDOUS WASTE FACILITY PERMIT

Name of Permittee: Rinchem Company, Inc.

EPA Identification Number: NMD002208627

Permit Number: NMD002208627-2

Pursuant to the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act (RCRA), as amended (42 U.S.C. 6901, et seq.), and the New Mexico Hazardous Waste Act, NMSA 1978, Sections 74-4-1 et seq. (Repl. Pamph. 1993), and regulations promulgated thereunder by the New Mexico Environmental Improvement Board (codified and to be codified in the Hazardous Waste Management Regulations [20.4.1 NMAC]), a Permit is issued to Rinchem Company, Inc., (the Permittee) to operate a hazardous waste Container Storage Facility (the Facility), comprising seven rooms. The Facility is located at 6133 Edith Boulevard N.E., in the City of Albuquerque, Bernalillo County, New Mexico, on Latitude 35.15 North, and Longitude 106.63 West.

The Permittee shall comply with all terms and conditions of this Permit. This Permit consists of the conditions herein including those in the Attachments. Applicable provisions of regulations cited are those which are in effect on the effective date of this permit, New Mexico Hazardous Waste Management Regulations 20.4.1 NMAC (Effective June 14, 2000).

This Permit is based on the assumption that all information contained in the Permit Application and the administrative record is accurate and that the Facility shall be maintained and operated as specified in the application. The permit application consists of information submitted in February 1998 and supplementary technical documents.

Any inaccuracies found in the submitted information may be grounds for the termination or modification of this Permit in accordance with 20.4.1.900 NMAC, incorporating 40 CFR §270.41, §270.42, and §270.43 and for potential enforcement action.

This Permit shall become effective thirty days (30) after notice of the decision has been served on the applicant, and shall remain in effect for ten (10) years in accordance with the New Mexico Hazardous Waste Act, Section 74-4-4 unless modified, suspended or revoked under Section 74-4-4.2 or 20.4.1.900 NMAC, incorporating 40 CFR §270.41, §270.42, §270.43, or continued in accordance with 20.4.1.900 NMAC, incorporating 40 CFR §270.51, or issued for a duration that is less than the full allowable term in accordance with 20.4.1.900 NMAC, incorporating 40 CFR §270.50(c).

Signed this _____ day of February 2002.

MODULE I GENERAL PERMIT CONDITIONS

MODULE HIGHLIGHT

This Module contains conditions pertaining to all hazardous waste storage facilities permitted under the New Mexico Hazardous Waste Act (HWA) and the Resource Conservation and Recovery Act (RCRA).

PERMIT CONSTRUCTION: CITATIONS

Whenever provisions of this Permit or of the New Mexico Hazardous Waste Management Regulations (HWMR), 20.4.1 NMAC, incorporating 40 CFR Parts 260 through 270 are cited, the citation shall include all subordinate provisions of the cited provision paragraphs of this Permit or of the HWMR. When subordinate sections are cited, such citations shall include all subsections of the cited paragraphs.

I.A. EFFECT OF PERMIT

The Secretary of the New Mexico Environment Department (**Secretary**) issues this Permit to Rinchem Company Inc., (**the Permittee**) the owner and operator of a Container Storage Facility (EPA I.D. Number NMD002208627). This Permit authorizes the Permittee to accept, manage and store off-site generated hazardous waste at the Facility, and establishes the general and specific standards for these activities, pursuant to the New Mexico Hazardous Waste Act (HWA) NMSA 1978, §74-4-1 et seq. (Repl. Pamp. 1993), and the New Mexico Hazardous Waste Management Regulations, 20.4.1.100 NMAC et seq.

Compliance with this Permit during its term shall constitute compliance for purposes of enforcement with Subtitle C of the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. §6901 et seq., and/or HWA, and/or their implementing regulations. Compliance with this Permit shall not constitute a defense to any order issued or any action brought under HWA §§74-4-10.1.E or 74-4-13; RCRA §§3008(a), 3008(h), 3013, 7002, or 7003; the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), 42 U.S.C. §9601 et seq., or any other law providing for protection of public health or the environment. This Permit does not convey any property rights of any sort or any exclusive privilege, nor authorize any injury to persons or property, any invasion of other private rights, or any infringement of State or local laws or regulations, in accordance with 20.4.1.900 NMAC, incorporating 40 CFR §§270.4 and 270.30(g).

The complete Permit consists of Permit Modules I through V and Permit Attachments A through L as follows:

| | | |
|------------|---|--|
| Module I | - | General Permit Conditions |
| Module II | - | General Facility Conditions |
| Module III | - | Storage of Hazardous Waste in Containers |

PERMIT MODULE I

| | | |
|--------------|---|--|
| Module IV | - | Corrective Action |
| Module V | - | Subpart CC Standards for Organic Air Emissions |
| Attachment A | - | General Facility Description |
| Attachment B | - | Authorized Wastes |
| Attachment C | - | Design and Operation of the Container Storage Facility |
| Attachment D | - | Waste Analysis Plan |
| Attachment E | - | Security Plan |
| Attachment F | - | Inspection Plan |
| Attachment G | - | Preparedness and Prevention Procedures |
| Attachment H | - | Contingency Plan |
| Attachment I | - | Record Keeping |
| Attachment J | - | Personnel Training |
| Attachment K | - | Closure Plan |
| Attachment L | - | Corrective Action Units |
| Attachment M | - | Financial Insurance |

If there is a conflict between the language of the Permit Modules and the language of the Permit Attachments, the language of the Permit Modules shall override the language in the Permit Attachments.

I.B. PERMIT ACTIONS

I.B.1. Term of Permit

This Permit shall be effective for a fixed period of ten (10) years from the effective date of issuance as specified in the Permit certificate. [20.4.1.900 NMAC, incorporating 40 CFR §270.50(a)].

I.B.2. Permit Modification, Suspension and Revocation

This Permit may be modified, suspended, or revoked for cause as specified in HWA §74-4-4.2 and 20.4.1.900 NMAC, incorporating 40 CFR §270.41 through §270.43. The filing of a request by the Permittee for a Permit modification, suspension, or revocation, or the notification of planned changes or anticipated noncompliance, shall not stay any Permit condition, in accordance with 20.4.1.900 NMAC, incorporating 40 CFR §270.30(f).

I.B.3 Permit Renewal

Permittee may renew this Permit by submitting an application for a new permit at least one hundred eighty (180) calendar days before the expiration date of this Permit. In reviewing any application for a permit renewal, the Secretary shall consider improvements in the state of control and measurement technology and changes in applicable regulations. [20.4.1.900 NMAC (incorporating 40 CFR §270.10(h) and §270.30(b))].

I.B.4 Continuation of Expiring Permit

If the Permittee has submitted a timely and complete application for renewal of this Permit, as specified in 20.4.1.900 NMAC (incorporating 40 CFR §270.10, §270.13 through §270.29), this Permit shall remain in effect until the effective date of the new permit if, through no fault of the Permittee, the Secretary has not issued a new permit on or before the expiration date of this Permit. [20.4.1.900 NMAC (incorporating 40 CFR §270.51)].

I.B.5. Permit Review

The Secretary shall review this Permit no later than five (5) years after the effective date of this Permit, and shall modify this Permit as necessary pursuant to Section §74-4-4.2 of the HWA and 20.4.1.900 NMAC (incorporating 40 CFR §270.41, §270.50(b) and §270.50(d)). Such modification(s) shall not extend the effective term of this Permit as specified in Permit Condition I.B.1. [20.4.1.900 NMAC, incorporating 40 CFR §270.41, §270.50(b) and §270.50(d)].

I.B.6. Scope of Permit

This Permit authorizes the management and storage of hazardous wastes only in the seven rooms of the Facility, as defined herein, and at no other locations on the Facility.

I.C. SEVERABILITY

The provisions of the Permit are severable, and if any provision of this Permit, or any application of any provision of this Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this Permit shall not be affected thereby.

I.D. DEFINITIONS

For purposes of this Permit, terms used herein shall have the same meanings as those in HWA, RCRA, and their implementing regulations, unless this Permit specifically provides otherwise.

Where a term is not defined in HWA, RCRA, pursuant regulations, EPA guidelines or publications, or this Permit, the meaning associated with such a term shall be defined by a standard dictionary reference or the generally accepted scientific or industrial meaning of the term.

“Action levels” are health-based concentrations of hazardous constituents determined by the secretary to be indicators for the protection of human health and/or the environment.

“Area of Concern” (AOC) means any discernable area at the Facility, or an area off-site impacted by migration of contamination from the Facility, where the Secretary determines may have a probable release of hazardous waste or hazardous constituents not from a SWMU and may cause a current or potential threat to human health or the environment. An AOC may require investigation and remedial action under Section 74-4-4.2.B of the HWA or 20.4.1.900 NMAC (incorporating 40 CFR §270.32(b)(2), in order to ensure adequate protection of human health and the environment.

“Container Storage Unit” (CSU) for the purposes of this Permit is used synonymously with the Rinchem Company Container Storage Facility which comprises seven storage rooms.

A **“Corrective Action Management Unit” (CAMU)** includes any area within the Rinchem Facility that is designated by the Secretary under the HWA and its regulations, for the purpose of implementing corrective action requirements. A CAMU shall only be used for the management of remediation wastes pursuant to implementing such corrective action requirements at the Facility.

“Corrective Measures” include all corrective action necessary to protect human health and the environment for all releases of hazardous waste or hazardous constituents from any solid waste management unit at the Facility, regardless of the time at which waste was placed in the unit, as required under Section 74-4-4.2.B of the HWA and 20.4.1.500 NMAC, incorporating 40 CFR §264.101. Corrective measures may address releases to air, soils, surface water or groundwater.

“Extent of contamination” is defined as the horizontal and vertical area in which the concentrations of hazardous constituents in the environmental media being investigated are above detection limits or background concentrations indicative of the region, whichever is appropriate as determined by the Secretary.

“Facility” means Rinchem Company, Inc. Container Storage Facility including all contiguous land, and structures, other appurtenances, and improvements on the land, used for managing and storing hazardous waste, located at 6133 Edith Boulevard, NE, Albuquerque, New Mexico. For the purposes of implementing corrective action under 20.4.1.500 NMAC, incorporating 40 CFR §264.101, or RCRA Section 3008(h), HWA 74-4-10.E. The Facility includes all contiguous property under the control of the owner or operator seeking a permit under 20.4.1 NMAC, incorporating 40 CFR 260-270. [20.4.1.100 NMAC, incorporating 40 CFR §260.10.]

"Foreign Source" refers to hazardous waste generated outside the United States of America.

"Hazardous Constituents" are those substances listed in 20.4.200 NMAC, incorporating 40 CFR §261 Appendix VIII, and 20.4.1.500 NMAC, incorporating 40 CFR §264 Appendix IX.

"Hazardous Waste" means a hazardous waste as defined in Section 74-4-3(I) of HWA, and 20.4.1.200 NMAC, incorporating 40 CFR §261.3.

"He" means "he" or "she" as appropriate.

"Interim Measures" are actions necessary to minimize or prevent the further migration of contaminants and limit actual or potential human and environmental exposure to contaminants while long-term corrective action remedies are evaluated and, if necessary, implemented.

"Off-Site Source" means a generator of hazardous waste located within the United States of America, but outside the Permittee's Facility boundary.

"Release" means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing of any hazardous waste or hazardous constituents into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing hazardous waste or hazardous constituents).

"Remediation Waste" for the purposes of this permit includes all solid and hazardous wastes, and all media (including groundwater, surface water, soils, and sediments) and debris, which contain listed hazardous wastes or which themselves exhibit a hazardous waste characteristic, that are managed for the purpose of implementing corrective action requirements. For the Facility, remediation wastes may originate only from within the Facility boundary, but may include releases beyond the Facility boundaries.

"Secretary" means the Secretary of the New Mexico Environment Department or his designee or authorized representative.

A **"Solid Waste Management Unit"** (SWMU) means any discernable unit in which solid waste has been placed at any time, irrespective of whether the unit is or ever was intended for the management of solid waste. RCRA regulated hazardous waste management units are also solid waste management units. SWMUs include areas that have been contaminated by routine and systematic releases of hazardous waste or hazardous constituents, excluding one-time accidental spills that are immediately remediated and cannot be linked to solid waste management activities (e.g. product or process spills).

I.E. DUTIES AND REQUIREMENTS

I.E.1. Duty to Comply

The Permittee shall comply with all conditions in this Permit, except to the extent and for the duration such noncompliance is authorized in an Emergency Permit specified in 20.4.1.900 NMAC, incorporating 40 CFR §270.61. Any Permit noncompliance, except under the terms of an Emergency Permit, constitutes a violation of HWA and/or RCRA and may subject the Permittee, its successors and assigns, officers, directors, employees, parents, or subsidiaries, to an administrative or civil enforcement action, including civil penalties and injunctive relief, as specified under §74-4-10 or §74-4-10.1 of HWA or Sections 3008(a) and (g), 7002, or 7003 of RCRA; to permit modification, suspension, revocation, or denial of a permit application or modification request under §74-4-4.2 of HWA; or to criminal fines or imprisonment under HWA Section 74-4-11 or Section 3008(d), (e), or (f) of RCRA; or to a combination of the foregoing. [20.4.1.900 NMAC, incorporating 40 CFR §270.30(a)]

I.E.2. Duty to Reapply

If the Permittee wishes to continue an activity regulated by this Permit after the expiration date of this Permit, the Permittee shall apply for and obtain a new permit. The Permittee shall submit a complete application for a new permit at least 180 calendar days before the expiration date of this Permit, unless permission for a later date has been granted by the Secretary [20.4.1.900 NMAC, incorporating 40 CFR §270.10(h) and §270.30(b)]. The Secretary shall not grant permission for applications to be submitted later than the expiration date of the existing Permit.

I.E.3. Transfer of Permit

The Permittee shall not transfer this Permit to any person except after providing notice to the Secretary and receiving approval from the Secretary for this action. The prospective new owner or operator must file a disclosure statement with the Secretary as specified at HWA, §74-4-4.7. The Secretary may require modification or revocation and reissuance of this Permit in accordance with 20.4.1.900 and 20.4.1.901 NMAC, incorporating 40 CFR §270.40(b) and §270.41(b)(2).

Before transferring ownership or operation of the Facility during its active life or post-closure care period, the Permittee shall notify the new owner or operator in writing of the requirements of 20.4.1.500 NMAC, incorporating 40 CFR Part 270, and of this Permit. [20.4.1.900 NMAC, incorporating 40 CFR §270.30(1)(3) and §270.40)].

I.E.4. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for the Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the terms of this Permit, as provided by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(c).

I.E.5. Duty to Mitigate

In the event of noncompliance with this Permit, the Permittee shall take all reasonable steps to minimize releases to the environment, and shall carry out such measures as are reasonable to prevent significant adverse impacts on human health or the environment, as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(d).

I.E.6. Proper Operation and Maintenance

The Permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Permittee to achieve compliance with the conditions of this Permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance/quality control procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of this Permit as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(e).

I.E.7. Duty to Provide Information

The Permittee shall furnish to the Secretary, within a reasonable time as specified by the Secretary, any relevant information which the Secretary may request to determine whether cause exists for modifying, suspending, or revoking this Permit, or to determine compliance with this Permit. The Permittee shall also furnish to the Secretary, upon request, copies of records required to be kept by this Permit as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.74(a) and 20.4.1.900 NMAC, incorporating 40 CFR §270.30(h).

Permit Condition I.E.7 shall not be construed to limit, in any manner, the Secretary's authority under HWA§74-4-4.3 or RCRA § 3007(a).

I.E.8. Inspection and Entry

The Permittee shall allow the Secretary, or authorized representatives, upon the presentation of credentials and other documents as may be required by law, the following entry and inspection privileges specified in 20.4.1.900 NMAC, incorporating 40 CFR §270.30(i):

I.E.8.a. Entrance to premises - to enter at reasonable times into the Permittee's premises where the regulated Facility or activity is located or conducted, or where records must be kept under the conditions of this Permit;

I.E.8.b. Access to records - to have access to and copy, at reasonable times, any records that must be kept under the conditions of this Permit;

I.E.8.c. Inspection - to inspect at reasonable times the Facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Permit; and

I.E.8.d. Sampling - to sample or monitor at reasonable times, for the purposes of assuring Permit compliance or as otherwise authorized by RCRA and/or HWA, any substances or parameters, including soil, surface water, and ground water at the Facility.

Permit Condition I.E.8 shall not be construed to limit, in any manner, the Secretary's authority under HWA §74-4-4.3 or RCRA § 3007(a).

I.E.9. Monitoring and Records

I.E.9.a. Representative sampling

For purposes of monitoring, the Permittee shall take samples and measurements representative of the monitored activity as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(j)(1), and the procedures stipulated in Permit Condition II.C.2.

I.E.9.b. Record retention

The Permittee shall retain records of all ground water monitoring information, including all calibration and maintenance records, well logs, copies of all reports and records required by this Permit, the waste minimization certification required by 20.4.1.500 NMAC, incorporating 40 CFR §264.73(b)(9), and records of all data used to complete the Permit Application for a period of at least three (3) years from the date of the sample, measurement, report, record, certification, or application as required by 20.4.1.900 NMAC incorporating 40 CFR §270.30(j)(2). This period may be extended by request of the Secretary at any time and is automatically extended during the course of any unresolved enforcement action regarding this Facility.

I.E.9.c. Monitoring records contents

PERMIT MODULE I

In accordance with 20.4.1.900 NMAC, incorporating 40 CFR §270.30(j)(3), records of monitoring information shall include:

- i. the dates, exact place, and times of sampling or measurements;
- ii. the names and qualifications of the individuals who performed the sampling or measurements;
- iii. the name and address of the laboratory that performed the analysis;
- iv. the dates analyses were performed;
- v. the names and qualifications of the individuals who performed the analyses;
- vi. the analytical techniques or methods used; and
- vii. the results of such analyses.

I.E.10. Reporting Planned Changes

The Permittee shall give notice to the Secretary, as soon as possible, of any planned physical alterations or additions to the Facility, as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(l)(1).

I.E.11. Reporting Anticipated Noncompliance

The Permittee shall give advance notice to the Secretary of any planned changes to the Facility or in any activities, which may result in noncompliance with Permit requirements, as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(l)(2).

I.E.12. Certification of Construction or Modification

If the Facility is modified, the Permittee shall not store hazardous waste in the modified portion of the Facility, until the following conditions specified in 20.4.1.900 NMAC, incorporating 40 CFR §270.30(1)(2), have been satisfied:

- I.E.12.a. Submittal of statement** - the Permittee has submitted to the Secretary, by certified mail or hand delivery, a letter signed by the Permittee

and an independent professional engineer registered in New Mexico stating that the Facility modification meets the requirements of this Permit; and

I.E.12.b. Inspection by the Secretary - the Secretary has:

- i. inspected the modified or newly constructed portion of the Facility and finds it is as required by the conditions of this Permit; or
- ii. waived the inspection or, within fifteen (15) calendar days from the date of submission of the letter required by Permit Condition I.E.11.a., has not notified the Permittee of his intent to inspect.

I.E.13. Twenty-Four Hour and Subsequent Reporting

I.E.13.a. Oral report - The Permittee shall report to the Secretary any noncompliance which may endanger human health or the environment. Any such information shall be reported orally within 24 hours from the time the Permittee becomes aware of the circumstances, as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(1)(6)(i). The report shall include the following:

- i. information concerning release of any hazardous waste that may cause an endangerment to public drinking water supplies; and
- ii. any information of a release or discharge of hazardous waste, or of a fire or explosion at the Facility, which could threaten the environment or human health outside the Facility.

I.E.13.b. Written report - The Permittee shall submit a written report within five (5) calendar days from the time the Permittee becomes aware of the noncompliance as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(1)(6)(iii). The written report shall contain the following:

- i. a description of the noncompliance and its cause;
- ii. name, address, and telephone number of the owner or operator;
- iii. name, address, and telephone number of the Facility;
- iv. the period of the occurrence including exact date and time, and, if the noncompliance has not been corrected, the anticipated time it is expected to continue;

- v. name and quantity of materials involved;
- vi. the extent of injuries, if any;
- vii. an assessment of actual or potential hazards to the environment and human health outside the Facility, where this is applicable;
- viii. estimated quantity and disposition of recovered material that resulted from the incident; and
- ix. steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

The Secretary may extend the time for submitting the written report to up to fifteen (15) calendar days.

I.E.13.c. Contingency Plan implementation - If the Contingency Plan provided in Permit Attachment H is implemented, the Permittee shall comply with the reporting requirements required by 20.4.1.500 NMAC, incorporating 40 CFR §264.56(j).

I. E.14. Corrective Action

Corrective action required pursuant to 20.4.1.500 NMAC, incorporating 40 CFR §264.101 shall continue under this Permit for any period necessary to comply with the requirements specified in Module IV of this Permit.

I.E.15. Other Noncompliance

The Permittee shall report all other instances of noncompliance not otherwise required to be reported under this Permit at the time monitoring reports are submitted. The reports shall contain the information listed in Permit Condition I.E.13.b., as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(l)(10).

I.E.16. Other Information

Whenever the Permittee becomes aware that he failed to submit any relevant facts in the Permit Application, or submitted incorrect information in the Permit Application or in any report to the Secretary, the Permittee shall promptly submit such facts or information in writing to the Secretary as required by 20.4.1.900 NMAC, incorporating 40 CFR §270.30(l)(11).

I.E.17. Waiver of Defense.

In any judicial action brought in the United States District Court for the District of New Mexico under RCRA (or under the HWA), the Permittee waives all objections and defenses it may have to the jurisdiction of such Federal Court or to venue in such Federal District.

I.E.18. Admissibility of Data

In any administrative or judicial action to enforce a condition of this Permit, the Permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Permit.

I.F. SIGNATORY REQUIREMENT

- * The Permittee shall sign and certify all applications, reports, or information submitted to or requested by the Secretary or required by this Permit, in accordance with, and using the certification language specified in 20.4.1.900 NMAC, incorporating 40 CFR §§270.11 and 270.30(k).

I.G. REPORTS, NOTIFICATIONS, AND SUBMISSIONS TO THE NMED

The Permittee shall submit by certified mail or hand delivery all reports, notifications, or other submissions which are required by this Permit to be sent or given to the NMED. The submissions should be sent by certified mail or hand delivered to:

Manager
Permits Management Program
New Mexico Environment Department
Hazardous Waste Bureau
2905 Rodeo Park Drive East
Building 1
Santa Fe, New Mexico 87505-6303

Telephone Number: (505) 428-2500
Facsimile Number: (505) 428-2567

I.H. CONFIDENTIAL INFORMATION

The Permittee may claim confidentiality for any information required to be submitted by this Permit, to the extent authorized by the HWA §74-4-4.3(D) and 20.4.1.900 NMAC, incorporating 40 CFR §270.12.

I.I. DOCUMENTS TO BE MAINTAINED AT THE FACILITY

The Permittee shall maintain at the Facility, until completion of closure as specified in Permit Module K, the following documents and all amendments, revisions and modifications to these documents:

1. *Waste Analysis Plan*, contained in Attachment D, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.13(b) and this Permit.
2. *Inspection Plan*, contained in Attachment F, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.15(b)(2) and this Permit.
3. *Personnel Training* documents and records, contained in Attachment J, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.16(d) and this Permit.
4. *Contingency Plan*, contained in Attachment H, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.53(a) and this Permit, and including summary reports and details of all incidents that require implementation of the Contingency Plan, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.56(j).
5. Operating Record, contained in Attachment I, *Record Keeping*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.73 and this Permit.
6. *Closure Plan*, contained in Attachment K, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.112(a) and this Permit.
7. Annually adjusted closure cost estimate as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.142(d), and this Permit.
8. The names, addresses, and phone numbers of the Emergency Coordinator (EC) and all persons designated as alternate EC, as required by Permit Condition II.J.4, and shown in Table H-1 of Permit Attachment H, *Contingency Plan*.
9. A list of all equipment, as contained in the Permit Attachment H, Table H-2, *Emergency Equipment List*, which must be regulated as required by 20.4.1.500 NMAC, incorporating 40 CFR Part 264, Subpart CC.
10. A signed duplicate copy of the liability policy required under Permit Condition II.Q.1., as required by Permit Condition II.Q.2.

MODULE II

GENERAL FACILITY CONDITIONS

MODULE HIGHLIGHTS:

This Module sets forth the standards that every owner/operator of a Container Storage Facility (CSF) is required to meet, in order to manage and store hazardous waste at the CSF in a manner protective of human health and the environment.

II. A. DESIGN AND OPERATION OF THE FACILITY

The Permittee shall maintain and operate the CSF to minimize the possibility of a fire, explosion, or any unplanned, sudden or nonsudden release of hazardous waste or constituents to air, soil, ground water, or surface water which could threaten human health or the environment, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.31.

II.B. REQUIRED NOTICES

II.B.1. Hazardous Waste Imports

The Permittee shall not accept wastes from a foreign source without prior authorization from the U. S. Environmental Protection Agency (EPA). The Permittee shall include the authorization in the CSF operating record, and send a copy of the authorization document to the New Mexico Environment Department.

II.B.2. Hazardous Waste From Off-site Sources

The Permittee shall receive off-site hazardous waste in compliance with the requirements and conditions specified in this Permit. The Permittee shall only receive the hazardous waste listed in Permit Attachment B, *Authorized Wastes*, for management and storage at the CSF.

II.C. GENERAL WASTE ANALYSIS

II.C.1. Waste Analysis Plan

The Permittee shall not manage or store hazardous wastes which fail to meet the characterization requirements of Permit Conditions II.C.1. through II.C.4, and 20.4.1.500 NMAC, incorporating 40 CFR §264.13. The Permittee shall ensure that documentation from each generator demonstrating that all hazardous waste destined for management or storage at the CSF from the generator complies with the waste characterization and analysis procedures described in Permit Attachment D, *Waste Analysis Plan*. Knowledge of process shall not be used in lieu of detailed chemical analysis. The Permittee shall inform each generator in writing that the generator must comply with the waste analysis requirements

specified in Permit Attachment D, and as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.13(c).

II.C.2. Sampling and Analysis

The Permittee shall use the methods for statistically selecting waste containers for visual examination and volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and total metals analysis, establishing the background and upper confidence limits for hazardous waste sampling by applying the statistical methods contained in 20.4.1.500 NMAC, incorporating 40 CFR §264 Appendix IV, *Cochran's Approximation to the Behrens-Fisher Student's t-test*.

II.C.3. Waste Profile Sheets

Prior to accepting hazardous waste for management or storage at the CSF, the generator of the off-site hazardous waste shall provide the Permittee Waste Profile Sheets that contain all the chemical composition of the hazardous waste, their percentages, and waste constituents required by this Permit. The Permittee shall review the generator supplied information and chemical analytical data to check for completeness and accuracy, to ensure that the waste meets the criteria of the waste acceptance plan and the procedures described in Permit Attachment D [20.4.1.500 NMAC, incorporating 40 CFR §264.13(a)(2) and §264.13 (b)(5)].

II.C.4. Quality Assurance Objectives

The Permittee shall follow the waste analysis procedures required by 20.4.1.500 NMAC, incorporating 40 CFR §264.13. The Permittee shall verify the analysis of each waste stream annually as part of its quality assurance program, as required by *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods*, EPA Publication SW-846, and the procedures presented in Permit Attachment D, *Waste Analysis Plan*.

II.D. SECURITY

In order to prevent the unknowing entry and to minimize the possibility of unauthorized entry of persons into the CSF, the Permittee shall comply with the security provisions and procedures described in Permit Attachment E, *Security Plan*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.14.

II.D.1. Barriers and Means to Control Entry

The Permittee shall maintain an artificial barrier (i.e. a fence in good repair) around the CSF and a means to control entry into the active portion of the CSF, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.14(b)(2), and as specified in Permit Attachment E, *Security Plan*.

The six foot high light gauge fabric, 2-inch mesh chain link fence shall be maintained around the CSF to prevent unauthorized personnel and livestock from gaining access to the CSF warehouse and its surrounding land. Access to the CSF shall be only through the gates described in the *Security Plan* contained in Permit Attachment E.

II.D.2. Warning Signs

Warning signs in English and Spanish, for example: **DANGER, NO UNAUTHORIZED PERSONNEL, KEEP OUT,** and **PELIGRO, NO PERMITIDA LA ENTRADA SIN AUTORIZACION**, shall be posted at all the gates and around the fence, and at other locations of the CSF in sufficient numbers to be visible from all angles of approach to the CSF. These bilingual signs must be legible from a distance of at least 25 feet from any approach to the perimeter fence, in compliance with the standards contained in 20.4.1.500 NMAC, incorporating 40 CFR §264.14(c).

II.E. GENERAL INSPECTION REQUIREMENTS

II.E.1. Inspection Schedule

The Permittee shall implement the Inspection Plan contained in Permit Attachment F, to detect any container and equipment malfunctions and deteriorations, operator errors, and discharges, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.15(a).

II.E.2. Inspection Frequency

The Permittee shall inspect monitoring equipment, safety and emergency equipment, security devices, and operating and structural equipment at the frequency specified in the weekly and monthly inspection schedules contained in Permit Attachment F, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.15(b).

II.E.3. Remediation Of Equipment/Structures

The Permittee shall remedy any deterioration or malfunction of equipment or structures which an inspection reveals, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.15(c).

II.E.4. Inspection Log and Checklist

The Permittee shall use the inspection checklists contained in the Rinchem General Inspection Sheets, Permit Attachment F. The Permittee shall record the date and time of the inspection, the name of the inspector, a notation of the observations made, and the date and nature of any repairs or other remedial actions, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.15(d).

II.E.5. Inspection Records

The Permittee shall maintain inspection checklists in the CSF operating record for at least three (3) years from the date of inspection, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.15(d).

II.F. PERSONNEL TRAINING

The Permittee shall conduct personnel training following the procedures described in Permit Attachment J, *Personnel Training*, and the following Permit Conditions, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.16.

II.F.1. Personnel Training Requirements

The Permittee shall train all persons involved in the management and storage of hazardous waste in procedures relevant to the positions in which they are employed, as described in Permit Attachment J, *Personnel Training*, and as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.16.

II.F.2. Personnel Training Content

The personnel training program shall include the courses and procedures described in Permit Attachment J, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.16(a-c).

II.F.3. Personnel Training Records

The Permittee shall maintain training documents and records, and keep training records on current personnel at the CSF Office for at least three years from the date the employee last worked at the Facility, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.16(d) and (e).

II.G. SPECIAL PROVISIONS FOR IGNITABLE, REACTIVE, OR INCOMPATIBLE WASTES

The Permittee shall follow the procedures for managing and storing ignitable, reactive, and incompatible wastes set forth in Permit Attachment C, *Design and Operation of the Container Storage Facility*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.17.

H. LOCATION STANDARDS

Since the CSF is located in Bernalillo County of New Mexico listed in Appendix VI of 40 CFR, the Permittee must demonstrate consideration of seismic and floodplain standards, as required by

20.4.1.500 NMAC, incorporating 40 CFR §264.18, and as specified in Permit Attachment A, *General Facility Description*.

II.I. PREPAREDNESS AND PREVENTION

II.I.1. Required Equipment

At a minimum, the Permittee shall maintain at the CSF the equipment set forth in Permit Attachment H, Table H-2, *Emergency Equipment List*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.32.

II.I.2. Testing and Maintenance of Equipment

The Permittee shall test and maintain the equipment specified in Permit Attachment H, as necessary, to assure its proper operation in time of emergency, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.33.

II.I.3. Access to Communications or Alarm System

The Permittee shall maintain access to the communications or alarm system as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.34.

II.I.4. Required Aisle Space

At a minimum, the Permittee shall maintain enough aisle space to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area of CSF operation, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.35, and as described in Permit Attachment C, *Design and Operation of the Container Storage Facility*.

II.I.5. Arrangements with Local Authorities

The Permittee shall maintain coordination agreements with the City of Albuquerque and Bernalillo County Fire Departments, and the St. Joseph's Northeast Hospital as described in Permit Attachment H, *Contingency Plan*. These arrangements shall be either Memoranda of Understanding (MOU) or Mutual Aid Agreements (MAA) between the Permittee and the off-site cooperating agencies, and shall include the elements required by 20.4.1.500 NMAC, incorporating 40 CFR §264.37(a). Copies and descriptions of these MOUs and agreements shall be maintained at the Facility office in the operating record as required by 20.4.1.500 NMAC (incorporating 40 CFR §264.37(b)).

II.J. CONTINGENCY PLAN

II.J.1. Implementation of Plan

The Permittee shall immediately implement the Contingency Plan contained in Permit Attachment H, whenever there is a fire, explosion, or release of hazardous waste or hazardous waste constituents which could threaten human health or the environment, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.51(b).

II.J.2. Copies of the Plan

The Permittee shall maintain copies of the Contingency Plan and all revisions and amendments to the Plan at the CSF, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.53. The Permittee shall provide copies of the current Contingency Plan and all revisions to the Plan to the Secretary and all entities with which the Permittee has emergency MOUs or MAAs, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.53.

II.J.3. Amendments to Plan

The Permittee shall review and immediately amend, if necessary, the Contingency Plan, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.54.

II.J.4. Emergency Coordinator

An Emergency Coordinator (EC) and an alternate EC, as specified in Permit Attachment H, shall be available at all times in case of an emergency. The Emergency Coordinator or alternate EC shall be thoroughly familiar with the Contingency Plan and shall have the authority to commit the resources needed to implement the Contingency Plan, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.55. In the event of an imminent or actual emergency, the EC shall activate the internal emergency alarms, notify the appropriate State or local agencies with designated response roles, and implement the other procedures, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.56, and as described in Permit Attachment H.

II.K. MANIFEST SYSTEM

The Permittee shall comply with the manifest requirements of 20.4.1.500 NMAC, incorporating 40 CFR §264.71, §264.72, and §264.76. The Permittee shall not accept for management or storage any hazardous waste from an off-site source without the accompanying manifest.

II.L. RECORD KEEPING AND REPORTING

In addition to the record keeping and reporting requirements specified elsewhere in this Permit and 20.4.1.500 NMAC, incorporating 40 CFR §264.73(a), the Permittee shall comply with the following conditions:

II.L.1. Operating Record

The Permittee shall maintain a written operating record for each hazardous waste at the CSF for at least three (3) years from the date of report, sampling, measurement, or certification, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.73(a), and §270.30(j)(2). The Permittee shall maintain the operating record until closure of the CSF.

II.L.2. Biennial Report

The Permittee shall comply with the biennial reporting requirements of 20.4.1.500 NMAC, incorporating 40 CFR §264.75.

II.L.3. Personnel and Telephone Number Changes

The Permittee shall inform the Secretary in writing of changes in its management personnel and telephone numbers within fifteen (15) calendar days of the changes.

II.M. GENERAL CLOSURE REQUIREMENTS

II.M.1. Performance Standard

The Permittee shall close the CSF following the procedures described in the Closure Plan outlined in Permit Attachment K, as required 20.4.1.500 NMAC, incorporating 40 CFR §264.111.

II.M.2. Amendment to Closure Plan

The Permittee shall amend the Closure Plan, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.112(c), whenever necessary.

II.M.3. Notification of Closure

The Permittee shall notify the Secretary in writing at least forty-five (45) calendar days prior to the date on which he expects to begin closure of the CSF, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.112(d).

II.M.4. Time Allowed For Closure

Within ninety (90) calendar days after receiving the final volume of hazardous waste, the Permittee shall remove all hazardous waste from the CSF to a permitted treatment, storage or disposal Facility, and shall complete closure activities, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.113, following the schedule specified in the *Closure Plan* in Permit Attachment K, or as amended, as required by Permit Condition II.M.2.

II.M.5. Disposal or Decontamination of Equipment, Structures, and Soils

The Permittee shall decontaminate or dispose of all contaminated equipment, structures, and soils, as specified in the *Closure Plan*, Permit Attachment K, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.114.

II.M.6. Sampling for Metals, Organics and Halogenated Organics in the Container Storage Facility Building

The Permittee shall collect soil and ground water samples at and around the CSF for metals (i.e., Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Zinc), organics and halogenated organics in the CSF using EPA approved methods in the latest copy of SW-846, or an alternate method approved by the Secretary.

II.M.7. Certification of Closure

Within sixty (60) calendar days from the date of completion of partial closure of the CSF, and within sixty calendar (60) days of completion of final closure of the Unit, the Permittee shall provide to the Secretary a final closure report and written closure certification signed by an independent professional engineer registered in the State of New Mexico, that the CSF was closed as required by the procedures specified in the Closure Plan, Permit Attachment K, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.115.

II.N. COST ESTIMATE FOR FACILITY CLOSURE

II.N.1. Cost Estimates

The Permittee shall implement a financial instrument in the amount of the most recent closure cost estimate set forth in Permit Attachment M, *Financial Assurance*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.142.

II.N.2. Adjustment of Cost Estimates

The Permittee shall adjust the Closure Cost estimate for inflation within sixty (60) calendar days prior to the anniversary date of the establishment of the financial instrument(s) used to comply with 20.4.1.500 NMAC, incorporating 40 CFR §264.143, and Permit Condition II.P, or when using an approved State-required mechanism, upon such a date as required by the State, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.142(b).

II.N.3. Revision of Cost Estimates

The Permittee shall revise the Closure cost estimates within 30 days after NMED approves a request to modify the Closure Plan, if the change increases the cost of Closure, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.142(c).

II.N.4. Record Keeping

The Permittee shall maintain current Closure cost estimates in the Facility operating record, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.142(d).

II.O. FINANCIAL ASSURANCE FOR FACILITY CLOSURE

II.O.1. Submittal of Financial Assurance Documentation

The signed duplicate original of the closure financial assurance instrument required to be submitted to the Secretary at least sixty (60) calendar days before receiving hazardous waste for management and storage at the CSF, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.143.

II.O.2. Changes to the Financial Assurance Instrument

The Permittee shall not change the financial assurance instrument without approval of the Secretary, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.143.

II.P. LIABILITY REQUIREMENTS

II.P.1. Liability Coverage Amounts

The Permittee shall have and maintain liability coverage for sudden and accidental occurrences in the amount of one million dollars (\$1,000,000) per occurrence, with an annual aggregate of at least two million dollars (\$2,000,000), exclusive of legal defense costs, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.147(a). The Permittee shall have and maintain liability coverage for nonsudden accidental occurrences in the amount of three million dollars (\$3,000,000) per occurrence, with an annual aggregate of at least six million dollars (\$6,000,000), exclusive of legal defense costs, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.147(b).

II.P.2. Submittal of Liability Documentation

The signed duplicate original of the liability policy required in compliance with 20.4.1.500 NMAC, incorporating 40 CFR §264.147, is contained in Permit Attachment M.

II.Q. DISCLOSURE

As required by the HWA §74-4-4.7, the Permittee filed a disclosure statement with the New Mexico Environment Department (NMED) with the information required by, and on a form developed by, the NMED in cooperation with the New Mexico Department of Public Safety (DPS), at the same time the Permittee submitted the application for a Permit to the Hazardous Waste Bureau (HWB). A copy of the letter from the DPS to the NMED regarding background investigation conducted on personnel of Rinchem Company, Inc., is included in Appendix A-1 of Permit Attachment A. If any information required to be included in the disclosure statement provided by the Permittee to

comply with the HWA, §74-4-4.7, changes, or if any information is added after filing the statement, the Permittee shall provide that information to the Secretary within 30 calendar days after the change or addition. Failure to provide such information in a timely manner may constitute the basis for the revocation of this Permit.

II.R. INCAPACITY OF OWNERS OR OPERATORS, GUARANTORS, OR FINANCIAL INSTITUTIONS

Declaration of Bankruptcy by Financial Institution

The Permittee shall notify the Secretary by certified mail of the commencement of bankruptcy, and the name of any guarantor within ten calendar days after commencement of the proceeding, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.148(a).

II.S. ESTABLISHMENT OF OTHER FINANCIAL ASSURANCE OR LIABILITY COVERAGE

The Permittee shall establish other financial assurance or liability coverage within 60 days from the date the Trustee or institution issuing the surety bond, letter of credit, or insurance policy declares bankruptcy; otherwise the Permittee will be deemed to be without the required financial assurance, as specified by 20.4.1.500 NMAC, incorporating 40 CFR §264.148(b).

II.T. GROUND WATER MONITORING

The Permittee shall conduct quarterly ground water detection monitoring at the CSF, when it fails to achieve clean closure. The Permittee shall analyze the ground water samples for those parameters contained in 20 NMAC 4.1.200, incorporating 40 CFR §261, Appendix VIII, that have been detected in the ground water at the monitoring wells, or are expected to be in or derived from waste stored at the CSF, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.93(a).

II.U. ESTABLISHMENT OF A BASELINE

The Permittee shall conduct background soil sampling at the CSF in areas not impacted by waste management within 180 calendar days from the effective date of this Permit. The sampling locations must be approved by NMED. This sampling activity is necessary for the establishment of a baseline that shall be used for reference during closure activities described in Permit Attachment K, *Closure Plan*. The Permittee shall submit a copy of the background sample data to NMED. The results of this initial sampling event will assist the Permittee in characterizing the soil at the CSF and its proximity, and shall be used for reference during closure of the CSF.

MODULE III

STORAGE OF HAZARDOUS WASTE IN CONTAINERS

III.A. MODULE HIGHLIGHTS

This Module contains the regulatory requirements for Rinchem Company, Inc., (**the Permittee**) to manage and store the hazardous wastes at the Container Storage Facility (CSF). The Facility is authorized to manage and store at the CSF only those hazardous wastes listed in Permit Attachment B, *Authorized Wastes*). Specific Facility and process information for the management, storage and transfer of hazardous waste, and a description of the CSF are provided in Permit Attachments A, and C. The location of the CSF is shown in Permit Attachment C, Figure C-1, *Plan View of the Container Storage Facility*. The photographs following Figure C-1, labeled Rooms A through F show the interior of each room at the Facility.

III.A.1. Waste Handling Building

The Permittee shall manage and store hazardous waste in the CSF building as specified in Permit Attachment C subject to the following conditions:

III.A.1.a. Storage Containers

The Permittee shall manage and store hazardous waste in the containers specified by Permit Condition III.C.1. of this Permit Module.

III.A.1.b. Storage Locations and Quantities

The Permittee shall manage and store hazardous waste containers at the CSF as specified in Table III.B.1. The Permittee shall manage and store quantities of hazardous waste containers in these locations not to exceed the maximum capacities specified in Table III.B.1.

III.A.1.c. Storage on Concrete Floor

The Permittee shall manage and store hazardous waste containers unloaded from the trucks transporting waste containers from off-site generators to the CSF in individual storage areas, segregated by waste type and compatibility. Each storage area shall have a concrete floor that slopes towards the aisles to expose any spills quickly as described in Permit Attachment C, *Design and Operation of the Container Storage Unit*.

III.A.1.d. Storage Time Limit

The Permittee shall not store any hazardous waste in the CSF for more than one (1) year.

III.A.1.e. Minimum Aisle Space

The Permittee shall maintain sufficient aisle space between storage drums in the storage rooms to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment and decontamination equipment to any area within the CSF as described in Permit Attachment C, and as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.35.

III.B. PERMITTED AND PROHIBITED WASTE IDENTIFICATION

III.B.1. Permitted Waste

The Permittee shall manage and store for subsequent transfer to a permitted treatment, storage, or disposal facility, only the hazardous wastes listed in Permit Attachment B, *Authorized Wastes*, subject to the terms of this Permit.

III.B.2. Prohibited Waste

The Permittee is prohibited from managing and storing any hazardous waste that is not identified in Permit Condition III.B.1. of this Permit. The Permittee shall not store more than 55,000 gallons of the Hazardous Wastes Types in containers at the CSF at any one time. Table III.B.1. shows the maximum amounts of hazardous waste that the Permittee shall manage and store at the CSF subject to the terms of this Permit.

TABLE III.B.1.

Maximum Storage Capacities of Rinchem's Container Storage Facility

| TYPE OF STORAGE UNIT | EPA HAZARDOUS WASTE TYPE | AREA (Square Feet) | MAXIMUM VOLUME OF WASTES (Gallons) |
|----------------------|--------------------------|--------------------|------------------------------------|
| Room A | Inorganic Chemicals | 1250 | 15,840 |
| Room B | Organic Chemicals | 1250 | 15,840 |
| Room C | Organic Chemicals | 5000 | 79,860 |
| Room D | Organic Chemicals | 5000 | 73,900 |
| Room E | Organic Chemicals | 5500 | 81,800 |
| Room F | Inorganic Chemicals | 5500 | 81,800 |

III.C. CONDITION OF CONTAINERS

If a container holding hazardous waste is not in good condition (e.g., has severe rusting, apparent structural defects) or if it begins to leak, the Permittee shall transfer the hazardous waste from such a container to a container that is in good condition or otherwise manage the waste in compliance with the Conditions of this Permit, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.171.

III.C.1. Acceptable Storage Containers

The Permittee shall use containers that comply with the requirements of the U.S. Department of Transportation shipping container regulations (*49 CFR §173 – Shipper's -General Requirements for Shipment and Packaging*, and *49 CFR §178 - Specifications for Packaging*) for management and storage of hazardous waste at the CSF. The following is a description of the type of containers that the Permittee shall use at the CSF:

Standard 55-gallon (208-liter) drums - with a gross internal volume of 7.3 ft³ (0.21 m³), as well as 10 gallon/1.23 ft³ (0.04 m³), and 35 gallon/4.64 ft³ (0.13 m³) drums, as necessary.

III.D. COMPATIBILITY OF WASTE WITH CONTAINERS

The Permittee shall use containers made of, or lined with, materials which will not react with and are otherwise compatible with, the hazardous waste to be stored, so that the ability of the container to contain the waste is not impaired, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.172. The Permittee shall ensure compliance with this requirement by conducting pre-acceptance characterization of waste, as described in Permit Attachment D, *Waste Analysis Plan*, considering the precautions described under "*Preventive Measures*", in Permit Attachment C.

III.E. MANAGEMENT OF CONTAINERS

The Permittee shall keep all containers closed during storage, except when it is necessary to add or remove waste, and shall not open, handle, or store containers in a manner which may rupture the container or cause it to leak, as required by 20.4.1.500 NMAC, incorporating at 40 CFR §264.173.

III.F. SECONDARY CONTAINMENT SYSTEMS

The Permittee shall construct and maintain secondary containment systems for all containers in the CSF in accordance with the specifications required by 20.4.1.500 NMAC, incorporating 40 CFR §264.175, and the procedures described in Permit Attachment C, *Design and Operation of the Container Storage Unit*.

III.G. INSPECTION SCHEDULES AND PROCEDURES

The Permittee shall inspect the CSF for the condition of containers and secondary containment systems, safety equipment, and aisle space daily, quarterly, and annually, to detect leaking containers, deterioration of containers and the containment system caused by corrosion and other factors, in accordance with the Schedules contained in Permit Attachment F, *Appendix F-1, Inspection Matrix Sheets*, and as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.174.

III.H. RECORD KEEPING

The Permittee shall place the results of all waste analyses and any other documentation in the CSF operating record, as specified in (Module II) Permit Condition II.L., *Record Keeping and Reporting*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.73(a).

III.I. CLOSURE

During closure of the CSF, the Permittee shall remove all hazardous waste and hazardous waste residues from the containment system in accordance with the procedures described in Permit Attachment F, *Closure Plan*, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.178. [Remaining containers, liners, bases and soils containing or contaminated with hazardous waste or hazardous waste residues must be decontaminated or removed, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.178].

III.J. SPECIAL CONTAINER PROVISIONS FOR IGNITABLE OR REACTIVE WASTE

III.J.1. Location of Ignitable and Reactive Waste

The Permittee shall not locate containers holding ignitable or reactive hazardous waste within 15 meters (50 feet) of the Facility's property line as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.176.

III.J.2. Procedures to Prevent Ignition/Reaction

The Permittee shall take precautions to prevent accidental ignition or reaction of ignitable or reactive waste and follow the procedures specified in Permit Attachment C, as required by 20.4.1.500 NMAC, incorporating §264.17 and §264.176.

III.J.3. Storage of Hazardous Waste Containers

Containers of ignitable and reactive wastes shall be stacked no more than two high, in order to comply with the National Fire Protection Association's Flammable and Combustible Liquids Code.

III.K. SPECIAL CONTAINER PROVISIONS FOR INCOMPATIBLE WASTE

III.K.1. Storage of Incompatible Wastes

The Permittee shall not place incompatible wastes in the same containers, as set forth in Permit Attachment C, *Design and Operation of the Container Storage Facility*, and as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.177(a).

III.K.2. Management of Unwashed Containers

The Permittee shall not place hazardous waste in an unwashed container that previously held an incompatible waste or material, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.177(b).

III.K.3. Separation of Hazardous Waste Containers

The Permittee shall separate containers of incompatible wastes as described in Permit Attachments C, and as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.177(c).

**PERMIT ATTACHMENT B
AUTHORIZED WASTES:
PART A PERMIT APPLICATION**

The following pages (i.e., PART A Permit Application, and Appendix B-1) contain the list of hazardous wastes that Rinchem Company, Inc., is authorized to accept for management and storage at the Container Storage Facility.

See attached page

XII. Process Codes and Design Capacities

A. PROCESS CODE - Enter the code from the list of process codes below that best describes each process to be used at the facility. Thirteen lines are provided for entering codes. If more lines are needed, attach a separate sheet of paper with the additional information. For other processes (i.e., D99, S99, T04 and X99), describe the process (including its design capacity) in the space provided in item XIII.

B. PROCESS DESIGN CAPACITY - For each code entered in column A, enter the capacity of the process.

1. **AMOUNT** - Enter the amount. In a case where design capacity is not applicable (such as in a closure/post-closure or enforcement action), enter the total amount of waste for that process.

2. **UNIT OF MEASURE** - For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

C. PROCESS TOTAL NUMBER OF UNITS - Enter the total number of units used with the corresponding process code.

| PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY |
|-------------------|--------------------------------|---|
| Disposal: | | |
| D79 | Underground Injection | Gallons; Liters; Gallons Per Day; or Liters Per Day |
| D80 | Landfill | Acre-feet or Hectare-meter |
| D81 | Land Treatment | Acres or Hectares |
| D82 | Ocean Disposal | Gallons Per Day or Liters Per Day |
| D83 | Surface Impoundment | Gallons or Liters |
| D99 | Other Disposal | Any Unit of Measure Listed Below |
| Storage: | | |
| S01 | Container (Barrel, Drum, Etc.) | Gallons or Liters |
| S02 | Tank | Gallons or Liters |
| S03 | Waste Pile | Cubic Yards or Cubic Meters |
| S04 | Surface Impoundment | Gallons or Liters |
| S05 | Drip Pad | Gallons or Liters |
| S06 | Containment Building-Storage | Cubic Yards or Cubic Meters |
| S99 | Other Storage | Any Unit of Measure Listed Below |
| Treatment: | | |
| T01 | Tank | Gallons Per Day or Liters Per Day |
| T02 | Surface Impoundment | Gallons Per Day or Liters Per Day |
| T03 | Inclinator | Short Tons Per Hour; Metric Tons Per Hour; Gallons Per Hour; Liters Per Hour; or Btu's Per Hour |
| T04 | Other Treatment | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T80 | Boller | Gallons or Liters |
| T81 | Cement Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T82 | Lime Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T83 | Aggregate Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T84 | Phosphate Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T85 | Coke Oven | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T86 | Blast Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |

| PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY |
|-----------------------------------|--|---|
| T87 | Smelting, Melting, Or Refining Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| T88 | Titanium Dioxide Chloride Process Oxidation Reactor | |

| 3 | | | | | |
| 4 | | | | | |

EPA I.D. Number (Enter from page 1)

Secondary ID Number (Enter from page 1)

N M D 0 0 2 2 0 8 6 2 7

XIV. Description of Hazardous Wastes

A. EPA HAZARDOUS WASTE NUMBER - Enter the four-digit number from 40 CFR, Part 261 Subpart D of each listed hazardous waste you will handle. For hazardous wastes which are not listed in 40 CFR, Part 261 Subpart D, enter the four-digit number(s) from 40 CFR, Part 261 Subpart C that describes the characteristics and/or the toxic contaminants of those hazardous wastes.

B. ESTIMATED ANNUAL QUANTITY - For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic contaminant entered in column A estimate the total annual quantity of all the non-listed waste(s) that will be handled which possess that characteristic or contaminant.

C. UNIT OF MEASURE - For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

| ENGLISH UNIT OF MEASURE | CODE | METRIC UNIT OF MEASURE | CODE |
|-------------------------|------|------------------------|------|
| PCOUNDS | P | KILOGRAMS | K |
| TONS | T | METRIC TONS | M |

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES

1. PROCESS CODES:

For listed hazardous waste: For each listed hazardous waste entered in column A select the code(s) from the list of process codes contained in item XII A on page 3 to indicate how the waste will be stored, treated, and/or disposed of at the facility.

For non-listed hazardous waste: For each characteristic or toxic contaminant entered in column A, select the code(s) from the list of process codes contained in item XII A on page 3 to indicate all the processes that will be used to store, treat, and/or dispose of all the non-listed hazardous wastes that possess that characteristic or toxic contaminant.

NOTE: THREE SPACES ARE PROVIDED FOR ENTERING PROCESS CODES. IF MORE ARE NEEDED:

1. Enter the first two as described above.
2. Enter "000" in the extreme right box of item XIV-D(1).
3. Enter in the space provided on page 7, item XIV-E, the line number and the additional code(s).

2. PROCESS DESCRIPTION: If a code is not listed for a process that will be used, describe the process in the space provided on the form (D(2)).

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER - Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described on the form as follows:

1. Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B, C and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
2. In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "Included with above" and make no other entries on that line.
3. Repeat step 2 for each EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM XIV (shown in line numbers X-1, X-2, X-3, and X-4 below) - A facility will treat and dispose of an estimated 900 pounds per year of chrome shavings from leather tanning and finishing operation. In addition, the facility will treat and dispose of three non-listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an Incinerator and disposal will be in a landfill.

| Line Number | A. EPA HAZARD WASTE NO. (Enter code) | B. ESTIMATED ANNUAL QUANTITY OF WASTE | C. UNIT OF MEASURE (Enter code) | D. PROCESS | |
|-------------|--------------------------------------|---------------------------------------|---------------------------------|--------------------------------|--|
| | | | | (1) PROCESS CODES (Enter code) | (2) PROCESS DESCRIPTION (If a code is not entered in D(1)) |
| 1 | K 0 5 4 | 900 | P | T 0 3 D 8 0 | |
| | D 0 0 2 | 100 | P | T 0 3 D 8 0 | |
| X 3 | D 0 0 1 | 100 | P | T 0 3 D 8 0 | |
| X 4 | D 0 0 2 | | | | Included With Above |

Secondary ID Number (Enter from page 1)

XV. Map

Attach to this application a topographic map, or other equivalent map, of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in this map area. See Instructions for precise requirements.

XVI. Facility Drawing

All existing facilities must include a scale drawing of the facility (see instructions for more detail).

XVII. Photographs

All existing facilities must include photographs (aerial or ground-level) that clearly delineate all existing structures; existing storage, treatment and disposal areas; and sites of future storage, treatment or disposal areas (see instructions for more detail).

XVIII. Certification(s)

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

PERMIT ATTACHMENT D WASTE ANALYSIS PLAN

Introduction

The following information on Waste Analysis Plan was provided to the New Mexico Environment Department by Rinchem Company Inc., (**Rinchem**) in accordance with the requirements of the New Mexico Hazardous Waste Management Regulations 20.4.1.500 NMAC, incorporating 40 CFR §264.13, pursuant to 20.4.1.900 NMAC, incorporating 40 CFR §270.14(b)(2-3).

This Waste Analysis Plan (WAP) provides information about how Rinchem plans to accept, manage, and store hazardous wastes at their Albuquerque Container Storage Facility (**the Facility**) in order to meet the requirements of New Mexico Hazardous Waste Management Regulations 20.4.1NMAC, which incorporate by reference 40 CFR Parts 260 through 270. The WAP shall be included in the operating record that Rinchem shall keep on-site in the administration office. The waste stream that Rinchem shall be accepting for storage and subsequent transfer to a disposal facility are listed in Appendix B-1, Permit Attachment B, *Authorized Wastes*.

The procedures in the current WAP pertain to wastes that Rinchem will accept from off-site sources within the United States. Rinchem shall notify the Secretary in writing at least four weeks in advance of the date the first shipment of hazardous waste from a new waste stream is expected to arrive at the Facility. An example of the form to be used for waste acceptance is in Appendix D-1 (*Waste Profile Sheet*) of this Attachment.

Rinchem shall obtain a Permit from the EPA before it can accept hazardous waste from a foreign source.

Waste Characterization

In order to safely manage and store hazardous wastes Rinchem shall correctly characterize each hazardous waste stream.

Rinchem shall use the following four methods to characterize the hazardous waste they accept for management and storage before subsequent transfer to a permitted waste disposal facility:

- 1) Detailed Chemical Analysis
- 2) Acceptable Knowledge of Process (KOP) and published information

- 3) Hazardous Materials Categorization (HazCat) procedures
- 4) Chemical Fingerprint Checks

Knowledge of process (KOP) is the knowledge that a generator has about the waste, such as the chemical composition and content of the waste and the process that produced the waste. This knowledge helps with the determination of the waste characterization and is sufficient to determine both the hazards associated with management and storage and the requirements and restrictions for disposal. Existing published or documented data such as Material Safety Data Sheets (MSDS) on the hazardous waste or waste produced from similar processes can also be used. An example of the form used by Rinchem follows.

Rinchem shall submit the waste stream profile to a qualified laboratory with proper QA/QC procedures in place to perform a detailed chemical analysis of a sample of the waste stream when KOP is not adequate for determination of the safe management and storage procedures for the hazardous waste. The sample shall be sent to the lab together with a chain of custody form. The containers and preservatives used for the sample shall be specified by the lab doing the analysis. Testing parameters shall be chosen based on knowledge of the process from which the waste was produced and the information that the analysis yields about the waste, for example, BTU values, flashpoint, etc. The test methods that shall be used shall be those described in the most current version of EPA's publication titled "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846" or comparable methods.

Hazard categorization (HazCat) procedures - the processes and tests described in "HazCat, Chemical Identification System" to identify unknowns (Turkington, 1988, or most current), or a comparable method shall be followed to help characterize solid and liquid wastes that cannot be positively identified by the generator or from labeling information. Rinchem's HazCat system has over a hundred tests which allow them to identify the hazardous characteristics of the waste material. The properties that shall be tested for include:

- flammability levels
- oxidizer characteristics
- corrosive characteristics
- reactivity
- cyanides

- halides
- PCB present
- pesticides
- herbicides

Rinchem shall select specific parameters using Knowledge of Process information from the generator or any other applicable information about the characteristics of the waste. A chemical fingerprint check shall be performed on each incoming waste stream excluding labpacks and highly reactive wastes, to verify that the characteristics of the waste stream shall be consistent with the information provided by the generator and with the parameters listed on the profile for that waste stream. Fingerprint procedures shall be conducted according to published methods such as Turkington, 1988, or equivalent. The fingerprint parameters that may be tested or observed include:

- Physical state,
- Physical description,
- pH,
- Color,
- Ignitability,
- Specific gravity,

The above parameters shall be selected not only for the fact that they shall indicate that the waste is actually what the generator claims that it is, but they shall provide sufficient information about the waste so that it can be properly stored in a safe manner.

Pre-acceptance of a Waste Stream

For each new hazardous waste stream that is a candidate for storage at the Rinchem Facility, the following procedures shall be followed prior to notifying a generator that a waste stream can be accepted at the Rinchem facility:

- 1) The generator shall provide pertinent chemical and physical data requested on the waste profile sheet. Appendix J-1 contains waste profile sheets which show the information contained in the form. The profile includes a certification that any samples of waste submitted as part of the waste acceptance process shall be representative of the waste stream of interest, and that the generator shall notify Rinchem of known changes in the waste stream.
- 2) The generator shall provide Rinchem pertinent chemical and physical data and certifications requested to satisfy the land disposal restrictions (LDR) requirements specified under 20.4.1.800 NMAC, incorporating 40 CFR 268.
- 3) The data on the waste profile shall be verified as necessary through HazCat, chemical fingerprint checks or detailed chemical analysis of a representative sample of the waste.
- 4) After comparing the data supplied by the generator with that obtained by verification and assuring that Rinchem's chemical analysis contains all the information which must be known to store and dispose of the waste in accordance with New Mexico Hazardous Waste Management Regulations 20.4.1.500 NMAC, incorporating 40 CFR §264 and 20.4.1.800 NMAC. Pursuant to §268, Rinchem shall determine the acceptability of the waste based on the requirements of the regulations and this Permit.

Physical Acceptance of Waste at the Facility

Except in the case of labpacks and highly reactive wastes, upon arrival of a waste shipment at the Facility, a determination shall be made to insure that the customer had sent what was profiled and accepted. First, a verification shall be made that a pre-acceptance inspection sheet (PAIS) has been filled out for the generator's shipment of waste. An example of what a PAIS might contain is attached herein as Appendix J-2 of this Attachment. Secondly, the manifest and LDR form shall be compared with the profile (which shall be kept in the facility office) to make sure that they match. Some of the items that shall be compared include the waste description and the U.S. Department of Transportation (DOT) shipping information. Next, a fingerprint analysis (discussed above), shall be performed, which shall provide reasonable assurance that the waste shipped from the generator agrees with the accompanying manifest. The results of the fingerprint testing of a given waste stream shall be compared to the values obtained from previous shipments of the waste stream and the waste profile sheet and shall be required to fall within an established tolerance limit.

The minimum number of containers that shall be sampled from each shipment of a waste stream shall be determined according to the cube root procedure, Method D 140-70 of the American Society for Testing and Materials (ASTM).

For a typical load, the cube root procedure and formula provide the following:

| NUMBER OF DRUMS RECEIVED | NUMBER OF DRUMS SAMPLED |
|--------------------------|-------------------------|
| 1 | 1 |
| 2-8 | 2 |
| 9-27 | 3 |
| 28-64 | 4 |
| 65-125 | 5 |

The hazardous waste drums to be sampled shall be chosen at random by the person taking the samples. The sampling shall take place in a well ventilated area of the Facility such as the dock.

One of the methods referred to in 20.4.1.200 NMAC, incorporating 40 CFR §261, Appendix I, or an equivalent procedure approved by the Secretary shall be used to obtain representative samples of the waste by employees wearing personal protective equipment (PPE). Typically, the employee's PPE shall include goggles or safety glasses, gloves and an apron or coveralls. Rinchem's Health and Safety Plan shall be followed.

The method of sampling that shall most frequently be used, unless the technology changes, shall be sampling of containerized liquid waste with a "Composite Liquid Waste Sampler (COLIWASA). The COLIWASA is an effective representative sampler for homogeneous and multilayer liquids. Disposable glass COLIWASAs shall be used except when sampling hydrofluoric acid and strong alkali solutions, when a teflon one shall be used. A separate COLIWASA shall be used to sample each container. Figure J-1 is a schematic diagram of a COLIWASA type sampler.

Some of the hazardous wastes received at the facility shall be labpacks of small quantity chemical wastes which can be categorized into several types:

- FIG. D-1

- Excess or residual reagent chemicals
- Off-specification or expired chemicals
- Relatively small quantities of chemical solutions or mixtures of known composition
- Laboratory solid waste material

In most cases, knowledge of process may be sufficient to determine both the hazards associated with the management and storage of labpack wastes and the requirements and restrictions for its disposal; therefore, analytical testing may not be conducted on these wastes. The cube root procedure mentioned above shall be used to determine the number of containers in each labpack waste stream that shall be inspected for conformity of the paperwork list with the container contents.

In the case of highly reactive wastes being shipped for treatment at other off-site treatment, storage, and disposal facilities, the inspection process may entail no more than inspecting the container for proper packaging and labeling in order to protect the employees.

Unacceptable Waste Shipments

The Hazardous Waste Coordinator or his Designee shall qualify a waste shipment as unacceptable when any of the following conditions exists:

- Failure of the generator to pre-qualify the waste stream or provide appropriate data;
- Waste shipments that contain components that Rinchem is prohibited from accepting for storage and disposal, such as radioactive and/or explosive wastes;
- Improper or inappropriate packaging, labeling, or manifesting;
- Characteristic quantity or composition discrepancy between the waste and the waste manifest or profile;
- Values for fingerprint analysis parameters that shall be out of the tolerance levels set by Rinchem; and
- Lack of generator credit approval.

The Hazardous Waste Coordinator (or Designee) must also classify the waste as unacceptable by Rinchem if it is significantly different in composition or volume from the information shown on the waste profile sheet, the pre-acceptance analytical data of the representative sample, or on the manifest. Containers shall be counted to determine any waste quantity discrepancies.

Wastes found to be in non-conformance shall be rejected on the spot or they may be reevaluated for possible acceptance by the Facility despite the variance. Rinchem's reevaluation procedure shall be designed to determine whether a waste material can be handled at the facility and whether the generator concurs with the characterization conducted by the Facility. The Hazardous Waste Coordinator shall evaluate the hazardous waste shipment brought to the Container Storage Facility using the following criteria:

- Rinchem Company Inc./Facility requirements
- discussions with the generator
- facility parameters for waste storage
- the need for additional supplemental analysis

If all of the above parameters, including supplemental chemical analytical data indicate that the waste can be accepted and the generator concurs, new manifests or profiles shall be created as necessary to ensure compliance. If a discrepancy cannot be resolved within 10 days of the hazardous waste shipment receipt, the waste shall be returned to the generator and the Secretary shall be notified in writing of the discrepancy and the attempts to reconcile it.

Waste Tracking and the Operating Record

Rinchem shall maintain a written record and a computerized system of all manifested wastes that enter the Facility, as required by 20.4.1.500 NMAC, incorporating 40 CFR §264.73(a). This operating log shall contain a listing of all manifested wastes being received and shipped, the location of waste within the Facility storage rooms, the quantity and description of the wastes, the name of the generator, and the final destination of the waste. The operating record shall also contain all waste profiles delivered to Rinchem, waste acceptance and QA/QC forms. Once a waste shipment has been analyzed and accepted, the containers in the shipment shall be appropriately marked/labeled so that they can be tracked within the Facility. The containers shall be moved to the appropriate storage area based on the hazard class and compatibility of the waste.

Analysis Review

The pre-acceptance evaluation of a hazardous waste stream shall be repeated when a generator notifies Rinchem that the process generating the waste has changed or if Rinchem has reason to suspect that the waste is not in conformance with available pre-acceptance documentation. In the case of a change in the process generating the waste, the generator must submit a new waste profile sheet and sample data. The waste stream shall also be re-analyzed by Rinchem if a waste shipment received at the Facility does not match the waste designated on the accompanying manifest or shipping paper.

Mr. James H. Moore Jr.
Director of Operations
Rinchem Company, Inc.
6133 Edith Boulevard N.E.
Albuquerque, New Mexico 87107

RE: REQUEST FOR SUPPLEMENTARY INFORMATION ON PERMIT RENEWAL APPLICATION
EPA ID NO. NMD002208627

Dear Mr. Moore:

The New Mexico Environment Department (NMED) Hazardous and Radioactive Materials Bureau (HRMB) RCRA Permits Management Program has completed review of the Rinchem Company Inc.'s (RCI's) response to HRMB's May 2, 1995 notice of deficiency on the Facility Permit renewal application.

The enclosed Attachment lists the required information necessary for NMED to declare the application technically adequate and to commence drafting the permit text. The information requested must be submitted to HRMB within thirty (30) calendar days from the date you receive this letter. Please present the required information in two hard copies and on a 3.5" diskette compatible with Word Perfect 5.2. Failure to submit the required information in this designated time may result in issuance of a Notice of Intent (NOI) to deny a Permit.

If you have any questions, please contact Cornelius Amindyas of my staff at (505) 827-1561.

Sincerely yours,

Robert S. (Stu) Dinwiddie, Ph.D., Manager
RCRA Permits Management Program
Hazardous and Radioactive Materials Bureau

REQUEST FOR SUPPLEMENTARY INFORMATION:

December 3, 1997

The New Mexico Environment Department (NMED) Hazardous and Radioactive Materials Bureau (HRMB) has completed review of Rinchem Company Inc.'s (RCI's) response to HRMB's May 2, 1995 notice of deficiency on the Facility Permit renewal application. After reviewing the subject response to the NOD, HRMB has determined that RCI must address the following issues satisfactorily before the application can be declared technically adequate, and a draft permit developed:

A) WASTE ANALYSIS PLAN as required by 20 NMAC 4.1.500 incorporating 40 CFR §264.13

1. Waste Analysis Plan, pages 2-7:

RINCHEM never mentions if chemical analyses (EPA SW-846 methods) will be performed in-house or in a contracted laboratory. Although quality assurance/quality control (QA/QC) procedures are mentioned on page 4, the details are not presented. RINCHEM must therefore present the QA/QC that will be applied during sample management at closure.

2. Waste Analysis Plan, page 4, paragraph 1:

RINCHEM mentions that the HAZCAT CHEMICAL IDENTIFICATION SYSTEM will be used to characterize unidentified wastes. What parameters will be tested by the HAZCAT procedures, and what is the rationale for using a specific parameter?

3. Waste Analysis Plan, Recordkeeping:

The New Mexico Hazardous Waste Management Regulations 20 NMAC 4.1.500 incorporating 40 CFR § 264.113(b)(1) state that the owner or operator must keep a written waste analysis plan which specifies the parameters for which each hazardous waste must be analyzed and the rationale for the selection of these parameters. This was not done in RINCHEM's permit application. Rinchem must fulfill this requirement, and indicate where a copy of the operating record, including the Waste Analysis Plan will be kept in accordance with the above requirement, and to comply with 20 NMAC 4.1.500 incorporating 40 CFR §264.73(b)(3).

4. Waste Analysis Plan, page 4, paragraph 3:

"The test methods that will be used are described in the most current version of EPA's "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846" or compatible methods."

How specific will the choice of analytical methods be? Will RINCHEM test for all potential hazardous constituents? RINCHEM must provide details on how it will choose the appropriate analyses to identify wastes it plans to manage, since this requirement was not addressed in the reapplication text dated February 10, 1995.

B) CLOSURE PLAN as required by 20 NMAC 4.1.500 incorporating 40 CFR §264.112 through §264.117.

RINCHEM must provide a comprehensive Closure Plan that contains information that describes how each hazardous waste management unit will be closed, including a description of the waste inventory, procedures for decontamination, groundwater monitoring, and removal of contaminated soil as required by 20 NMAC 4.1.500 incorporating 40 CFR §264.112(b)(1-5). In addition, the following information must be included in the subject plan:

1. Closure Plan, Page 50, paragraph 3:

"...a soil gas survey or the technology being used at the time to detect organic substances will be conducted. The survey will be performed in storage areas C and D, on the docks, in the sumps and any other areas where there is known to have been a spill of any organic solvent or waste."

- a) Since there is no sampling plan available to determine if this will be an adequate survey, RINCHEM must provide a detailed sampling and analysis plan for closure as per 20 NMAC 4.1.500 incorporating 40 CFR §264.112(b)(4) and (5).
- b) Provide a description of what detection equipment will be used, how halogenated organics will be detected, whether the sampling will be passive or extractive, and how many samples will be taken. Present the screening action levels, and how they will be chosen.
- c) Provide a map indicating closure sample locations. Describe the sample collection procedures.

2. Closure Plan, Page 50, Paragraph 4:

"In the rooms where corrosives have been stored, concrete corings will be done at several places in each storage area. A pH test will be conducted on each concrete sample and the soil beneath to determine if further investigation is warranted."

- a) Explain how pH will be determined in the concrete and soil, how many samples will be taken, and how RINCHEM plans to achieve clean closure. Include information on how the soil will be tested for organic vapors in this area as well.
- b) Provide information on the natural 'background' soil pH, and whether or not, RINCHEM plans to propose a screening action level for pH.
- c) Provide criteria that RINCHEM plans to use to determine if the soil is clean. The samples must be tested for possible contaminants in the corrosives, such as metals.

3. *Closure Plan, page 50, paragraph 5:*

"..in case the analysis described above reveals any areas of suspect contamination, concrete and soil will be excavated in the area of concern, analyzed and disposed of in the appropriate manner."

- a) As per 20 NMAC 4.1.500 incorporating 40 CFR § 264.112(b)(4). RINCHEM must provide a detailed description of the steps needed to remove or decontaminate all hazardous waste residues and contaminated containment system components, equipment, structures, and soils during partial and final closure, including, but not limited to, procedures for cleaning equipment and removing contaminated soils, methods for sampling and testing surrounding soils, and the criteria for determining the extent of decontamination required to satisfy the closure performance standard contained in 20 NMAC 4.1.500 incorporating 40 CFR §264.112(b) (5).). There is no such plan provided in response to the NOD previously sent to RINCHEM by HRMB.
- b) Provide a detailed description of other activities necessary during the closure period, including, but not limited to, ground water monitoring, leachate collection, and run-on and run-off control, in compliance with of 20 NMAC 4.1.500 incorporating 40 CFR §264.112(b)(5). RINCHEM did not provide this information in its permit application.

4. *Closure Plan, pages 49-53:*

Quality assurance and quality control (QA/QC) procedures were never discussed for field sampling or screening. The QA/QC measures must be addressed in the complete sampling and analysis plan that RINCHEM is required to submit for its closure plan in the part B permit application. Include a complete site map of the facility with possible sampling locations marked on it.

5. RINCHEM must include in the permit application a sample copy of the waste profile sheet its customers fill out.

C) *Closure; Time Allowed for Closure:*

Provide information about the time needed for closure (from the commencement to completion), in accordance with the requirements contained in 20 NMAC 4.1.500 incorporating 40 CFR §264.113.

D) *Disposal or Decontamination of Equipment, Structures, and Soils:*

Provide information on how during partial and final closure periods contaminated equipment, structures, and soils will be disposed of or decontaminated, in order to fulfill the requirements of 20 NMAC 4.1.500 incorporating 40 CFR §264.114.

E) *Certification of Closure:*

Describe how RINCHEM will confirm through certification by a New Mexico registered independent Engineer, that the hazardous waste management units (at

RINCHEM) have been closed in accordance with the specifications contained in the approved Closure Plan, as required by 20 NMAC 4.1.500 incorporating 40 CFR §264.115. Provide a survey plat of the facility to the local zoning authority, in compliance with all applicable standards of 20 NMAC 4.1.500 incorporating 40 CFR §264.116.

F) *Post-Closure Care and Use of Property:*

Submit a Post-Closure Care Plan for the units comprising the facility, and information on subsequent use of the property in accordance with 20 NMAC 4.1.500 incorporating 40 CFR §264.117.

G) *Risk Analysis:*

Provide a Risk Analysis that includes, and considers the following issues:

1. Provide a description of the existing air quality, other sources of contamination and the potential cumulative impact on human health and the environment. Present an estimate of the individual excess lifetime cancer risk.
2. Present an outline of the potential for health risks caused by human exposure to the hazardous waste constituents managed by RINCHEM;
3. Submit an account of potential damage to domestic animals, wildlife, vegetation, and physical structures caused by exposure to hazardous waste constituents from the RINCHEM Facility. Discuss other exposure pathways such as prey consumption by carnivores, and water ingestion pathways;
4. Describe any sensitive receptors within a 2 kilometer radius, and an estimate of exposed individuals living and/or working on the RINCHEM premises, and in the surrounding metropolitan community;
5. Show calculations of the lifetime cancer risk as a function of downwind concentrations, unit risk value, and exposure duration;
6. Give a detailed network of receptor points to permit the estimation and identification of receptor points that are exposed to maximum contaminant concentrations; and
7. Provide a detailed estimation of the exposed population. The non-inhalation pathways (ingestion and dermal) must be addressed using appropriate pathway exposure models, and what measures will be taken to minimize release of hazardous waste to the environmental media.

Mr. James H. Moore Jr.
Director of Operations
Rinchem Company, Inc.
6133 Edith Boulevard N.E.
Albuquerque, New Mexico 87107

RE: **Technical Review Notice of Deficiency**
EPA ID NO. NMD002208627

Dear Mr. Moore:

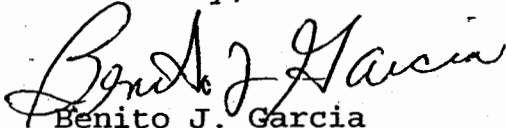

The Hazardous and Radioactive Materials Bureau (HRMB) of the New Mexico Environment Department (NMED) has completed a technical review of the Rinchem Company, Inc. (RCI), Resource Conservation and Recovery Act (RCRA) Hazardous Waste Part B Permit Application dated February 1995. HRMB has determined the Part B permit application to be technically deficient. Therefore, HRMB is requesting that RCI address the enclosed list of deficiencies (Attachments A and B). HRMB will declare the Part B permit application technically complete once RCI adequately addresses the enclosed information request.

Please submit the information requested by hardcopy and on a 3.5" diskette in WordPerfect 5.2, thereby expediting any further revisions that may be required. The information requested must be submitted to HRMB no later than 30 days from the date that you receive this notice. Failure to submit the required information within the specified time frame could result in the issuance of a Notice of Violation and/or a proposal to disapprove the Part B permit application.

Mr. Moore
April 24, 1996

RCI Red File '96

ATTACHMENT A

The following RCRA Permitting Program comments are referencing 20 NMAC 4.1 (rev. 11-1-95) 40 CFR Parts 264, 266, 267, 268 and 270, and Rinchem Company, Inc. (RCI) RCRA Hazardous Waste Part B Permit Application February, 1995.

270.14 Contents of Part B: General Requirements.

270.14(b)(11)(ii)(A) Seismic Standard.

RCI has provided information in their Part B Geologic Map (Fig. 1, pg. 42) addressing this requirement. HRMB is requesting the following additional information to be provided.

1. The location of the facility on RCI's Geologic Map should be identified with the wording "Rinchem Company, Inc."
2. RCI's Geologic Map is incomplete. The map should include a more detailed legend identifying the various symbols for geologic maps that are incorporated on this map (e.g. fault zones, strike and dip etc.).

270.14(b)(11)(iii) Federal Insurance Administration (FIA) flood map.

3. The location of the facility on RCI's Flood Map (Fig. 2, pg. 43), should be identified with the wording "Rinchem Company, Inc."

270.14(b)(19)(x) through (xii) Topographic Map.

RCI's Topographic Map (Fig. 4, pg. 67) is incomplete. The map shall clearly show the following.

4. The location of the facility on RCI's Topographic Map should be identified with the wording "Rinchem Company, Inc."
5. All of the required information requested by this citation is not included in RCI's Topographic Map. Some of this required information is included in RCI's facility drawing entitled "Rinchem Company, Inc. Facility" (Fig. 5, following page 68). If Figures 4 and 5 are to be used conjointly to meet this requirement, it should be indicated as such.
6. 270.14(b)(19)(iv) Surrounding land uses (residential, agricultural, recreational). Please provide this information on Fig. 4.
7. 270.14(b)(19)(viii) Access control (fences, gates). RCI facility gates are not shown. Please provide this information.
8. 270.14(b)(19)(x) Buildings; treatment, storage, or disposal operations; or other structure (recreation areas, runoff control systems, access and internal roads, storm, sanitary,

and process sewerage systems, loading and unloading areas, fire control facilities, etc.). Figs. 4 or 5 do not illustrate runoff control systems (e.g. Storage Area D drain line(s) and 500 gal. and 3,790 gal. concrete tanks); access and internal roads (e.g. access road from Edith Blvd.); storm, sanitary, and process sewerage systems; and fire control facilities. Please provide this information.

9. 270.14(b)(19)(xi) Barriers for drainage or flood control. Please provide this information (e.g. rainwater catchment ponds).
10. 270.14(d) Information requirements for solid waste management units.
 - a. 270.14(d)(1)(i) through (v) Required solid waste management unit information at a facility seeking a permit.

A RCRA Facility Assessment (RFA) was conducted in 1987 by the U.S. Environmental Protection Agency. As a result of the RFA the following solid waste management units (SWMU) were identified at RCI:

- 1) Storage Area for Inorganic Chemicals
- 2) Controlled Temperature Storage Area for Inorganic Chemicals
- 3) Storage Area for Organic Chemicals
- 4) Controlled Temperature Storage Area for Organic Chemicals
- 5) Truck Loading Dock
- 6) Spill Drain System
- 7) Spill Collection Tanks

Please provide the information requested in 270.14(d)(i) through (v) for each of these SWMU's.

- b. 270.14(d)(2) The owner or operator of any facility containing one or more solid waste management units must submit all available information pertaining to any release of hazardous wastes or hazardous constituents from such unit or units. Please provide this information.

270.15 Specific Part B information requirements for containers.

11. 270.15(a) A description of the containment system to demonstrate compliance with §264.175. Show at least the following:
 - a. 270.15(a)(1) Basic design parameters, dimensions, and materials of construction. Please provide this information.
 - b. 270.15(c) Sketches, drawings, or data demonstrating compliance with §264.176 (location of buffer zone and containers holding ignitable or reactive wastes ... , where applicable.

In a letter to NMED dated June 2, 1995, Item 12, RCI had stated: "However, in Areas C and F containers of reactives will not be placed closer than 50 feet to the property boundaries. There is a line in each of these areas indicating 50 feet from the property boundaries." HRMB is requesting that RCI provide this information by indicating the specified location of these lines in Storage Areas C and F on a scale drawing of the facility.

Part 270, Subpart D - Changes to Permit.

12. RCI has specified in their Part B permit application that they will make modifications to their Inspection Schedule (pg. 9), Contingency Plan (pg. 23), Emergency Coordinator List (pg. 25), and Facility Emergency Equipment List (pg. 27) outside of the permit modification procedures. HRMB has approved modification outside of the permit modification procedures to RCI's Emergency Coordinator List only. This approval was granted in July 1994 as a result of a permit modification request submitted by the permittee. All other changes to the facility's permit will follow the procedures as specified in Part 270, Subpart D - Changes to Permit. Please make these corrections to the language in the Part B permit application.

Part 264, Subpart I - Use and Management of Containers.

13. 264.171 Condition of containers: Please provide this information in narrative form addressing these requirements.

14. 264.172 Compatibility of waste with containers. Please provide this information in narrative form addressing these requirements.
15. 264.173(a) and (b) Management of containers. Please provide this information in narrative form addressing these requirements.

264.15 General Inspection Requirements.

16. 264.15(b)(4) requires that: "Areas subject to spills, such as loading and unloading areas, must be inspected daily when in use."

RCI's Container Loading/Unloading Area is listed on their Weekly Inspection Sheet (pg. 10). This should be corrected to reflect "daily".

264.143 Financial assurance for closure.

17. 264.143(h) Use of a financial mechanism for multiple facilities. "Evidence of financial assurance submitted to the Regional Administrator must include a list showing, for each facility, the **EPA Identification Number**, name, address, and the amount of funds for closure assured by the mechanism."

RCI has included their unpermitted transfer facility Chaparral, Rt. 74, 511 Highway 213, Chaparral, N.M. 88201 on their Hazardous Waste Facility Certificate of Liability Insurance.

HRMB is requesting that RCI remove the Chaparral transfer facility from their policy. Chaparral does not have an assigned EPA Identification Number. Please submit a revised Hazardous Waste Facility Certificate of Liability Insurance policy to HRMB once this correction has been completed.

ATTACHMENT B

Technical Comments

The following comments are provided on the technical adequacy and completeness of the Waste Analysis Plan and the Closure Plan of RINCHEM'S "RCRA Hazardous Waste Part B Permit Application". The first category below gives a summary of the RCRA Technical Compliance Program (RCRA TCP) comments. The second category lists a specific RCRA TCP comments for particular items within the "RCRA Hazardous Waste Part B Permit Application".

SUMMARY:

RCRA TCP has determined that Closure Plan is incomplete. The closure plan mentions that a soil gas survey for organic vapors will be performed upon closure. The closure plan gives no information on how the soil gas vapor survey will be done. RCRA TCP can not determine if the soil gas vapor survey will be adequate. The Closure Plan also mentions that concrete and soil borings will be sampled for pH; RCRA TCP cannot determine if this will be adequate based on the amount of information given. In the event that RINCHEM does detect a release at closure, the closure plan is inadequate. It is missing any consideration for ground water monitoring, any decontamination plan for equipment, and any sampling plan/criteria for determining the extent of contamination.

The Waste Analysis Plan had insufficient information available for RCRA TCP to make a determination on the adequacy. Deficiencies include, but are not limited to: missing details on how RINCHEM will choose appropriate analyses from EPA's SW-846 manual to identify wastes, failure to denote the lab that will perform the chemical analyses, missing quality control and quality assurance procedures for sampling, missing rationale for choosing the group of parameters for the finger print analyses, and lack of details on how RINCHEM will use of the HAZCAT Chemical Identification System.

Specific items are listed below along with the appropriate regulatory citation.

SPECIFIC COMMENTS:

Reference to the RINCHEM text is located by plan, page, and paragraph, where applicable. The specific text is quoted and highlighted in bold. Following are the RCRA TCP comments.

| | |
|--------------------|-----------------------|
| <u>ITEM</u> | <u>COMMENT</u> |
|--------------------|-----------------------|

- | | |
|---|--|
| 1 | <p>Closure Plan, Page 50, paragraph 3, "...a soil gas survey or the technology being used at the time to detect organic substances will be conducted. The survey will be performed in storage areas C and D, on the docks, in the sumps and any other areas where there is known to have been a spill of any organic solvent or waste." RCRA TCP Comment: There is no sampling plan available to determine if this will be an adequate survey. What detection equipment will be used? How will halogenated organics be detected? Will the sampling be passive or extractive? How many samples will be taken? The sampling map is missing. What are the screening action levels? RINCHEM must supply information on sample locations and collection procedures. <u>RINCHEM must provide a detailed sampling and analysis plan for closure as per 20 NMAC 4.1, Subpart V, 40 CFR § 264.112(b)(4) and (5).</u></p> |
| 2 | <p>Closure Plan, page 50, paragraph 4: "In the rooms where corrosives have been stored, concrete corings will be done at several places in each storage area. A pH test will be conducted on each concrete sample and the soil beneath to determine if further investigation is warranted." RCRA TCP Comment: There is no sampling plan available to determine if this will be adequate to determine clean closure. How will pH be determined in the concrete and soil? How many samples will be taken? There is no sampling map available. The soil should be tested for organic vapors in this area as well. Is there information on the natural 'background' soil pH? Will RINCHEM propose a screening action level for pH? RINCHEM needs some criteria to determine if the soil is clean. The samples should be tested for possible contaminants in the corrosives, such as metals. <u>RINCHEM must provide a detailed sampling and analysis plan for closure as per 20 NMAC 4.1, Subpart V, 40 CFR § 264.112(b)(4) and (5).</u></p> |
| 3 | <p>Closure Plan, page 50, paragraph 5: "...in case the analysis described above reveals any areas of suspect contamination, concrete and soil will be excavated in the area of concern, analyzed and disposed of in the appropriate manner." RCRA TCP Comment: <u>As per 20 NMAC 4.1, Subpart V, 40 CFR § 264.112(b)(4), RINCHEM must provide a detailed description of steps needed to remove or decontaminate all hazardous waste residues and contaminated containment system components, equipment, structures, and soils during partial and final closure, including, but not limited to, procedures for cleaning equipment and removing contaminated soils, methods for sampling and testing</u></p> |

| <u>ITEM</u> | <u>COMMENT</u> |
|-------------|----------------|
|-------------|----------------|

- | | |
|----|--|
| 3 | surrounding soils, and criteria for determining the extent of decontamination required to satisfy the closure performance standard (20 NMAC 4.1, Subpart V, 40 CFR § 264.112(b) (5).). There is no such plan provided in this application. Furthermore, <u>20 NMAC 4.1, Subpart V, 40 CFR § 264.112(b)(5) requires a detailed description of other activities necessary during the closure period, including, but not limited to, ground water monitoring, leachate collection, and run-on and run-off control. RINCHEM does not provide this information in its permit application.</u> |
| 4 | Closure Plan, pages 49-53: Quality assurance and quality control was never discussed for field sampling or screening. This issue must be addressed in the complete sampling and analysis plan that RINCHEM must submit for its closure plan in the part B permit application. |
| 5 | RINCHEM must provide a complete site map with possible sampling locations marked on it. |
| 6 | RINCHEM must include in the permit application a sample copy of the waste profile sheet its customers fill out. |
| 7 | Waste Analysis Plan, page 4, paragraph 3: "The test methods that will be used are described in the most current version of EPA's "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846" or compatible methods." RCRA TCP Comment: How specific will the choice of analytical method be? Will RINCHEM test for all potential hazardous constituents? RINCHEM must provide details on how it will choose the appropriate analyses to identify wastes. |
| 8. | Waste Analysis Plan, page 4, paragraph 1: RINCHEM mentions that the HAZCAT CHEMICAL IDENTIFICATION SYSTEM will be used to characterize unidentified wastes. What parameters will be tested by the HAZCAT procedures and what is the rationale for using a specific parameter? Is HAZCAT defensible in terms of waste identification? |

| <u>ITEM</u> | <u>COMMENT</u> |
|-------------|----------------|
|-------------|----------------|

- | | |
|-----|--|
| 9. | Waste Analysis Plan, pages 2-7: RINCHEM never mentions if chemical analyses (EPA SW-846 methods) will be performed in house or in a contracted lab. No mention is made of quality control/quality assurance procedures. |
| 10. | Waste Analysis Plan, page 4, paragraph 2: Why were the six fingerprint parameters chosen? <u>20 NMAC 4.1, Subpart V, 40 CFR § 264.113(b)(1)</u> states that the owner or operator must keep a written waste analysis plan which specifies the parameters for which each hazardous waste must be analyzed and the rationale for the selection of these parameters. This was not done in RINCHEM's permit application. |

RINCHEM COMPANY, INC.

Ms. Barbara Hoditschek
RCRA Permits Program Manager
Hazardous and Radioactive Materials Bureau
New Mexico Environment Department
525 Camino de los Marquez, Suite 4
P.O. Box 26110
Santa Fe, NM 85702

RE: REAPPLICATION FOR RINCHEM COMPANY, INC. RCRA PART B PERMIT,
NMD002208627-1

Dear Ms. Hoditschek:

Enclosed please find Parts A and B of our application for the renewal of our RCRA Part B Permit, # NMD002208627-1. Even though our current permit does not expire until 1998, we have chosen to reapply for a 10-year permit instead of submitting a major modification. We believe that this will simplify the review process and prevent reapplication and review of the permit again in three years. We also believe that the changes proposed allow the facility to actively serve the community in a safe and economical manner.

The main changes that are incorporated into the application are the following:

- the size of the hazardous waste management unit has increased
- the storage capacity has increased from 27,500 gallons to 55,000 gallons
- we will be accepting foreign waste
- the list of waste codes that can be stored at the facility has been expanded to include all RCRA regulated waste codes

Part B of the application is written so that it follows the order of the requirements of 40 CFR 270.14 through 270.27. However, the following sections were not addressed since they do not apply to our situation: 270.14(b)(6), (14), (16), (18), (20) and (21); 270.14(c); and 270.16 through 270.27.

WE DO IT WELL

BECAUSE WE CARE

We propose to implement the approach that your department took to changes we made to the emergency coordinator list which allows us to make changes to the list and send you an updated version without going through the formal permit modification process. This approach is taken with the contingency plan and the set of inspection schedules.

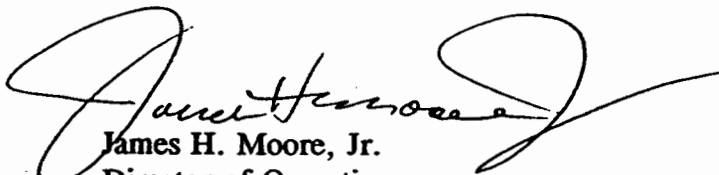

It is our understanding that Rinchem is able to provide the following services at the facility without them being specifically covered in our permit:

- elementary neutralization as defined in 40 CFR 264.1(g)(6)
- crushing of fluorescent bulbs and segregation of recyclable components to the extent that the actions comply with the requirements for recyclable materials in 40 CFR 261.6 or do not qualify as treatment as defined in 40 CFR 262.34
- shredding and compacting of solid RCRA and non-RCRA regulated waste for volume reduction prior to shipment for disposal to the extent that the physical, chemical or biological nature (or waste codes) of the waste do not change in accordance with the 40 CFR 260.10 definition of treatment
- bioremediation treatability studies in accordance with 40 CFR 261.4 (f)

If you have any questions, please do not hesitate to contact me at (505)345-3655.

We look forward to working with you and Phillip Solano to develop a permit that meets the regulatory requirements and allows Rinchem Company Inc. to conduct its business in a competitive manner.

Thanks for your time and consideration of this matter,

James H. Moore, Jr.
Director of Operations

XI: Nature of Business (Provide a brief description)

See attached page

XII: Process Codes and Design Capacities

A. PROCESS CODE Enter the code from the list of process codes below that best describes each process to be used at the facility. Thirteen lines are provided for entering codes. If more lines are needed, attach a separate sheet of paper with the additional information. For other processes (i.e., D99, S99, T04 and X99), describe the process (including its design capacity) in the space provided in Item XIII.

B. PROCESS DESIGN CAPACITY For each code entered in column A, enter the capacity of the process.

1. AMOUNT Enter the amount. In a case where design capacity is not applicable (such as in a closure/post-closure or enforcement action), enter the total amount of waste for that process.

2. UNIT OF MEASURE For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

C. PROCESS TOTAL NUMBER OF UNITS Enter the total number of units used with the corresponding process code.

| PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY | PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY |
|-------------------|--------------------------------|---|-----------------------------------|--|---|
| <u>Disposal:</u> | | | | | |
| D79 | Underground Injection | Gallons; Liters; Gallons Per Day; or Liters Per Day | T87 | Smelting, Melting, Or Refining Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| D80 | Landfill | Acre-feet or Hectare-meter | T88 | Titanium Dioxide Chloride Process | |
| D81 | Land Treatment | Acres or Hectares | T89 | Methane Reforming Furnace | |
| D82 | Ocean Disposal | Gallons Per Day r Liters Per Day | T90 | Pulping Liquor Recovery Furnace | |
| D83 | Surface Impoundment | Gallons or Liters | T91 | Combustion Device Used In The Recovery Of Sulfur Values From Spent Sulfuric Acid | |
| D99 | Other Disposal | Any Unit of Measure Listed Below | T92 | Halogen Acid Furnaces | |
| <u>Storage:</u> | | | T93 | Other Industrial Furnaces Listed In 40 CFR §260.10 | |
| T1 | Container (Barrel, Drum, Etc.) | Gallons or Liters | T94 | Containment Building-Treatment | Cubic Yards or Cubic Meters |
| S02 | Tank | Gallons or Liters | <u>Miscellaneous (Subpart X):</u> | | |
| S03 | Waste Pile | Cubic Yards or Cubic Meters | X01 | Open Burning/Open Detonation | Any Unit of Measure Listed Below |
| S04 | Surface Impoundment | Gallons or Liters | X02 | Mechanical Processing | Short Tons Per Hour; Metric Tons Per Hour; Short Tons Per Day; Metric Tons Per Day; Pounds Per Hour; or Kilograms Per Hour |
| S05 | Drip Pad | Gallons or Liters | X03 | Thermal Unit | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| S06 | Containment Building-Storage | Cubic Yards or Cubic Meters | | | |
| S99 | Other Storage | Any Unit of Measure Listed Below | X04 | Geologic Repository | Cubic Yards or Cubic Meters |
| <u>Treatment:</u> | | | X99 | Other Subpart X | Any Unit of Measure Listed Below |
| T01 | Tank | Gallons Per Day or Liters Per Day | | | |
| T02 | Surface Impoundment | Gallons Per Day or Liters Per Day | | | |
| T03 | Incinerator | Short Tons Per Hour; Metric Tons Per Hour; Gallons Per Hour; Liters Per Hour; or Btu's Per Hour | | | |
| T04 | Other Treatment | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |
| T80 | Boller | Gallons or Liters | | | |
| T81 | Cement Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |
| T82 | Lime Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |
| T83 | Aggregate Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |
| T84 | Phosphate Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |
| T85 | Coke Oven | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |
| T86 | Blast Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour | | | |

| UNIT OF MEASURE | UNIT OF MEASURE CODE | UNIT OF MEASURE | UNIT OF MEASURE CODE | UNIT OF MEASURE | UNIT OF MEASURE CODE |

COMPANY, INC.

6133 EDITH BOULEVARD NE
ALBUQUERQUE, NM 87107
PHONE (505) 345-3655

NATURE OF BUSINESS STATEMENT

Rinchem Company, Inc. will use the facility to store and treat hazardous wastes under RCRA's regulations. We will also transport waste from generator's sites to disposal facilities under RCRA and other regulations using the facility as a transfer station. Rinchem plans to store, treat and transport waste from foreign and domestic generators.

The wastes manifested to Rinchem Company, Inc. may be stored at the facility until economic quantity loads can be transported to disposal facilities. Some wastes will be bulked for transportation in tankers and other bulk containers.

The services Rinchem will provide its customers outside of the RCRA permit include elementary neutralization, crushing of fluorescent bulbs and segregation of recyclable components, shredding and compaction of solid RCRA and non-RCRA regulated waste for volume reduction prior to shipment for disposal and bioremediation treatability studies.

In addition to RCRA regulated activities, Rinchem will also be managing non-RCRA regulated wastes at the facility and storing various chemicals for its chemical distribution and warehousing operations.

EPA I.D. Number (Enter from page 1)

Secondary ID Number (Enter from page 1)

N M D 0 0 2 2 0 8 6 2 7

XII. Process Codes and Design Capabilities (Continued)

EXAMPLE FOR COMPLETING ITEM XII (Shown in line number X-1 below): A facility has a storage tank, which can hold 533,788 gallons.

| Line Number | A. Process Code (From list above) | B. PROCESS DESIGN CAPACITY | | C. Process Total Number Of Units | For Official Use Only |
|-------------|--------------------------------------|----------------------------|------------------------------------|----------------------------------|-----------------------|
| | | 1. Amount (Specify) | 2. Unit Of Measure (Enter code) | | |
| X 1 | S 0 2 | 5 3 3 7 8 8 | G | 0 0 1 | |
| 1 | S 0 1 | 5 5 0 0 0 | G | 0 0 1 | |
| 2 | | | | | |
| 3 | | | | | |
| 4 | | | | | |
| 5 | | | | | |
| 6 | | | | | |
| 7 | | | | | |
| 8 | | | | | |
| 9 | | | | | |
| 1 0 | | | | | |
| 1 1 | | | | | |
| 1 2 | | | | | |
| 1 3 | | | | | |

NOTE: If you need to list more than 13 process codes, attach an additional sheet(s) with the information in the same format as above. Number the lines sequentially, taking into account any lines that will be used for "other" processes (i.e., D99, S99, T04 and X99) in Item XIII.

XIII. Other Processes (Follow Instructions from Item XII for D99, S99, T04 and X99 process codes)

| Line Number (Enter as in seg w/XII) | A. Process Code (From list above) | B. PROCESS DESIGN CAPACITY | | C. Process Total Number Of Units | D. Description Of Process |
|--|--------------------------------------|----------------------------|------------------------------------|----------------------------------|---------------------------|
| | | 1. Amount (Specify) | 2. Unit Of Measure (Enter code) | | |
| X 1 | T 0 4 | | | | In-situ Vitrification |
| 1 | | | | | |
| 2 | | | | | |
| 3 | | | | | |
| 4 | | | | | |

EPA I.D. Number (Enter from page 1)

Secondary ID Number (Enter from page 1)

N M D 0 0 2 2 0 8 6 2 7

XIV. Description of Hazardous Wastes

A. EPA HAZARDOUS WASTE NUMBER - Enter the four-digit number from 40 CFR, Part 261 Subpart D of each listed hazardous waste you will handle. For hazardous wastes which are not listed in 40 CFR, Part 261 Subpart D, enter the four-digit number(s) from 40 CFR, Part 261 Subpart C that describes the characteristics and/or the toxic contaminants of those hazardous wastes.

B. ESTIMATED ANNUAL QUANTITY - For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic contaminant entered in column A estimate the total annual quantity of all the non-listed waste(s) that will be handled which possess that characteristic or contaminant.

C. UNIT OF MEASURE - For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

| ENGLISH UNIT OF MEASURE | CODE | METRIC UNIT OF MEASURE | CODE |
|-------------------------|------|------------------------|------|
| POUNDS | P | KILOGRAMS | K |
| TONS | T | METRIC TONS | M |

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES**1. PROCESS CODES:**

For listed hazardous waste: For each listed hazardous waste entered in column A select the code(s) from the list of process codes contained in item XII A. on page 3 to indicate how the waste will be stored, treated, and/or disposed of at the facility.

For non-listed hazardous waste: For each characteristic or toxic contaminant entered in column A, select the code(s) from the list of process codes contained in item XII A. on page 3 to indicate all the processes that will be used to store, treat, and/or dispose of all the non-listed hazardous wastes that possess that characteristic or toxic contaminant.

NOTE: THREE SPACES ARE PROVIDED FOR ENTERING PROCESS CODES. IF MORE ARE NEEDED:

- Enter the first two as described above.
- Enter "000" in the extreme right box of item XIV-D(1).
- Enter in the space provided on page 7, item XIV-E, the line number and the additional code(s).

2. PROCESS DESCRIPTION: If a code is not listed for a process that will be used, describe the process in the space provided on the form (D(2)).

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER - Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described on the form as follows:

- Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B, C and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
- In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "Included with above" and make no other entries on that line.
- Repeat step 2 for each EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM XIV (shown in line numbers X-1, X-2, X-3, and X-4 below) - A facility will treat and dispose of an estimated 900 pounds per year of chrome shavings from leather tanning and finishing operation. In addition, the facility will treat and dispose of three non-listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

| Line Number | A. EPA HAZARD WASTE NO. (Enter code) | B. ESTIMATED ANNUAL QUANTITY OF WASTE | C. UNIT OF MEASURE (Enter code) | D. PROCESS | |
|-------------|--------------------------------------|---------------------------------------|---------------------------------|--------------------------------|--|
| | | | | (1) PROCESS CODES (Enter code) | (2) PROCESS DESCRIPTION (If a code is not entered in D(1)) |
| 1 | K 0 5 4 | 900 | P | T 0 3 D 8 0 | |
| 2 | D 0 0 2 | 400 | P | T 0 3 D 8 0 | |
| 3 | D 0 0 1 | 100 | P | T 0 3 D 8 0 | |
| 4 | D 0 0 2 | | | | Included With Above |

XV. Map

Attach to this application a topographic map, or other equivalent map, of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in this map area. See instructions for precise requirements.

XVI. Facility Drawing

All existing facilities must include a scale drawing of the facility (see instructions for more detail).

XVII. Photographs

All existing facilities must include photographs (aerial or ground-level) that clearly delineate all existing structures; existing storage, treatment and disposal areas; and sites of future storage, treatment or disposal areas (see instructions for more detail).

XVIII. Certification(s)

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

GENERAL FACILITY DESCRIPTION [40 CFR 270.14(b)(1)]

The Rinchem Company, Inc. (Rinchem) Albuquerque facility is located at 6133 Edith Blvd N.E., Bernalillo County, New Mexico. The two-acre site is zoned M-1. The facility is 600 feet west of Edith Blvd. and just east of the Santa Fe Railroad mainline.

The legal description of the property as recorded in book C21 on page 80 filed in the office of the Bernalillo County Clerk is as follows:

Lot 4A-1 Subdivision of Lot 4A Edith Land Company, as the same is shown and designated on the Replat of Lot 4A, Edith Land Company, now comprising Lots 4A-1, 4A-2, filed in the Office of the County Clerk, New Mexico, on May 20, 1983.

The facility consists of an approximately 23,000 square foot warehouse and office, loading/unloading dock, a back dock and two rainwater containment areas.

CHEMICAL AND PHYSICAL ANALYSIS [40 CFR 270.14(b)(2)]

Before accepting a generator's waste at the facility, Rinchem requires the generator to provide data defining the chemical and physical characteristics of the waste stream. Profiles of each waste accepted at the facility are maintained in office files at the facility. Profiling and waste analysis procedures used at the Rinchem facility are given in the Waste Analysis Plan.

Rinchem will accept wastes for storage under this permit that have any of the listed EPA waste codes (F001-F039, K001-K136, P001-P123 and U001-U249) and wastes that exhibit any of the characteristics of ignitability, corrosivity, toxicity and/or reactivity (waste codes D001-D043). Rinchem will also accept combinations of listed wastes and/or characteristic wastes.

WASTE ANALYSIS PLAN [40 CFR 270.14(b)(3)]

Attached is a copy of the Rinchem Company Inc.'s waste analysis plan.

RINCHEM COMPANY INC.'S WASTE ANALYSIS PLAN

Introduction

This plan will be maintained as part of the permit and at the facility as a separate document in order to ensure that wastes can be handled, stored and disposed of in accordance with RCRA requirements. The procedures in the waste analysis plan will pertain to wastes from domestic and foreign sources. The only procedure that will be different for the acceptance of foreign waste will be that Rinchem will notify the Regional Administrator in writing at least four weeks in advance of the date the first shipment of waste from a new waste stream is expected to arrive at the facility. See the following page for an example of the form to be used. The notification will be made for each different waste stream from each foreign source.

Waste Characterization

In order to safely handle and store hazardous wastes and ensure that land disposal restrictions are met, the wastes must be correctly characterized. Four types of characterization that will be used are

- Knowledge of process (KOP) and published information
- Detailed chemical analysis
- Hazardous Materials Categorization (HazCat) procedures
- Chemical fingerprint checks

Knowledge of process(KOP) is the knowledge that a generator has about the waste such as the content of the waste and the process that produced the waste. This knowledge helps with the

determination of the waste characterization and is many times sufficient to determine both the hazards associated with handling and storage and the requirements and restrictions for disposal. Existing published or documented data such as Material Safety Data Sheets (MSDS) on the hazardous waste or waste produced from similar processes can also be used. An example of the form used by Rinchem follows.

When KOP is not adequate to determine the safe handling, storage and/or treatment procedures, a detailed chemical analysis of a sample of the waste stream will be performed by a qualified laboratory with proper QA/QC procedures in place when submitting the waste stream profile. The containers and preservatives used for the sample will be specified by the lab doing the analyzation, and the sample will be sent to the lab with a chain of custody form. Testing parameters are chosen based on the knowledge of the process from which the waste was produced and the information that the analysis yields about the waste, for example, Btu values, flashpoint, etc. The test methods that will be used are described in the most current version of EPA's "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW-846" or comparable methods.

-

HazCat procedures - the processes and tests described in "HAZCAT™ CHEMICAL IDENTIFICATION SYSTEM" (Turkington, 1988, or most current) to identify unknowns - or a comparable method are followed to help characterize solid and liquid wastes that can not be positively identified by the generator or from labeling information. Our HazCat system has over a hundred tests which allow us to identify the hazardous characteristics of the waste material. The properties that can be tested for include:

- flammability levels
- oxidizer characteristics
- corrosive characteristics
- reactivity
- cyanides
- halides
- PCB presence
- pesticides
- herbicides

To verify that the characteristics of the waste stream are consistent with the information provided by the generator and with the parameters listed on the profile for that waste stream, a chemical fingerprint check will be performed on each incoming waste stream excluding labpacks and highly reactive wastes. Fingerprint procedures will be conducted according to published methods such as Turkington, 1988, or equivalent. The fingerprint parameters that may be tested or observed include:

- Physical state
- Physical description
- pH
- Color
- Ignitable screen (ignitibility)
- Specific gravity

The above parameters will be selected not only for the fact that they will indicate that the waste is actually what the generator claims that it is, but they will provide sufficient information about the waste so that it can be properly stored, treated and disposed of.

Pre-acceptance of a Waste Stream

For each new hazardous waste stream that is a candidate for storage at the facility, the following procedures will be followed prior to notifying a generator that a waste stream can be accepted at the Rinchem facility:

- 1) The generator will provide pertinent chemical and physical data requested on the waste profile sheet. A sample waste profile sheet is included to show the contents of the form rather than the exact format of the form. The profile includes a certification that any samples of waste submitted as part of the waste acceptance process are representative and that the generator will notify Rinchem of known changes in the waste stream.
- 2) The generator will provide pertinent chemical and physical data and certifications requested to satisfy land disposal restriction requirements in 40 CFR 268.
- 3) The data on the waste profile will be verified as necessary through HazCat, chemical fingerprint checks or detailed analysis of a representative sample of the waste.
- 4) After comparing the data supplied by the generator with that obtained by verification and assuring that our analysis contains all the information which must be known to store, treat and dispose of the waste in accordance with Parts 264 and 268, Rinchem will determine the acceptability of the waste based on the permit conditions.

Physical Acceptance of Waste at the Facility

Except in the case of labpacks and highly reactive wastes, upon arrival of a waste shipment at Rinchem, a determination will be made to insure that the customer did send what was profiled and accepted. First, a verification will be made that a PRE-ACCEPTANCE INSPECTION SHEET (PAIS) has been filled out for the generator's shipment of waste. An example of what a PAIS might contain is attached. Second, the manifest and LDR form will be compared with the profile (which is kept in the facility office) to make sure they match. Some of the items that will be compared include the waste description and DOT shipping information. Next, a fingerprint analysis (see the **Waste Characterization** section) will be performed which will provide reasonable assurance that the waste shipped from the generator agrees with the accompanying manifest. The results of the fingerprint testing of a given waste stream will be compared to the values obtained from previous shipments of the waste stream and the waste profile sheet and will be required to fall within an established tolerance limit.

The minimum number of containers that will be sampled from each shipment of a waste stream will be determined according to the cube root procedure, Method D 140-70, of the American Society for Testing and Materials. For a typical load, the formula provides the following:

Generator Name: _____ Manifest Doc. No.: _____
 Inspection Symbols: Acceptable (✓) Unacceptable (U) Unable to Accomplish (UA)

It is vital to be firm but very courteous when dealing with customers regarding suspected discrepancies. If they don't readily agree that changes are necessary, ask for permission to contact your supervisor. We do not reject shipments without every effort to rectify non-compliance and we do not accept shipments until they comply.

| | | | | | |
|--|--|--|--|--|----------------|
| | | | | | Initial Pickup |
| | | | | | 1st Transfer |
| | | | | | 2nd Transfer |
| | | | | | 3rd Transfer |
| | | | | | 4th Transfer |

[illegible]

| # DRUMS RECEIVED | # DRUMS SAMPLED |
|------------------|-----------------|
| 1 | 1 |
| 2-8 | 2 |
| 9-27 | 3 |
| 28-64 | 4 |
| 65-125 | 5 |

The drums to be sampled will be chosen at random by the person taking the samples. The sampling will take place in a well ventilated area of the facility such as the dock.

One of the methods referred to in 40 CFR 261, Appendix I, or an equivalent procedure will be used to obtain representative samples of the waste by employees wearing personal protective equipment (PPE) as described in the PREVENTATIVE MEASURES section.

Typically, the employee's PPE will include goggles or safety glasses, gloves and an apron or coveralls. Rinchem's Health and Safety Plan will be followed.

The method of sampling that will most frequently used - unless the technology changes - will be sampling of containerized liquid waste with a COLIWASA. COLIWASA stands for "containerized liquid waste sampler." See the following page for a schematic of a type of

Figure WAP-2. Schematic of a Collapsed Type Sampler

9

COLIWASA. The COLIWASA is an effective representative sampler for homogeneous and multilayer liquids. Disposable glass COLIWASAs will be used except when sampling hydrofluoric acid and strong alkali solutions - in which case a teflon one will be used. A separate will be used to sample each container.

Some of the hazardous wastes received at the facility are labpacks of small quantity chemical wastes which can be categorized into several types:

- Excess or residual reagent chemicals
- Off-specification or expired chemicals
- Relatively small quantities of chemical solutions or mixtures of known composition
- Solid waste laboratory material

In most cases, knowledge of process is sufficient to determine both the hazards associated with the handling and storage of labpack wastes and the requirements and restrictions for its disposal; therefore, analytical testing is not usually conducted on these wastes. The cube root procedure mentioned above will be used to determine the number of containers in each labpack waste stream which will be inspected for conformity of the paperwork with the container contents.

In the case of highly reactive wastes being shipped for treatment at other off-site TSDF's, the inspection process may entail no more than inspecting the container for proper packaging and labeling in order to protect the employees.

Unacceptable Waste Shipments

The Hazardous Waste Coordinator (or his designee) will qualify a waste shipment as unacceptable if any of the following conditions exist:

- Failure of the generator to pre-qualify the waste stream or provide appropriate data
- Waste shipments that contain components for which Rinchem is not permitted such as radioactive and/or explosive wastes
- Improper or inappropriate packaging, labeling, or manifesting
- Characteristic quantity or composition discrepancy between the waste and the waste manifest or profile
- Values for fingerprint analysis parameters that are out of the tolerance levels set by the Rinchem
- Lack of generator credit approval

The Hazardous Waste Coordinator (or designee) must also classify the waste as unacceptable for the Rinchem facility if it is significantly different in composition or volume from the information shown on the waste profile sheet, the pre-acceptance analysis of the representative sample, or on the manifest. Containers are counted to determine any quantity discrepancies.

Waste found to be in non-conformance may be rejected on the spot or they may be reevaluated for possible acceptance by the facility despite the variance. Rinchem's

reevaluation procedure is designed to determine whether a waste material can be handled at the facility and whether the generator concurs with the characterization conducted by Rinchem. The Hazardous Waste Coordinator evaluates the shipment according to the following criteria:

- Rinchem facility requirements
- discussions with the generator
- facility parameters for storage
- the need for additional supplemental analysis

If all of the above parameters including supplemental analysis indicate the waste can be accepted and the generator concurs, new manifests or profiles may be created as necessary to ensure compliance. If a discrepancy cannot be resolved within 10 days of the shipment receipt, the waste will be returned to the generator or the appropriate regulatory agencies will be notified, in writing, of the discrepancy and of attempts to reconcile it.

Waste Tracking

Once a waste shipment has been analyzed and accepted, the containers in the shipment will be appropriately marked so that they can be tracked within the facility. The containers will be moved to the appropriate storage area based on the hazard class and compatibility of the material as described in the PREVENTION OF ACCIDENTAL IGNITION OR REACTION

**OF IGNITABLE, REACTIVE OR INCOMPATIBLE WASTES and ADDITIONAL
CONTAINER INFORMATION sections.**

Analysis Review

The pre-acceptance evaluation of a hazardous waste stream will be repeated when a generator notifies Rinchem that the process generating the waste has changed or if Rinchem has reason to suspect that the waste is in non-conformance with available pre-acceptance documentation. In the case of a change in the process generating the waste, the generator must submit a new waste profile sheet and sample. The waste stream will also be reanalyzed if a waste shipment received at the facility does not match the waste designated on the accompanying manifest or shipping paper.

SECURITY [40 CFR 270.14(b)(4)]

Description of 24-hour Surveillance System and/or Artificial or Natural Barriers

The Rinchem Company, Inc. facility employs a number of measures to ensure adequate security in order to assure the protection of the facility and to comply with government regulations.

The facility has an alarm system that is connected to each window and door, the fire sprinkler system, the temperature control systems and the pull stations. This monitoring system is manned 24 hours a day by an outside security company. A list of employee names and phone numbers to contact is kept at this monitoring company should an emergency occur.

The entire facility, including the outside area around the building, is maintained in a secure manner. A fence encompasses the entire facility. The fencing is constructed of 6 foot high, light gauge fabric, 2" mesh chain link fence.

All gates are maintained in a closed and locked condition during all periods of facility non-working hours. All critical locks and the alarm code are changed when a facility employee leaves the company or when a key is lost. During working hours, the gates are kept closed or are observed by facility personnel. Access through the main truck loading/unloading gate is blocked by a barrier with a sign informing the truck drivers to check in with the office

before entering. The customer service representatives seated immediately inside the office entrance door confirm identification of all visitors and the purpose of their visit. Visitors are not allowed in the warehouse without an employee accompanying them.

Description of Warning Signs

Warning signs are posted at all of the gates and several other fence locations around the facility in such a manner as to be visible from all angles of approach and bear the legend in English "Danger - Unauthorized Persons Keep Out." Warning signs in Spanish are posted next to or below the English warning signs and bear the legend "PELIGRO - Personas Sin Autorizacion NO ENTRADA." All signs are legible from a distance of 25 feet.

INSPECTION SCHEDULES [40 CFR 270.14(b)(5)]

Attached are the general inspection schedule forms that are used at the Rinchem facility. There are forms for the regular 5 day work week, quarterly, semiannual and annual schedules. The criteria to be inspected are placed on the schedule that is appropriate for the frequency of inspection to be performed. There is a section on each form for recording the date and nature of repairs performed and/or remedial action taken. The schedules are maintained and kept at the Rinchem Company, Inc. facility.

SAFETY-KLEEN SYSTEMS, INC. STORAGE FACILITY RCRA PERMIT
APPLICATION, ALBUQUERQUE FACILITY EPA ID NMD000804294
HWB-SKAL-02-001

Dear Mr. Ashley:

After substantial review of the Safety-Kleen Farmington's (SKFA), October 4, 2000 permit application, Attachment A, *Waste Analysis Plan* (WAP) and the 2000 permit application Part A, Section 1.0, Attachments C, D and E, the existing SKFA operating permit dated April 4, 1991, and the August 20, 2002 draft permit wastes characterization requirements, NMED has made a determination that additional information is required prior to granting administrative completeness pursuant to 20.4.2.200 NMAC (A) (3) (a) and (b). The NMED comments are attached.

Please respond to this Notice of Deficiency within sixty (60) days of receipt of this letter.

Should you have any questions please contact Mr. Steve Pullen of my staff at (505) 428-2544.

Mr. David Ashley
November 15, 2002

NOTICE OF DEFICIENCY COMMENTS
SAFETY KLEEN – FARMINGTON and ALBUQUERQUE

Regulatory citations in these comments only reference the applicable Code of Federal Regulations (CFR) requirements without including the associated New Mexico regulation for brevity.

NMED expects a response to each of these comments and altered permit application language where appropriate. The responses to these comments should be included in both the Safety-Kleen Albuquerque (SKAL) and SKFA permit application waste analysis plans since the WAP's are essentially identical and by doing so, will prevent an additional NOD being submitted for the SKAL facility.

General SKFA WAP Comments:

1. The WAP fails to identify the specific waste characterization regulations that must be addressed before wastes can be managed at the facility. NMED requires that Safety-Kleen address, at a minimum, the data quality objectives (DQOs) identified at Appendix I at the back of these comments. All appropriate DQOs are to be identified in the Introduction portion of the WAP. The WAP must also be augmented to include a discussion of how Safety-Kleen personnel will perform a QA/QC analysis to ensure that all waste characterization has met the DQOs.
2. The Safety-Kleen Farmington facility permit application fails to address all applicable land disposal restriction (LDR) regulatory requirements. Safety-Kleen must specify in the WAP how it will both accomplish these activities, and document these determinations as required by 20.4.1.800 NMAC (incorporating 40 CFR 268.7 (a) (6)), 20.4.1.300 NMAC (incorporating 40 CFR 262.10 (h) and 40 CFR 262.40 (c)). Safety-Kleen must specifically commit to ensuring that all hazardous wastes stored at the facility are characterized for all applicable LDR notification requirements as identified below;
 - a. Identify all hazardous constituents in prohibited hazardous wastes requiring treatment as required by 20.4.1.800 NMAC (incorporating 40 CFR 268.7 (a), 40 CFR 268.40 (a) (1) and (2)), including both the constituents associated with each waste listed in 40 CFR 268.40 as "regulated hazardous constituents", and all underlying hazardous constituents (UHCs) in characteristic hazardous wastes as required by 40 CFR 268.9 (a);
 - b. Identify applicable "waste code subcategories" as identified in Column 2 of the "Treatment Standards for Hazardous Wastes" table located in 40 CFR 268.40, as required by 40 CFR 268.7 (a), and as referenced in the Required Information

Column, Item No. 4, of the "Generator Paperwork Requirements Table" located in 40 CFR 268.7 (a);

- c. Identify the waste's applicable "treatability group" (i.e., wastewater or non-wastewater) as identified in Column 2 of the "Treatment Standards for Hazardous Wastes" table located in 40 CFR 268.40, and the "Universal Treatment Standards" table located in 40 CFR 268.48, and as required by 40 CFR 268.7 (a), as referenced in Column 1. Item No. 4, of the "Generator Paperwork Requirements" located in 40 CFR 268.7 (a), and as defined in 40 CFR 268.2 (d) and (f); and
- d. Identify whether the waste must be treated before it can be land disposed as required by 40 CFR 268.7 (a). To accomplish this, Safety-Kleen shall identify the applicable constituent concentration or technology based treatment standards for the wastes and/or the individual hazardous constituents as identified in the "Treatment Standards for Hazardous Wastes" table located in 40 CFR 268.40.

These requirements apply to all wastes managed at Safety-Kleen regardless of how long the wastes are stored, including wastes stored under a transfer basis.

3. NMED can find no commitment in the application to store prohibited wastes for less the one-year as required by 40 CFR 268.50. The application/WAP shall be altered accordingly.
4. The permit application fails to discuss whether any of the waste management activities performed by Safety-Kleen at both the facilities, would constitute the generation of a new waste or require a new manifest. The New Mexico Environment Department questions whether the aggregation of wastes with different LDR statuses is occurring at Safety-Kleen. Generator status determination in this circumstance depends primarily on the establishment of a waste's "point of generation". The definition of what the "point of generation" is and its implications are described in EPA's guidance manual, *Land Disposal Restrictions: Summary of Requirements*, dated August 2001 (EPA 2001). EPA 2001, Section 8.2 states, "for characteristic wastes, each change in treatability group constitutes a new point of generation". The permit application states in Section A.1.1, Paragraph 1, Item c, *Drum Washer/Dumpster Sediment*, that, "the chemical composition of this waste is very similar to that of the bottom sediment from the tank and therefore, carries the same EPA hazardous waste codes". The application fails to mention the possibility here or anywhere else of a change in LDR treatability groups and a resultant new waste.

Safety-Kleen shall explain the following;

- a. Whether the commingling or aggregation of wastes with different LDR statuses would constitute the generation of a new waste; and
- b. Whether segregating the sediments referenced in Section A.1.1 would constitute the generation of a new waste due a change in treatability group (referenced above).

The issue is relevant to waste characterization because the generator of a waste must create a manifest in accordance with 40 CFR 262 and perform a LDR status determination at the point of generation (POG) in accordance with 40 CFR 268.7.

5. The WAP suggests that a laboratory analysis was performed only four times on Safety-Kleen wastes in the period between 1997 and 1999 (i.e., four different waste streams were analyzed once). This information was gleaned from WAP Section A.2, which proposes to perform no analytical waste characterization at the point of generation because "the composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications". This Section also proposes no verification characterization will be performed at the Farmington facility because "with such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible." Annual characterization data from Attachment A-1 demonstrates four laboratory analyses. Safety-Kleen shall explain whether this observation is accurate.
6. In general, NMED considers the waste characterization commitments in the Albuquerque Safety-Kleen facility (SKAL) permit application, dated July 27, 2001, to be more detailed and thus preferable. Specific examples are provided below.
7. The WAP fails to recognize that before wastes are stored they must be characterized as to whether they are authorized wastes (i.e., included in the Part A portion of the permit application or not otherwise prohibited by the permit).
8. Safety-Kleen shall submit a copy of applicable Safety-Kleen Standard Operating Procedures (SOPs) as related to the characterization and sampling of hazardous wastes.

SKFA WAP Section Specific Comments:

1. Section A.1 - The second sentence inaccurately states that the specifications for SKFA's "products" are provided in Attachment A.1. Please explain how the table of annually waste stream characterization relates to SKFA product. NMED is interested in product characterization due to its association with related wastes. (See SKFA WAP Section Specific Comment 5.c).

2. Section A.1 - The second sentence references the table in Attachment A.1. Is this table representative of SKFA's documentation in response to the existing annual waste characterization permit requirement found in Permit Conditions II.C and Attachment A, Section A.3? If so, please explain why the table does not provide waste characterization information for wastes resulting from the dry cleaner service for SKFA.
3. Section A.1 - The second sentence references the tables in Attachment A.1. There are few other references to the tables in the text portion of the WAP. Safety-Kleen shall elaborate on the purpose of the tables. At a minimum, Safety-Kleen must answer the following questions;
 - a. Is the Attachment meant as an example of the data needed to fulfill the following requirements;
 - i. to repeat initial analysis of wastes to ensure that the analysis is accurate and up to date as required by 40 CFR 264.13 (b) (4); and
 - ii. SKFA Operating Permit Condition II.C, together with the Waste Analysis Plan (Permit Attachment A), Section A.3, commit to analyzing each waste type "at least once each calendar year".
 - b. Is Attachment A.1 meant to identify all applicable parameters to be analyzed for each hazardous waste as required by 40 CFR 264.13 (b) (1)? Is there a reason why this analysis data does not include other possible hazardous constituents as referenced at 40 CFR 268.40 (a)?
 - c. The WAP states that the Attachment data represents the "specifications for the products". It is NMED's understanding that the data represents constituent concentrations before the reclamation process. SKFA must provide a complete chemical description of all products resulting in wastes stored at the facility, including a description in chemical variability.
 - d. The tables demonstrate that for a particular waste type (e.g., waste aqueous cleaners), wastes from different SK service centers during a particular period of time (e.g., 1998-1999) had widely ranging hazardous characteristic constituent and other physical property values. Is SKFA implying that all wastes with hazardous characteristic constituent and other physical property values that fall within the maximum and minimum values presented on the Tables are the same wastes and can be aggregated or consolidated without requiring a new manifest?

- e. The tables all include a value for the 90th percentile of the upper confidence limit (UCL) for the 50th percentile. The WAP does not explain what this data is used for. SW-846 Chapter 9, Section 9.1.1.1 discusses the use of UCLs to evaluate the degree of sampling accuracy and precision of multiple samples of a single waste stream to determine whether it is hazardous. The tables represent numerous waste streams and thus are something very different than what is discussed in SW-846. SKFA must clarify.
- f. Safety-Kleen must explain the significance of the table notation "non-detect" (ND) when the detection limit of the analysis was significantly higher than the regulatory limit. The inappropriate ND occurs on numerous tables but is a particular problem on the table for waste dry cleaner bottoms – semi-volatile analysis. Safety-Kleen must explain why NMED should not make it a permit requirement that all analysis be performed to ensure that the method detection limit (MDL) be below the applicable regulatory limit, or that Safety-Kleen be required to record one-half the MDL instead of ND.
- g. Safety-Kleen must explain whether the "site" column necessarily indicates the Safety-Kleen service centers that shipped wastes to a recycling center and the number of shipments in a particular period (i.e., did SKFA not ship any dry cleaner, paint, or photographic wastes during the referenced periods?). Section A.1.1 (a) suggests that spent solvent is removed from the storage tank on a monthly basis yet this is not reflected in the table.
- h. The tables reference the following 11 different wastes;
 - i. Waste aqueous cleaners
 - ii. Waste dry cleaner filter powder
 - iii. Waste dry cleaner bottoms
 - iv. Waste immersion cleaner
 - v. Paint waste (other)
 - vi. Waste paint gun cleaner
 - vii. Waste parts washer solvent (105)
 - viii. Waste parts washer solvent (105/150)
 - ix. Waste premium gold parts washer solvent (150)
 - x. Waste parts washer sludge
 - xi. Waste parts washer tank bottoms

Safety-Kleen must explain why all of these wastes are not referenced in the Section A.1 of the WAP.

- 9. Section A.1.1 - The section in general describes wastes resulting from the parts washer service and applies characteristic waste codes to all the wastes but does not apply any of

the listed waste codes to the wastes. Attachment A.1 demonstrates that the wastes contain significant concentrations of trichloroethylene, tetrachloroethylene, and methyl ethyl ketone. These chemicals are all solvents in F001, F002 or F005 wastes. Safety-Kleen shall explain why the wastes resulting from parts washer service are not described as carrying a "F" code as the dry cleaner and paint wastes do. Furthermore, Safety-Kleen must explain why NMED should not require through the permit that wastes resulting from the parts washer service (see Section A.1.1) be analyzed on a periodic basis for the presence of all constituents of concern in the F001-F005 listed wastes referenced at 40 CFR 268.48.

10. Section A.1.2 - Paragraph 1, last sentence, states, "... other types of dry cleaning waste (e.g., freon) will be managed on a transfer basis only". Section A.5.c states that "unique or non-standard waste streams" will also be managed on a "transfer basis" only. Section A.7 states that for waste "managed on a transfer basis, the Subpart CC regulations do not apply". Safety-Kleen shall thoroughly explain why NMED should not require, through the permit, that all waste managed at the facility be managed subject to the requirements of 40 CFR Parts 264, 268 and 270 as is required by 40 CFR 262.34 (b) of any generator who accumulates hazardous waste for more than 90 days.
11. Section A.1.2 - Paragraph 2, Sentence 1, refers to the distillation of wastes from dry cleaner service. Safety-Kleen shall specify where this distillation process occurs. The WAP implies distillation may be happening at the generator locations or the Farmington service center. If the distillation process is occurring at either of these locations, Safety-Kleen must explain whether the distillation process is a materials recovery process meeting the definition of treatment provided at 40 CFR 260.10, and thus requiring a permit.
12. Section A.1.4 - This section references three photographic/imaging wastes, yet implies that none of them can be considered a hazardous waste. Safety-Kleen shall significantly elaborate on the regulatory status of these wastes. Sentence 1 states, "some photographic imaging wastes managed at the facility are not solid wastes per 40 CFR 261.2 (c) because their hazardous constituent is reclaimed." Is Safety-Kleen referencing this regulation in relation to the photo fixer solution from which silver may be recovered?

NMED understands that the U.S. EPA has made solid waste determinations on a material-by-material basis (See RCRA Regulations and Keyword Index, 2000 Edition, published by Aspen Law and Business (Aspen 2000) and the RCRA Hotline Question and Answer #54 (RCRA-54)). Safety-Kleen shall provide these EPA determinations.

13. NMED feels that it may be appropriate to identify wastes in the permit that are not subject to the permit, but to be consistent, all such wastes must be identified. Please provide a list of all materials (non-products) stored at the facility that might be considered

by an inspector to be hazardous waste subject to the permit and that Safety-Kleen feels are not subject to 40 CFR Parts 264, 268 and 270 permitting conditions. Furthermore, because the photo fixer solution which would normally carry a D011 waste code is obviously prohibited from land disposal under the LDRs, the off-site shipment of this waste must be accompanied by a LDR notification form as required by 40 CFR 268.7 (a) (1). That notice shall include the following information (see RCRA-126);

- a. EPA Hazardous Waste Number (waste code);
 - b. The hazardous constituents and their corresponding treatment standards and all other applicable prohibitions set forth in 40 CFR 268.32;
 - c. The manifest number associated with the shipment of the waste; and
 - d. Waste analysis data where available.
14. Section A.2 - Paragraph 3, last sentence, states, "... procedures to verify waste characteristics occur at several check points in the management of the solvent". The WAP identifies three checkpoints; the QC procedures performed when Safety-Kleen services its clients, when the wastes are transferred into the storage tank, and the annual characterization performed at the reclamation center. If Safety-Kleen has additional procedures to verify waste characteristics they must be elaborated on in the WAP.
15. Section A.2 - Paragraph 3, first sentence, references HWMR 206.B.3 inappropriately. NMED believes the appropriate and applicable regulation is 20.4.1.500 NMAC (incorporating 40 CFR 264.13 (a) (3) (i)).
16. Section A.2 - The SKAL permit application contains the following commitments that shall be included in the SKFA application, or provide a reason as to why they/it should not be included:
- a. Questionable wastes received at the service center shall be analyzed before they leave the facility;
 - b. The Branch Manager will be notified of any contamination that may have occurred. Furthermore, NMED requires through its omnibus authority specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.32 (b) (2)) that Safety-Kleen commit in its WAP, to notifying the Hazardous Waste Bureau (HWB), Enforcement Program Manager of any contamination that may have occurred;
 - c. Training commitments; and

d. The procedures for wastes rejected at the time of service.

17. Section A.2 - The section implies that waste characterization will primarily be through acceptable knowledge (AK). Acceptable knowledge is defined in EPA guidance, "Waste Analysis at Facilities that Generate, Treat, Store, and Dispose of Hazardous Waste" dated April 1994, as process knowledge and prior sampling data performed before the effective date of RCRA regulations. Current sampling and analysis is the preferred method, and the Permittee shall obtain characterization by sampling and analysis whenever feasible.

Acceptable knowledge may be used as the sole method to characterize waste only when the waste is from processes that are well documented with supporting information that address all characterization requirements of the permit, including the requirement to determine the LDR status of the waste as well as the other DQOs referenced at General Comment #1. Safety-Kleen shall maintain written documentation supporting the use of AK for each waste stream. SKFA shall include in the record all specific AK documentation assembled and used in the AK process, whether or not it supports the decision to use AK.

18. Section A.2.1 - Paragraph 2 states that as part of the QC procedures, a Safety-Kleen sales representative makes a visual examination of the wastes prior to recovery. Safety-Kleen must commit in Section A.6 of the WAP, to include a record of each of these QC examinations in both SKFA's and SKAL's operating record.
19. Section A.2.1.c - Safety-Kleen must elaborate on the sampling technique(s) used to determine whether the contents of a waste drum deviate from the description in the section. Safety-Kleen shall also describe the sampling techniques used to characterize waste at the service center as referenced in last paragraph of Section A.2.1.c.
20. Section A.2.3 - This section addresses paint waste but makes no mention of waste abrasive blasting media used to remove paint. This is generally a waste stream created at paint shops that is generally characteristically hazardous for metals. Does Safety-Kleen manage abrasive blasting media?
21. Section A.3 - This section shall be amended with a description of the quality assurance procedures to be used when performing laboratory analyses (e.g., equipment calibration and maintenance, data reduction and validation, and records management). The section must also be amended with a commitment to ensure those procedures are adhered to and documented in the both the SKFA and SKAL operating record.
22. Section A.3, Table A-1 - Table A-1 inappropriately lists "TCLP" as a parameter (the parameter is toxicity characteristic, TCLP is a sample preparation method) and fails to

address paint and photo chemical wastes. The SKAL permit application Section A.3 has a preferable discussion of waste parameters.

23. Section A.3, Table A-1 - Table A-1 must be augmented with a parameter and its associated rationale regarding the determination of a waste's LDR status. In fact, "determination of a waste's LDR status" can be the rationale and "hazardous constituent concentration" might be the parameter. Safety-Kleen shall alter other tables accordingly.
24. Section A.3, Table A-2 - Table A-2 must clarify that TCLP is simply a sample preparation method (which is not necessary when a waste is in liquid form). To determine a waste's toxicity characteristic, it may be necessary to first perform a leaching procedure (TCLP) and then perform a total analysis. The table should also identify the test method(s) Safety-Kleen will use to measure inorganic constituents in a waste.
25. Section A.3, Table A-3 - Table A-3 references U.S. EPA's *Test Methods for the Evaluation of Solid Waste Physical/Chemical Methods*, SW846, Section 1.2.1.1. The current on-line version of SW846 available at <http://www.epa.gov/epaoswer/hazwaste/test/main.htm>, is not organized with sample collection methodologies at Section 1.2.1.1. Please reference the appropriate section of the on-line version. Furthermore, SW846 does say at Section 3.3.4, *Sample Collection*, that "The procedures describing how the sampling operations are actually performed in the field should be specified. A simple reference to standard methods is not sufficient, unless a procedure is performed exactly as described in the published method." Safety-Kleen shall amend the WAP accordingly.
26. Section A.3, Table A-3 - Table A-3 states that the sampling device to be used for solvent tank bottoms is the same device to be used for spent solvents. This device is the Copliwasa tube. SW846 Chapter 9, Section 9.2.2.3, states, "... the Coliwasa is a device employed to sample free-flowing liquids and slurries ...". Safety-Kleen shall explain how effective the Coliwasa is at sampling tank bottoms.
27. Section A.3, Table A-4 - Table A-4 states that the frequency of analysis for all wastes will be "at least annually". The SKAL permit application WAP, Section A.3.1, and the SKFA current operating permit WAP, commit to performing an abbreviated analysis on "every load received at the recycle center". If this is in fact standard Safety-Kleen procedure, it shall be referenced in the SKAL and SKFA WAPs.
28. Section A.4 - The section must recognize and reference the permit modification procedures at 20.4.1.900 NMAC (incorporating 40 CFR 270.42), *Permit modification at the request of the Permittee*.

29. Section A.5 - The section fails to address all applicable LDR notification requirements. Safety-Kleen must specifically commit to ensuring that all hazardous wastes stored at the facility, regardless of where the wastes are generated, are characterized for all applicable LDR notification requirements as identified at General Comment #2.
30. Section A.5 - The section shall be augmented to commit to maintaining in the SKFA and SKAL operating records, a copy of all LDR status notifications, including those for wastes generated onsite and for wastes received from off-site generators, as required by 40 CFR 264.73 (15) and (16). Additionally, please explain what is meant by the term "receiving facility" as used in the last paragraph of Section A.5.
31. Section A.5.b - NMED is unfamiliar with the waste type abbreviations "MS" and "IC". Please elaborate in the WAP.
32. Section A.6 - The section lists information to be kept in the facility operating record including numerous inappropriately listed non-waste characterization items that are not referenced elsewhere in the application. Safety-Kleen must relocate this information in a more appropriate location within the SKAL and SKFA applications.
33. Section A.6, Item 1 - The section inappropriately references a regulation as "Pt. V. sec.264, Appendix I". NMED believes the appropriate reference should be 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Appendix I). That regulation (which is applicable to SKFA and SKAL) requires, in part, the inclusion of a description of the process that produces a waste. NMED requires Safety-Kleen to include in its application a commitment to characterize the waste generating process as outlined at Appendix II.
34. Section A.6, Item 10 - The section references where LDR notifications are maintained. Safety-Kleen shall clarify the phrase "resource recovery (May 1994) branch manager's office". NMED requires that the LDR records be kept at the facility for inspection purposes.
35. Section A.7 - The section is titled "Waste Determination for Subpart BB and CC Compliance" but does not address characterizing wastes for their Subpart BB applicability by measuring their total organic concentration by weight. Safety-Kleen must amend the SKAL and SKFA WAPs accordingly.

Appendix I

Data Quality Objectives (DQOs)

Waste characterization data obtained through WAP implementation shall be used to ensure that the Permittee meets regulatory obligations at permitted hazardous waste storage units. A portion of the DQOs that shall be met for all waste characterization will be to comply with the following applicable Resource Conservation and Recovery Act (RCRA) regulatory requirements:

1. To determine all information which must be known to treat, store and dispose of the wastes in accordance with New Mexico's Hazardous Waste Regulations, 40 CFR 264.13 (a) (1);
2. To determine if the waste is hazardous 40 CFR 262.10 (c) and 40 CFR 262.11;
3. To ascertain the hazardous constituents in a waste stream to identify all applicable hazardous waste codes and all underlying hazardous constituents in accordance with 40 CFR 262.11, 40 CFR 268.7 (a) (2), and 40 CFR 268.9 (a);
4. To ascertain whether the waste must be treated before it can be land disposed in accordance with 40 CFR 268.7 and 40 CFR 268.9;
5. To ascertain whether a routine waste generating process has changed sufficiently to create a new waste stream and alternative regulatory requirements pursuant to 40 CFR 264.13 (a) (3) (i), 40 CFR 268.7 (a) (3) (iii), and 40 CFR 268.7 (b) (3) (ii));
6. To facilitate appropriate waste packaging for transportation in accordance with 40 CFR 262.10 (h);
7. To ascertain the presence and concentration of wastes constituents that might cause unlawful air emissions in accordance with 40 CFR 270.25 (a), 40 CFR 264.179, 40 CFR 264.200, 40 CFR 264.13 (b) (6), 40 CFR 264.601 (c) (1), 40 CFR 264.1050, and 40 CFR 264.1082;
8. To ensure that wastes are not inappropriately diluted to avoid LDR treatment requirements in accordance with 40 CFR 268.3;
9. To determine the presence of prohibited materials in accordance with 40 CFR 268.50 (f);
10. To determine the presence of free liquids in wastes in accordance with 40 CFR 270.15 (b) (1), 40 CFR 264.13 (b) (6);

11. To ascertain waste/waste and waste/container compatibility characteristics in accordance with 40 CFR 270.15, 40 CFR 270.16, 40 CFR 264.172, 40 CFR 264.177, and 40 CFR 264.199; and
12. To ascertain waste ignitability and reactivity characteristics in accordance with 40 CFR 270.16 (j), 40 CFR 264.17 (a), and 40 CFR 264.198 (a).

Appendix II

Waste Process Information

The Permittee shall obtain process knowledge documentation from the generator that is explicitly relevant and traceable to each waste stream. The following information presents process knowledge the Permittee are required to obtain:

1. Area(s) and/or building(s) from which the waste stream was or is generated;
2. Waste stream volume and time period of generation;
3. Description of waste generating process; and
4. Material inputs or other information that identifies the chemical content of the waste stream and the physical waste form.

SKFA 2003

OVERNIGHT DELIVERY
RETURN RECEIPT REQUESTED

March 9, 2003

Mr. Steve Pullen
Permits Management Program
State of New Mexico Environment Department
Hazardous Waste Bureau
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303

Re: Notices of Deficiency (NOD) for Safety-Kleen Farmington and Safety-Kleen Albuquerque Facilities

Dear Mr. Pullen:

Safety-Kleen Systems, Inc. (S-K) operates service centers in Farmington, New Mexico (4210A Hawkins Road) and Albuquerque (2720 Girard NE) for temporary accumulation and storage of hazardous wastes, prior to transporting offsite for reclamation, treatment or disposal. RCRA Permit Renewal Applications were submitted to the New Mexico Environment Department/Hazardous Waste Bureau (NMED/HWB).

In a letter (Notice of Deficiency) dated November 15, 2002, NMED/HWB required additional information. A response to the NMED/HWB NOD and the required information is provided with this correspondence. Each of the NMED/HWB items is summarized below for convenience. A response providing the supplemental information follows each of the NMED requests.

NMED/HWB (SKFA Specific) Item No. 1.

Section A.1 – The second sentence inaccurately states that the specifications for SKFA's "products" are provided in Attachment A.1.

S-K Response No. 1.

The omission of information about Safety-Kleen products was an oversight. Please find enclosed, MSDSs for the relevant Safety-Kleen parts washer service and paint service products. These MSDSs include more information than required by OSHA (40 CFR 1910.1200).

NMED/HWB (SKFA Specific) Item No. 2.

Section A.1 – The table referenced in Attachment A.1 does not include waste characterization information for wastes resulting from the dry cleaner service for SKFA.

S-K Response No. 2.

It appears to have been an administrative omission, not to include dry cleaner waste characterization data. Please find attached the most recent full waste characterization package with summary tables including dry cleaner data.

NMED/HWB (SKFA Specific) Item No. 3.

Section A.1 – Safety-Kleen must answer the following questions;

- a. Is the attachment meant as an example needed to fulfill the following requirements:
 - i. To repeat analysis to ensure that the analysis is accurate and up to date as required by 40 CFR 264.13(b)(4); and
 - ii. SKFA Operating Permit Condition II.C together with the Waste Analysis Plan (Permit Attachment A), commitment to analyzing each waste type "at least once per year?
- b. Is Attachment A.1 meant to identify all applicable parameters to be analyzed for each hazardous waste as required by 40 CFR 264.13(b)(1)? Is there a reason why this analysis data does not include other possible hazardous constituents as referenced at 40 CFR 268.40(a)?
- c. SKFA must provide a complete chemical description of all products resulting in wastes stored at the facility, including a description in chemical variability.
- d. The tables demonstrate that for a particular waste type, wastes from different SK service centers had widely ranging hazardous characteristic constituent and other physical property values. Is Safety-Kleen implying that all wastes with hazardous characteristic constituent physical property values that fall within the maximum and minimum values represented in the Tables are the same wastes and can be aggregated or consolidated without requiring a new manifest?
- e. The tables all include a value for the 90th percentile of the upper confidence limit (UCL) for the 50th percentile. SW-846 Chapter 9, Section 9.1.1.1 discusses the use of UCLs to evaluate the degree of sampling accuracy and precision of multiple samples of a single waste stream to determine whether it is hazardous. The tables represent numerous waste streams and thus are something very different than what is discussed in SW-846. SKFA must clarify.
- f. Safety-Kleen must explain the significance of the table notation "non-detect" (ND) when the detection limit of the analysis is significantly higher than the regulatory limit. The inappropriate ND occurs on numerous tables but is a particular problem for waste dry cleaner bottoms – semi-volatile analysis. Safety-Kleen must explain why NMED should not make it a permit requirement that all analysis be performed to ensure that the method detection limit (MDL) be below the applicable regulatory limit, or that Safety-Kleen be required to record one-half the MDL instead of ND.
- g. Safety-Kleen must explain whether the "site" column necessarily indicates the safety-Kleen service centers that shipped wastes to a recycling center and the number of shipments in a particular period.
- h. The tables reference the following 11 different wastes;
 - i. Waste aqueous cleaners
 - ii. Waste dry cleaner filter powder
 - iii. Waste dry cleaner bottoms
 - iv. Waste immersion cleaner
 - v. Paint waste (other)
 - vi. Waste paint gun cleaner
 - vii. Waste parts washer solvent (105)
 - viii. Waste parts washer solvent (150)
 - ix. Waste premium gold parts washer solvent (150)
 - x. Waste parts washer sludge
 - xi. waste parts washer tank bottoms.

Safety-Kleen must explain why all these wastes are not referenced in section A.1 of the WAP.

S-K Response No. 3.

- a.
 - i. This attachment represents the sampling done in one year to represent waste managed by Safety-Kleen throughout the year. This process is performed to characterize waste managed by Safety-Kleen. When significant process changes occur, analysis will be performed to recharacterize the waste.
 - ii. Safety-Kleen characterizes its wastes at least annually. The attachment represents one year's data. This process is completed each year to on waste streams managed by Safety-Kleen.
- b. The purpose of the attachment is to summarize the data collected to characterize Safety-Kleen's wastes and indicate the waste codes that characterization indicates are appropriate for the waste stream. During the process of characterizing the waste streams, hazardous constituents are also revealed. Hazardous constituents that are expected to occur in the waste streams, based on the same laboratory analyses as the characterization, are then reflected in the Land Disposal Restriction Notifications (LDRs).
- c. It was an error to indicate that waste characterization represents product specification. Please find attached, MSDSs for the relevant Safety-Kleen products. These MSDSs contain information beyond that required by OSHA.
- d. The attachment is not meant to imply that wastes from various sources with varying chemical and physical properties may be aggregated or consolidated without requiring a new manifest. The attachment identifies waste generated with essentially similar raw materials in essentially similar processes. The attachment indicates that there is some variability in the waste generated based on the operator of the process. For example (page 88 of the attached annual characterization package, samples 2015441 and 2015462), an operator in Albuquerque, NM might have used their parts washer more than a operator in Omaha, NE. By using the parts washer more, more oil and grease was added, raising the flash point. In the same example, the operator in Omaha may have cleaned a carburetor in the parts washer, introducing gasoline and thus, benzene. Regardless of day-to-day variations in the use of the parts washers, operators use parts washers to clean automotive parts, essentially the same process with the same raw materials.
- e. Please see "d." above.
- f. Please see "d." above.
- g. The "site" column indicates the Safety-Kleen site whose customer's waste the sample represents. The sampling is not meant to represent each shipment of hazardous waste. For example, spent solvent is removed from the facility storage tank on an as needed basis, perhaps once per month. The tank bottoms samples listed in the annual waste recharacterization table represent a sampling of tank
- h. The entries in the annual waste recharacterization represent wastes handled by Safety-Kleen throughout the country. Not a of these wastes are managed to a significant degree at the Safety-Kleen Farmington facility. For this reason, not all wastes are included in the permit application, and only some of these wastes would be stored at the Safety-Kleen Farmington facility.

NMED/HWB (SKFA Specific) Item No. 9.

Safety-Kleen shall explain why the wastes resulting from parts washer service are not described as carrying a "F" code as the dry cleaner and paint wastes do and why Safety-Kleen should not analyze for all constituents of concern in the F001 – F005 Listed wastes referenced in 40 CFR 268.48.

S-K Response No. 9.

Mr. Steve Pullen

March 9, 2002

Page 4

The description of wastes carrying a "F" code is dependant on the presence in the spent solvent before use of 10 percent or more of any of the constituents listed as constituents of F001 through F005 wastes. The parts washer solvent is less than 10 percent of each and less than ten percent of all those constituents. The case is different with both dry cleaner solvent and with paint waste.

The solvents used in these process are more than ten percent of one or several of the constituents listed as part of F001 through F005. Hazardous waste codes F001 through F005 are not appropriate for parts washer solvent. Please see the attached MSDSs for lacquer thinner and parts washer solvents (Safety-Kleen products).

NMED/HWB (SKFA Specific) Item No. 10.

Why should Safety-Kleen Farmington not manage all wastes at the facility according to 40 CFR Parts 264, 268, and 270 as required by 40 CFR 262.34(b)?

S-K Response No. 10.

The phrase, "transfer basis", may have been misunderstood. All wastes managed b y the facility are managed as required by 40 CFR 262.34(b). Some customers generate wastes that Safety-Kleen is not permitted to store. For these wastes, the customer may profile the waste at a TSDF permitted to manage them. Once the waste profile has been approved at the TSDF, Safety-Kleen Farmington may transport that waste to the designated facility, complying with all applicable requirements of 40 CFR 263.

NMED/HWB (SKFA Specific) Item No. 11.

Section A.1.2 – Paragraph 2, sentence 1 refers to the distillation of wastes from dry cleaner service.

Safety-Kleen must explain where such distillation occurs and whether this meets the definition of treatment provided at 40 CFR 260.10, thus requiring a permit.

S-K Response No. 11.

Dry cleaners use solvents rather than water to clean clothes. To be cost effective and protective of the environment, by not wasting resources, dry cleaning equipment typically includes distillation as a part of the cleaning equipment. This activity takes place only at dry cleaners. This activity does not meet the definition of treatment at 40 CFR 260.10 as the material involved is not a solid waste. Please see 40 CFR 261.4(a)(8)

NMED/HWB (SKFA Specific) Item No. 12.

Is Safety-Kleen referencing 40 CFR 261.2(c) in relation to the photofixer solution from which silver may be recovered?

S-K Response No. 12.

No, Safety-Kleen is not referencing 40 CFR 261.2(c) in relation to the photofixer solution from which silver may be recovered. The Safety-Kleen facility transports photo waste some of which is solid waste and not hazardous waste. The photofixer solution is managed as a hazardous waste with waste code D011.

NMED/HWB (SKFA Specific) Item No. 13.

Mr. Steve Pullen

March 9, 2002

Page 5

Please provide a list of all materials (non-products) stored at the facility that might be considered to be hazardous waste subject to the permit and that Safety-Kleen feels are not subject to 40 CFR 264, 268, and 270 permitting conditions. Also, photofixer must be accompanied by a LDR notification.

S-K Response No. 13.

Safety-Kleen may transport some hazardous wastes (as allowed in 40 CFR 263) without otherwise managing these wastes. Safety-Kleen believes that an inspector would agree that waste transported to meet the requirements of 40 CFR 263 are not subject to 40 CFR 264, 268, and 270 permitting conditions at the transport facility. Safety-Kleen agrees that photofixer is a hazardous waste and subject to LDR requirements. These requirements will be met.

NMED/HWB (SKFA Specific) Item No. 14.

If Safety-Kleen has additional procedures to verify waste characteristics they must be elaborated on in the WAP.

S-K Response No. 14.

There are no additional procedures in place to verify waste characteristics. However, any information that becomes known to Safety-Kleen that effects the waste characterization information will be considered, regardless of how the information comes to Safety-Kleen.

NMED/HWB (SKFA Specific) Item No. 15.

Section A.2 – Paragraph 3, first sentence, references HWMR 206.B.3 inappropriately. NMED believes the appropriate and applicable reference is 20.4.1.500 NMAC (incorporating 40 CFR 264.13(a)(3)(I)).

S-K Response No. 15.

Safety-Kleen agrees that the regulatory cite is in error. The reference has been corrected.

NMED/HWB (SKFA Specific) Item No. 16.

Section A.2 – The SKAL permit application contains several commitments that should be included in the SKFA application.

S-K Response No. 16.

Safety-Kleen agrees. Those same commitments have been included in the SKFA permit application, specifically in the WAP, enclosed.

NMED/HWB (SKFA Specific) Item No. 17.

Safety-Kleen shall include in the record all specific acceptable knowledge (AK) documentation assembled and used in the AK process, whether or not it supports the decision to use AK.

S-K Response No. 17.

Mr. Steve Pullen

March 9, 2002

Page 6

Safety does use knowledge of the raw materials and processes that create hazardous wastes as a starting point in understanding the nature of the hazardous waste. However, analytical testing is used to determine waste codes and hazardous constituents in the waste.

NMED/HWB (SKFA Specific) Item No. 18.

Safety-Kleen must commit to include a record of the visual examination of wastes prior to recovery made by Safety-Kleen sales representatives.

S-K Response No. 18.

Safety-Kleen does make a record of this visual inspection of wastes and commits to continue to do so.

NMED/HWB (SKFA Specific) Item No. 19.

Safety-Kleen must elaborate on the sampling technique(s) used to determine whether the contents of a waste drum deviate from the description in the section. Safety-Kleen shall also describe the sampling techniques used to characterize waste at the service center as referenced in the last paragraph of Section A.2.1.c.

S-K Response No. 19.

This section has been modified. These modifications along with previously submitted characterization procedures describe in more detail the sampling techniques used to determine the acceptability of the material.

NMED/HWB (SKFA Specific) Item No. 20.

Does Safety-Kleen manage abrasive blasting media?

S-K Response No. 20.

Safety-Kleen does not manage abrasive blasting media as one of its core waste streams. However, if a customer properly profiles abrasive blasting media waste at a disposal facility, Safety-Kleen may act as a transporter only, transporting the properly manifested waste to a designated facility.

NMED/HWB (SKFA Specific) Item No. 21.

Section A.3 – This section shall be amended with a description of the quality assurance procedures to be used when performing laboratory analyses. The section must also be amended with a commitment to ensure those procedures are adhered to and documented in the both of SKFA and SKAL operating record.

S-K Response No. 21.

Neither Safety-Kleen Farmington, nor Safety-Kleen Albuquerque operate a laboratory. All analyses are performed by contract laboratories following EPA protocol.

NMED/HWB (SKFA Specific) Item No. 22.

Section A.3, Table A-1 inappropriately lists TCLP as a parameter. The SKAL permit application Section A.3 has a preferable discussion of the waste parameters.

S-K Response No. 22.

As it is Safety-Kleen's intention to operate all facilities to the same standard, the SKAL discussion has been included in the SKFA permit application. See the SKFA WAP, attached.

NMED/HWB (SKFA Specific) Item No. 23.

Safety_Kleen must include parameter and rational to determine waste LDR status.

S-K Response No. 23.

Tables A-1 and A-2 have been updated to meet this requirement.

NMED/HWB (SKFA Specific) Item No. 24.

Safety_Kleen must identify TCLP as a sample preparation method, not an analytical method.

S-K Response No. 24.

Table A-2 has been updated to meet this requirement.

NMED/HWB (SKFA Specific) Item No. 25.

Please reference the current section of SW-846 for Sample Collection. Also, provide detailed information about sampling procedures and techniques.

S-K Response No. 25.

Table A.3 has been modified to meet this requirement. Also, Safety-Kleen training course, ET-143 "Sampling Hazardous Materials and Wastes" is attached.

NMED/HWB (SKFA Specific) Item No. 26.

Safety_Kleen must explain how effective the Coliwasa is at sampling tank bottoms.

S-K Response No. 26.

The Coliwasa may not be the most effective means of sampling tank bottoms. Please see Safety-Kleen training course ET-143, "Sampling Hazardous Materials and Wastes", attached. Employees are required to adhere to training provided.

NMED/HWB (SKFA Specific) Item No. 27.

If it is in fact standard Safety-Kleen procedure to sample every load at the recycle center, the WAP shall so.

S-K Response No. 27.

Mr. Steve Pullen

March 9, 2002

Page 8

While it is standard procedure to sample every load at the recycle center, it may be inappropriate to describe that procedure in the branch (service center) WAPs as the WAPs at the recycle centers (i.e. SK-Denton, TX, SK-Reedley, CA, etc.) are controlled at those site and by those states' regulatory agencies.

NMED/HWB (SKFA Specific) Item No. 28.

Section A.4 must recognize and reference 20.4.1.900 NMAC (incorporating 40 CFR 270.42).

S-K Response No. 28.

This change has been made to Section A.4.

NMED/HWB (SKFA Specific) Item No. 29.

Safety-Kleen must commit that all wastes stored at the facility are characterized for applicable LDR notification requirements.

S-K Response No. 29.

This change has been made to Section A.5.

NMED/HWB (SKFA Specific) Item No. 30.

Safety-Kleen must commit to maintaining the LDR notice in the facility record. Also, Safety-Kleen should explain what is meant by "receiving facility" in the last paragraph of Section A.5

S-K Response No. 30.

This change has been made to Section A.5. "Receiving facility" means, "designated facility" as defined in 40 CFR 260.10.

NMED/HWB (SKFA Specific) Item No. 31.

Safety-Kleen must elaborate on the meaning of the abbreviations, "MS" and "IC", in the WAP

S-K Response No. 31.

"MS" means mineral spirits and "IC" means immersion cleaner. These abbreviations have been removed from the WAP.

NMED/HWB (SKFA Specific) Item No. 32.

Safety-Kleen must relocate non-waste characterizations items for the facility record elsewhere in the permit application.

S-K Response No. 32.

Safety-Kleen believes the information is appropriately listed here as the record includes information related to the proper storage of the waste. Safety-Keen will move the information to whichever section(s) NMED desires. Safety-Kleen will maintain the required records regardless of the section of the permit application they appear in.

NMED/HWB (SKFA Specific) Item No. 33.

Section A.6 inappropriately references "Pt. V. sec. 264, Appendix I". Also, Safety-Kleen must commit to characterize the waste generating process as outlined at Appendix II (sic).

S-K Response No. 33.

This inappropriate reference has been corrected and now appropriately commits to this requirement.

NMED/HWB (SKFA Specific) Item No. 34.

Section A.6, Item 10 stated that LDR notifications will be maintained at the "branch manager's office". NMED requires that LDR records be maintained at the facility for inspection purposes.

S-K Response No. 34.

Section A.6, Item 10 has been restated to clarify this commitment.

NMED/HWB (SKFA Specific) Item No. 35.

Safety-Kleen must characterize wastes for Subpart BB applicability.

S-K Response No. 35.

The WAP has been modified to meet this requirement.

If you have any questions, comments, or concerns, please contact me (602-821-2422) or Mike Crawford (505-884-2277).

Sincerely,

David Ashley
EHS Manager
Safety-Kleen Corporation

WASTE ANALYSIS PLAN

ABSTRACT

| Waste Description | EPA Waste Code No. | Facility Capacity ¹ (gallons) | Annual Amount ² |
|--|-------------------------------|---|----------------------------|
| Spent Solvents | D001 ³ | 12,000 | 50 |
| Bottom Sediment From the Tank and Ancillary Equipment | D001 ³ | N/A | 2 |
| Spent Immersion Cleaner | D001 ³ | 4,464 | 3 |
| Dry Cleaning Waste | D001, F002 ³ | 6 | |
| Paint Waste | F003, F005, D001 ³ | 4,464 | |
| Photo Chemical Wastes | D011 | 4,464 | |

NOTES: 1 The facility capacity is in gallons.

2 The annual amount is in thousands of gallons.

3 and may also include D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033 D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043

4 The total amount of drummed waste stored in the warehouse will not exceed 3,820 gallons.

The Facility shall store only wastes it is authorized to store. That is, Safety-Kleen will only store wastes included in Part A of the application for hazardous waste permit and not otherwise prohibited by the permit. Safety-Kleen will not store any hazardous waste for more than one year.

These waste streams are characterized annually as described in the "Statistical Analysis of Annual Waste Characterization Data", attached and incorporated herein by reference. (The most recent data are also included.) The testing and sampling methodology is as described in A.3, below. The data generated in this process is used to assign waste codes, if any, for each waste stream. The data generated in the annual recharacterization (AR) is also used to assist recycle centers in recycling or treating the waste streams. Recycle centers also rely on their own waste analysis plans to generate data to recycle materials and or dispose of waste. If while providing service to a customer if there is suspicion that the waste does not meet the acceptance criteria, the waste will not be picked up and the customer must provide information explaining what is in the waste and how the waste was adulterated. Please see the text below in this waste analysis plan.

Providing service to Safety-Kleen customers is dependent on a review of the customer business. If the business is a typical generator of that waste stream (for example, a garage generating parts washer waste), then limited review is performed. If the business is not a typical generator of that waste stream or if the business has other processes on site, a more detailed review of the business is performed and a certification from the customer is required stating the waste will be as described without adulterants. For example, laboratory analysis of that customer's waste may be required.

In this AR process, regulated hazardous constituents and reasonably expected underlying hazardous constituents (UHC)s are also discovered. UHC which is discovered in the annual recharacterisation will be assumed to expected throughout the waste stream. The applicable constituent concentration or technology based treatment standards for the wastes and / or individual hazardous constituents will be identified, if required by regulation, on the LDR

generated from this data. The LDRs generated in this process also identify whether the waste must be treated before being land disposed when required by regulation.

AR data is used to update subpart BB and Subpart CC plans (see these plans elsewhere in this permit application). It is anticipated that minor changes in the waste streams are unlikely to significantly change in air emissions.

Recycle centers test every shipment of waste for PCBs. If a shipment is discovered to contain PCBs, the source of the PCBs is traced and appropriate 40 CFR 761 requirements are implemented. Any equipment contaminated by PCBs is removed from service decontaminated cleaned before being put into service.

The Safety-Kleen transportation department is responsible for selecting packaging for Safety-Kleen waste streams, in addition to their responsibility for company compliance with Federal, State, and local transportation regulations and rules. The transportation department has selected packaging based on past waste recharacterizations and continue to review AR and other data to maintain compliance with material packaging requirements.

A.1 DESCRIPTION OF WASTES

Several types of waste result from the servicing of Safety-Kleen customers and the maintenance of the service center. It should be noted that the solvents managed at this facility are incompatible with strong oxidizers and reactive metals, none of which are present in the containers, container storage area, or the concrete sealant. The solvents are also compatible with one another. Analytical data for the wastes and specifications for the products are in Attachment A-1 and qualitative descriptions follow.

A.1.1 Wastes Resulting From the Parts of Washer Service

Used solvents from parts washers is accumulated in a 12,000 gallon aboveground, storage tank via the return and fill station. Containers of used material are poured into a dumpster at the return and fill station which in turn empties into the tank. This waste handling method results in several types of solvent waste:

- a. Used solvent - The used solvent is removed from the tank by a tanker truck on a scheduled basis. About 5,000 gallons are removed every month. This waste is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- b. Bottom sediment in the tank - Approximately once every two years, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- c. Dumpster Sediment - Sediment may also accumulate in the drum washers in the return/fill station. The sediment is manually removed and placed in containers. The dumpster sediment is representative of the waste codes described in items a and b above.
- d. Used Aqueous Parts Cleaning Solvent - may be bulked at the service center into containers that meet DOT specifications or may be co-mingled with the other solvent into the used solvent tank. It may be toxic using the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- e. Immersion Cleaner - is a different type of solvent that is not placed in the aboveground storage tank. Containers of immersion cleaner typically remain in the drum in which it was originally used until it is received at the recycle center. Drums are placed in the drum storage area of the warehouse and are stacked no more than two-high in the drum storage area of the warehouse.

The immersion cleaner is a non-halogenated hydrocarbon mixture and may exhibit the toxic characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.

A.1.2 Wastes Resulting From the Dry Cleaner Service

Dry cleaning wastes consist of used filter cartridges, powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in containers meeting DOT specifications. The containers are then palletized, stacked two-high and placed in the container storage area of the warehouse. Approximately 95% of the dry cleaning solvent used is perchloroethylene (F002 and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and the remaining 5% is trichloro-trifluoroethane (F002) and toxic using the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043).

A.1.3 Wastes Resulting From the Paint Service

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and may be toxic as per the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043). The wastes are collected in containers which meet DOT requirements at the customer's place of business and containers are then palletized and stored in an enclosed concrete masonry building (the H-3 Flammable Storage Building).

A.1.4 Photographic/Imaging Wastes

Some photographic imaging wastes managed by the facility are not solid wastes per 40 CFR 261.2(c) because their hazardous constituent is reclaimed. Others are managed under the provisions of Subpart F of 40 CFR 266 – Recyclable Materials Utilized for Precious Metals Recovery. Imaging waste consists typically of three waste streams. Photo fixer solution is an aqueous solution used to etch photo film during processing. This material is characteristic for silver (D011). Safety-Kleen is able to recover the silver from the solution. Used Photo developer is an aqueous solution that exhibits no hazardous waste characteristics but may not be allowed to discharge into public wastewater treatment systems in some communities. Silver collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste as per 40 CFR 260.30(c) and are managed as a non-regulated material.

A.2 QUALITY CONTROL PROCEDURES

The used solvents are the primary feed stocks for the generation of Safety-Kleen solvent products. As a result, quality control of the used solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The service center collects used solvents from approximately 1,100 customers, most of who are small quantity generators, and an estimated 14,000 drums containing recoverable solvents are returned to the service center each year for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

Furthermore, as discussed earlier in the Facility Description, all the materials collected at the service center are managed at all times in a closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers as described in Section A.2.1. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

However, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR (a)(3)(i), Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated. It is Safety-Kleen's practice that suspected non-conforming material must not be

accepted until a full analysis has been conducted. If a container with questionable contents is returned to the service center, a sample will be taken and analysis will be performed at the recycling center, Safety-Kleen Tech Center (Elk Grove Village, Illinois) or other qualified lab according to the procedures outlined in Section A.3 of this attachment. The Branch Manager will be notified of any contamination that may have occurred.

Safety-Kleen trains personnel to verify the physical characteristics of the wastes at several points in the management of the solvent. These procedures are described briefly below.

Safety-Kleen controls the use and management of its solvents by:

1. Limiting the solvents stored to those compatible with one another and their containers;
2. Limiting the uses of each type of solvent for (example, dry cleaning waste is only collected from dry cleaner shops);
3. Determining the customer's type of business (i.e., the SIC code is recorded) and the purpose for which the customer will use the machine;
4. Training customers to use the machines properly;
5. Training employees to inspect the physical characteristics of used solvent and determine whether it is acceptable;
6. When waste is collected from a customer, indicate on the service document whether the used solvent meets Safety-Kleen's acceptance criteria;
7. Marking each container with the customer's name, address, and EPA I.D. number (if available). This information remains on containerized waste until it is accepted at the reclamation facility;
8. Keeping a record of each incoming and outgoing shipment in the operating log; and

Safety-Kleen's customers sign a service document containing the following information:

- a. the name, address and EPA I.D. number of the facility to which the waste is being shipped;
- b. the customer's name, address and EPA I.D. number (if available); and
- c. the description and amount of Safety-Kleen solvent waste generated.

In addition, each incoming and outgoing shipment is recorded in the facility's operating log.

If a waste is rejected at the time of service, the customer will be given a choice as to whether he will dispose of the waste himself or require Safety-Kleen's assistance. If he requests Safety-Kleen's assistance, a sample will be drawn using a Coliwsa tube or similar sampling device to ensure representative samples. The sample will be analyzed for flash point and volatile organic compounds. If this analysis does not adequately define the constituents, additional analyses will be performed as necessary (e.g., semi-volatile organic compounds, PCBs, etc.).

The laboratory sends waste analyses results to the service center. If through the additional analysis the waste is determined to be acceptable at the branch, it will be relabeled, manifested and then managed with the other wastes. If it is determined through the additional analysis to not be acceptable, the waste will either be: (a) managed at the Service Center on a 10 day transfer basis and manifested to a properly permitted reclamation or disposal facility, or (b) manifested and shipped directly to a properly permitted reclamation or disposal facility. The analytical results from the additional characterization analysis will be used to appropriately manage the waste. The Branch Manager has the right to refuse any further service to a business which has returned waste that does not meet acceptable criteria.

A.2.1 Qualitative Waste Analysis

a. General Inspection Procedures:

Safety-Kleen visually inspects each drum of waste when it is collected at the customer's location. Safety-Kleen examines the waste for volume, appearance, consistency and odor and is intimately familiar with the characteristics of the waste it receives. Based on the known waste characteristics, Safety-Kleen has established the specific acceptance criteria set forth below, to be used by Safety-Kleen personnel in their visual inspections. These inspection procedures allow Safety-Kleen to ensure that the waste being picked up meets appropriate acceptance criteria.

If a particular drum of waste does not meet the acceptance criteria, the Safety-Kleen service representative will either (1) sample the waste for testing at a Safety-Kleen laboratory to determine whether the waste has been contaminated; or (2) reject the waste. In the event the waste is not sampled, Safety-Kleen will notify the generator's State Agency that is authorized to implement the RCRA hazardous waste management program (or EPA if the RCRA program has not been delegated to the State).

If the waste is sampled for further analysis, the service representative will collect a sample, then seal the drum and label it as hazardous waste. The drum is left with the customer pending the results of the laboratory tests. The laboratory testing initially involves analyzing the suspect waste for flash-point and the presence of volatile organic compounds. Pending those results, additional constituents may also be analyzed. The costs of any sampling and testing performed as a result of the waste failing to meet the acceptance criteria, will be borne by the customer.

If the laboratory analysis reveals that the sampled waste is not contaminated, Safety-Kleen will accept the waste from the customer. If the laboratory confirms that the waste is contaminated, the generator will be responsible for securing an alternate means of disposal or they may contract with Safety-Kleen to handle the waste on a ten-day transfer basis.

b. Waste Specific Criteria:

The following is a description of the specific acceptance criteria for each waste stream.

1. Used solvent:

The acceptance criteria for determining by visual inspection whether used solvent has been contaminated are volume, odor and color, the most significant of which is volume. If the volume of waste in a given drum exceeds the specified level, the Safety-Kleen service representative will conduct an inquiry of the customer's operation and handling procedures. Contingent on the customer's responses, the solvent may be accepted, a sample of the waste may be collected for laboratory testing as described above, or the waste may be rejected.

In addition to the volume criterion, the odor of the used solvent may typically indicate whether the waste has been contaminated. Used solvent has a distinctive odor. The service representatives are expressly instructed not to deliberately sniff the waste. However, if the solvent has been contaminated the service representative may notice a difference in the odor when he services the machine.

The used solvent is also visually inspected for its color. Unused solvent typically has a clear or greenish tint. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. In the case of a print shop, the solvent may be clear, green, brown, black, or many colors. Therefore, if the used solvent does not appear to be the expected color, the service representative will sample the waste for possible contamination as described above, or will reject the waste.

2. Immersion Cleaner:

The criteria for the inspection of used immersion cleaner are volume and color. If the volume of waste exceeds the specified level a sample will be tested for contamination following the procedures described above or the waste will be rejected.

Unused immersion cleaner is amber in color. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. If the used immersion cleaner does not appear to be the expected color, the service representative will either sample the waste for possible contamination as described above, or reject the drum of waste.

3. Dry Cleaner Wastes:

Dry cleaner wastes normally consist of used filter cartridges, powder residue, and still bottoms.

a. Used Filter Cartridges:

Used filter cartridges are placed in containers meeting DOT specifications. It is obvious to the service representative whether the items in the drums are filter cartridges. The drums may also contain approximately one inch of liquid which should either be clear or have a light brownish tint. If the amount of the liquid is greater than approximately one inch or if the liquid is a color other than light brown, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

b. Powder Residue:

The criteria for the acceptance of powder residue are consistency and color, the former being the more significant criterion of the two. A drum of powder residue should not contain any liquid. As the name implies, it will be dry or "powdery". If there is any liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

The powder residue is also inspected for color and should appear to be grayish-black. If the residue is not grayish-black in color, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

c. **Still Bottoms:**

The criteria for the acceptance of dry cleaning still bottoms are consistency and color. The waste should have a highly viscous, tar-like consistency. If the consistency of the waste is too thin or if there is more than one inch of free liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or will be rejected.

In addition to consistency, the still bottom waste is inspected for color. The waste should appear dark brown or black in color. If the waste is a different color, a service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

4. **Paint Wastes:**

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

a. **Lacquer Thinner Waste:**

The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in pails which meet DOT requirements. The paint gun cleaning machine operates as a closed system where by there should never be a combined volume of more than the expected amount of solvent in the two collection pails. The solvent is pumped from a tube in a left hand pail (facing the machine) through the machine into the right hand pail. The left hand pail starts with clean solvent which will be pumped out as the machine is used to clean the spray guns. If a service representative discovers more than the expected amount of solvent in the two pails, or there is an overfill from the right hand pail, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

b. **Paint Waste:**

b.1 **Liquid**

The significant criterion for the inspection of paint waste is consistency. The waste should contain no more than 30 percent solids. The service representative will insert a Colliwasa or similar sampling device into the drum. The sampling device should glide easily down to the bottom of the drum. The service representative will handle this waste as a Class 3 flammable waste. If there is resistance to the insertion of the glass tube, it is assumed that the level of solids is in excess of 30 percent and the service representative will reject the waste.

The contents of the glass tube are also visually examined for consistency and water content. The material should be a "free flowing" liquid, but should not contain a significant amount of water. If there is more than approximately 10 inches of water in the 3 foot tube (the water and paint will separate in the tube and thus can be measured) the waste will be rejected.

b.2 **Solid:**

For waste containing more than 30 percent solids the service representative will handle the waste as a Class 4 flammable waste.

5. **Photographic/Imaging Waste**

Photographic/Imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects

the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

A.3 WASTE ANALYSES AT THE RECYCLE CENTER OR QUALIFIED LABORATORY

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure a product quality. The following section summarizes the waste analyses practiced at the recycle center for the hazardous materials returned from the Albuquerque branch. For each waste type stored at the branch, at least the following analyses must be performed annually (annual re-characterization analysis). If a particular waste stream is not managed at the service center during the previous year, no re-characterization analysis is performed. Copies of the results for the annual analyses must be maintained at the branch office for the life of the permit. A copy of the most recent re-characterization analysis is contained in Attachment A-1.

A.3.1 Solvents

- Flash point (must be greater than 90°F).

If the flashpoint is unacceptable, the Albuquerque Branch Manager will be notified immediately and the load will receive appropriate special handling. If the results are acceptable, the following tests will be performed:

- Volatile Organic Analysis, using EPA Methods 8015, 8021, 8260, or approved equivalents.
- Physical appearance, including bottom sediment and water content
- Specific gravity
- pH
- Distillation performance

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately.

In addition to the tests listed above, which will be performed on a representative sample from every load received at the recycle center from the Albuquerque service center, a full Toxicology Characteristic Leaching Procedure (TCLP) analysis for all 40 constituents, (except for pesticides and herbicides) will be performed at least once each calendar year.

A.3.2 Solvent Tank Bottom Sludge and Free Water

- Flash point (Must be greater than 90°F).
- Analysis for content of lead, cadmium, and chromium.
- pH

As described above for solvent, a full TCLP analysis (except for the pesticides and herbicides) will be performed on a representative sample at least once each calendar year.

A.3.3 Immersion Cleaner Solvent

Containers of waste immersion cleaner are typically characterized at the recycle center using the following criteria:

- Flash point
- Physical appearance
- Specific gravity
- Percent water
- Volatile Organic Analysis (using EPA methods 8015, 8021, 8260 or approved equivalents)

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately. As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of immersion cleaner at least once each calendar year.

A.3.4 Dry Cleaning Solvent/Still Bottoms

- Physical appearance
- Volatile Organic Analysis for Perchloroethylene (using EPA methods 8015, 8021, 8260 or approved equivalents)
- Specific gravity

If any of these tests yield unacceptable results or indicate contamination outside the normal range, the Branch Manager will be notified immediately.

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of dry cleaning waste at least once each calendar year.

A.3.5 Paint Waste

Paint wastes are generally characterized at the recycle center using the following criteria:

- Metals
- Flash points
- Physical appearance
- Specific gravity
- Percent water
- Volatile organic analysis (using EPA methods 8015, 8021, 8260, or approved equivalents)

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of paint waste at least once each calendar year.

A.4 WASTE ANALYSIS PLAN UPDATE

This waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revision of the plan is typically the responsibility of the Safety-Kleen corporate or regional compliance offices. Any revision to this plan will be in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.42)

A.5 LAND BAN NOTIFICATION/CERTIFICATION FORMS

In accordance with 40 CFR 268.7(a)(2), Safety-Kleen provides a one time written notice for wastes banned for land disposal with the initial shipment. No further notification is necessary unless the waste changes. Safety-Kleen will provide the written notice for wastes banned from landfills as follows:

1. Printing the Notice language on manifests - such as for core-business customers to branch shipments; or
2. Special forms for each regularly handled waste types (e.g., parts washer solvents, immersion cleaner, dry cleaning wastes, etc); or
3. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis in accordance with 40 CFR 263.12.

The notice is required paperwork for all Safety-Kleen waste types. Further, all wastes stored at the facility will have been characterized and appropriate notification made of LDR requirements, regardless of where the waste was generated and a copy of the required notice maintained in the facility record. Shipments lacking the proper Notice will not be accepted by any Safety-Kleen facility. When a shipment with the proper Notice is received, the notice is kept in the files of the receiving facility with the manifest or with the pre-print if a manifest is not used.

A.6 OPERATING LOG RECORD

Safety-Kleen maintains an operating log record on site which includes the following information as it becomes available:

1. A description and the quantity of each hazardous waste received, and the method and date of its storage as required by Pt. V. Sec. 264, Appendix I;
2. The location of hazardous waste within the facility and quantity;
3. Records and results of waste analyses performed;
4. Summary reports and details of all incidents that require implementing the contingency plan;
5. Records and results of inspections;
6. Monitoring, testing or analytical data and corrective action where required;
7. For off-site facilities, Notices to generators as specified in 264.12(b);
8. Closure and post-closure cost estimates;
9. A certification by the permittee no less often than annually, that the permittee has a program in place to reduce the volume and toxicity of hazardous waste; and
10. The land ban notices and requirements. These records are kept on file at the facility.

A.7 WASTE DETERMINATION FOR SUBPART BB AND CC COMPLIANCE

For purposes of waste determination, this facility utilizes knowledge of the wastes described in Section A.1, A.2 and A.3 above. For those hazardous wastes which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the owner/operator may use knowledge of the waste based on information included in manifests, shipping papers, or waste certification notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment A-1 (waste characterization analytical results), as required in 40 CFR 264.1063(d) and 264.1083. Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart CC standards.

Table A-1

Parameters And Rationale For Hazardous Waste Analysis

| Hazardous Waste | Parameter* | Rationale |
|---------------------------|--|---|
| 1. Spent Solvents | Flash Point | Ignitable Characteristic (D001) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 3. Used Immersion Cleaner | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,1,2,2,2-trifluoroethane | Contains this ingredient (F002) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Flash Point | Ignitable Characteristic (D001) |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

* Earlier sample analyses indicated the parameters listed are the only ones of concern.

Table A-2

Parameters And Test Methods

| Parameter | Test Method | Reference |
|--|---|--|
| Flash Point | Setaflash closed cup tester | U.S. EPA SW 846, Third Ed., Method 1020 (ASTM Method D327-78) or an equivalent method. |
| Hydrocarbons, Volatile and Semivolatile Organic Compounds LDR Constituents | Gas Chromatography (GC) and/or Mass Spectroscopy | U.S. EPA Methods 8010, 8015, 8020, 8120, 8240, and/or 8270 or equivalent methods. |
| Toxicity Characteristics | TCLP if necessary, followed by 1310 or (3010, 7760) then 6010 and 1310 then 7470. | 40 CFR 261, Appendix II; 55 FR 11798 (March 29, 1990) |

Table A-3

Methods To Sample Hazardous Wastes

| Hazardous Waste | Reference for Sampling | Description of Sampling Method | Sampler |
|----------------------------|--|--|---|
| 1. Spent Solvents | Sampling a tank "Samples & Sampling Procedures for Hazardous Waste Streams" EPA – 600/2-80-018 and Safety-Kleen training, ET-143, "Sampling Hazardous Materials and Wastes". | Test Methods for the Evaluation of Solid Waste Physical/ Chemical Methods, SW846, U.S. EPA Chapter One, et. seq. And Safety-Kleen Training ET-143, "Sampling Hazardous Materials and Wastes" | Coliwas Tube, Weighted Bottle Sampler, Pond Sampler, Trier, Large Trier, Auger, Grain Thief, or Scoop as appropriate. |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 | Same as number 1 |
| 3. Spent Immersion Cleaner | Same as number 1 | Same as number 1 | Same as number 1 |
| 4. Dry Cleaning Wastes | Same as number 1 | Same as number 1 | Same as number 1 |

Table A-4

Frequency of Analysis

| Hazardous Waste | Analysis* | Frequency |
|---------------------------|--|-------------------|
| 1. Spent Solvents | Flash Point | At least annually |
| | TCLP | At least annually |
| 2. Solvent Tank Bottoms | Flash Point | At least annually |
| | TCLP | At least annually |
| 3. Used Immersion Cleaner | TCLP | At least annually |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,2,2-trifluoroethane | At least annually |
| | TCLP | At least annually |
| | Flash Point | At least annually |
| | | |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

* Past analyses have indicated the parameters listed are the only ones of concern.

WASTE ANALYSIS PLAN

ABSTRACT

| Waste Description | EPA Waste Code No. | Facility Capacity ¹ (gallons) | Annual Amount ² |
|----------------------------------|-------------------------------|---|----------------------------|
| Used Solvents | D001 ³ | 12,000 | 143 |
| Tank/Dumpster Bottom Sediment | D001 ³ | N/A | 3 |
| Used Immersion Cleaner | See Below ³ | 6,990 | 3 |
| Dry Cleaning Waste | F002 ³ | Included with Used Immersion Cleaner | 6 |
| Used Solvent (aqueous) | See Below ³ | Included with Used Immersion Cleaner | 3 |
| Paint Waste | D001, F003, F005 ³ | 9,650 | 14 |
| Photo Chemical Wastes | D011 | Included with Used Immersion Cleaner | 3 |

¹ The facility capacity is in gallons.

² The annual amount is in thousands of gallons.

³ and may include D004, D005, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, D043.

The Facility shall store only wastes it is authorized to store. That is, Safety-Kleen will only store wastes included in Part A of the application for hazardous waste permit and not otherwise prohibited by the permit. Safety-Kleen will not store any hazardous waste for more than one year.

These waste streams are characterized annually as described in the "Statistical Analysis of Annual Waste Characterization Data", attached and incorporated herein by reference. (The most recent data are also included.)

The testing and sampling methodology is as described in A.3, below. The data generated in this process is used to assign waste codes, if any, for each waste stream. The data generated in the annual recharacterization (AR) is also used to assist recycle centers in recycling or treating the waste streams. Recycle centers also rely on their own waste analysis plans to generate data to recycle materials and or dispose of waste. If while providing service to a customer if there is suspicion that the waste does not meet the acceptance criteria, the waste will not be picked up and the customer must provide information explaining what is in the waste and how the waste was adulterated. Please see the text below in this waste analysis plan.

Providing service to Safety-Kleen customers is dependent on a review of the customer business. If the business is a typical generator of that waste stream (for example, a garage generating parts washer waste), then limited review is performed. If the business is not a typical generator of that waste stream or if the business has other processes on site, a more detailed review of the business is performed and a certification from the customer is required stating the waste will be as described without adulterants. For example, laboratory analysis of that customer's waste may be required.

In this AR process, regulated hazardous constituents and reasonably expected underlying hazardous constituents (UHC)s are also discovered. UHC which is discovered in the annual recharacterisation will be assumed to expected throughout the waste stream. The applicable constituent concentration or technology based treatment standards for the wastes and / or individual hazardous constituents will be identified, if required by regulation, on the LDR generated from this data. The LDRs generated in this process also identify whether the waste must be treated before being land disposed when required by regulation.

AR data is used to update subpart BB and Subpart CC plans (see these plans elsewhere in this permit application). It is anticipated that minor changes in the waste streams are unlikely to significantly change in air emissions.

Recycle centers test every shipment of waste for PCBs. If a shipment is discovered to contain PCBs, the source of the PCBs is traced and appropriate 40 CFR 761 requirements are implemented. Any equipment contaminated by PCBs is removed from service decontaminated cleaned before being put into service.

The Safety-Kleen transportation department is responsible for selecting packaging for Safety-Kleen waste streams, in addition to their responsibility for company compliance with Federal, State, and local transportation regulations and rules. The transportation department has selected packaging based on past waste recharacterizations and continue to review AR and other data to maintain compliance with material packaging requirements.

A.1 DESCRIPTION OF WASTES

Several types of waste result from the servicing of Safety-Kleen customers and the maintenance of the service center. It should be noted that the solvents managed at this facility are incompatible with strong oxidizers and reactive metals, none of which are present in the containers, container storage area, or the concrete sealant. The solvents are also compatible with one another. Analytical data for the wastes and specifications for the products are in Attachment A-1 and qualitative descriptions follow.

A.1.1 Wastes Resulting From the Parts of Washer Service

Used solvents from parts washers is accumulated in a 12,000 gallon underground, storage tank via the return and fill station. Containers of used material are poured into a dumpster at the return and fill station which in turn empties into the tank. This waste handling method results in several types of solvent waste:

- a. Used solvent - The used solvent is removed from the tank by a tanker truck on a scheduled basis. About 5,000 gallons are removed every month. This waste is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- b. Bottom sediment in the tank - Approximately once every two years, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- c. Dumpster Sediment - Sediment may also accumulate in the drum washers in the return/fill station. The sediment is manually removed and placed in containers. The dumpster sediment is representative of the waste codes described in items a and b above.
- d. Used Aqueous Parts Cleaning Solvent - may be bulked at the service center into containers that meet DOT specifications or may be co-mingled with the other solvent into the used solvent tank. It may be toxic using the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- e. Immersion Cleaner - is a different type of solvent that is not placed in the underground storage tank. Containers of immersion cleaner typically remain in the drum in which it was originally used until it is received at the recycle center. Drums are placed in the drum storage area of the warehouse and are stacked no more than two-high in the drum storage area of the warehouse.

The immersion cleaner is a non-halogenated hydrocarbon mixture and may exhibit the toxic characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.

A.1.2 Wastes Resulting From the Dry Cleaner Service

Dry cleaning wastes consist of used filter cartridges, powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in containers meeting DOT specifications. The containers are then palletized, stacked two-high and placed in the container storage area of the warehouse. Approximately 95% of the dry cleaning solvent used is perchloroethylene (F002 and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and the remaining 5% is trichloro-trifluoroethane (F002) and toxic using the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043).

A.1.3 Wastes Resulting From the Paint Service

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and may be toxic as per the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043). The wastes are collected in containers which meet DOT requirements at the customer's place of business and containers are then palletized and stored in an enclosed concrete masonry building (the H-3 Flammable Storage Building).

A.1.4 Photographic/Imaging Wastes

Some photographic imaging wastes managed by the facility are not solid wastes per 40 CFR 261.2(c) because their hazardous constituent is reclaimed. Others are managed under the provisions of Subpart F of 40 CFR 266 – Recyclable Materials Utilized for Precious Metals Recovery. Imaging waste consists typically of three waste streams. Photo fixer solution is an aqueous solution used to etch photo film during processing. This material is characteristic for silver (D011). Safety-Kleen is able to recover the silver from the solution. Used Photo developer is an aqueous solution that exhibits no hazardous waste characteristics but may not be allowed to discharge into public wastewater treatment systems in some communities. Silver collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste as per 40 CFR 260.30(c) and are managed as a non-regulated material.

A.2 QUALITY CONTROL PROCEDURES

The used solvents are the primary feed stocks for the generation of Safety-Kleen solvent products. As a result, quality control of the used solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The service center collects used solvents from approximately 1,100 customers, most of who are small quantity generators, and an estimated 14,000 drums containing recoverable solvents are returned to the service center each year for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

Furthermore, as discussed earlier in the Facility Description, all the materials collected at the service center are managed at all times in a closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers as described in Section A.2.1. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

However, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR (a)(3)(i)), Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated. It is Safety-Kleen's practice that suspected non-conforming material must not be

accepted until a full analysis has been conducted. If a container with questionable contents is returned to the service center, a sample will be taken and analysis will be performed at the recycling center, Safety-Kleen Tech Center (Elk Grove Village, Illinois) or other qualified lab according to the procedures outlined in Section A.3 of this attachment. The Branch Manager will be notified of any contamination that may have occurred.

Safety-Kleen trains personnel to verify the physical characteristics of the wastes at several points in the management of the solvent. These procedures are described briefly below.

Safety-Kleen controls the use and management of its solvents by:

1. Limiting the solvents stored to those compatible with one another and their containers;
2. Limiting the uses of each type of solvent for (example, dry cleaning waste is only collected from dry cleaner shops);
3. Determining the customer's type of business (i.e., the SIC code is recorded) and the purpose for which the customer will use the machine;
4. Training customers to use the machines properly;
5. Training employees to inspect the physical characteristics of used solvent and determine whether it is acceptable;
6. When waste is collected from a customer, indicate on the service document whether the used solvent meets Safety-Kleen's acceptance criteria;
7. Marking each container with the customer's name, address, and EPA I.D. number (if available). This information remains on containerized waste until it is accepted at the reclamation facility;
8. Keeping a record of each incoming and outgoing shipment in the operating log; and

Safety-Kleen's customers sign a service document containing the following information:

- a. the name, address and EPA I.D. number of the facility to which the waste is being shipped;
- b. the customer's name, address and EPA I.D. number (if available); and
- c. the description and amount of Safety-Kleen solvent waste generated.

In addition, each incoming and outgoing shipment is recorded in the facility's operating log.

If a waste is rejected at the time of service, the customer will be given a choice as to whether he will dispose of the waste himself or require Safety-Kleen's assistance. If he requests Safety-Kleen's assistance, a sample will be drawn using a Coliwsa tube or similar sampling device to ensure representative samples. The sample will be analyzed for flash point and volatile organic compounds. If this analysis does not adequately define the constituents, additional analyses will be performed as necessary (e.g., semi-volatile organic compounds, PCBs, etc.).

The laboratory sends waste analyses results to the service center. If through the additional analysis the waste is determined to be acceptable at the branch, it will be relabeled, manifested and then managed with the other wastes. If it is determined through the additional analysis to not be acceptable, the waste will either be: (a) managed at the Service Center on a 10 day transfer basis and manifested to a properly permitted reclamation or disposal facility, or (b) manifested and shipped directly to a properly permitted reclamation or disposal facility. The analytical results from the additional characterization analysis will be used to appropriately manage the waste. The Branch Manager has the right to refuse any further service to a business which has returned waste that does not meet acceptable criteria.

A.2.1 Qualitative Waste Analysis

a. General Inspection Procedures:

Safety-Kleen visually inspects each drum of waste when it is collected at the customer's location. Safety-Kleen examines the waste for volume, appearance, consistency and odor and is intimately familiar with the characteristics of the waste it receives. Based on the known waste characteristics, Safety-Kleen has established the specific acceptance criteria set forth below, to be used by Safety-Kleen personnel in their visual inspections. These inspection procedures allow Safety-Kleen to ensure that the waste being picked up meets appropriate acceptance criteria.

If a particular drum of waste does not meet the acceptance criteria, the Safety-Kleen service representative will either (1) sample the waste for testing at a Safety-Kleen laboratory to determine whether the waste has been contaminated; or (2) reject the waste. In the event the waste is not sampled, Safety-Kleen will notify the generator's State Agency that is authorized to implement the RCRA hazardous waste management program (or EPA if the RCRA program has not been delegated to the State).

If the waste is sampled for further analysis, the service representative will collect a sample, then seal the drum and label it as hazardous waste. The drum is left with the customer pending the results of the laboratory tests. The laboratory testing initially involves analyzing the suspect waste for flash-point and the presence of volatile organic compounds. Pending those results, additional constituents may also be analyzed. The costs of any sampling and testing performed as a result of the waste failing to meet the acceptance criteria, will be borne by the customer.

If the laboratory analysis reveals that the sampled waste is not contaminated, Safety-Kleen will accept the waste from the customer. If the laboratory confirms that the waste is contaminated, the generator will be responsible for securing an alternate means of disposal or they may contract with Safety-Kleen to handle the waste on a ten-day transfer basis.

b. Waste Specific Criteria:

The following is a description of the specific acceptance criteria for each waste stream.

1. Used solvent:

The acceptance criteria for determining by visual inspection whether used solvent has been contaminated are volume, odor and color, the most significant of which is volume. If the volume of waste in a given drum exceeds the specified level, the Safety-Kleen service representative will conduct an inquiry of the customer's operation and handling procedures. Contingent on the customer's responses, the solvent may be accepted, a sample of the waste may be collected for laboratory testing as described above, or the waste may be rejected.

In addition to the volume criterion, the odor of the used solvent may typically indicate whether the waste has been contaminated. Used solvent has a distinctive odor. The service representatives are expressly instructed not to deliberately sniff the waste. However, if the solvent has been contaminated the service representative may notice a difference in the odor when he services the machine.

The used solvent is also visually inspected for its color. Unused solvent typically has a clear or greenish tint. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. In the case of a print shop, the solvent may be clear, green, brown, black, or many colors. Therefore, if the used solvent does not appear to be the expected color, the service representative will sample the waste for possible contamination as described above, or will reject the waste.

2. Immersion Cleaner:

The criteria for the inspection of used immersion cleaner are volume and color. If the volume of waste exceeds the specified level a sample will be tested for contamination following the procedures described above or the waste will be rejected.

Unused immersion cleaner is amber in color. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. If the used immersion cleaner does not appear to be the expected color, the service representative will either sample the waste for possible contamination as described above, or reject the drum of waste.

3. Dry Cleaner Wastes:

Dry cleaner wastes normally consist of used filter cartridges, powder residue, and still bottoms.

a. Used Filter Cartridges:

Used filter cartridges are placed in containers meeting DOT specifications. It is obvious to the service representative whether the items in the drums are filter cartridges. The drums may also contain approximately one inch of liquid which should either be clear or have a light brownish tint. If the amount of the liquid is greater than approximately one inch or if the liquid is a color other than light brown, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

b. Powder Residue:

The criteria for the acceptance of powder residue are consistency and color, the former being the more significant criterion of the two. A drum of powder residue should not contain any liquid. As the name implies, it will be dry or "powdery". If there is any liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

The powder residue is also inspected for color and should appear to be grayish-black. If the residue is not grayish-black in color, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

c. **Still Bottoms:**

The criteria for the acceptance of dry cleaning still bottoms are consistency and color. The waste should have a highly viscous, tar-like consistency. If the consistency of the waste is too thin or if there is more than one inch of free liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or will be rejected.

In addition to consistency, the still bottom waste is inspected for color. The waste should appear dark brown or black in color. If the waste is a different color, a service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

4. **Paint Wastes:**

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

a. **Lacquer Thinner Waste:**

The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in pails which meet DOT requirements. The paint gun cleaning machine operates as a closed system where by there should never be a combined volume of more than the expected amount of solvent in the two collection pails. The solvent is pumped from a tube in a left hand pail (facing the machine) through the machine into the right hand pail. The left hand pail starts with clean solvent which will be pumped out as the machine is used to clean the spray guns. If a service representative discovers more than the expected amount of solvent in the two pails, or there is an overfill from the right hand pail, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

b. **Paint Waste:**

b.1 **Liquid**

The significant criterion for the inspection of paint waste is consistency. The waste should contain no more than 30 percent solids. The service representative will insert a Colliwasa or similar sampling device into the drum. The sampling device should glide easily down to the bottom of the drum. The service representative will handle this waste as a Class 3 flammable waste. If there is resistance to the insertion of the glass tube, it is assumed that the level of solids is in excess of 30 percent and the service representative will reject the waste.

The contents of the glass tube are also visually examined for consistency and water content. The material should be a "free flowing" liquid, but should not contain a significant amount of water. If there is more than approximately 10 inches of water in the 3 foot tube (the water and paint will separate in the tube and thus can be measured) the waste will be rejected.

b.2 **Solid:**

For waste containing more than 30 percent solids the service representative will handle the waste as a Class 4 flammable waste.

5. **Photographic/Imaging Waste**

Photographic/Imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects

the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

A.3 WASTE ANALYSES AT THE RECYCLE CENTER OR QUALIFIED LABORATORY

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure a product quality. The following section summarizes the waste analyses practiced at the recycle center for the hazardous materials returned from the Albuquerque branch. For each waste type stored at the branch, at least the following analyses must be performed annually (annual re-characterization analysis). If a particular waste stream is not managed at the service center during the previous year, no re-characterization analysis is performed. Copies of the results for the annual analyses must be maintained at the branch office for the life of the permit. A copy of the most recent re-characterization analysis is contained in Attachment A-1.

A.3.1 Solvents

- Flash point (must be greater than 90°F).

If the flashpoint is unacceptable, the Albuquerque Branch Manager will be notified immediately and the load will receive appropriate special handling. If the results are acceptable, the following tests will be performed:

- Volatile Organic Analysis, using EPA Methods 8015, 8021, 8260, or approved equivalents.
- Physical appearance, including bottom sediment and water content
- Specific gravity
- pH
- Distillation performance

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately.

In addition to the tests listed above, which will be performed on a representative sample from every load received at the recycle center from the Albuquerque service center, a full Toxicology Characteristic Leaching Procedure (TCLP) analysis for all 40 constituents, (except for pesticides and herbicides) will be performed at least once each calendar year.

A.3.2 Solvent Tank Bottom Sludge and Free Water

- Flash point (Must be greater than 90°F).
- Analysis for content of lead, cadmium, and chromium.
- pH

As described above for solvent, a full TCLP analysis (except for the pesticides and herbicides) will be performed on a representative sample at least once each calendar year.

A.3.3 Immersion Cleaner Solvent

Containers of waste immersion cleaner are typically characterized at the recycle center using the following criteria:

- Flash point
- Physical appearance
- Specific gravity
- Percent water
- Volatile Organic Analysis (using EPA methods 8015, 8021, 8260 or approved equivalents)

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately. As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of immersion cleaner at least once each calendar year.

A.3.4 Dry Cleaning Solvent/Still Bottoms

- Physical appearance
- Volatile Organic Analysis for Perchloroethylene (using EPA methods 8015, 8021, 8260 or approved equivalents)
- Specific gravity

If any of these tests yield unacceptable results or indicate contamination outside the normal range, the Branch Manager will be notified immediately.

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of dry cleaning waste at least once each calendar year.

A.3.5 Paint Waste

Paint wastes are generally characterized at the recycle center using the following criteria:

- Metals
- Flash points
- Physical appearance
- Specific gravity
- Percent water
- Volatile organic analysis (using EPA methods 8015, 8021, 8260, or approved equivalents)

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of paint waste at least once each calendar year.

A.4 WASTE ANALYSIS PLAN UPDATE

This waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revision of the plan is typically the responsibility of the Safety-Kleen corporate or regional compliance offices. Any revision to this plan will be in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.42)

A.5 LAND BAN NOTIFICATION/CERTIFICATION FORMS

In accordance with 40 CFR 268.7(a)(2), Safety-Kleen provides a one time written notice for wastes banned for land disposal with the initial shipment. No further notification is necessary unless the waste changes. Safety-Kleen will provide the written notice for wastes banned from landfills as follows:

1. Printing the Notice language on manifests - such as for core-business customers to branch shipments; or
2. Special forms for each regularly handled waste types (e.g., parts washer solvents, immersion cleaner, dry cleaning wastes, etc); or
3. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis in accordance with 40 CFR 263.12.

The notice is required paperwork for all Safety-Kleen waste types. Further, all wastes stored at the facility will have been characterized and appropriate notification made of LDR requirements, regardless of where the waste was generated and a copy of the required notice maintained in the facility record. Shipments lacking the proper Notice will not be accepted by any Safety-Kleen facility. When a shipment with the proper Notice is received, the notice is kept in the files of the receiving facility with the manifest or with the pre-print if a manifest is not used.

A.6 OPERATING LOG RECORD

Safety-Kleen maintains an operating log record on site which includes the following information as it becomes available:

1. A description and the quantity of each hazardous waste received, and the method and date of its storage as required by Pt. V. Sec. 264, Appendix I;
2. The location of hazardous waste within the facility and quantity;
3. Records and results of waste analyses performed;
4. Summary reports and details of all incidents that require implementing the contingency plan;
5. Records and results of inspections;
6. Monitoring, testing or analytical data and corrective action where required;
7. For off-site facilities, Notices to generators as specified in 264.12(b);
8. Closure and post-closure cost estimates;
9. A certification by the permittee no less often than annually, that the permittee has a program in place to reduce the volume and toxicity of hazardous waste; and
10. The land ban notices and requirements. These records are kept on file at the facility.

A.7 WASTE DETERMINATION FOR SUBPART BB AND CC COMPLIANCE

For purposes of waste determination, this facility utilizes knowledge of the wastes described in Section A.1, A.2 and A.3 above. For those hazardous wastes which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the owner/operator may use knowledge of the waste based on information included in manifests, shipping papers, or waste certification notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment A-1 (waste characterization analytical results), as required in 40 CFR 264.1063(d) and 264.1083. Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart CC standards.

CERTIFICATION STATEMENT

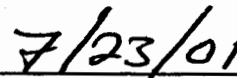

Albuquerque, New Mexico Service Center

NMD 000804294

The undersigned, being an authorized representative of Safety-Kleen Systems, Inc. the permit applicant, certifies under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Mike Crawford
Branch Manager

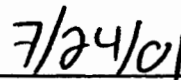

Date

ATTESTATION

The undersigned, attesting witness to the Certification Statement and this document dated July 27, 2001, of which this affidavit is a part, states that I am personally responsible for the preparation of the document, that I personally gathered or reviewed the information contained herein, and further that the information, to the best of my knowledge and belief is true, accurate, and complete.

Dan Czecholinski
Environmental Compliance Manager

Safety-Kleen is an international, service-oriented company whose customers are primarily engaged in automotive repair, industrial maintenance, and dry cleaning. The company, in operation since 1968, offers solvent collection and reclamation services to customers nationwide. The Albuquerque Service Center is a service branch which leases and services Safety-Kleen parts cleaning equipment and solvents to Safety-Kleen customers. The service branch also collects spent parts washer solvent, spent immersion cleaner, dry cleaning wastes (perchloroethylene), paint waste/lacquer thinner, photo/imaging wastes and spent industrial solvents. Once a sufficient quantity of materials is collected, the materials are transported to a recycle center, contract reclaimer or other permitted facility for treatment and/or disposal.

Description of Hazardous Wastes

EPA HAZARDOUS WASTE NUMBER: Every hazardous waste has a unique EPA Hazardous Waste Number (HW number) which is assigned to it by the EPA. The HW number is a four digit number that identifies the waste. The first digit identifies the waste by its hazard characteristics. The second digit identifies the waste by its physical characteristics. The third and fourth digits identify the waste by its chemical characteristics.

ESTIMATED ANNUAL QUANTITY: The estimated annual quantity of waste is estimated in terms of the number of drums, tanks, or other containers. The quantity is estimated in terms of the number of drums, tanks, or other containers. The quantity is estimated in terms of the number of drums, tanks, or other containers.

UNIT OF MEASURE: The unit of measure is used to describe the quantity of waste. The unit of measure is used to describe the quantity of waste. The unit of measure is used to describe the quantity of waste.

| ENGLISH UNIT OF MEASURE | CODE | METRIC UNIT OF MEASURE | CODE |

Map

Attach to this application a topographic map, or other equivalent map, of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in this map area. See instructions for precise requirements.

Facility Drawing

All existing facilities must include a scale drawing of the facility (see instructions for more detail).

Photographs

All existing facilities must include photographs (aerial or ground-level) that clearly delineate all existing structures; existing storage, treatment and disposal areas; and sites of future storage, treatment or disposal areas (see instructions for more detail).

Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

| Photo Chemical Wastes | D011 | Included with Used Immersion Cleaner | 3 |

¹ The facility capacity is in gallons.

² The annual amount is in thousands of gallons.

³ and may include D004, D005, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, D043.

WASTE ANALYSIS PLAN

A.1 DESCRIPTION OF WASTES

Several types of waste result from the servicing of Safety-Kleen customers and the maintenance of the service center. It should be noted that the solvents managed at this facility are incompatible with strong oxidizers and reactive metals, none of which are present in the containers, container storage area, or the concrete sealant. The solvents are also compatible with one another. Analytical data for the wastes and specifications for the products are in Attachment A-1 and qualitative descriptions follow.

A.1.1 Wastes Resulting From the Parts Washer Service

Used solvents from parts washers is accumulated in a 12,000 gallon underground, double-walled storage tank via the return and fill station. Containers of used material are poured into a dumpster at the return and fill station which in turn empties into the tank. This waste handling method results in several types of solvent waste:

- a. Used solvent - The used solvent is removed from the tank by a tanker truck on a scheduled basis. About 5,000 gallons are removed every month. This waste is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- b. Bottom sediment in the tank - Approximately once every two years, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- c. Dumpster Sediment - Sediment may also accumulate in the drum washers in the return/fill station. The sediment is manually removed and placed in containers. The dumpster sediment is representative of the waste codes described in items a and b above.
- d. Used Aqueous Parts Cleaning Solvent - may be bulked at the service center into containers that meet DOT specifications or may be co-mingled with the other solvent into the used solvent tank. It may be toxic using the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- e. Immersion Cleaner - is a different type of solvent that is not placed in the underground storage tank. Containers of immersion cleaner typically remain in

the drum in which it was originally used until it is received at the recycle center. Drums are placed in the drum storage area of the warehouse and are stacked no more than two-high in the drum storage area of the warehouse.

The immersion cleaner is a non-halogenated hydrocarbon mixture and may exhibit the toxic characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.

A.1.2 Wastes Resulting From the Dry Cleaner Service

Dry cleaning wastes consist of used filter cartridges, powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in containers meeting DOT specifications. The containers are then palletized, stacked two-high and placed in the container storage area of the warehouse. Approximately 95% of the dry cleaning solvent used is perchloroethylene (F002 and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and the remaining 5% is trichloro-trifluoroethane (F002) and toxic using the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043).

A.1.3 Wastes Resulting From the Paint Service

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and may be toxic as per the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043). The wastes are collected in containers which meet DOT requirements at the customer's place of business and containers are then palletized and stored in an enclosed concrete masonry building (the H-3 Flammable Storage Building).

A.1.4 Photographic/Imaging Wastes

Some photographic imaging wastes managed by the facility are not solid wastes per 40 CFR 261.2(c) because their hazardous constituent is reclaimed. Others are managed under the provisions of Subpart F of 40 CFR 266 – Recyclable Materials Utilized for Precious Metals Recovery. Imaging waste consists typically of three waste streams. Photo fixer solution is an aqueous solution used to etch photo film during processing. This material is characteristic for silver (D011). Safety-Kleen is able to recover the silver from the solution. Used Photo developer is an aqueous solution that exhibits no hazardous waste characteristics but may not be allowed to discharge into public wastewater treatment systems in some communities. Silver collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste as per 40 CFR 260.30(c) and are managed as a non-regulated material.

A.2 QUALITY CONTROL PROCEDURES

The used solvents are the primary feed stocks for the generation of Safety-Kleen solvent products. As a result, quality control of the used solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The service center collects used solvents from approximately 1,100 customers, most of who are small quantity generators, and an estimated 14,000 drums containing recoverable solvents are returned to the service center each year for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

Furthermore, as discussed earlier in the Facility Description, all the materials collected at the service center are managed at all times in a closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers as described in Section A.2.1. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

However, in accordance with HWMR 206.B.3, Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated. It is Safety-Kleen's practice that suspected non-conforming material must not be accepted until a full analysis has been conducted. If a container with questionable contents is returned to the service center, a sample will be taken and analysis will be performed at the recycling center, Safety-Kleen Tech Center (Elk Grove Village, Illinois) or other qualified lab according to the procedures outlined in Section A.3 of this attachment. The Branch Manager will be notified of any contamination that may have occurred.

Safety-Kleen trains personnel to verify the physical characteristics of the wastes at several points in the management of the solvent. These procedures are described briefly below.

Safety-Kleen controls the use and management of its solvents by:

1. Limiting the solvents stored to those compatible with one another and their containers;
2. Limiting the uses of each type of solvent for (example, dry cleaning waste is only collected from dry cleaner shops);
3. Determining the customer's type of business (i.e., the SIC code is recorded) and the purpose for which the customer will use the machine;
4. Training customers to use the machines properly;
5. Training employees to inspect the physical characteristics of used solvent and determine whether it is acceptable;

6. When waste is collected from a customer, indicate on the service document whether the used solvent meets Safety-Kleen's acceptance criteria;
7. Marking each container with the customer's name, address, and EPA I.D. number (if available). This information remains on containerized waste until it is accepted at the reclamation facility;
8. Keeping a record of each incoming and outgoing shipment in the operating log; and

Safety-Kleen's customers sign a service document containing the following information:

- a. the name, address and EPA I.D. number of the facility to which the waste is being shipped;
- b. the customer's name, address and EPA I.D. number (if available); and
- c. the description and amount of Safety-Kleen solvent waste generated.

In addition, each incoming and outgoing shipment is recorded in the facility's operating log.

If a waste is rejected at the time of service, the customer will be given a choice as to whether he will dispose of the waste himself or require Safety-Kleen's assistance. If he requests Safety-Kleen's assistance, a sample will be drawn using a Coli-wasa tube or similar sampling device to ensure representative samples. The sample will be analyzed for flash point and volatile organic compounds. If this analysis does not adequately define the constituents, additional analyses will be performed as necessary (e.g., semi-volatile organic compounds, PCBs, etc.).

The laboratory sends waste analyses results to the service center. If through the additional analysis the waste is determined to be acceptable at the branch, it will be relabeled, manifested and then managed with the other wastes. If it is determined through the additional analysis to not be acceptable, the waste will either be: (a) managed at the Service Center on a 10 day transfer basis and manifested to a properly permitted reclamation or disposal facility, or (b) manifested and shipped directly to a properly permitted reclamation or disposal facility. The analytical results from the additional characterization analysis will be used to appropriately manage the waste. The Branch Manager has the right to refuse any further service to a business which has returned waste that does not meet acceptable criteria.

A.2.1 Qualitative Waste Analysis

- a. General Inspection Procedures:
Safety-Kleen visually inspects each drum of waste when it is collected at the customer's location. Safety-Kleen examines the waste for volume, appearance, consistency and odor and is intimately familiar with the characteristics of the waste it receives. Based on the known waste characteristics, Safety-Kleen has established the specific acceptance criteria set forth below, to be used by Safety-Kleen personnel in their visual inspections. These inspection procedures allow Safety-Kleen to ensure that the waste being picked up meets appropriate acceptance criteria.

If a particular drum of waste does not meet the acceptance criteria, the Safety-Kleen service representative will either (1) sample the waste for testing at a Safety-Kleen laboratory to determine whether the waste has been contaminated; or (2) reject the waste. In the event the waste is not sampled, Safety-Kleen will notify the generator's State Agency that is authorized to implement the RCRA hazardous waste management program (or EPA if the RCRA program has not been delegated to the State).

If the waste is sampled for further analysis, the service representative will collect a sample, then seal the drum and label it as hazardous waste. The drum is left with the customer pending the results of the laboratory tests. The laboratory testing initially involves analyzing the suspect waste for flash-point and the presence of volatile organic compounds. Pending those results, additional constituents may also be analyzed. The costs of any sampling and testing performed as a result of the waste failing to meet the acceptance criteria, will be borne by the customer.

If the laboratory analysis reveals that the sampled waste is not contaminated, Safety-Kleen will accept the waste from the customer. If the laboratory confirms that the waste is contaminated, the generator will be responsible for securing an alternate means of disposal or they may contract with Safety-Kleen to handle the waste on a ten-day transfer basis.

b. **Waste Specific Criteria:**

The following is a description of the specific acceptance criteria for each waste stream.

1. **Used solvent:**

The acceptance criteria for determining by visual inspection whether used solvent has been contaminated are volume, odor and color, the most significant of which is volume. If the volume of waste in a given drum exceeds the specified level, the Safety-Kleen service representative will conduct an inquiry of the customer's operation and handling procedures. Contingent on the customer's responses, the solvent may be accepted, a sample of the waste may be collected for laboratory testing as described above, or the waste may be rejected.

In addition to the volume criterion, the odor of the used solvent may typically indicate whether the waste has been contaminated. Used solvent has a distinctive odor. The service representatives are expressly instructed not to deliberately sniff the waste. However, if the solvent has been contaminated the service representative may notice a difference in the odor when he services the machine.

The used solvent is also visually inspected for its color. Unused solvent typically has a clear or greenish tint. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. In the case of a print shop, the solvent may be clear, green, brown, black, or many colors. Therefore, if the used solvent does

not appear to be the expected color, the service representative will sample the waste for possible contamination as described above, or will reject the waste.

2. Immersion Cleaner:

The criteria for the inspection of used immersion cleaner are volume and color. If the volume of waste exceeds the specified level a sample will be tested for contamination following the procedures described above or the waste will be rejected.

Unused immersion cleaner is amber in color. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. If the used immersion cleaner does not appear to be the expected color, the service representative will either sample the waste for possible contamination as described above, or reject the drum of waste.

3. Dry Cleaner Wastes:

Dry cleaner wastes normally consist of used filter cartridges, powder residue, and still bottoms.

a. Used Filter Cartridges:

Used filter cartridges are placed in containers meeting DOT specifications. It is obvious to the service representative whether the items in the drums are filter cartridges. The drums may also contain approximately one inch of liquid which should either be clear or have a light brownish tint. If the amount of the liquid is greater than approximately one inch or if the liquid is a color other than light brown, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

b. Powder Residue:

The criteria for the acceptance of powder residue are consistency and color, the former being the more significant criterion of the two. A drum of powder residue should not contain any liquid. As the name implies, it will be dry or "powdery". If there is any liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

The powder residue is also inspected for color and should appear to be grayish-black. If the residue is not grayish-black in color, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

c. **Still Bottoms:**

The criteria for the acceptance of dry cleaning still bottoms are consistency and color. The waste should have a highly viscous, tar-like consistency. If the consistency of the waste is too thin or if there is more than one inch of free liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or will be rejected.

In addition to consistency, the still bottom waste is inspected for color. The waste should appear dark brown or black in color. If the waste is a different color, a service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

4. **Paint Wastes:**

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

a. **Lacquer Thinner Waste:**

The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in pails which meet DOT requirements. The paint gun cleaning machine operates as a closed system where by there should never be a combined volume of more than the expected amount of solvent in the two collection pails. The solvent is pumped from a tube in a left hand pail (facing the machine) through the machine into the right hand pail. The left hand pail starts with clean solvent which will be pumped out as the machine is used to clean the spray guns. If a service representative discovers more than the expected amount of solvent in the two pails, or there is an overfill from the right hand pail, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

b. **Paint Waste:**

b.1 **Liquid**

The significant criterion for the inspection of paint waste is consistency. The waste should contain no more than 30 percent solids. The service representative will insert a Colliwasa or similar sampling device into the drum. The sampling device should glide easily down to the bottom of the drum. The service representative will handle this waste as a Class 3 flammable waste. If there is resistance to the insertion of the glass tube, it is assumed that the level of solids is in excess of 30 percent and the service representative will reject the waste.

The contents of the glass tube are also visually examined for consistency and water content. The material should be a "free flowing" liquid, but should not contain a significant

amount of water. If there is more than approximately 10 inches of water in the 3 foot tube (the water and paint will separate in the tube and thus can be measured) the waste will be rejected.

b.2 Solid:

For waste containing more than 30 percent solids the service representative will handle the waste as a Class 4 flammable waste.

5. Photographic/Imaging Waste

Photographic/Imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

A.3 WASTE ANALYSES AT THE RECYCLE CENTER

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure a product quality. The following section summarizes the waste analyses practiced at the recycle center for the hazardous materials returned from the Albuquerque branch. For each waste type stored at the branch, at least the following analyses must be performed annually (annual re-characterization analysis). If a particular waste stream is not managed at the service center during the previous year, no re-characterization analysis is performed. Copies of the results for the annual analyses must be maintained at the branch office for the life of the permit. A copy of the most recent re-characterization analysis is contained in Attachment A-1.

A.3.1 Solvents

- Flash point (must be greater than 90°F).

If the flashpoint is unacceptable, the Albuquerque Branch Manager will be notified immediately and the load will receive appropriate special handling. If the results are acceptable, the following tests will be performed:

- Volatile Organic Analysis, using EPA Methods 8015, 8021, 8260, or approved equivalents.
- Physical appearance, including bottom sediment and water content
- Specific gravity

- pH
- Distillation performance

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately.

In addition to the tests listed above, which will be performed on a representative sample from every load received at the recycle center from the Albuquerque service center, a full Toxicology Characteristic Leaching Procedure (TCLP) analysis for all 40 constituents, (except for pesticides and herbicides) will be performed at least once each calendar year.

A.3.2 Solvent Tank Bottom Sludge and Free Water

- Flash point (Must be greater than 90°F).
- Analysis for content of lead, cadmium, and chromium.
- pH

As described above for solvent, a full TCLP analysis (except for the pesticides and herbicides) will be performed on a representative sample at least once each calendar year.

A.3.3 Immersion Cleaner Solvent

Containers of waste immersion cleaner are typically characterized at the recycle center using the following criteria:

- Flash point
- Physical appearance
- Specific gravity
- Percent water
- Volatile Organic Analysis (using EPA methods 8015, 8021, 8260 or approved equivalents)

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately. As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of immersion cleaner at least once each calendar year.

A.3.4 Dry Cleaning Solvent/Still Bottoms

- Physical appearance
- Volatile Organic Analysis for Perchloroethylene (using EPA methods 8015, 8021, 8260 or approved equivalents)
- Specific gravity

If any of these tests yield unacceptable results or indicate contamination outside the normal range, the Branch Manager will be notified immediately.

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of dry cleaning waste at least once each calendar year.

A.3.5 Paint Waste

Paint wastes are generally characterized at the recycle center using the following criteria:

- Metals
- Flash points
- Physical appearance
- Specific gravity
- Percent water
- Volatile organic analysis (using EPA methods 8015, 8021, 8260, or approved equivalents)

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of paint waste at least once each calendar year.

A.4 WASTE ANALYSIS PLAN UPDATE

This waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revision of the plan is typically the responsibility of the Safety-Kleen corporate or regional compliance offices.

A.5 LAND BAN NOTIFICATION/CERTIFICATION FORMS

In accordance with 40 CFR 268.7(a)(2), Safety-Kleen provides a one time written notice for wastes banned for land disposal with the initial shipment. No further notification is necessary unless the waste changes. Safety-Kleen will provide the written notice for wastes banned from landfills as follows:

1. Printing the Notice language on manifests - such as for core-business customers to branch shipments; or
2. Special forms for each regularly handled waste types (e.g., parts washer solvents, immersion cleaner, dry cleaning wastes, etc); or
3. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis in accordance with 40 CFR 263.12.

The notice is required paperwork for all Safety-Kleen waste types. Shipments lacking the proper Notice will not be accepted by any Safety-Kleen facility. When a shipment with the proper Notice is received, the notice is kept in the files of the receiving facility with the manifest or with the pre-print if a manifest is not used.

A.6 OPERATING LOG RECORD

Safety-Kleen maintains an operating log record on site which includes the following information as it becomes available:

1. A description and the quantity of each hazardous waste received, and the method and date of its storage as required by Pt. V. Sec. 264, Appendix I;
2. The location of hazardous waste within the facility and quantity;
3. Records and results of waste analyses performed;
4. Summary reports and details of all incidents that require implementing the contingency plan;
5. Records and results of inspections;
6. Monitoring, testing or analytical data and corrective action where required;
7. For off-site facilities, Notices to generators as specified in 264.12(b);
8. Closure and post-closure cost estimates;
9. A certification by the permittee no less often than annually, that the permittee has a program in place to reduce the volume and toxicity of hazardous waste; and

10. The land ban notices and requirements. These records are kept on file at the facility.

A.7 WASTE DETERMINATION FOR SUBPART BB AND CC COMPLIANCE

For purposes of waste determination, this facility utilizes knowledge of the wastes described in Section A.1, A.2 and A.3 above. For those hazardous wastes which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the owner/operator may use knowledge of the waste based on information included in manifests, shipping papers, or waste certification notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment A-1 (waste characterization analytical results), as required in 40 CFR 264.1063(d) and 264.1083. Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart CC standards.

* Under consideration for removal from recharacterization.

** Parts washer solvent tank bottoms are SK-generated wastes from the cleanout of solvent storage tanks.
Safety-Kleen does not accept this waste stream from non-SK generators.

*** This DOT is acceptable to use for any size container of paint waste. For those states that require 30-gal paint waste to be listed separately, use SK DOT 12630;
for states that require 55-gal paint waste to be listed separately, use SK DOT 12631.

2001 ANNUAL RECHARACTERIZATION CODE LIST

Physical Properties

| | |
|----|------------------|
| pH | pH |
| SG | Specific Gravity |
| FP | Flash Point |

Metals

| | |
|----|----------|
| As | Arsenic |
| Ba | Barium |
| Cd | Cadmium |
| Cr | Chromium |
| Pb | Lead |
| Hg | Mercury |
| Se | Selenium |
| Ag | Silver |

Semi- Volatiles

| | |
|------------|--------------------------|
| Cresol | 2,3 & 4 Methylphenol |
| 2,4DNT | 2,4 Dinitrotoluene |
| Cl6-benz | Hexachlorobenzene |
| C16-1,3But | Hexachloro 1,3 Butadiene |
| C16-eth | Hexachloroethane |
| Nitrobenz | Nitrobenzene |
| C15-phen | pentachlorophenol |
| pyridine | Pyridine |
| 2,4,5 TCP | 2,4,5 Trichlorophenol |
| 2,4,6,TCP | 2,4,6 Trichlorophenol |

Volatiles

| | |
|-----------|----------------------|
| benzene | Benzene |
| CCl4 | Carbon Tetrachloride |
| Clbenz | Chlorobenzene |
| CHCl3 | Chloroform |
| 1,4-DCIB | 1,4 Dichlorobenzene |
| 1,2DCA | 1,2 Dichloroethane |
| 1,1-DCE | 1,1 Dichloroethylene |
| MEK | Methyl Ethyl Ketone |
| PCE | Perchloroethylene |
| TCE | Trichloroethylene |
| Vchloride | Vinyl Chloride |

TABLE OF CONTENTS

TABLE OF CONTENTS

| | |
|--|-----------|
| PART 1 GENERAL PERMIT CONDITIONS | 1 |
| 1.1 INTRODUCTION | 1 |
| 1.2 EFFECT OF PERMIT | 1 |
| 1.3 PERMIT ACTIONS | 2 |
| 1.3.1 Term of Permit | 2 |
| 1.3.2 Permit Modification, Suspension and Revocation | 3 |
| 1.3.3 Permit Renewal | 3 |
| 1.3.4 Continuation of Expiring Permit | 3 |
| 1.3.5 Scope of Permit | 3 |
| 1.4 PERMIT CONSTRUCTION | 3 |
| 1.4.1 Citations | 3 |
| 1.4.2 Severability | 4 |
| 1.5 DEFINITIONS | 4 |
| 1.6 DUTIES AND REQUIREMENTS | 6 |
| 1.6.1 Duty to Comply | 6 |
| 1.6.2 Duty to Reapply | 7 |
| 1.6.3 Transfer of Permit | 7 |
| 1.6.4 Need to Halt or Reduce Activity Not a Defense | 7 |
| 1.6.5 Duty to Mitigate | 7 |
| 1.6.6 Proper Operation and Maintenance | 8 |
| 1.6.7 Duty to Provide Information | 8 |
| 1.6.8 Inspection and Entry | 8 |
| 1.6.9 Monitoring and Records | 9 |
| 1.6.10 Reporting Requirements | 10 |
| 1.6.11 Contingency Plan Implementation | 12 |
| 1.6.12 Corrective Action | 13 |
| 1.6.13 Other Noncompliance | 13 |
| 1.6.14 Other Information | 13 |
| 1.6.15 Waiver of Defense | 13 |
| 1.6.16 Admissibility of Data | 13 |
| 1.7 SIGNATORY REQUIREMENT | 13 |
| 1.8 REPORTS, NOTIFICATIONS, AND SUBMISSIONS TO THE NEW MEXICO ENVIRONMENT DEPARTMENT | 14 |
| 1.9 CONFIDENTIAL INFORMATION | 14 |
| 1.10 DOCUMENTS TO BE MAINTAINED AT THE FACILITY | 14 |
| PART 2 GENERAL FACILITY CONDITIONS | 16 |
| 2.1 INTRODUCTION | 16 |
| 2.2 OPERATION AND MAINTENANCE OF THE FACILITY | 16 |
| 2.2.1 Hazardous Waste From Off-site Sources | 16 |
| 2.3 REQUIRED NOTICES | 16 |
| 2.3.1 Hazardous Waste Imports | 16 |
| 2.3.2 Required Notification To Off-Site Sources | 16 |
| 2.4 LAND DISPOSAL REGULATIONS | 17 |
| 2.4.1 Prohibitions | 17 |

| | | |

Safety-Kleen Systems, Inc. Farmington, NM, Service Center
Facility Operating Permit
RCRA Permit No. NMD980698849

PART 1
GENERAL PERMIT CONDITIONS

PART 1

GENERAL PERMIT CONDITIONS

1.1 INTRODUCTION

This Part contains conditions pertaining to all hazardous waste storage facilities permitted under the New Mexico Hazardous Waste Act NMSA 1978, Sections 7-4-4-1 et. seq. (Repl. Pamp. 1993) (HWA) and the Resource Conservation and Recovery Act 42 U.S.C. Section 6901 et. seq. (RCRA).

1.2 EFFECT OF PERMIT

The Secretary of the New Mexico Environment Department (Secretary) issues this Permit to Safety-Kleen Systems Inc. (Permittee) Service Center, located in Farmington, New Mexico, the owner and operator, of a 12,000-gallon spent solvent above ground storage tank and one container storage unit (EPA I.D. Number NMD980698849). This Permit authorizes the Permittee to accept, manage, store, and transfer off-site hazardous waste at the Facility, and establishes the general and specific standards for these activities, pursuant to the New Mexico Hazardous Waste Act and the New Mexico Hazardous Waste Regulations, 20.4.1.100 NMAC et. seq.

Compliance with this permit during its term constitutes compliance, for purposes of enforcement, with 20.4.1.500 and 20.4.1.800 NMAC, which incorporate 40 CFR Parts 264 and 268, only for those management practices specifically authorized by this permit. The Permittee must also comply with 20.4.1.100, 20.4.1.200, 20.4.1.300, and 20.4.1.400 NMAC, which incorporate 40 CFR Parts 260, 261, 262, and 263, to the extent the requirements of those Sections are applicable. The Permittee must also comply with all applicable self-implementing provisions imposed by statute or rule.

Compliance with this Permit shall not constitute a defense to any order issued or any action brought under HWA Sections 74-4-10.E or 74-4-13; RCRA Sections 3008(a), 3008(h), 3013, 7002, or 7003 (42 U.S.C. 6928(a) and (h), 6934, and 6973); Sections 104, 106(a), and 107 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA - 42 U.S.C. 9601 et. seq.), or any other law providing for protection of public health or the environment. This Permit does not convey any property rights of any sort or any exclusive privilege, nor authorize any injury to persons or property, any invasion of other private rights, or any infringement of State or local laws or regulations, in

accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.4 and 40 CFR 270.30(g)).

The complete Permit consists of Permit Parts 1 through 7 and Permit Attachments 1 through 12 as follows:

- Part 1 - General Permit Conditions
- Part 2 - General Facility Conditions
- Part 3 - Storage of Hazardous Waste in Containers
- Part 4 - Storage of Hazardous Waste in Tanks
- Part 5 - Corrective Action
- Part 6 - Subpart BB Standards for Equipment Leaks
- Part 7 - Subpart CC Standards for Organic Air Emissions
- Attachment 1 - Description and Design and Operation of the Facility
- Attachment 2 - Authorized Wastes and Part A Application
- Attachment 3 - Waste Analysis Plan
- Attachment 4 - Security Plan
- Attachment 5 - Inspection Schedule
- Attachment 6 - Preparedness and Prevention
- Attachment 7 - Contingency Plan
- Attachment 8 - Manifesting, Reporting, and Record Keeping
- Attachment 9 - Personnel Training
- Attachment 10 - Closure Plan
- Attachment 11 - Corrective Action Units
- Attachment 12 - Financial Assurance and Closure Cost Estimate

1.3 PERMIT ACTIONS

1.3.1 Term of Permit

This Permit shall be effective for a fixed period of ten (10) years from the effective date of issuance as specified in the

Permit certificate and shall not be extended by modification beyond the maximum duration in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.50(a) and (b)).

1.3.2 Permit Modification, Suspension and Revocation

This Permit may be modified, suspended, terminated, re-issued, or revoked for cause as specified in HWA Section 74-4-4.2 and 20.4.1.900 NMAC (incorporating 40 CFR 270.41 through 270.43). The filing of a request by the Permittee for a permit modification, suspension, termination, re-issuance, or revocation, or the notification of planned changes or anticipated noncompliance, shall not stay any permit condition, in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.30(f)).

1.3.3 Permit Renewal

The Permittee shall renew this Permit by submitting an application for a new permit at least one hundred eighty (180) calendar days before the expiration date of this Permit pursuant to 20.4.1.900 NMAC (incorporating 40 CFR 270.10(h) and 270.30(b)).

1.3.4 Continuation of Expiring Permit

If the Permittee has submitted a timely and complete application for renewal of this Permit as specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.10 and 40 CFR 270.13 through 270.29), this Permit shall remain in effect until the effective date of the new Permit if, through no fault of the Permittee, the Secretary has not issued a new Permit on or before the expiration date of this Permit as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.51)).

1.3.5 Scope of Permit

This Permit authorizes the storage of hazardous wastes in the one designated container storage room of the Facility and the 12,000-gallon spent solvent storage tank as defined herein, and at no other locations at the Facility.

1.4 PERMIT CONSTRUCTION

1.4.1 Citations

Whenever provisions of this Permit or of the New Mexico Hazardous Waste Management Regulations (HWMR), 20.4.1 NMAC (incorporating 40 CFR Parts 260 through 270) are cited, the citation shall include all subordinate provisions of the cited provision paragraphs of this Permit or of the HWMR. When subordinate

sections are cited, such citations shall include all subsections of the cited paragraphs.

If there is a conflict between the language of the Permit Parts and the language of the Permit Attachments, the language of the Permit Parts shall override the language in the Permit Attachments.

1.4.2 Severability

The provisions of the Permit are severable, and if any provision of this Permit, or any application of any provision of this Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this Permit shall not be affected thereby.

1.5 DEFINITIONS

For purposes of this Permit, terms used herein shall have the same meanings as those in HWA, RCRA, and their implementing regulations, unless this Permit specifically provides otherwise. Where a term is not defined in HWA, RCRA, pursuant regulations, EPA guidelines or publications, or this Permit, the meaning associated with such a term shall be defined by a standard dictionary reference or the generally accepted scientific or industrial meaning of the term.

"Action levels" are health-based concentrations of hazardous constituents determined by the Secretary to be indicators for the protection of human health and/or the environment.

"Area of Concern (AOC)" means any discernable area that may have a release of hazardous waste or hazardous constituents, which is a solid waste management unit (SWMU) and which the Secretary determines may pose a threat to human health or the environment.

"Container Storage Unit" (CSU) means the Safety-Kleen Systems Inc. Farmington Service Center Container Storage Facility comprised of one hazardous waste storage room.

"Corrective Action Management Unit" (CAMU) includes any area within the Safety-Kleen Systems Inc. Farmington Service Center that is designated by the Secretary under the HWA, and its regulations, for the purpose of implementing corrective action requirements. A CAMU shall only be used for the management of remediation wastes while implementing corrective measures requirements at the Facility.

"Corrective Measures" includes all corrective action necessary to protect human health and the environment for all releases of

hazardous waste or hazardous constituents from any solid waste management unit at the Facility, regardless of the time at which waste was placed in the unit, as required under Section 74-4-4.2.B of the HWA and 20.4.1.500 NMAC (incorporating 40 CFR 264.101)). Corrective measures may address releases to air, soils, surface water or groundwater.

"Extent of Contamination" is defined as the horizontal and vertical area in which the concentrations of hazardous constituents in the environmental media being investigated are above detection limits or background concentrations indicative of the region, whichever is appropriate as determined by the Secretary.

"Facility" means Safety-Kleen Systems Inc. Farmington Service Center, located in Farmington, NM, including all contiguous land, and structures, other appurtenances, and improvements on the land, used for managing, accepting, and storing hazardous waste, located at 4210 A. Hawkins Road, Farmington, NM 87401. For the purposes of implementing any provision of the HWA, RCRA, and this Permit including, but not limited to, corrective action under 20.4.1.500 NMAC (incorporating 40 CFR 264.101), or RCRA Section 3008(h), HWA 74-4-10.E, the Facility includes all contiguous property under the control of the owner or operator seeking a permit under 20.4.1 NMAC, incorporating 40 CFR 260 through 40 CFR 270 pursuant to 20.4.1.100 NMAC (incorporating 40 CFR 260.10).

"Foreign Source" refers to hazardous waste generated outside the United States of America.

"Hazardous Constituents" are those substances listed in 20.4.200 NMAC (incorporating 40 CFR 261 Appendix VIII), and 20.4.1.500 NMAC (incorporating 40 CFR 264 Appendix IX).

"Hazardous Waste" means a hazardous waste as defined in Section 74-4-3 (I) of HWA, and 20.4.1.200 NMAC (incorporating 40 CFR 261.3).

"Interim Measures" are actions necessary to minimize or prevent the further migration of contaminants and limit actual or potential human and environmental exposure to contaminants while long-term corrective action remedies are evaluated and, if necessary, implemented.

"Off-Site Source" means a generator of hazardous waste located within the United States of America, but outside the Permittee's Facility boundary.

"Release" means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching,

dumping, or disposing of any hazardous waste or hazardous constituents into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing hazardous waste or hazardous constituents).

"Remediation Waste" for the purposes of this permit includes all solid and hazardous wastes, and all media (including groundwater, surface water, soils, and sediments) and debris, which contain listed hazardous wastes or which themselves exhibit a hazardous waste characteristic, that are managed for the purpose of implementing corrective action requirements. For the Facility, remediation wastes may originate only from within the Facility boundary, but may include releases beyond the Facility boundaries.

"Secretary" means the Secretary of the New Mexico Environment Department or his/her designee or authorized representative.

"Solid Waste Management Unit" (SWMU) means any discernible waste management unit or area at a RCRA facility in which solid waste has been placed at any time, and from which the Secretary determines there may be a risk of a release of hazardous constituents, regardless of whether the SWMU is or ever was intended for the management of solid or hazardous waste. Placement of solid waste includes one time and accidental events that were not remediated, as well as any unit or area at which solid waste has been routinely and systematically placed.

1.6 DUTIES AND REQUIREMENTS

1.6.1 Duty to Comply

The Permittee shall comply with all conditions in this Permit, except to the extent and for the duration such noncompliance is authorized in an emergency permit specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.61). Any permit noncompliance, except under the terms of an emergency permit, constitutes a violation of HWA and/or RCRA and may subject the Permittee, its successors and assigns, officers, directors, employees, parents, or subsidiaries, to an administrative or civil enforcement action, including civil penalties and injunctive relief, under Section 74-4-10 or Section 74-4-10.1 of HWA or Sections 3008(a) and (g), 7002, or 7003 of RCRA; to permit modification, suspension, reissuance, termination, revocation, denial of a permit application modification request under Section 74-4-4.2 of HWA; to criminal fines or imprisonment under HWA Section 74-4-11 or Section 3008(d), (e), or (f) of RCRA; or to a combination of the foregoing pursuant to 20.4.1.900 NMAC (incorporating 40 CFR 270.30(a)).

1.6.2 Duty to Reapply

If the Permittee wishes to continue an activity regulated by this Permit after the expiration date of this Permit, the Permittee shall apply for and obtain a new Permit. The Permittee shall submit a complete application for a new Permit at least 180 calendar days before the expiration date of this Permit, unless permission for a later date has been granted by the Secretary in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.10(h) and 40 CFR 270.30(b)). The Secretary shall not grant permission for applications to be submitted later than the expiration date of the existing permit.

1.6.3 Transfer of Permit

The Permittee shall not transfer this Permit to any person except after providing notice to and receiving approval from the Secretary. The prospective new owner or operator must file a disclosure statement with the Secretary as specified in Section 74-4-4.7 of HWA. The Secretary may require modification or revocation and re-issuance of this permit in accordance with 20.4.1.900 NMAC and 20.4.1.901 NMAC (incorporating 40 CFR 270.40(b) and 40 CFR 270.41(b)(2)).

Before transferring ownership or operation of the Facility during its active operating life or post-closure care period, the Permittee shall notify the new owner or operator in writing of the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264) and 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(3) and 40 CFR 270.40)) pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.12(c)), and of this Permit.

1.6.4 Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for the Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the terms of this Permit, as provided by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(c)).

1.6.5 Duty to Mitigate

In the event of noncompliance with this Permit, the Permittee shall take all reasonable steps to minimize releases to the environment, and shall carry out such measures as are reasonable to prevent significant adverse impacts on human health or the environment, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(d)).

1.6.6 Proper Operation and Maintenance

The Permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Permittee to achieve compliance with the conditions of this Permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance/quality control procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems only when necessary to achieve compliance with the conditions of this Permit as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(e)).

1.6.7 Duty to Provide Information

The Permittee shall furnish, within a reasonable time, any relevant information the Secretary requests to determine whether cause exists for modifying, suspending, or revoking this Permit, or to determine compliance with this Permit. The Permittee shall also furnish to the Secretary, upon request, copies of records required to be retained by this Permit pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.74(a)) and 20.4.1.900 NMAC (incorporating 40 CFR 270.30(h)).

Permit Condition 1.6.7 shall not be construed to limit, in any manner, the Secretary's authority under Section 74-4-4.3 of HWA, or Section 3007(a) of RCRA.

1.6.8 Inspection and Entry

The Permittee shall allow the Secretary, or authorized representatives, upon the presentation of credentials and other documents as may be required by law, the following entry and inspection privileges as specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.30(i)):

Permit Condition 1.6.8 shall not be construed to limit, in any manner, the Secretary's authority under Section 74-4-4.3 of HWA, or Section 3007(a) of RCRA.

1.6.8.a Entrance to premises

The Permittee shall allow the Secretary, or authorized representatives, upon the presentation of credentials and other documents as may be required by law, to enter at reasonable times into the Permittee's premises where the regulated Facility or activity is located or conducted, or where records must be kept

under the conditions of this Permit as specified in 20.4.1.900 NMAC, incorporating 40 CFR 270.30(i);

1.6.8.b Access to Records

To have access to and copy, at reasonable times, any records that must be kept under the conditions of this Permit;

1.6.8.c Inspection

To inspect at reasonable times the Facility, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Permit; and

1.6.8.d Sampling

To sample or monitor at reasonable times, for the purposes of assuring Permit compliance or as otherwise authorized by RCRA and/or HWA, any substances or parameters, including soil, surface water, and ground water at the Facility.

1.6.9 Monitoring and Records

1.6.9.a Representative sampling

For purposes of monitoring, the Permittee shall take samples and measurements representative of the monitored activity as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(1)), and the procedures specified in Permit Condition 2.5.2.

1.6.9.b Record retention

The Permittee shall retain records of all ground water monitoring information, including all calibration and maintenance records, well logs, copies of all reports and records required by this Permit, the waste minimization certification required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73 (b)(9)), and records of all data used to complete the Permit Application for a period of at least three (3) years from the date of the sample, measurement, report, record, certification, or application as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(2)). This period may be extended by request of the Secretary at any time and is automatically extended during the course of any unresolved enforcement action regarding this facility.

1.6.9.c Monitoring records contents

In accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(3)), records of monitoring information shall include:

1. The dates, exact place, and times of sampling or measurements;
2. The names and qualifications of the individuals who performed the sampling or measurements;
3. The name and address of the laboratory or laboratories that performed the analyses;
4. The dates analyses were performed;
5. The names and qualifications of the individuals who performed the analyses;
6. The analytical techniques or methods used; and
7. The results of such analyses.

1.6.10 Reporting Requirements

1.6.10.a Reporting Planned Changes

The Permittee shall give notice to the Secretary, as soon as possible, of any planned physical alterations or additions to the permitted facility, in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(1));

1.6.10.b Reporting Anticipated Noncompliance

The Permittee shall give advance notice to the Secretary of any planned changes in the permitted facility or in any activities, which may result in noncompliance with Permit requirements, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(2));

1.6.10.c Certification of Construction or Modification

If the Facility is modified, the Permittee shall not store hazardous waste in the modified portion of the permitted Facility, until the following conditions specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(2)), have been satisfied;

1.6.10.c.i Submittal of statement

The Permittee has submitted to the Secretary, by certified mail or hand delivery, a letter signed by the Permittee and an independent professional engineer registered in New Mexico stating that the Facility modification meets the requirements of this Permit; and

1.6.10.c.ii Inspection by the Secretary

The Secretary has:

1. Inspected the modified or newly constructed portion of the CSU or the 12,000-gallon spent solvent storage tank and finds it is in compliance with conditions of this Permit; or
2. Waived the inspection or, within fifteen (15) calendar days from the date of submission of the letter required by Permit Condition 1.6.10.c.i, has not notified the Permittee of his intent to inspect.

1.6.10.d Twenty-Four Hour and Subsequent Reporting

1.6.10.d.i Oral report

The Permittee shall report to the Secretary any noncompliance which may endanger human health or the environment. Any such information shall be reported orally within 24 hours from the time the Permittee becomes aware of the circumstances, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(6)(i)). The report shall include the following:

1. Information concerning release of any hazardous waste that may cause an endangerment to public drinking water supplies; and
2. Any information of a release or discharge of hazardous waste, or of a fire or explosion from the CSU, the 12,000-gallon spent solvent storage tank, or any other facility area, which could threaten the environment or human health outside the Facility.

The description of the occurrence shall include:

- a. Name, address, and telephone number of the owner or operator;
- b. Name, address, and telephone number of the Facility;
- c. Date, time, and type of incident;
- d. Name and quantity of material(s) involved;
- e. The extent of injuries, if any;

- f. An assessment of actual or potential hazards to the environment and human health outside the Facility, where this is applicable; and
- g. The estimated quantity and disposition of recovered material that resulted from the incident.

1.6.10.d.ii Written report

The Permittee shall submit a written notice within 5 calendar days from the time the Permittee becomes aware of the noncompliance pursuant to 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(6)(iii)). The Secretary may waive the five-day requirement in favor of a written report within 15 days.

The written notice shall contain the following:

- 1. A description of the noncompliance and its cause;
- 2. Name, address, and telephone number of the owner or operator;
- 3. Name, address, and telephone number of the Facility;
- 4. The period of the occurrence including exact date and time, and, if the noncompliance has not been corrected, the anticipated time it is expected to continue;
- 5. Name and quantity of materials involved;
- 6. The extent of injuries, if any;
- 7. An assessment of actual or potential hazards to the environment and human health outside the Facility, where this is applicable;
- 8. Estimated quantity and disposition of recovered material that resulted from the incident; and
- 9. Steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

1.6.11 Contingency Plan Implementation

If the Contingency Plan provided in Permit Attachment 7 is implemented, the Permittee shall comply with the reporting requirements required by 20.4.1.500 NMAC (incorporating 40 CFR 264.56(j)).

1.6.12 Corrective Action

Corrective action required pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.101) shall continue under this Permit for any period necessary to comply with the requirements specified in Part V of this Permit.

1.6.13 Other Noncompliance

The Permittee shall report all other instances of noncompliance not otherwise required to be reported under this Permit at the time monitoring reports are submitted. The reports shall contain the information listed in Permit Condition 1.6.10.d.ii, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(10)).

1.6.14 Other Information

Whenever the Permittee becomes aware that he failed to submit any relevant facts in the Permit Application, or submitted incorrect information in the Permit Application or in any report to the Secretary, the Permittee shall promptly submit such facts or information in writing to the Secretary as required by the requirements of 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(11)).

1.6.15 Waiver of Defense.

In any judicial action brought in the United States District Court for the District of New Mexico under RCRA (or under the HWA), the Permittee waives all objections and defenses it may have to the jurisdiction of such Federal Court or to venue in such Federal District.

1.6.16 Admissibility of Data

In any administrative or judicial action to enforce a condition of this Permit, the Permittee waives any objection to the admissibility as evidence of any data generated pursuant to this Permit.

1.7 SIGNATORY REQUIREMENT

The Permittee shall sign and certify all applications, reports, or information submitted to or requested by the Secretary or required by this Permit as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.11 and 270.30(k)).

**1.8 REPORTS, NOTIFICATIONS, AND SUBMISSIONS TO THE NEW
MEXICO ENVIRONMENT DEPARTMENT**

The Permittee shall submit by certified mail or hand delivery, all reports, notifications, or other submissions required by this Permit to be sent or given to the NMED. The submissions should be sent by certified mail or hand delivered to:

Manager

Permits Management Program

Hazardous Waste Bureau

New Mexico Environment Department

2905 Rodeo Park Drive East, Building 1

Santa Fe, New Mexico 87505-6303

Telephone Number: (505) 428-2500

Facsimile Number: (505) 428-2567

1.9 CONFIDENTIAL INFORMATION

The Permittee may claim confidentiality for any information required to be submitted by this Permit, to the extent authorized by Section 74-4-4.3 (D) of the HWA and 20.4.1.900 NMAC (incorporating 40 CFR 270.12).

1.10 DOCUMENTS TO BE MAINTAINED AT THE FACILITY

The Permittee shall maintain at the Facility, until completion of closure as specified in Permit Attachment 10, the following documents and all amendments, revisions and modifications to these documents:

1. *Waste Analysis Plan*, contained in Attachment 3, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.13(b)) and this Permit.
2. *Inspection Plan and Schedule*, contained in Attachment 5, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.15(b)(2)) and this Permit.
3. *Personnel Training* documents and records, contained in Attachment 9, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(d)) and this Permit.

4. *Contingency Plan*, contained in Attachment 7, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.53(a)) and this Permit, and including summary reports and details of all incidents that require implementation of the Contingency Plan as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.56(j)).
5. *Operating Record*, contained in Attachment 8, *Manifesting, Reporting, and Record Keeping*, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73) and this Permit.
6. *Closure Plan*, contained in Attachment 10, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.112(a)) and this Permit.
7. Annually adjusted closure cost estimate as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.142(b) and (d)), and this Permit.
8. The names, addresses, and phone numbers of the Emergency Coordinator (EC) and all persons designated as alternate EC, as required by Permit Condition 2.13.4 and as shown in Attachment 7-3 of Permit Attachment 7, *Contingency Plan*.
9. A list of all equipment, as contained in the Permit Attachment 7-2, *Emergency Equipment List*, which must be regulated as required by 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subpart BB, and Subpart CC).
10. A signed duplicate copy of the liability policy required under Permit Condition 2.19.

New Mexico Environment Department
September 2003

Safety-Kleen Systems, Inc. Farmington, NM, Service Center
Facility Operating Permit
RCRA Permit No. NMD980698849

PART 2
GENERAL FACILITY CONDITIONS

PART 2

GENERAL FACILITY CONDITIONS

2.1 INTRODUCTION

This Part sets forth the standards that every owner/operator of a Hazardous Waste Storage Facility is required to meet, in order to manage and store hazardous waste in the CSU and in the 12,000-gallon spent solvent aboveground storage tank in a manner protective of human health and the environment.

2.2 OPERATION AND MAINTENANCE OF THE FACILITY

The Permittee shall maintain and operate the Facility to minimize the possibility of a fire, explosion, or any unplanned, sudden or non-sudden release of hazardous waste or constituents to air, soil, ground water, or surface water, which could threaten human health, or the environment as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.31).

2.2.1 Hazardous Waste From Off-site Sources

The Permittee shall receive off-site hazardous waste in compliance with the requirements and conditions specified in this Permit. The Permittee shall only receive the hazardous waste listed in Permit Attachment 2, *Authorized Wastes and Part A Application*, for management and storage at the Facility.

2.3 REQUIRED NOTICES

2.3.1 Hazardous Waste Imports

The Permittee shall not accept wastes from a Foreign Source without prior authorization from the U. S. Environmental Protection Agency (EPA). The Permittee shall include the authorization in Facility operating record, and send a copy of the authorization document to the New Mexico Environment Department.

2.3.2 Required Notification To Off-Site Sources

Before the Permittee receives hazardous waste from an Off-Site Source for the first time, the Permittee shall inform the generator in writing that the Permittee has the appropriate permit(s) for, and will accept, the waste the generator is shipping. The Permittee shall keep a copy of this written notice as part of the operating record as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.12(b)).

2.4 LAND DISPOSAL REGULATIONS

2.4.1 Prohibitions

The Permittee shall not place in any land disposal unit the wastes specified in RCRA Section 3004 unless the Secretary has established disposal or treatment standards for the hazardous waste and the Permittee meets such standards and other applicable conditions of this Permit.

The Permittee is prohibited, pursuant to 20.4.1.800 NMAC (incorporating 40 CFR 268.50(a)), from storing hazardous waste restricted from land disposal pursuant to 20.4.1.800 NMAC (incorporating 40 CFR part 268 Subpart C) unless the following conditions are met:

1. The Permittee stores such wastes in tanks, containers, or containment buildings on-site solely for the purpose of the accumulation of such quantities of hazardous waste as necessary to facilitate proper recovery, treatment, or disposal;
2. The Permittee stores such wastes in tanks, containers, or in the CSU solely for the purpose of the accumulation of such quantities of hazardous waste as necessary to facilitate proper recovery, treatment, or disposal pursuant to 20.4.1.800 NMAC (incorporating 40 CFR 268.50(a)(2)), and;
 - a. Each container is clearly marked to identify its contents and the date each period of accumulation begins; and
 - b. Each tank is clearly marked with a description of its contents, the quantity of each hazardous waste received, and the date each period of accumulation begins, or such information is recorded and maintained in the Operating Record pursuant to 20.4.1.800 NMAC (incorporating 40 CFR 268.50(a)(2)(ii)).

The Permittee may store such wastes for up to one year unless the Secretary can demonstrate that such storage was not solely for the purpose of accumulation of such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment, or disposal as required in 20.4.1.800 NMAC (incorporating 40 CFR 268.50(b)).

The Permittee may store such wastes beyond one year, however the Permittee bears the burden of proving that such storage was

solely for the purpose of accumulation of such quantities of hazardous waste as are necessary to facilitate proper recovery, treatment, or disposal as required in 20.4.1.800 NMAC (incorporating 40 CFR 268.50(c)).

The prohibition of 20.4.1.800 NMAC (incorporating 40 CFR 268.50(a)), does not apply to hazardous wastes that meet the treatment standards specified under 40 CFR 268.41, 40 CFR 268.42, and 40 CFR 268.43, or the treatment standards specified under the variance in 40 CFR 268.44, or where treatment standards have not been specified, or is in compliance with the applicable prohibitions specified in 40 CFR 268.32, or RCRA Section 3004 in accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268.50(e)).

2.4.2 Liquid Hazardous Wastes Containing Polychlorinated Biphenyls (PCBs)

The Permittee is prohibited from managing or storing liquid hazardous wastes containing PCBs at concentrations greater than or equal to 50 parts per million (ppm). Hazardous wastes with PCB concentrations in excess of 50 ppm must be regulated by a Toxic Substances Control Act (TSCA) permit from the United States Environmental Protection Agency (EPA), and must be stored at the Facility as required by the requirements of 40 CFR 761.65(b), and must be removed from storage and treated or disposed of within one year of the date when such wastes are first placed into storage as required by 20.4.1.800 NMAC (incorporating 40 CFR 268.50(f)). A copy of the TSCA Permit issued by the EPA for the storage of PCBs must be submitted to the New Mexico Environment Department before acceptance of such waste at the facility pursuant to 20.4.1.800 NMAC (incorporating 40 CFR 268.50).

2.4.3 Waste Minimization

The Permittee shall submit a certified plan in writing annually by December 1, for the previous year ending September 30, indicating that:

The Permittee has a program in place to reduce the volume and toxicity of all hazardous wastes which are generated by the Permittee's Facility operation to the degree determined to be economically practicable; and the proposed method of treatment, storage, or disposal is the most practicable method currently available to the Permittee which minimizes the present and future threat to human health and the environment. This certified plan shall address the items below:

1. Any written policy or statement that outlines goals, objectives, and/or methods for source reduction and recycling of hazardous waste at the Facility;

2. Any employee training or incentive programs designed to identify and implement source reduction and recycling opportunities;
3. Any source reduction and/or recycling measures implemented in the last five years or planned for the near future;
4. An itemized list of the dollar amounts of capital expenditures and operating costs devoted to source reduction and recycling of hazardous waste;
5. Factors that have prevented implementation of source reduction and/or recycling;
6. Sources of information on source reduction and/or recycling received at the Facility (e.g., local government, trade associations, suppliers, etc.);
7. An investigation of additional waste minimization efforts, which could be implemented at the Facility. This investigation shall analyze the potential for reducing the quantity and toxicity of each waste stream through production reformulation, recycling, and all other appropriate means. The analysis shall include an assessment of the technical feasibility, cost and potential waste reduction for each option;
 - a. The certified plan shall also include:
 1. A flow chart or matrix detailing all hazardous wastes the Permittee's Facility produces, by quantity and type and by building/area;
 2. A written determination demonstrating the need to use those processes which produce a particular hazardous waste due to a lack of alternative processes, available technology, or available alternative processes that would produce less volume of hazardous waste;
 3. A written determination that shall demonstrate the applicability or inapplicability of the following waste minimization techniques:

When removing coating from parts (stripping wastes) before applying a new coat, avoid the use of:

1. Excess thinner;

2. Abrasive media stripping;
3. Bead-blasting for paint stripping; and
4. Clean coating equipment after each use.

When using solvents (spent solvent wastes) for parts cleaning operations:

1. The use of water-soluble cutting fluids instead of oil-based fluids;
2. The use of bead-blasting for paint-stripping;
3. The prevention of cross-contamination;
4. The use of peel coatings in place of protective oils; and
5. Reduce the number of different solvents.

A written determination that shall demonstrate the applicability/inapplicability of a continued annual reduction of hazardous waste streams on the Permittee's Facility from the milestone date of November 2001. The milestone date represents a 50% reduction from the effective date of the modified operating permit.

The Permittee shall include this certified plan in the operating record.

2.5 GENERAL WASTE CHARACTERIZATION

2.5.1 General Requirements

The Permittee shall not store or treat any hazardous waste at a permitted hazardous waste management unit at the Facility unless the hazardous waste has been fully characterized as specified by the characterization requirements of this Permit, including the Waste Analysis Plan (WAP) located in Permit Attachment 3 to demonstrate compliance with all waste characterization requirements of 20.4.1.500 NMAC (incorporating 40 CFR Part 264), specifically 40 CFR 264.13, 20.4.1.800 NMAC (incorporating 40 CFR Part 268), particularly 40 CFR 268.7 and 40 CFR 268.9.

The waste characterization requirements of this Permit do not apply to wastes stored at the Facility on a transfer basis (i.e., for less than ten (10) days) as described at 20.4.1.400 NMAC (incorporating 40 CFR 263.12). The containers shall be inspected to ensure they are in good condition and shall be segregated from

other profiled wastes, clearly identified as 10-day wastes along with the date of arrival.

The following types of waste shall not be accepted for management at the Facility:

1. DOT forbidden, Class 1, Division 1.1, 1.2, 1.3, and 1.4 explosives;
2. Pyrophoric wastes; and
3. Radioactive waste.

Waste characterization requirements are specified both in this Permit Section and the WAP. If there is a conflict between the conditions in this Permit Section and the conditions in the WAP, the conditions in this Permit Section shall supersede the conflicting conditions in the WAP.

The Permittee shall obtain the following hazardous waste characterization information at the waste's point of generation in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.9(c)) and 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subparts BB and CC):

1. All applicable EPA Hazardous Waste Numbers (i.e., waste codes) in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.13) and 20.4.1.800 NMAC (incorporating 40 CFR 268.9(a));
2. Whether the waste meets the applicable Land Disposal Restriction (LDR) treatment standards specified at 20.4.1.800 NMAC (incorporating 40 CFR 268.40, 40 CFR 268.45, and 40 CFR 268.49) in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(a) and (b)). To determine the applicable treatment standard(s) for each listed and/or characteristic waste code, the Permittee must obtain the following waste characterization information:
 - a. Identify all applicable hazardous constituents as defined in 20.4.1.100 NMAC (incorporating 40 CFR 260.10) or underlying hazardous constituents (UHC), as defined in 20.4.1.800 NMAC (incorporating 40 CFR 268.2(i)), in the waste or in the treated residue, in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7 and 40 CFR 268.9 respectively), unless the waste will be treated and monitored for all constituents. The Permittee shall specifically address all inorganic

constituents listed on the table of Universal Treatment Standards at 40 CFR 268.48;

- b. Identify the waste's treatability category (i.e., wastewater or non-wastewater) as defined at 20.4.1.800 NMAC (incorporating 40 CFR 268.2(d) and (f));
 - c. Whether the waste belongs to a treatment/regulatory subcategory as identified in table "Treatment Standards for Hazardous Wastes" at 20.4.1.800 NMAC (incorporating 40 CFR 268.40);
 - d. For hazardous debris as defined at 20.4.1.800 NMAC (incorporating 40 CFR 268.2(g)) to be treated with the alternative treatment technologies provided by 20.4.1.800 NMAC (incorporating 40 CFR 268.45), identify the contaminants subject to treatment as described at 20.4.1.800 NMAC (incorporating 40 CFR 268.45(b)); and
 - e. For contaminated soil subject to LDRs as provided in 20.4.1.800 NMAC (incorporating 40 CFR 268.49(a)), identify the constituents subject to treatment as described in 20.4.1.800 NMAC (incorporating 40 CFR 268.49(d)).
3. Whether air emission requirements in 20.4.1.500 NMAC (incorporating 40 CFR Part 264 Subpart BB) apply to a waste managed in equipment, in compliance 40 CFR subpart BB. This determination shall conform to Permit Condition 2.5.6.a; and
 4. Whether air emission requirements in 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subpart CC) apply to a waste managed in a tank or container, in compliance with 40 CFR 264.1082. This determination shall conform to Permit Condition 2.5.6.b.

The Permittee shall characterize all hazardous wastes, prior to placement in a storage or treatment unit at the Facility, to determine the following in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.13(a)(1)):

1. Whether the waste is listed as an authorized waste in Permit Attachment 2, *Authorized Wastes and Part A Application*, and is not otherwise prohibited by the Permit;

2. The waste characteristics necessary to prevent the mixing or placing of incompatible wastes in the same container or in unacceptable proximity in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.17 and 40 CFR 264.177), or in a tank system in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.199). The Permittee shall characterize the waste sufficiently to prevent the impairment of containers by associated wastes in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.172), and to prevent the impairment of secondary containment systems by associated wastes in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.193(c)(1));
3. Characterization sufficient to prevent accidental ignition or reaction of ignitable or reactive wastes in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.17), in containers in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.177), and tank systems in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.198); and
4. Whether the waste contains free liquids, as defined at 20.4.1.500 NMAC (incorporating 40 CFR 260.10 and 40 CFR 261.7(b)(1)).

2.5.2 Acceptable Knowledge

The Permittee shall obtain the waste characterization information required under Permit Section 2.5.1 above by real-time sampling and analysis, and/or by use of Acceptable Knowledge (AK).

Acceptable Knowledge is defined in U.S. EPA's *Waste Analysis at Facilities that Generate, Treat and Dispose of Hazardous Wastes* (OSWER 9938.4-03, April 1994) as process knowledge and prior sampling data that may or may not conform to RCRA. Sampling and analysis is the preferred method, and the Permittee shall obtain characterization by sampling and analysis whenever feasible.

Acceptable Knowledge may be used as the sole method to characterize waste only when the waste is from processes that are well documented with supporting information that address all characterization requirements of this Permit, including the requirement to determine the LDR status of the waste as specified at Permit Condition 2.5.1, or if there is prior sampling and analysis data with documentation that demonstrates conformance to the sampling and analysis requirements of this Permit.

Acceptable Knowledge shall be considered a suitable waste characterization method for waste that is an unused, commercial chemical product, reagent, or chemical of known physical and chemical constituents, for example is a P or U-listed EPA

Hazardous Waste Number under 20.4.1.200 NMAC (incorporating 40 CFR 261.33), and the waste is documented by a packaging label, a Material Safety Data Sheet, or equivalent information supplied by the manufacturer identifying the chemical content of the waste.

For treated wastes, hazardous constituents shall be identified utilizing current sampling and analysis (i.e., acceptable knowledge is not permitted) in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(b)).

2.5.2.a Acceptable Knowledge Documentation

The Permittee shall maintain documentation supporting the use of AK for each waste stream including all specific AK documentation assembled and used in the AK process, whether or not it supports the decision to use AK. This AK documentation shall be used to generate an AK Summary Report for each waste stream that shall be maintained in the Facility Operating Record in accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(a)(6)) and 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(3)).

For each waste stream, the Permittee shall maintain in the Operating Record, at a minimum, the following information supporting the use of process knowledge in the process knowledge documentation:

1. The location where the waste stream is generated;
2. Waste stream volume and time period of generation;
3. Description of the waste generating process; and
4. All material inputs or other information that identifies the chemical content and physical form of the waste stream.

2.5.3 Waste Sampling

The Permittee shall establish and utilize a Sampling and Analysis Plan (SAP) for each waste stream undergoing sampling. The SAP shall identify the appropriate sampling methods to characterize the waste stream in accordance with Permit Condition 2.5.1. The Permittee shall maintain the SAP in the specific waste's characterization documentation and shall document SAP compliance in the Facility's Operating Record for a minimum of three years from the date the waste was last stored (or treated).

The SAP shall identify the sample containers, preservation techniques, and holding times for each waste sampled. The SAP must conform to the most recent version of *Test Methods for*

Evaluating Solid Waste, Physical/Chemical Methods, (U.S. EPA Publication SW-846) Chapter 9, *Sampling Plan*. The SAP must ensure collection of a representative sample of wastes by means that preserve its original physical form and composition and ensure prevention of contamination or changes in concentration of the constituents to be analyzed. The SAP shall ensure sample collection meets the quality assurance objectives (QAO's) required under Permit Section 2.5.5. The number of samples of each waste shall be sufficient to demonstrate that the upper limit of the confidence interval for the population mean is less than the applicable regulatory threshold, in accordance with SW-846.

The Secretary may reject any data if it is determined to be unreliable for any reason.

2.5.4 Laboratory Analysis

The Permittee shall establish and utilize a Sampling and Analysis Plan (SAP) for each waste stream undergoing analysis. The SAP shall identify the appropriate laboratory analytical methods to characterize the waste stream in accordance with Permit Condition 2.5.1. The Permittee shall perform or obtain laboratory analysis of wastes in accordance with the conditions of this Permit Section, the WAP, and the SAP. The SAP shall identify the appropriate laboratory analytical methods, analytical detection limits, and analytical reporting limits. The Permittee shall maintain the SAP in the specific waste's characterization documentation and in the Facility's Operating Record.

If the Permittee wishes to use an analytical method other than that identified in the WAP, the Permittee shall submit a petition to use the alternative analytical method to NMED for its approval in accordance with 20.4.1.100 NMAC (incorporation 40 CFR 260.21).

If the Permittee uses an independent contract laboratory to perform analyses, the Permittee shall inform the laboratory in writing that it must operate under the waste analysis conditions set forth in this Permit.

When using laboratory analysis as part of a hazardous waste determination, the Permittee shall require the laboratory to report concentrations for all hazardous constituents listed at 20.4.1.800 NMAC (incorporating 40 CFR 268.48, Table of Universal Treatment Standards), that the analytical test method is capable of measuring. When using laboratory analysis to demonstrate that the waste meets its applicable LDR treatment standard concentrations specified at 20.4.1.800 NMAC (incorporating 40 CFR 268.40, Treatment Standards for Hazardous Wastes), in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(a) and (b)), the

Permittee shall demonstrate that analytical method detection limits (MDL's) are not higher than the treatment standard.

2.5.5 Quality Assurance (QA)/ Quality Control (QC)

The Permittee shall perform and record all waste characterization QA/QC procedures in accordance with SW-846 for data used to support waste characterizations required under this Permit Section. The statistical concepts of waste characterization precision, accuracy, completeness, comparability, and representativeness, as described at SW-846, shall be addressed. The Permittee shall maintain a record of all QA/QC determinations in a manner traceable to specific wastes in the Facility Operating Record.

When performing waste sampling required under this Permit Section, the Permittee shall use the applicable sample collection QA/QC procedures specified at SW-846, Chapter 1, Section 3.4, *Field QA and QC Requirements*, including, but not limited to, those dealing with equipment preparation and field equipment maintenance, calibration, and cleaning. The Permittee shall identify and perform the appropriate number of control samples associated with each sample collected, for example; trip and field blanks, field duplicates, and field spikes.

When performing laboratory analysis required under this Permit Section, the Permittee shall analyze method blanks, laboratory duplicates, and laboratory control samples to assess the quality of the data resulting from laboratory analytical programs.

The Permittee shall ensure, prior to placement of a waste in a storage or treatment unit at the Facility, that all waste characterization information is accurate by making the following determinations:

1. Whether the waste was characterized at the point of generation in compliance with Permit Condition 2.5.1, 20.4.1.800 NMAC (incorporating 40 CFR 268.9(c)), and 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subparts BB and CC));
2. Whether routinely generated wastes are re-characterized to ensure the waste's characterization is accurate and up to date in compliance with Permit Condition 2.5.5.a, *Characterization Re-evaluation Frequency*, and 20.4.1.500 NMAC (incorporating 40 CFR 264.13(a)(3));
3. Whether Facility personnel who perform waste characterization at the point of generation have appropriately identified when the process or operation

generating routinely generated wastes has changed in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.13(a)(3)(i)); and

4. Whether Facility personnel, including personnel who perform waste characterization at the point of generation, are trained in the applicable waste characterization requirements as required by 20.4.1.500 (incorporating 40 CFR 264.16)).

2.5.5.a Characterization Re-Evaluation Frequency

The Permittee shall re-evaluate the characterization of routinely generated wastes to ensure that the characterization remains accurate and up to date for subsequent batches of waste, in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.13(b)(4)). The results of the re-evaluation shall be thoroughly documented and placed in the operating record for a minimum of three years from the date the waste was last stored (or treated).

The Permittee shall perform re-evaluation of a waste in accordance with the following minimum requirements:

1. Annually to verify the accuracy of initial characterization results achieved. For wastes originally characterized through sampling and analysis, re-evaluation shall be achieved using the same sampling and analysis methodologies used in the initial analysis. For wastes characterized through AK, re-evaluation may be achieved through a review of AK information;
2. When there is a change in waste-generating processes. Any information that indicates a change in the process that generates the waste and may affect the waste shall cause the waste to be re-characterized; and
3. When the Permittee is notified by an off-site facility receiving hazardous waste from the Facility that the characterization of the waste received at the receiving facility does not match a pre-approved waste analysis certification or accompanying waste manifest or shipping paper. The Permittee shall notify NMED within 24 hours of their receipt of such a discrepancy notice from a receiving facility.

Wastes listed at 20.4.1.200 NMAC (incorporating 40 CFR 261.31, P and U listings) and for which the Permittee possesses an MSDS or equivalent information from the manufacturer identifying chemical

content are exempt from the re-evaluation requirements of this Permit Condition.

2.5.6 Air Emissions

The Permittee shall submit to NMED within three months of the effective date of this Permit a list of all locations at the Facility subject to the air emission control requirements at 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subparts BB and CC). The Permittee shall record the results of air emission waste characterization in the Facility Operating Record.

2.5.6.a Wastes Managed in Equipment

If the Permittee manages hazardous wastes at the Facility in equipment subject to the requirements of 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subpart BB), the Permittee shall characterize that waste in compliance with the requirements of this Permit Section. That characterization shall determine whether the equipment is in "light" or "heavy liquid" service or in "gas/vapor" service, as defined at 20.4.1.500 NMAC (incorporating 40 CFR 264.1031 and 264.1063(h)), and determine whether the organic concentration of the waste equals or exceeds ten percent by weight, using one of the methods specified at 20.4.1.500 NMAC (incorporating 40 CFR 264.1063(d)). The Permittee shall use samples in making this concentration determination that are representative of the highest total organic content hazardous waste expected to contact the equipment, in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1063(g)).

2.5.6.b Air Emissions from Tanks and Containers

If the Permittee manages hazardous waste at the Facility in tanks or containers subject to the requirements of 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subpart CC), the Permittee shall characterize that waste to determine whether it has an average volatile organic (VO) concentration at the point of point of generation of less than 500 parts per million by weight (ppmw), in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1082(c)(1)). The average VO concentration shall be determined using the procedures specified in 20.4.1.500 NMAC (incorporating 40 CFR 264.1083(a)). The Permittee shall review and update this waste characterization at least once every 12 months following the date of the initial determination for the wastes entering the unit subject to this Permit Condition.

The Permittee shall not be required to determine the volatile organic concentration of hazardous wastes in containers for the purpose of complying with this Permit Condition if the Permittee

controls air pollution emissions from all hazardous waste containers in accordance with the container construction specifications and operation requirements at 20.4.1.500 NMAC (incorporating 40 CFR 264.1086(b)).

2.5.7 Wastes Received from Off-Site

The Permittee shall obtain from the off-site facility, a detailed chemical and physical analysis of any hazardous waste received at the Facility, in compliance with the Waste Analysis Plan located in Permit Attachment 3, and 20.4.1.500 NMAC (incorporating 40 CFR 264.13(c)). This characterization may be in the form of AK if all applicable waste characterization requirements specified in this Permit Section are met and documented.

The Permittee shall physically examine the shipment of waste from the off-site facility at the time of acceptance for correct documentation, including appropriate waste container identification and labeling. The Permittee shall not accept at the Facility a hazardous waste shipment from an off-site facility without Uniform Hazardous Waste Manifests and LDR Notification Forms, as applicable. If discrepancies are found, the Permittee shall notify NMED of the discrepancy within five days, and shall return the waste to the off-site facility within 90 days, unless the off-site facility provides acceptable resolution to the discrepancy within 90 days after receipt of the waste at the Facility.

2.5.8 Waste Shipped to an Off-Site Facility

Prior to off-Facility shipment of hazardous waste, the Permittee shall comply with all generator standards in 20.4.1.300 NMAC (incorporating 40 CFR Part 262), in compliance with 20.4.1.300 NMAC (incorporating 40 CFR 262.10(h)) and 20.4.1.500 NMAC (incorporating 40 CFR 264.71(c)), including the waste characterization necessary to facilitate appropriate packaging for transportation, including the U.S. DOT Proper Shipping Name, Hazard Class, an ID Number for each waste.

2.5.9 Treated Waste Requirements

The Permittee shall characterize treatment-derived wastes by determining whether the waste is a hazardous waste in compliance with the requirements of Permit Section 2.5 and in compliance with the notification and record keeping requirements specified at 20.4.1.800 NMAC (incorporating 40 CFR 268.7(b)(3)(ii), *Treatment Facility Paperwork Requirements Table*, Requirement #1), unless otherwise specified below.

Treatment-derived wastes, including wastes that are de-characterized and are no longer hazardous, shall be characterized by determining whether the waste meets the applicable Land Disposal Restriction (LDR) treatment standards specified at 20.4.1.800 NMAC (incorporating 40 CFR 268.40, 268.45, and 268.49) in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(b)). This characterization shall include the determination of the existence within the waste of any of the constituents of concern for F001-F005, and F039, in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(b)(3)(ii)), and underlying hazardous constituents in characteristic wastes as defined at 20.4.1.800 NMAC (incorporating 40 CFR 268.2), unless the waste will be treated and monitored for all constituents, in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(b)(3)(ii)). Treatment-derived waste characterization shall be performed by testing wastes in accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7 (b) (1) and (b) (2)).

2.5.10 Remediation Wastes

The Permittee shall characterize remediation waste, as defined at 20.4.1.100 NMAC (incorporating 40 CFR 260.10), in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1(j)). The Permittee shall characterize remediation waste, including contaminated soil, in compliance with all waste characterization requirements in this Permit Section 2.5, including, but not limited to; a hazardous waste determination, the identification of all applicable hazardous waste codes, and LDR status determination.

The Permittee shall obtain, at a minimum, the following information when characterizing remediation hazardous waste; the origin of the waste and how it was subsequently managed, the time and circumstances of the release that created the waste, and any investigation or other reports (e.g., RCRA Facility Investigation or SWMU Reports) describing the release.

2.5.11 Containerized Waste

The Permittee shall characterize hazardous wastes placed inside containers, including overpacked drums, to ensure that the wastes do not react dangerously with, decompose, or ignite sorbent material in the container, in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.316(c)), and to ensure that the wastes are not incompatible or reactive, in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.316(d) and 264.317(e)). The Permittee shall characterize laboratory packs if they are intended to undergo the alternative treatment standards at 40 CFR 268.42 (c), as to whether they contain any of the prohibited hazardous wastes (i.e., EPA Hazardous Waste Codes specified at 40 CFR Part 268 Appendix IV).

2.5.12 Impermissible Dilution

The Permittee shall not dilute a restricted waste, or the residue from treatment of a restricted waste as a substitute for treatment in compliance with 20.4.1.800 (incorporating 40 CFR 268.3). Dilution to avoid an applicable treatment standard includes, but is not limited to, the addition of solid waste to reduce a hazardous constituent's concentration, and an ineffective treatment method that does not destroy, remove, or permanently immobilize hazardous constituents. Aggregating or mixing wastes as part of a legitimate treatment process are not considered impermissible dilution for purposes of this Permit Condition.

2.5.13 Waste Characterization Records

The Permittee shall record and maintain in the Facility Operating Record the results of waste analysis and waste determinations performed as specified in this Permit Section in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(3), (7), (10), (11), (12), (15), and (16)), and copies of the notification and certification statements required at Permit Condition 2.5.14. The requirements of this Permit Condition apply to solid wastes even when the hazardous characteristic is removed prior to disposal, or when the waste is excluded from the definition of hazardous or solid waste under 40 CFR 261.2 through 261.6, or exempted from Subtitle C regulation, subsequent to the point of generation, in accordance with 20.4.1.800 (incorporating 40 CFR 268.7(a)(8)). The Permittee shall maintain records of the LDR status determination for all wastes in accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(a)(6)).

2.5.14 Notification and Certification

The Permittee shall provide the notification and certification statements associated with the treatment and storage of hazardous wastes in compliance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7 and 268.9).

2.5.15 Generator Certification

The Permittee shall obtain a generator's signature on a certification for each small and large quantity generator pickup of parts washer solvent, immersion cleaner, or paint gun cleaner to be stored at the Facility under this Permit and maintain the certification in the Facility Operating Record. The certification shall contain the following wording:

"The Generator identified on the attached manifest number [insert manifest number] (herein after the "Generator") certifies under

penalty of law that the Generator has not mixed the solvent identified in the attached manifest with other material, that the Generator has not introduced any substances in the solvent which is regulated as hazardous waste or which contains polychlorinated biphenyls (PCBs), and that the Generator has not otherwise caused the alteration or the characteristics or components of the solvents."

Waste Characterization Documentation Table

| Name | Location | Description |
|--|---|---|
| Waste Analysis Plan (WAP) | Permit Attachment 3 | Permittee's commitments regarding waste characterization procedures. The WAP is a fully enforceable document. If contradictions exist between the WAP and the Permit, see Permit Condition 2.5.1. |
| Sampling and Analysis Plan (SAP) | Permit Conditions 2.5.3, 2.5.4, and 2.5.5 | Required when sampling and analysis is required. See permit conditions for specifics. |
| Record of quality assurance/quality control determinations | Permit Condition 2.5.5 | Regards waste sampling and analysis. Record traceable to a specific waste. See permit condition for specifics. |
| Record of waste re-evaluation | Permit Condition 2.5.5.a | See permit conditions for specifics. |
| Record of waste characterization | Permit Condition 2.5.9, and the WAP | General requirement to maintain a record of waste characterization results. |
| Record of evaluation of air emission control applicability | Permit Condition 2.5.6.b | Re-evaluation of average volatile organic concentration in wastes managed in containers and tanks to be performed annually. See permit condition for specifics. |
| LDR Notification and Certification Statements | Permit Condition 2.4, and the WAP | Accompanies manifest when waste is transferred off-site. Identifies all waste codes and underlying hazardous constituents associated with waste plus other information identified at 40 CFR 268.7(a). |

| Name | Location | Description |
|-------------------------------------|--|--|
| Uniform Waste Manifests | Not referenced in Permit or WAP but required at 40 CFR 262 Subpart B | Documents transfer of waste to an off-site TSDF. |
| Hazardous Waste Management Database | WAP | Documents amounts of wastes received and shipped off-site. |
| Waste disposal request form | WAP | Documents transfer of waste to an off-site TSDF. |
| LDR status determination records | WAP | Documents determination of LDR status. |

2.5.16 Waste Analysis Plan (WAP)

The waste analysis plan, located in Permit Attachment 3, shall be modified, and submitted to the Secretary for approval, whenever a new waste product is collected or when sampling and material management methods change. The approved revision(s) to the WAP shall be provided to the Facility manager and training shall be conducted for appropriate personnel.

Changes to the waste analysis plan will be processed as minor modifications, pursuant to 20.4.1.900 NMAC (incorporating 40 CFR 270.42).

2.6 DUST SUPPRESSION

The Permittee shall not use waste or used oil or any other material, which is contaminated with dioxin, PCB, or any other hazardous waste, other than a waste identified solely on the basis of ignitability, for dust suppression or road treatment at the Facility pursuant to 20.4.1.700 NMAC (incorporating 40 CFR 266.23(b)).

2.7 SECURITY

In order to prevent the unknowing entry and minimize the possibility of unauthorized entry of persons into the Facility, the Permittee shall comply with the security provisions and procedures described in Permit Attachment 4, *Security Plan*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.14).

2.7.1 Barriers and Means to Control Entry

The Permittee shall maintain an artificial barrier (i.e. a fence in good repair) around the Facility as a means to control entry into the active portion of the Facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.14(b)(2)), and as specified in Permit Attachment 4, *Security Plan*.

The six-foot high chain link fence as described in Permit Attachment 4 shall be maintained around the Facility to prevent unauthorized personnel and livestock from gaining access to the Facility and its surrounding land. Access to the Facility shall only be through the gates described in Permit Attachment 4.

2.7.2 Warning Signs

Warning signs in English, Spanish, and Navajo, shall be posted at all the gates and around the fence, and at other locations of the Facility in sufficient numbers to be visible from all angles of approach to the facility. These signs must be legible from a distance of at least 25 feet from any approach to the perimeter fence, in compliance with the standards contained in 20.4.1.500 NMAC (incorporating 40 CFR 264.14(c)).

2.8 GENERAL INSPECTION REQUIREMENTS

2.8.1 Inspection Schedule

The Permittee shall implement the *Inspection Plan* contained in Permit Attachment 5, to detect any container and storage tank equipment malfunctions and/or deteriorations, operator errors, and discharges in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.15 (a)).

2.8.2 Inspection Frequency

The Permittee shall inspect monitoring equipment, safety and emergency equipment, security devices, and operating and structural equipment at the frequency specified in the weekly and monthly inspection schedules contained in Permit Attachment 5 and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.15(b)).

2.8.3 Remediation Of Equipment/Structures

The Permittee shall remedy any deterioration or malfunction of equipment or structures, which an inspection reveals as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.15(c)).

2.8.4 Inspection Log and Checklist

The Permittee shall use the inspection checklists contained in Permit Attachment 5, *Inspection Plan*. The Permittee shall record the date and time of the inspection, the name of the inspector, a notation of the observations made, and the date and nature of any repairs or other remedial actions in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.15(d)).

2.8.5 Inspection Records

The Permittee shall maintain inspection checklists in the Facility operating record for at least 3 years from the date of inspection as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.15(d)).

2.9 PERSONNEL TRAINING

The Permittee shall conduct personnel training following the procedures described in Permit Attachment 9, *Personnel Training*, and the following Permit Conditions as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16).

2.9.1 Personnel Training Requirements

The Permittee shall train all persons involved in the management and storage of hazardous waste in procedures relevant to the positions in which they are employed, as described in Permit Attachment 9, *Personnel Training*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16).

2.9.2 Personnel Training Content

The personnel training program shall include the courses and procedures described in Permit Attachment 9, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(a) through (c)).

2.9.3 Personnel Training Records

The Permittee shall keep training records on current personnel until closure of the Facility. Training records on former employees shall be kept at the Facility office for at least 3 years from the date the employee last worked at the Facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(d) and (e)).

2.10 LOCATION STANDARDS

Since the Facility is located within the boundaries of San Juan County, New Mexico, which is not listed in 40 CFR 264 Appendix

VI, *Political Jurisdictions in Which Compliance With 40 CFR 264.18(a) Must Be Demonstrated*, Section 2.10 is not applicable.

Because the Facility is not located within a 100-year floodplain, the Permittee is not required to comply with the floodplain standards specified in 20.4.1.500 NMAC (incorporating 40 CFR 264.18(b)).

2.11 SPECIAL PROVISIONS FOR IGNITABLE, REACTIVE, OR INCOMPATIBLE WASTES

The Permittee shall follow the procedures for managing and storing ignitable, reactive, and incompatible wastes set forth in Permit Attachment 1, *Description and Design and Operation of the Facility* and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.17).

2.12 PREPAREDNESS AND PREVENTION

2.12.1 Required Equipment

The Permittee shall maintain at the Facility the equipment set forth in Permit Attachment 7-2, *Emergency Equipment and Locations*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.32 and 40 CFR 264.52(e)).

The Permittee shall ensure the Facility alarm system is operating at all times in order to provide immediate emergency instruction, either voice or signal, to facility personnel in the event of an emergency pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.32(a)).

2.12.2 Testing and Maintenance of Equipment

The Permittee shall test and maintain the equipment specified in Permit Attachment 7-2 as necessary to assure its proper operation in time of emergency pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.33).

2.12.3 Access to Communications or Alarm System

The Permittee shall maintain access to the communications or alarm system as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.34).

2.12.4 Required Aisle Space

The Permittee shall maintain enough aisle space to allow the unobstructed movement of Facility personnel, fire protection equipment, spill control equipment, and decontamination equipment

to any area of Facility operation as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.35), and as described in Permit Attachment 1, *Description and Design and Operation of the Facility*.

2.12.5 Arrangements with Local Authorities

The Permittee shall maintain coordination agreements with the City of Farmington Fire Department and the San Juan Regional Medical Center as described in Permit Attachment 7, *Contingency Plan*. These arrangements shall be either Memoranda of Understanding or Mutual Aid Agreements between the Permittee and the off-site cooperating agencies, and shall include the elements required by 20.4.1.500 NMAC (incorporating 40 CFR 264.37 (a)). Copies and descriptions of these Memoranda of Understanding and Mutual Aid Agreements shall be maintained in the operating record at the Facility office as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.37(b)).

Where State or local authorities decline to enter into a such arrangements, the Permittee must document the refusal in the operating record, pursuant to 20.4.1.500 NMAC, incorporating 40 CFR 264.37(b).

2.13 CONTINGENCY PLAN

2.13.1 Implementation of Plan

The Permittee shall immediately implement the Contingency Plan contained in Permit Attachment 7, whenever there is a fire, explosion, or release of hazardous waste or hazardous waste constituents, which could threaten human health, or the environment as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.51(b)). Emergency equipment and locations as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.52(e) is provided in Attachment 7-2.

2.13.2 Copies of the Plan

The Permittee shall maintain copies of the Contingency Plan and all revisions and amendments to the Plan at the Facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.53). The Permittee shall provide copies of the current Contingency Plan and all revisions to the Plan to the Secretary and all entities with which the Permittee has emergency Memoranda of Understanding or Mutual Aid Agreements as specified in 20.4.1.500 NMAC (incorporating 40 CFR 264.53).

2.13.3 Amendments to Plan

The Permittee shall review and immediately amend, if necessary, the Contingency Plan, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.54).

2.13.4 Emergency Coordinator

An Emergency Coordinator and an alternate Emergency Coordinator, as specified in Permit Attachment 7-3, *Emergency Contacts*, shall be available at all times in case of an emergency. The Emergency Coordinator or alternate Emergency Coordinator shall be thoroughly familiar with the Contingency Plan and shall have the authority to commit the resources needed to implement the Contingency Plan pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.55). In the event of an imminent or actual emergency, the Emergency Coordinator shall activate the internal emergency alarms, notify the appropriate State or local agencies with designated response roles, and implement the other procedures as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.56), and as described in Permit Attachment 8, *Manifesting, Reporting, and Record Keeping*.

2.14 MANIFEST SYSTEM

The Permittee shall comply with the manifest requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.71, 40 CFR 264.72, and 40 CFR 264.76). The Permittee shall not accept for management or storage any hazardous waste from an off-site source without the accompanying manifest.

2.15 RECORD KEEPING AND REPORTING

In addition to the record keeping and reporting requirements specified elsewhere in this Permit and 20.4.1.500 NMAC (incorporating 40 CFR 264.73(a)), the Permittee shall comply with the following conditions:

2.15.1 Operating Record

The Permittee shall maintain all applicable documentation in the Facility operating record until closure of the Facility in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)).

The Permittee shall maintain a written operating record for each hazardous waste received until closure of the Facility pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)). The Permittee shall maintain a written operating record of all monitoring records for at least 3 years from the date of report, sampling, measurement, or certification and shall maintain all

records from ground water monitoring wells and associated ground water surface elevations for the active life of the Facility as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(2)).

The Permittee shall retain in the Facility operating record, the information contained in the notice (except the manifest number), and the certification and demonstration if applicable, required by the generator or the owner or operator pursuant to 40 CFR 268.7, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(16)).

2.15.2 Biennial Report

The Permittee shall comply with the biennial reporting requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.75).

2.15.3 Personnel and Telephone Number Changes

The Permittee shall inform the Secretary in writing of changes in its management personnel and telephone numbers within 15 calendar days of the changes.

2.16 GENERAL CLOSURE REQUIREMENTS

2.16.1 Performance Standard

The Permittee shall close the Facility following the procedures described in the Closure Plan outlined in Permit Attachment 10, *Closure Plan*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.111 and 40 CFR 264.112(a) and (b)).

2.16.2 Amendment to Closure Plan

The Permittee shall submit a written notification of or request for a Permit modification to authorize a change of the approved Closure Plan whenever necessary, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.112(c)).

2.16.3 Notification of Closure

The Permittee shall notify the Secretary in writing at least 45 calendar days prior to the date on which the Permittee expects to begin closure of the Facility and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.112(d)).

2.16.4 Time Allowed For Closure

Within 90 calendar days after receiving the final volume of hazardous waste, the Permittee shall remove all hazardous waste from the Facility to a permitted treatment, storage or disposal

facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.113(a)), following the schedule specified in Permit Attachment 10, *Closure Plan*, or as amended as required by Permit Condition 2.16.2.

Within 180 days after receiving the final volume of hazardous waste the Permittee shall complete final closure activities in accordance with the schedule specified in Permit Attachment 10, *Closure Plan*, or as amended as required by Permit Condition 2.15.2 pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.113(b)).

2.16.5 Disposal or Decontamination of Equipment, Structures, and Soils

The Permittee shall decontaminate or dispose of all contaminated equipment, structures, and soils, as specified in Permit Attachment 10, *Closure Plan*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.114). By removing any hazardous wastes or hazardous constituents during partial and final closure, the Permittee may become a generator of hazardous waste and therefore must handle that waste in accordance with 20.4.1.300 NMAC (incorporating 40 CFR 262).

2.16.6 Sampling for Metals, Organics and Halogenated Organics at the Facility

The Permittee shall collect soil and ground water samples at the Facility for metals (i.e., Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Selenium, Zinc), organics and halogenated organics using EPA approved methods in the latest copy of SW-846 and its updates, or an alternate method approved by the Secretary.

2.16.7 Certification of Closure

Within 60 calendar days from the date of completion of closure of the Facility, and within 60 calendar days of completion of final closure of the Facility, the Permittee shall provide to the Secretary, by registered mail, a final closure report and written closure certification signed by an independent professional engineer registered in the State of New Mexico, that the facility was closed as required by the procedures specified in Permit Attachment 10, *Closure Plan*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.115).

2.17 COST ESTIMATE FOR FACILITY CLOSURE

2.17.1 Cost Estimates

The Permittee shall provide a detailed written estimate, in current dollars, of the cost of closing the Facility in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.142(a)). The most recent closure cost estimate shall be inserted into Permit Attachment 12, *Financial Assurance and Closure Cost Estimates*.

2.17.2 Adjustment of Cost Estimates

During the active life of the Facility the Permittee shall adjust the closure cost estimate for inflation within 60 calendar days prior to the anniversary date of the establishment of the financial instrument(s) used to comply with 20.4.1.500 NMAC (incorporating 40 CFR 264.143), and Permit Condition 2.19, *Liability Requirements*, or when using an approved State required mechanism, upon such a date as required by the State pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.142(b)).

2.17.3 Revision of Cost Estimates

The Permittee shall revise the closure cost estimates within 30 calendar days after NMED approves a request to modify the Closure Plan if the change increases the cost of closure as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.142(c)).

2.17.4 Record Keeping

The Permittee shall maintain current cost estimates prepared in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.142(a) and (c)), and if the closure cost estimate was adjusted, the date of adjustment in the Facility operating record during the operating life of the Facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.142(d)).

2.18 FINANCIAL ASSURANCE FOR FACILITY CLOSURE

2.18.1 Submittal Of Financial Assurance Documentation

The Permittee shall establish financial assurance for closure of the Facility in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.143).

2.18.2 Changes To The Financial Assurance Instrument

The Permittee shall not change the financial assurance instrument without approval of the Secretary pursuant the applicable

financial assurance option referenced in 20.4.1.500 NMAC (incorporating 40 CFR 264.143).

2.19 LIABILITY REQUIREMENTS

2.19.1 Liability Coverage Amounts

The Permittee shall have and maintain liability coverage for sudden and accidental occurrences in the amount of one million dollars (\$1,000,000) per occurrence, with an annual aggregate of at least two million dollars (\$2,000,000), exclusive of legal defense costs in accordance with each applicable requirement of 20.4.1.500 NMAC (incorporating 40 CFR 264.147(a)).

The Permittee shall have and maintain liability coverage for nonsudden accidental occurrences in the amount of three million dollars (\$3,000,000) per occurrence, with an annual aggregate of at least six million dollars (\$6,000,000), exclusive of legal defense costs in accordance with each applicable requirement of 20.4.1.500 NMAC (incorporating 40 CFR 264.147(b)).

2.19.2 Submittal of Liability Documentation

The signed duplicate original of the liability policy required in compliance with 20.4.1.500 NMAC (incorporating 40 CFR 264.147) is contained in Permit Attachment 12, *Financial Assurance and Closure Cost Estimates*.

2.20 DISCLOSURE

As required by Section 74-4-4.7 of the HWA, the Permittee filed a disclosure statement with all requisite information with the New Mexico Environment Department. A copy of the letter from the New Mexico Department of Public Safety to NMED regarding background investigation conducted on Safety-Kleen Systems Inc., is included in Attachment 1-2 of Permit Attachment 1. If any information required to be included in the disclosure statement provided by the Permittee to comply with Section 74-4-4.7 of the HWA changes, or if any information is added after filing the statement, the Permittee shall provide that information to the Secretary within 30 calendar days after the change or addition. Failure to provide such information in a timely manner may constitute the basis for the revocation of this Permit.

2.21 INCAPACITY OF OWNERS OR OPERATORS, GUARANTORS, OR FINANCIAL INSTITUTIONS

2.21.1 Declaration Of Bankruptcy By Financial Institution

The Permittee shall notify the Secretary by certified mail of the commencement of bankruptcy, and the name of any guarantor within 10 calendar days after commencement of the proceeding as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.148(a)).

2.22 ESTABLISHMENT OF OTHER FINANCIAL ASSURANCE OR LIABILITY COVERAGE

The Permittee shall establish other financial assurance or liability coverage within 60 calendar days from the date the Trustee or institution issuing the surety bond, letter of credit, or insurance policy declares bankruptcy; otherwise the Permittee will be deemed to be without the required financial assurance pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.148(b)).

2.23 GROUND WATER MONITORING

The Permittee shall conduct quarterly ground water detection monitoring at the Facility, when it fails to achieve clean closure. The Permittee shall analyze ground water samples for the hazardous waste constituents contained in 20.4.1.200 NMAC (incorporating 40 CFR 261, Appendix VIII), that have been detected in the ground water at the monitoring wells, or are expected to be in, or derived from, waste stored at the Facility in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.93(a)).

2.24 ESTABLISHMENT OF A BASELINE

The Permittee shall conduct background soil sampling at the Facility in areas not impacted by waste management within 180 calendar days from the effective date of this Permit. Sampling locations shall be approved by NMED. The sampling activity is necessary for the establishment of baseline values that shall be used for reference during closure activities described in Permit Attachment 10, *Closure Plan*. The Permittee shall submit a copy of the background sample data to NMED.

2.25 TRANSPORTATION OF HAZARDOUS WASTE

The Permittee shall comply with all U.S. Department of Transportation, State, and local regulatory standards which apply to persons transporting hazardous waste within the United States and the State of New Mexico as required by 20.4.1.400 NMAC (incorporating 40 CFR 263); and any other local restrictions

established for transportation of hazardous waste in the affected communities.

RCRA Permit No. NMD980698849

PART 3
STORAGE OF HAZARDOUS WASTE IN CONTAINERS

PART 3

STORAGE OF HAZARDOUS WASTE IN CONTAINERS

3.1 INTRODUCTION

This Part contains the regulatory requirements for the Permittee to manage and store hazardous wastes at the Facility. The Permittee is authorized to manage and store in the Container Storage Unit (CSU) only those hazardous wastes listed in Permit Attachment 2, *Authorized Wastes and Part A Application*. Specific Facility and process information for the management, storage and transfer of hazardous waste, and a description of the CSU is provided in Permit Attachment 1. The location of the CSU is shown in Permit Attachment 1-3, *Container Storage Unit Layout*. The photographs located in Permit Attachment 1-1 show the interior of the CSU at the Facility.

The Permittee shall store a maximum of 3,820 gallons of hazardous waste in 55-gallon drums and smaller containers at any one time at the Facility. Attachment 1-1, Figure 1 shows the location of Safety-Kleen's Farmington New Mexico Service Center and Figures 4 and 5 show the surrounding off-site land use. Additional details on the construction and design of the CSU are included in Permit Attachment 1.

3.2 WASTE HANDLING BUILDING

The Permittee shall manage and store hazardous waste in the CSU building as specified in Permit Attachment 1, *Description and Design and Operation of the Facility*, subject to the following conditions:

3.2.1 Storage Containers

The Permittee shall manage and store hazardous waste in the containers specified by Permit Condition 3.4.1 of this Part.

3.2.2 Storage Locations and Quantities

The Permittee shall manage and store hazardous waste in containers in the CSU located within the physical boundary of the warehouse. The warehouse encloses an area of approximately 3060 square feet, which is further divided into the CSU, an office, rest room, a secure area for the storage of various Safety-Kleen products, and the 382-gallon secondary containment area for the CSU. The approximate area of the CSU is 475 square feet. The Permittee shall manage and store quantities of hazardous waste inside approved containers in this location not to exceed the maximum capacities specified in Table 3.1.

3.2.3 Storage Time Limit

The Permittee shall not store any hazardous waste in the CSU for more than 1 year pursuant to 20.4.1.800 NMAC (incorporating 40 CFR 268.50(b)) except as provided in Permit Condition 2.4.1.

3.2.4 Storage on Concrete Floor

The Permittee shall separate, by waste type and compatibility, hazardous waste containers unloaded from trucks transporting hazardous waste from off-site generators to the Facility in the CSU. The CSU shall have a concrete floor that slopes toward the trench secondary containment area to expose and contain any spills quickly as described in Permit Attachment 1, *Description and Design and Operation of the Facility*.

3.2.5 Minimum Aisle Space

The Permittee shall maintain sufficient aisle space between storage containers in the CSU to allow for the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment to any area within the CSU as described in Permit Attachment 6, *Preparedness and Prevention Procedures*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.35).

3.3 PERMITTED AND PROHIBITED WASTE IDENTIFICATION

3.3.1 Permitted Waste

The Permittee shall manage and store for subsequent transfer to a permitted treatment, storage, or disposal facility, only the hazardous wastes listed in Permit Attachment 2, *Authorized Wastes and Part A Application*, pursuant to the terms of this Permit.

3.3.2 Prohibited Waste

The Permittee is prohibited from managing and storing any hazardous waste that is not identified in Permit Condition 3.3.1 of this Permit. The Permittee shall not store more than 3,820 gallons of the hazardous waste types specified in Permit Condition 3.3.1 in containers in the CSU at any one time.

TABLE 3.1.

TOTAL STORAGE CAPACITY OF CONTAINER STORAGE UNIT

| TYPE OF STORAGE UNIT | EPA HAZARDOUS WASTE TYPE | AREA (Square Feet- Approximate) | MAXIMUM VOLUME OF WASTES (Gallons) |
|------------------------|---|---------------------------------------|------------------------------------|
| Container Storage Area | Spent Immersion Cleaner and Aqueous Parts Washer Solvents (D004-D011, D018, D019, D021-D030, D032-043), Dry Cleaning Waste (F002), Paint Wastes (D001, F002, F005), and Photo Imaging Wastes (D011) | 475 | 3820 |

3.4 CONDITION OF CONTAINERS

If a container holding hazardous waste is not in good condition (e.g., has severe rusting, apparent structural defects) or if it begins to leak, the Permittee shall transfer the hazardous waste from such a container to a container that is in good condition or otherwise manage the waste in compliance with the Conditions of this Permit and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.171).

3.4.1 Acceptable Storage Containers

The Permittee shall use containers that comply with the requirements of the United States Department of Transportation shipping container regulations (49 CFR 173, *Shipper's General Requirements for Shipment and Packaging*, and 49 CFR 178, *Specifications for Packaging*) for management and storage of hazardous waste at the CSU.

Containers used for storage of hazardous waste in the CSU shall have a maximum capacity of 55-gallons (208 liters) excluding the 85-gallon (322 liter) overpack drums.

Additional containers that are used for storage of wastes in the CSU are typically described as black, blue, or otherwise, and are coded 3H1/Y1.2/60/97 USA/+AA1170 4.1. Other manufacturers producing similar containers may be used as well. The containers are approximately 26.5 inches by 13.5 inches by 6 inches. The containers have a liquid capacity of approximately 9 gallons each

and are typically used to hold 5 gallons of material. Both petroleum based and water based solvents may be held in the containers.

3.5 COMPATIBILITY OF WASTE WITH CONTAINERS

The Permittee shall use containers made of, or lined with materials, which will not react with, and are otherwise compatible with, the hazardous waste to be stored, so that the ability of the container to contain the waste is not impaired as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.172). The Permittee shall ensure compliance with this requirement by conducting pre-acceptance characterization of waste as described in Permit Attachment 3, *Waste Analysis Plan*, considering the precautions described under "Preventive Measures" in Permit Attachment 1, *Description and Design and Operation of the Facility*.

3.6 MANAGEMENT OF CONTAINERS

The Permittee shall keep all containers closed during storage, except when it is necessary to add or remove waste, and shall not open, handle, or store containers in a manner which may rupture the container or cause it to leak as referenced in 20.4.1.500 NMAC (incorporating at 40 CFR 264.173).

3.7 SECONDARY CONTAINMENT SYSTEMS

The Permittee shall construct and maintain secondary containment systems for all containers in the CSU in accordance with the specifications contained in 20.4.1.500 NMAC (incorporating 40 CFR 264.175), and the procedures described in Permit Attachment 1, *Description and Design and Operation of the Facility*.

3.8 INSPECTION SCHEDULES AND PROCEDURES

The Permittee shall inspect the CSU and evaluate the condition of containers and secondary containment systems, safety equipment, and aisle space daily, quarterly, and annually, to detect leaking containers, deterioration of containers and the containment system caused by corrosion and other factors, in accordance with the Inspection Schedules located in Permit Attachment 5, *Inspection Plan and Schedule*, Attachment 5-1, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.174).

3.9 RECORD KEEPING

The Permittee shall place the results of all waste analyses and any other documentation showing compliance with the requirements of Permit Condition 2.15, *Record Keeping and Reporting*, in the

Facility operating record, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(a)).

3.10 CLOSURE

Before closure of the CSU, the Permittee shall remove all hazardous waste and hazardous waste residues from the containment system in accordance with the procedures described in Permit Attachment 10, *Closure Plan*. Remaining containers, liners, bases and soils containing or contaminated with hazardous waste or hazardous waste residues must be decontaminated or removed pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.178).

3.11 SPECIAL CONTAINER PROVISIONS FOR IGNITABLE OR REACTIVE WASTE

3.11.1 Location of Ignitable and Reactive Waste

The Permittee shall not locate containers holding ignitable or reactive hazardous waste within 15 meters (50 feet) of the Facility's property line as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.176).

3.11.2 Procedures to Prevent Ignition/Reaction

The Permittee shall take precautions to prevent accidental ignition or reaction of ignitable or reactive waste and follow the procedures specified in Permit Attachment 6, *Preparedness and Prevention*, and as required by 20.4.1.500 NMAC (incorporating 264.17 and 40 CFR 264.176).

3.11.3 Storage of Hazardous Waste Containers

Containers of ignitable and reactive wastes shall be stacked no more than two high, in order to comply with the National Fire Protection Association's Flammable and Combustible Liquids Code.

3.12 SPECIAL CONTAINER PROVISIONS FOR INCOMPATIBLE WASTE

3.12.1 Storage of Incompatible Wastes

The Permittee shall not place incompatible wastes in the same containers, as set forth in Permit Attachment 6, *Preparedness and Prevention*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.177(a)).

3.12.2 Management of Unwashed Containers

The Permittee shall not place hazardous waste in an unwashed container that previously held an incompatible waste or material in accordance with by 20.4.1.500 NMAC (incorporating 40 CFR 264.177(b)).

3.12.3 Separation of Hazardous Waste Containers

The Permittee shall separate containers of incompatible wastes as described in Permit Attachment 6, *Preparedness and Prevention*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.177(c)).

3.13 AIR EMISSION STANDARDS

The Permittee shall manage all hazardous waste placed in the CSU in accordance with the applicable requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264 Subparts BB, and CC) pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.200) and as required by Parts 6 and 7 of this Permit.

RCRA Permit No. NMD980698849

PART 4
STORAGE OF HAZARDOUS WASTE IN TANKS

PART 4

STORAGE OF HAZARDOUS WASTE IN TANKS

4.1 INTRODUCTION

This Part contains the regulatory requirements for the Permittee to manage and store hazardous wastes at the Facility. The Facility is authorized to manage and store in the 12,000-gallon above ground spent solvent storage tank only those hazardous wastes listed in Permit Attachment 2, *Authorized Wastes and Part A Application*. The storage tank system at the Facility consists of two 12,000-gallon aboveground, vertical cylindrical steel tanks and their ancillary pumps and piping. The tanks are enclosed within secondary containment provided by concrete slab and wall with a capacity of 18,266 gallons. One of the two tanks contains new solvent awaiting distribution and the other contains spent solvent awaiting return to a Safety-Kleen Recycle Center. The 12,000-gallon spent solvent storage tank is the only tank regulated by this Permit. The spent solvent is regulated as a hazardous waste because of the characteristic of ignitability and the possible characteristic of toxicity as measured by the Toxicity Characteristic Leaching Procedure (TCLP).

Ancillary equipment to the spent solvent storage tank includes a return and fill station containing an enclosed drum washer/dumpster into which the contents of a drum of used solvent are emptied. A maximum volume of 375 gallons is retained in the drum/washer dumpster. A float switch controls a pump that moves excess solvent to the spent solvent tank. When the tank is empty, solvent in the bottom of the main cabinet is re-circulated through the drum washer for any remaining drum cleaning requirements. All spent solvents and sediments are then pumped into the spent solvent tank. The return and fill station has a roof and is equipped with concrete secondary containment with a capacity of 730 gallons. Piping to the tank from the return and fill station is steel, with welded joints. It is protected by secondary containment except for approximately five feet at the rear of the return and fill station which must be inspected daily for leaks. The pump, which provides clean solvent for filling drums, is located within the secondary containment. The connections for emptying the spent solvent tank and filling the clean solvent tank from tanker trucks are located within the secondary containment.

Based on the registered professional engineer's assessment of the tank system, the two 12,000-gallon storage tanks were fabricated and installed in 1981.

4.2 PERMITTED AND PROHIBITED WASTE IDENTIFICATION

4.2.1 Permitted Waste

The Permittee may store a maximum total volume of 12,000 gallons of spent solvent in the 12,000-gallon spent solvent storage tank, as described and depicted in Permit Attachment 1, *Description and Design and Operation of Facility*, subject to the terms of this Permit. The hazardous waste exhibits the characteristic of ignitability (D001) and possible toxicity (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, D043).

4.2.2 Prohibited Waste

The Permittee is prohibited from storing, transporting, or treating hazardous waste that is not identified in Permit Condition 4.2.1 of this Permit.

4.2.3 Storage Time Limit

The Permittee shall not store any hazardous waste in the 12,000 gallon spent solvent storage tank for more than one year pursuant to 20.4.1.800 NMAC (incorporating 40 CFR 268.50(b)) except as provided in Permit Condition 2.4.1.

4.3 SECONDARY CONTAINMENT SYSTEMS

The Permittee shall construct and maintain secondary containment systems for both 12,000-gallon storage tanks, the drum washer/dumpster, and all other related appurtenances in the Facility in accordance with the specifications required by 20.4.1.500 NMAC (incorporating 40 CFR 264.193), and the procedures described in Permit Attachment 1, *Description and Design and Operation of the Facility*. The portion of the return and fill station not provided with secondary containment shall be inspected daily for leaks.

4.4 INSPECTION SCHEDULES AND PROCEDURES

The Permittee shall inspect the 12,000-gallon storage tanks, the drum washer/dumpster, and all other related appurtenances in the Facility in order to assess the condition of the tanks, drum washer/dumpster, related equipment, secondary containment systems, and safety equipment daily, quarterly, and annually, to detect leaks, deterioration of structures and equipment, and the containment system caused by corrosion and other factors, in accordance with the inspection schedules located in Permit Attachment 5, *Inspection Plan and Schedule*, Attachment 5-1, as

required by 20.4.1.500 NMAC (incorporating 40 CFR 264.195) and as follows:

4.4.1 Tanks

The Permittee shall inspect the tank systems in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.195) and the inspection schedules located in Permit Attachment 5, *Inspection Plan and Schedule*. The Permittee shall complete the items in Permit Conditions 4.4.1 and 4.4.2 as part of those inspections.

The Permittee shall inspect the following components of the tank system once each operating day as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.195(b)(1) through 40 CFR 264.195(b)(3));

1. Aboveground portions of the tank system, if any, to detect corrosion or releases of waste;
2. Data gathered from monitoring and leak detection equipment (e.g., level gauges) to ensure that the tank system is being operated according to its design;
3. The construction materials and the area immediately surrounding the externally accessible portion of the tank system, including the secondary containment system to detect erosion or signs of releases of hazardous waste (e.g., wet spots, dead vegetation).

4.4.2 Overfill Controls

The Permittee shall inspect the overfill controls, in accordance with the inspection schedules located in Permit Attachment 5, *Inspection Plan and Schedule*, pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.195(a)).

4.4.3 Documentation

The Permittee shall document compliance of Permit Condition 4.4 in the Facility Operating Record pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.195(d)).

4.5 RECORD KEEPING

The Permittee shall place the results of all waste analyses and any other documentation showing compliance with the requirements of Permit Condition 2.15, *Record Keeping and Reporting*, in the Facility operating record, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(a)).

4.6 OPERATING REQUIREMENTS

The Permittee shall not place hazardous wastes or treatment reagents in the spent solvent tank system if they could cause the tank, its ancillary equipment, or the containment system to rupture, leak, corrode, or otherwise fail. The Permittee shall prevent spills and overflows from the tank or containment systems using the methods described in Permit Attachment 6, *Preparedness and Prevention*, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.194(a) and (b)).

4.7 RESPONSE TO LEAKS OR SPILLS

In the event of a leak or a spill from the tank system, from a secondary containment system, or if a system becomes unfit for continued use, the Permittee shall remove the system from service immediately and complete the following actions as specified in 20.4.1.500 NMAC (incorporating 40 CFR 264.196):

4.7.1 Cessation Of Use

Stop the flow of hazardous waste into the system and inspect the system to determine the cause of the release as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(a));

4.7.2 Removal Of Waste

The Permittee shall remove waste and any accumulated precipitation from the system within 24 hours of the detection of the leak to prevent further release and to allow inspection and repair of the system. If the Permittee demonstrates that it is not possible to meet this time period, the Permittee shall notify the Secretary and demonstrate that the longer time period is required pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.196(b)).

If the collected material is a RCRA hazardous waste, it shall be managed in accordance with all applicable requirements of 20.4.1 NMAC (incorporating 40 CFR 264 through 40 CFR 270). If the collected material is discharged through a point source to U.S. waters or to a Publicly Owned Wastewater Treatment facility, it is subject to requirements of the Clean Water Act. If the collected material is released to the environment, it may be subject to reporting under 40 CFR Part 302.

4.7.3 Containment

The Permittee shall immediately conduct a visual inspection of all releases to the environment to prevent further migration of the leak or spill to soils or surface water and remove and

properly dispose of any visible contamination of the soil or surface water as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(c)).

4.7.4 Notification And Reports

The Permittee shall report to the Secretary within 24 hours of detection when a leak or spill occurs from the tank system or secondary containment system to the environment pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.196(d)(1)).

A leak or spill is exempted from these requirements if the quantity of waste leaked or spilled is one pound or less and is immediately contained and cleaned up as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(d)(2)). If the Permittee has reported the release pursuant to 40 CFR Part 302, this report will satisfy the requirements of this Permit Condition.

Within 30 days of detection of a release to the environment from the tank system or secondary containment system, the Permittee shall report the following information to the Secretary as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(d)(3));

1. Likely route of migration of the release;
2. Characteristics of the surrounding soil (including soil composition, geology, hydrogeology, and climate);
3. Results of any monitoring or sampling conducted in connection with the release. If the Permittee finds it will be impossible to meet this time period, the Permittee shall provide the Secretary with a schedule of when the results will be available. This schedule shall be submitted for approval before the required 30-day submittal period expires and shall provide for submission of data as soon as possible;
4. Proximity of downgradient drinking water, surface water, and populated areas;
5. Description of response actions taken or planned.

4.7.5 Provision of Secondary Containment

Unless the Permittee satisfies the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.196(e)(2) through 40 CFR 264.196(e)(4)), the tank system must be closed in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.197).

4.7.5.a Releases Caused By Spills

For a release caused by a spill that has not damaged the integrity of the system, the Permittee shall remove the released waste and make any necessary repairs to fully restore the integrity of the system before returning the tank system to service as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(e)(2)).

4.7.5.b Tank Leaks

For a release caused by a leak from the primary tank system to the secondary containment system, the Permittee shall repair the primary system prior to returning it to service as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(e)(3)).

4.7.5.c Releases To The Environment

For a release to the environment caused by a leak from the aboveground portion of the tank system that does not have secondary containment, and can be visually inspected, the Permittee shall repair that portion of the tank system prior to returning it to service in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.196(e)(4)). The repaired portion of the tank system may be returned to service without secondary containment provided that the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.196(f)) are satisfied.

4.7.5.d Tank Component Replacement

If the Permittee replaces a component to comply with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.196(e)(4)), that component must therefore satisfy the requirements for new tank systems or components pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.192 and 40 CFR 264.193).

4.7.5.e Tank System Repairs

For all major repairs to eliminate leaks or restore the integrity of the tank system, the tank system shall not be returned to service unless the Permittee has obtained a certification by an independent, qualified, registered professional engineer pursuant to 20.4.1.900 NMAC (incorporating 40 CFR 270.11(d)), that the repaired system is capable of handling hazardous wastes without release for the intended life of the system. This certification shall be submitted to the Secretary within 7 days after returning the tank system to use as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.196(f)).

4.8 CLOSURE AND POST CLOSURE

4.8.1 Closure

During closure of the tank system, the Permittee shall remove or decontaminate all waste residues, contaminated system components, contaminated soils, structures and equipment contaminated with waste, and manage them as hazardous waste unless 20.4.1.200 NMAC (incorporating 40 CFR 261.3(d)) applies. The closure plan, closure activities, cost estimates for closure, and financial responsibility for tank systems must meet all of the requirements specified in 20.4.1.500 NMAC (incorporating 40 CFR 264 Subparts G and H) and in accordance with Permit Attachment 10, *Closure Plan*.

4.8.2 Post-Closure

If the Permittee demonstrates that not all contaminated soils can be practically removed or decontaminated as required in 4.8.1, then the Permittee shall close the tank system and perform post-closure care in accordance with the closure and post-closure care requirements that apply to landfills pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.197(b)). In addition, for the purposes of closure, post-closure, and financial responsibility, such a tank system is then considered to be a landfill, and the Permittee shall meet all requirements for landfills as specified in 20.4.1.500 NMAC (incorporating 40 CFR 264 Subparts G and H).

4.9 SPECIAL REQUIREMENTS FOR IGNITABLE OR REACTIVE WASTES

The Permittee shall not place ignitable or reactive waste in the tank system or in the secondary containment system, unless the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.198) are satisfied.

The Permittee shall comply with the requirements for the maintenance of protective distances between the waste management area and any public ways, streets, alleys, or an adjoining property line that can be built upon, as required in Tables 2-1 through 2-6 of the National Fire Protection Association's Flammable and Combustible Liquids Code, (1977 or 1981), as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.198(b)).

4.10 SPECIAL REQUIREMENTS FOR INCOMPATIBLE WASTES

The Permittee shall not store incompatible wastes, or incompatible wastes and materials in the tank system, or place hazardous waste in a tank system that has not been decontaminated that previously held an incompatible waste or material unless the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.17(b))

are satisfied pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.199).

4.11 AIR EMISSION STANDARDS

The Permittee shall manage all hazardous waste placed in a tank in accordance with the applicable requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264 Subparts BB, and CC) pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.200) and as required by Parts 6 and 7 of this Permit.

NMD 980698849

Safety-Kleen is an international, service-oriented company whose customers are primarily engaged in automotive repair, industrial maintenance, and dry cleaning. The company, in operation since 1968, offers solvent collection and reclamation services to customers nationwide. The Farmington Service Center is a service branch which leases and services Safety-Kleen parts cleaning equipment and solvents to Safety-Kleen customers. The service branch also collects spent parts washer solvent, spent immersion cleaner, dry cleaning wastes (perchloroethylene), paint waste/lacquer thinner, photo/imaging wastes and spent industrial solvents. Once a sufficient quantity of materials is collected, the materials are transported to a recycle center, contract reclaimer or other permitted facility for treatment and/or disposal.

| PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY |
|--------------|--|---|
| D79 | Disposal Injection Well | Gallons; Liters; Gallons Per Day; or Liters Per Day |

XII. Process Codes and Design Capabilities (Continued)

EXAMPLE FOR COMPLETING ITEM XII (shown in line number X-1 below): A facility has a storage tank, which can hold 533,788 gallons.

| Line Number | A. Process Code (From list above) | B. PROCESS DESIGN CAPACITY | | C. Process Total Number Of Units | For Official Use Only |
|-------------|--------------------------------------|----------------------------|---------------------------------|----------------------------------|-----------------------|
| | | 1. Amount (Specify) | 2. Unit Of Measure (Enter code) | | |
| X 1 | S 0 2 | 533,788 | G | 001 | |
| 1 | S 0 1 | 3,820 | G | 001 | |
| 2 | S 0 2 | 12,000 | G | 001 | |
| 3 | | | | | |
| 4 | | | | | |
| 5 | | | | | |
| 6 | | | | | |
| 7 | | | | | |
| 8 | | | | | |
| 9 | | | | | |
| 10 | | | | | |
| 11 | | | | | |
| 12 | | | | | |
| 13 | | | | | |

NOTE: If you need to list more than 13 process codes, attach an additional sheet(s) with the information in the same format as above. Number the lines sequentially, taking into account any lines that will be used for "other" processes (i.e., D99, S99, T04 and X99) in item XIII.

XIII. Other Processes (Follow instructions from item XII for D99, S99, T04 and X99 process codes)

| Line Number (Enter the line number in neg w/XS) | A. Process Code (From list above) | B. PROCESS DESIGN CAPACITY | | C. Process Total Number Of Units | D. Description Of Process |

XIV. Description of Hazardous Wastes

- A. EPA HAZARDOUS WASTE NUMBER** - Enter the four-digit number from 40 CFR, Part 261 Subpart D of each listed hazardous waste you will handle. For hazardous wastes which are not listed in 40 CFR, Part 261 Subpart D, enter the four-digit number(s) from 40 CFR, Part 261 Subpart C that describes the characteristic and/or the toxic constituents of those hazardous wastes.
- B. ESTIMATED ANNUAL QUANTITY** - For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic constituent entered in column A estimate the total annual quantity of all the non-listed waste(s) that will be handled which possess that characteristic or constituent.
- C. UNIT OF MEASURE** - For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

| ENGLISH UNIT OF MEASURE | CODE | METRIC UNIT OF MEASURE | CODE |
|-------------------------|------|------------------------|------|
| POUNDS | P | KILOGRAMS | K |
| TONS | T | METRIC TONS | M |

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES

1. PROCESS CODES:

For listed hazardous waste: For each listed hazardous waste entered in column A select the code(s) from the list of process codes contained in Item XIV A, on page 3 to indicate how the waste will be stored, treated, and/or disposed of at the facility.

For non-listed hazardous waste: For each characteristic or toxic constituent entered in column A, select the code(s) from the list of process codes contained in Item XIV A, on page 3 to indicate all the processes that will be used to store, treat, and/or dispose of all the non-listed hazardous wastes that possess that characteristic or toxic constituent.

NOTE: THREE SPACES ARE PROVIDED FOR ENTERING PROCESS CODES. IF MORE ARE NEEDED:

- Enter the first two as described above.
- Enter "00" in the extreme right box of Item XIV-E.
- Use additional sheet, enter line number from previous sheet, and enter additional code(s) in Item XIV-E.

- 2. PROCESS DESCRIPTION:** If a code is not listed for a process that will be used, describe the process in the space provided on the form (D-2).

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER - Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described in the form as follows:

- Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B, C and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
- In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column (C) on that line enter "Included with above" and make no other entries on that line.
- Repeat step 2 for each EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM XIV (shown in line numbers X-1, X-2, X-3, and X-4 below): A facility will treat and dispose of an estimated 300 pounds per year of chrome shavings from leather tanning and finishing operations. In addition, the facility will treat and dispose of three non-listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

| Line Number | A. EPA HAZARD WASTE NO. (Enter code) | B. ESTIMATED ANNUAL QUANTITY OF WASTE | C. UNIT OF MEASURE (Enter code) | D. PROCESSES | |
|-------------|---|---------------------------------------|------------------------------------|---------------------------|--|
| | | | | (1) PROCESS CODES (Enter) | (2) PROCESS DESCRIPTION (If a code is not entered in D-1) |
| X-1 | K 3 3 4 | 300 | P | T 0 3 0 8 0 | |
| X-2 | D 3 3 2 | 200 | P | T 0 3 0 8 0 | |
| X-3 | D 3 3 1 | 100 | P | T 0 3 0 8 0 | |
| X-4 | D 3 3 2 | | | | Included with Above |

Secondary ID Number (Enter from page 1)

XV. Map

Attach to this application a topographic map, or other equivalent map, of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in this map area. See instructions for precise requirements.

XVI. Facility Drawing

All existing facilities must include a scale drawing of the facility (See instructions for more detail).

XVII. Photographs

All existing facilities must include photographs (aerial or ground-level) that clearly delineate all existing structures; existing storage, treatment and disposal areas; and sites of future storage, treatment or disposal areas (see instructions for more detail).

XVIII. Certification(s)

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Safety-Kleen Systems, Inc. Farmington, NM, Service Center
Facility Operating Permit
RCRA Permit No. NMD980698849

ATTACHMENT 3
WASTE ANALYSIS PLAN

ATTACHMENT 3 WASTE ANALYSIS PLAN

3.1 INTRODUCTION

The Waste Analysis Plan (WAP) was provided to the New Mexico Environment Department by Safety-Kleen Systems Inc., (Safety-Kleen, Facility) in accordance with the requirements of the New Mexico Hazardous Waste Management Regulations, 20.4.1.900 NMAC (incorporating 40 CFR 270.14(b)(2) and (3)) and Permit Condition 2.5.

The Facility shall store only wastes included in Part A of the Permit Application for the storage facility hazardous waste permit and not otherwise prohibited by the Permit. Safety-Kleen will not store any hazardous waste for more than one year.

Annual Waste Characterization data for the waste streams are located in Attachment 3-1. These waste streams are characterized annually as described in the "Statistical Analysis of Annual Waste Characterization Data", attached and incorporated herein by reference. The testing and sampling methodology is as described in Section 3.5. The data generated in this process is used to assign waste codes, if any, for each waste stream. The data generated in the annual recharacterization (AR) is also used to assist recycle centers in recycling or treating the waste streams. Recycle centers also rely on their own waste analysis plans to generate data to recycle materials and or dispose of waste. If while providing service to a customer if there is suspicion that the waste does not meet the acceptance criteria, the waste will not be picked up and the customer must provide information explaining what is in the waste and how the waste was adulterated.

Providing service to Safety-Kleen customers is dependent on a review of the customer business. If the business is a typical generator of that waste stream (for example, a garage generating parts washer waste), then limited review is performed. If the business is not a typical generator of that waste stream or if the business has other processes on site, a more detailed review of the business is performed and a certification from the customer is required stating the waste will be as described without adulterants. For example, laboratory analysis of that customer's waste may be required.

In this AR process, regulated hazardous constituents and reasonably expected underlying hazardous constituents (UHC)s are also discovered. Underlying Hazardous Constituents discovered in the AR shall be assumed to be expected throughout the waste stream. Safety-Kleen's Underlying Hazardous Constituents for

current year are contained in Attachment 3-1. The applicable constituent concentration or technology based treatment standards for the wastes and/or individual hazardous constituents will be identified, if required by regulation, on the Land Disposal Regulation (LDR) form generated from this data, an example of which is provided in Attachment 3-2. The LDRs generated in this process also identify whether the waste must be treated before being land disposed when required by regulation.

Annual recharacterization data is also used to update subpart BB and Subpart CC compliance plans. It is anticipated that minor changes in the waste streams are unlikely to significantly change in air emissions.

Recycle centers shall test every shipment of waste for PCBs. If a shipment is discovered to contain PCBs, the source of the PCBs is traced and appropriate 40 CFR 761 requirements are implemented. Any equipment contaminated by PCBs is removed from service decontaminated cleaned before being put into service.

The Safety-Kleen transportation department is responsible for selecting packaging for Safety-Kleen waste streams, in addition to their responsibility for company compliance with Federal, State, and Local transportation regulations and rules. The transportation department has selected packaging based on past waste recharacterizations and continues to review AR and other data to maintain compliance with material packaging requirements.

The Waste Analysis Plan also provides information about how Safety-Kleen plans to accept, manage, and store hazardous wastes at their Farmington, New Mexico, Service Center (Facility) in order to meet the requirements of the New Mexico Hazardous Waste Management Regulations 20.4.1 NMAC (incorporating 40 CFR 260 through 40 CFR 270). The WAP shall be included in the operating record that Safety-Kleen shall keep on-site in the Administration Office. The wastes that Safety-Kleen shall be accepting for storage and subsequent transfer to a Safety-Kleen recycling facility or a contract re-claimer are listed in Permit Attachment 2, *Authorized Wastes and Part A Application*.

Table 3-1

Waste Analysis Plan, Abstract

| Waste Description | EPA Hazardous Waste Numbers | Capacity ¹ | Annual Amount ² |
|---------------------------|-------------------------------|-----------------------|----------------------------|
| Spent Solvents | D001 ³ | 12,000 | 50,000 |
| Bottom Sediment from Tank | D001 ³ | N/A | 2,000 |
| Spent Immersion Cleaner | D001 ³ | 4,464 | 3,000 |
| Dry Cleaning Waste | D001, F002 ³ | 4,464 | 6,000 |
| Paint Waste | F003, F005, D001 ³ | 4,464 | |
| Photo Chemical Wastes | D011 | 4,464 | |

Notes: 1. The facility capacity is in gallons.

2. The annual amount is in gallons.

3. May also include D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043

The total amount of drummed waste shall not exceed 3,820 gallons in the Container Storage Unit at any one time.

3.2 DESCRIPTION OF WASTES

Several types of waste result from the servicing of Safety-Kleen customers and the maintenance of the service center. It should be noted that the solvents managed at this facility are incompatible with strong oxidizers and reactive metals, none of which are present in the containers, container storage area, or the concrete sealant. The solvents are also compatible with one another. Analytical data for the wastes and specifications for the products are located in Attachments 3-1 and 3-2. Qualitative descriptions of the acceptable wastes are identified in Sections 3.3.1 through 3.3.4.

3.2.1 Wastes Resulting from the Parts Washer Service

Used spent solvents from parts washers are accumulated in the 12,000-gallon above ground spent solvent storage tank via the return and fill station. Containers of used material are poured into the drum washer/dumpster at the return and fill station, which in turn empties into the 12,000-gallon spent solvent above ground storage tank. This waste handling method results in several types of solvent waste as described below.

3.2.1.a Used Solvent

The used solvent (Stoddard Solvent) is removed from the tank by a tanker truck on a scheduled basis. Approximately 5,000 gallons are removed monthly. This waste is ignitable (D001) and may exhibit toxicity characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.

3.2.1.b Bottom Sediment in the Tank

Approximately once every two years, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.

3.2.1.c Dumpster Sediment

Sediment may also accumulate in the drum washers in the return/fill station. The sediment is manually removed and placed in containers. The dumpster sediment is representative of the waste codes described in items 3.2.1.a and 3.2.1.b.

The sediment from the bottom of the drum washer/dumpster in the return and fill station is removed manually by a shovel, containerized and stored in the CSU. The containers are properly labeled indicating contents. The chemical composition of this waste is similar to that of the tank bottom sediment and therefore carries the same EPA hazardous waste codes.

3.2.1.d Immersion Cleaner

Immersion cleaner is a different type of solvent that is not placed in the aboveground storage tank. Containers of immersion cleaner typically remain in the drum in which it was originally

used until it is received at the recycle center. Drums are placed in the drum storage area of the warehouse and are stacked no more than two-high in the drum storage area of the warehouse.

The immersion cleaner is a non-halogenated mixture and may exhibit toxicity characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.

3.2.1.e Used Aqueous Parts Cleaner Solvents

This waste may be bulked at the service center into containers that meet DOT specifications or may be co-mingled with the other solvent into the used solvent tank. It may be toxic using the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.

3.2.2 Wastes Resulting from the Dry Cleaner Service

Dry cleaning wastes consist of spent filter cartridges, separator water powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in DOT approved containers (typically black 16-, 30-, or split 30-gallon containers). The containers are then palletized, stacked two high and placed in the CSU.

Approximately 90% of the dry cleaning solvent used is perchloroethylene (tetrachloroethylene) (F002, and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and 5% 1,1,2-trichloro- 1,2,2- trifluoroethane (F002) and may exhibit toxicity characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043), and 5% is mineral spirits with the waste code of D001. Other types of dry cleaning wastes (e.g. freon) will be managed on a transfer basis only.

3.2.3 Paint Wastes

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and may be toxic as per the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043). The wastes are collected in containers which meet DOT requirements at the customer's place of business and containers

are then palletized and stored in an enclosed concrete masonry building (Flammable Storage Building).

3.2.4 Photographic/Imaging Wastes

Some photographic wastes managed by the Facility are not solid wastes per 20.4.1.200 NMAC (incorporating 40 CFR 261.2(c)) because the hazardous constituent is reclaimed. Others are managed under the provisions of 20.4.1.700 NMAC (incorporating 40 CFR 266 Subpart F) relating to recyclable materials utilized for precious metals recovery. Imaging waste typically consists of three waste streams, photo fixer solution, used photo developer, and silver collection canisters. Photo fixer solution is an aqueous solution used to etch photo film during processing and exhibits a toxicity characteristic of D011 (Silver). The photo fixer solution is a hazardous waste and is subject to the requirements of 20.4.1.800 NMAC (incorporating 40 CFR 268). Safety-Kleen is able to recover the silver from this solution. Used photo developer is an aqueous solution that exhibits no hazardous waste characteristics but shall not be allowed to discharge into public wastewater treatment systems in some communities. The silver collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste in accordance with 20.4.1.100 NMAC (incorporating 40 CFR 260.30(c)), and are managed as a non-regulated material.

3.3 QUALITY CONTROL PROCEDURES

The used solvents are the primary feedstocks for the generation of Safety-Kleen solvent products. As a result, quality control of the used solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The Farmington service center collects spent solvent from approximately 400 customers, most of whom are small quantity generators, and containers of recoverable solvents which are returned to the service center each year for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

All the materials collected at the service center are managed at all times in a closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers as described in

Section 3.3. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

However, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR (a)(3)(i)), Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated. It is Safety-Kleen's practice that suspected non-conforming material must not be accepted until a full analysis has been conducted. If a container with questionable contents is returned to the service center, a sample will be taken and analysis will be performed at the recycling center, Safety-Kleen Tech Center (Elk Grove Village, Illinois) or other qualified lab according to the procedures outlined in Section 3.4 of this attachment. The Branch Manager will be notified of any contamination that may have occurred.

3.3.1 Quality Control Training

Safety-Kleen trains personnel to verify the physical characteristics of the wastes at several points in the management of the solvent. These procedures are described briefly below.

Safety-Kleen controls the use and management of its solvents by:

1. Limiting the solvents stored to those compatible with one another and their containers;
2. Limiting the uses of each type of solvent (example, dry cleaning waste is only collected from dry cleaner shops);
3. Determining the customer's type of business (i.e., the SIC code is recorded) and the purpose for which the customer will use the machine;
4. Training customers to use the machines properly;
5. Training employees to inspect the physical characteristics of used solvent and determine whether it is acceptable;
6. When waste is collected from a customer, indicate on the service document whether the used solvent meets Safety-Kleen's acceptance criteria;
7. Marking each container with the customer's name, address, and EPA I.D. number (if available). This

information remains on containerized waste until it is accepted at the reclamation facility;

8. Keeping a record of each incoming and outgoing shipment in the operating log; and

Safety-Kleen's customers sign a service document containing the following information:

1. The name, address and EPA I.D. number of the facility to which the waste is being shipped;
2. The customer's name, address and EPA I.D. number (if available); and
3. The description and amount of Safety-Kleen solvent waste generated.

In addition, each incoming and outgoing shipment shall be recorded in the Facility's Operating Log.

If a waste is rejected at the time of service, the customer will be given a choice as to whether he/she will dispose of the waste or require Safety-Kleen's assistance. If they request Safety-Kleen's assistance, a sample will be drawn using a Coliwasa tube or similar sampling device to ensure representative samples. The sample will be analyzed for flash point and volatile organic compounds. If this analysis does not adequately define the constituents, additional analyses will be performed as necessary (e.g., semi-volatile organic compounds, PCBs, etc.).

The laboratory sends waste analyses results to the service center. If through the additional analysis the waste is determined to be acceptable at the branch, it will be relabeled, manifested and then managed with the other wastes. If it is determined through the additional analysis to not be acceptable, the waste will either be: (a) managed at the Service Center on a 10 day transfer basis and manifested to a properly permitted reclamation or disposal facility, or (b) manifested and shipped directly to a properly permitted reclamation or disposal facility. The analytical results from the additional characterization analysis will be used to appropriately manage the waste. The Branch Manager has the right to refuse any further service to a business, which has returned waste that does not meet acceptable criteria.

3.3.2 Qualitative Waste Analysis

3.3.2.a General Inspection Procedures

See Attachment 3-3 for inspection training details.

1. Safety-Kleen visually inspects each drum of waste when it is collected at the customer's location. Safety-Kleen examines the waste for volume, appearance, consistency and odor and is intimately familiar with the characteristics of the waste it receives. Based on the known waste characteristics, Safety-Kleen has established the specific acceptance criteria set forth below, to be used by Safety-Kleen personnel in their visual inspections. These inspection procedures allow Safety-Kleen to ensure that the waste being picked up meets appropriate acceptance criteria;
2. If a particular drum of waste does not meet the acceptance criteria, the Safety-Kleen service representative will either (1) sample the waste for testing at a Safety-Kleen laboratory to determine whether the waste has been contaminated; or (2) reject the waste. In the event the waste is not sampled, Safety-Kleen will notify the generator's State Agency that is authorized to implement the RCRA hazardous waste management program (or EPA if the RCRA program has not been delegated to the State);
3. If the waste is sampled for further analysis, the service representative will collect a sample, then seal the drum and label it as hazardous waste. The drum is left with the customer pending the results of the laboratory tests. The laboratory testing initially involves analyzing the suspect waste for flash-point and the presence of volatile organic compounds. Pending those results, additional constituents may also be analyzed. The costs of any sampling and testing performed as a result of the waste failing to meet the acceptance criteria, will be borne by the customer;
4. If the laboratory analysis reveals that the sampled waste is not contaminated, Safety-Kleen will accept the waste from the customer. If the laboratory confirms that the waste is contaminated, the generator will be responsible for securing an alternate means of disposal or they may contract with Safety-Kleen to handle the waste on a 10-day transfer basis.

3.3.2.b Waste Specific Criteria

The following is a description of the specific acceptance criteria for each waste stream:

3.3.2.b.i Used Solvent

1. The acceptance criteria for determining by visual inspection whether used solvent has been contaminated are volume, odor and color, the most significant of which is volume. If the volume of waste in a given drum exceeds the specified level, the Safety-Kleen service representative will conduct an inquiry of the customer's operation and handling procedures. Contingent on the customer's responses, the solvent may be accepted, a sample of the waste may be collected for laboratory testing as described above, or the waste may be rejected.
2. In addition to the volume criterion, the odor of the used solvent may typically indicate whether the waste has been contaminated. Used solvent has a distinctive odor. The service representatives are expressly instructed not to deliberately sniff the waste. However, if the solvent has been contaminated the service representative may notice a difference in the odor when he services the machine.
3. The used solvent is also visually inspected for its color. Unused solvent typically has a clear or greenish tint. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. In the case of a print shop, the solvent may be clear, green, brown, black, or many colors. Therefore, if the used solvent does not appear to be the expected color, the service representative will sample the waste for possible contamination as described above, or will reject the waste.

3.3.2.b.ii Immersion Cleaner

1. The criteria for the inspection of used immersion cleaner are volume and color. If the volume of waste exceeds the specified level a sample will be tested for contamination following the procedures described above or the waste will be rejected.
2. Unused immersion cleaner is amber in color. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. If the used immersion cleaner does not appear to be the expected color, the service representative will either sample the waste for

possible contamination as described above, or reject the drum of waste.

3.3.2.b.iii Dry Cleaner Wastes

Dry cleaner wastes normally consist of used filter cartridges, powder residue, and still bottoms.

1. Used Filter Cartridges:

Used filter cartridges are placed in containers meeting DOT specifications. It is obvious to the service representative whether the items in the drums are filter cartridges. The drums may also contain approximately one inch of liquid, which should either be clear or have a light brownish tint. If the amount of the liquid is greater than approximately one inch or if the liquid is a color other than light brown, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

2. Powder Residue:

The criteria for the acceptance of powder residue are consistency and color, the former being the more significant criterion of the two. A drum of powder residue should not contain any liquid. As the name implies, it will be dry or "powdery". If there is any liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

The powder residue is also inspected for color and should appear to be grayish-black. If the residue is not grayish-black in color, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

3.3.2.b.iv Still Bottoms

The criteria for the acceptance of dry cleaning still bottoms are consistency and color. The waste should have a highly viscous, tar-like consistency. If the consistency of the waste is too thin or if there is more than one inch of free liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or will be rejected.

In addition to consistency, the still bottom waste is inspected for color. The waste should appear dark brown or black in color. If the waste is a different color, a service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

3.3.2.b.v Paint Wastes

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

1. Lacquer Thinner Waste:

The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in pails, which meet DOT requirements. The paint gun cleaning machine operates as a closed system where by there should never be a combined volume of more than the expected amount of solvent in the two collection pails. The solvent is pumped from a tube in a left hand pail (facing the machine) through the machine into the right hand pail. The left hand pail starts with clean solvent which will be pumped out as the machine is used to clean the spray guns. If a service representative discovers more than the expected amount of solvent in the two pails, or there is an overfill from the right hand pail, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

2. Paint Waste:

a. Liquid

The significant criterion for the inspection of paint waste is consistency. The waste should contain no more than 30 percent solids. The service representative will insert a COLIWASA or similar sampling device into the drum. The sampling device should glide easily down to the bottom of the drum. The service representative will handle this waste as a Class 3 flammable waste. If there is resistance to the insertion of the glass tube, it is assumed that the level of solids is in excess of 30 percent and the service representative will reject the waste.

The contents of the glass tube are also visually examined for consistency and water content. The

material should be a "free flowing" liquid, but should not contain a significant amount of water. If there is more than approximately 10 inches of water in the 3-foot tube (the water and paint will separate in the tube and thus can be measured) the waste will be rejected.

b. Solid

For waste containing more than 30 percent solids the service representative will handle the waste as a Class 4 flammable waste.

3.3.2.b.vi Photographic/Imaging Waste

Photographic/Imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

3.4 WASTE ANALYSIS

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure a product quality. The following section summarizes the waste analyses practiced at the recycle center for the hazardous materials returned from the Farmington branch. For each waste type stored at the branch, at least the following analyses must be performed annually (annual recharacterization analysis). If a particular waste stream is not managed at the service center during the previous year, no recharacterization analysis is performed. Copies of the results for the annual analyses shall be maintained at the branch office for the life of the permit. A copy of the most recent recharacterization analysis is contained in Attachment 3-1.

3.4.1 Solvents

1. Flash point (must be greater than 90°F)

If the flashpoint is unacceptable, the Farmington Branch Manager will be notified immediately and the load will receive appropriate special handling. If the results are acceptable, the following tests will be performed:

2. Volatile Organic Analysis, using EPA Methods 8015, 8021, 8260, or approved equivalents
3. Physical appearance, including bottom sediment and water content
4. Specific gravity
5. pH
6. Distillation performance

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately.

In addition to the tests listed above, which will be performed on a representative sample from every load received at the recycle center from the Farmington service center, a full Toxicology Characteristic Leaching Procedure (TCLP) analysis for all 40 constituents, (except for pesticides and herbicides) will be performed at least once each calendar year.

3.4.2 Solvent Tank Bottom Sludge and Free Water

1. Flash point (Must be greater than 90°F)
2. Analysis for content of lead, cadmium, and chromium
3. pH

As described above for solvent, a full TCLP analysis (except for the pesticides and herbicides) will be performed on a representative sample at least once each calendar year.

3.4.3 Immersion Cleaner Solvent

Containers of waste immersion cleaner are typically characterized at the recycle center using the following criteria:

1. Flash point
2. Physical appearance
3. Specific gravity
4. Percent water
5. Volatile Organic Analysis (using EPA methods 8015, 8021, 8260 or approved equivalents)

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately. As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of immersion cleaner at least once each calendar year.

3.4.4 Dry Cleaning Solvent/Still Bottoms

1. Physical appearance
2. Volatile Organic Analysis for Perchloroethylene (using EPA methods 8015, 8021, 8260 or approved equivalents)
3. Specific gravity

If any of these tests yield unacceptable results or indicate contamination outside the normal range, the Branch Manager will be notified immediately.

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of dry cleaning waste at least once each calendar year.

3.4.5 Paint Waste

Paint wastes are generally characterized at the recycle center using the following criteria:

1. Metals
2. Flash points
3. Physical appearance
4. Specific gravity
5. Percent water
6. Volatile organic analysis (using EPA methods 8015, 8021, 8260, or approved equivalents)

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of paint waste at least once each calendar year.

3.5 WASTE ANALYSIS PLAN UPDATE

The waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revision of the plan is typically the responsibility of the Safety-Kleen corporate or regional compliance offices. Any revision to this plan will be in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.42)

Tables 3-2 through 3-5 summarize the waste analysis plan practiced at the recycle centers for the hazardous waste materials returned from the Farmington Service Center.

Table 3-2

Parameters And Rationale For Hazardous Waste Analysis

| Hazardous Waste | Parameter* | Rationale |
|-------------------------|-------------------------------------|--|
| 1. Spent Solvents | Flash Point | Ignitable Characteristic (D001) |
| | TCLP (preparation method) | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status as required in 20.4.1.800 NMAC (incorporating 40 CFR 268.40) |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status as required in 20.4.1.800 NMAC (incorporating 40 CFR 268.40) |

* Earlier sample analyses indicated the parameters listed are the only ones of concern.

| | | |
|---------------------------|---|---|
| 3. Used Immersion Cleaner | TCLP (preparation method) | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status as required in 20.4.1.800 NMAC (incorporating 40 CFR 268.40) |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,,2,2-trifluoroethane TCLP Flash Point | Contains this ingredient (F002) Contains components which exceed the limits listed in 40 CFR 261.24 Ignitable Characteristic (D001) |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |

Table 3-3

Parameters And Test Methods

| Parameter | Test Method | Reference |
|---|---|--|
| Flash Point | Setaflash closed cup tester | U.S. EPA SW 846, Third Ed., Method 1020 (ASTM Method D327-78) or an equivalent method. |
| Hydrocarbons, Volatile and Semivolatile Organic Compounds LDR Constituents | Gas Chromatography (GC) and/or Mass Spectroscopy | U.S. EPA Methods 8010, 8015, 8020, 8120, 8240, and/or 8270 or equivalent methods. |
| Toxicity Characteristics | TCLP (preparation method), followed by 1310 or (3010, 7760) then 6010 and 1310 then 7470. | 40 CFR 261, Appendix II; 55 FR 11798 (March 29, 1990) |

Table 3-4

Methods To Sample Hazardous Wastes

| Hazardous Waste | Reference for Sampling | Description of Sampling Method | Sampler |
|----------------------------|--|---|---|
| 1. Spent Solvents | Sampling a tank "Samples & Sampling Procedures for Hazardous Waste Streams" EPA - 600/2-80-018 and Safety-Kleen training, ET-143, "Sampling Hazardous Materials and Wastes". | Test Methods for the Evaluation of Solid Waste Physical/Chemical Methods, SW846, U.S. EPA Chapter One, et. seq. And Safety-Kleen Training ET-143, "Sampling Hazardous Materials and Wastes" | Coliwas Tube, Weighted Bottle Sampler, Pond Sampler, Trier, Large Trier, Auger, Grain Thief, or Scoop as appropriate. |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 | Same as number 1 |
| 3. Spent Immersion Cleaner | Same as number 1 | Same as number 1 | Same as number 1 |
| 4. Dry Cleaning Wastes | Same as number 1 | Same as number 1 | Same as number 1 |

Table 3-5

Frequency of Analysis

| Hazardous Waste | Analysis* | Frequency |
|---------------------------|---|-------------------|
| 1. Spent Solvents | Flash Point | At least annually |
| | TCLP | At least annually |
| 2. Solvent Tank Bottoms | Flash Point | At least annually |
| | TCLP | At least annually |
| 3. Used Immersion Cleaner | TCLP | At least annually |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro- 1,2,2-trifluoroethane | At least annually |
| | TCLP | At least annually |
| | Flash Point | At least annually |

3.6 LAND BAN NOTIFICATION/CERTIFICATION FORMS

The Permittee shall follow all requirements of Section 2.4 of this Permit.

In accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268.7(a)(2)), Safety-Kleen shall provide a one time written notice for wastes banned for land disposal with the initial shipment. No further notification is necessary unless the waste or the Facility changes. Safety-Kleen shall provide the written notice for wastes banned from landfills, in accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268), as follows:

1. Printing the Notice language on manifests - such as for core-business customers to branch shipments; or
2. Special forms for each regularly handled waste types (e.g., parts washer solvents, immersion cleaner, dry cleaning wastes, etc); or
3. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis in accordance with 20.4.1.400 NMAC (incorporating 40 CFR 263.12).

The notice is required paperwork for all Safety-Kleen waste types. Shipments lacking the proper notice shall not be accepted by any Safety-Kleen facility. When a shipment with the proper notice is received, the notice is kept in the files of the receiving facility, or designated facility, as defined in 20.4.1.100 NMAC (incorporating 40 CFR 260.10), with the manifest or with the pre-print if a manifest is not used.

3.7 OPERATING LOG RECORD

Safety-Kleen shall maintain a written operating record on-site of all manifested wastes that enter the Facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73 (a)). The requirements of this Operating Log are detailed in Attachment 8, *Manifesting, Reporting, and Record*.

3.8 WASTE DETERMINATION FOR SUBPART BB AND CC COMPLIANCE

For purposes of waste determination, this Facility utilizes knowledge of the wastes described in Section 3.2, 3.3, and 3.4. For those hazardous wastes, which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the Permittee may use knowledge of the waste based on information included in manifests, shipping papers, or waste certification

notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment 3-1 (waste characterization analytical results), as required in 20.4.1.500 NMAC (incorporating 40 CFR 264.1063(d) and 264.1083). Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart BB and Subpart CC standards.

RE: NOTICE OF DEFICIENCY (NOD)
SAFETY-KLEEN SYSTEMS, INC. STORAGE FACILITY RCRA PERMIT
APPLICATION, FARMINGTON FACILITY EPA ID NMD980698849
HWB-SKFA-00-001 AND
SAFETY-KLEEN SYSTEMS, INC. STORAGE FACILITY RCRA PERMIT
APPLICATION, ALBUQUERQUE FACILITY EPA ID NMD000804294
HWB-SKAL-02-001

Dear Mr. Ashley:

After substantial review of the Safety-Kleen Farmington's (SKFA), October 4, 2000 permit application, Attachment A, *Waste Analysis Plan* (WAP) and the 2000 permit application Part A, Section 1.0, Attachments C, D and E, the existing SKFA operating permit dated April 4, 1991, and the August 20, 2002 draft permit wastes characterization requirements, NMED has made a determination that additional information is required prior to granting administrative completeness pursuant to 20.4.2.200 NMAC (A) (3) (a) and (b). The NMED comments are attached.

Please respond to this Notice of Deficiency within sixty (60) days of receipt of this letter.

Should you have any questions please contact Mr. Steve Pullen of my staff at (505) 428-2544.

Mr. David Ashley
November 15, 2002

**NOTICE OF DEFICIENCY COMMENTS
SAFETY KLEEN – FARMINGTON and ALBUQUERQUE**

Regulatory citations in these comments only reference the applicable Code of Federal Regulations (CFR) requirements without including the associated New Mexico regulation for brevity.

NMED expects a response to each of these comments and altered permit application language where appropriate. The responses to these comments should be included in both the Safety-Kleen Albuquerque (SKAL) and SKFA permit application waste analysis plans since the WAP's are essentially identical and by doing so, will prevent an additional NOD being submitted for the SKAL facility.

General SKFA WAP Comments:

1. The WAP fails to identify the specific waste characterization regulations that must be addressed before wastes can be managed at the facility. NMED requires that Safety-Kleen address, at a minimum, the data quality objectives (DQOs) identified at Appendix I at the back of these comments. All appropriate DQOs are to be identified in the Introduction portion of the WAP. The WAP must also be augmented to include a discussion of how Safety-Kleen personnel will perform a QA/QC analysis to ensure that all waste characterization has met the DQOs.
2. The Safety-Kleen Farmington facility permit application fails to address all applicable land disposal restriction (LDR) regulatory requirements. Safety-Kleen must specify in the WAP how it will both accomplish these activities, and document these determinations as required by 20.4.1.800 NMAC (incorporating 40 CFR 268.7 (a) (6)), 20.4.1.300 NMAC (incorporating 40 CFR 262.10 (h) and 40 CFR 262.40 (c)). Safety-Kleen must specifically commit to ensuring that all hazardous wastes stored at the facility are characterized for all applicable LDR notification requirements as identified below;
 - a. Identify all hazardous constituents in prohibited hazardous wastes requiring treatment as required by 20.4.1.800 NMAC (incorporating 40 CFR 268.7 (a), 40 CFR 268.40 (a) (1) and (2)), including both the constituents associated with each waste listed in 40 CFR 268.40 as "regulated hazardous constituents", and all underlying hazardous constituents (UHCs) in characteristic hazardous wastes as required by 40 CFR 268.9 (a);
 - b. Identify applicable "waste code subcategories" as identified in Column 2 of the "Treatment Standards for Hazardous Wastes" table located in 40 CFR 268.40, as required by 40 CFR 268.7 (a), and as referenced in the Required Information

Column, Item No. 4, of the "Generator Paperwork Requirements Table" located in 40 CFR 268.7 (a);

- c. Identify the waste's applicable "treatability group" (i.e., wastewater or non-wastewater) as identified in Column 2 of the "Treatment Standards for Hazardous Wastes" table located in 40 CFR 268.40, and the "Universal Treatment Standards" table located in 40 CFR 268.48, and as required by 40 CFR 268.7 (a), as referenced in Column 1, Item No. 4, of the "Generator Paperwork Requirements" located in 40 CFR 268.7 (a), and as defined in 40 CFR 268.2 (d) and (f); and
- d. Identify whether the waste must be treated before it can be land disposed as required by 40 CFR 268.7 (a). To accomplish this, Safety-Kleen shall identify the applicable constituent concentration or technology based treatment standards for the wastes and/or the individual hazardous constituents as identified in the "Treatment Standards for Hazardous Wastes" table located in 40 CFR 268.40.

These requirements apply to all wastes managed at Safety-Kleen regardless of how long the wastes are stored, including wastes stored under a transfer basis.

3. NMED can find no commitment in the application to store prohibited wastes for less than the one-year as required by 40 CFR 268.50. The application/WAP shall be altered accordingly.
4. The permit application fails to discuss whether any of the waste management activities performed by Safety-Kleen at both the facilities, would constitute the generation of a new waste or require a new manifest. The New Mexico Environment Department questions whether the aggregation of wastes with different LDR statuses is occurring at Safety-Kleen. Generator status determination in this circumstance depends primarily on the establishment of a waste's "point of generation". The definition of what the "point of generation" is and its implications are described in EPA's guidance manual, *Land Disposal Restrictions: Summary of Requirements*, dated August 2001 (EPA 2001). EPA 2001, Section 8.2 states, "for characteristic wastes, each change in treatability group constitutes a new point of generation". The permit application states in Section A.1.1, Paragraph 1, Item c, *Drum Washer/Dumpster Sediment*, that, "the chemical composition of this waste is very similar to that of the bottom sediment from the tank and therefore, carries the same EPA hazardous waste codes". The application fails to mention the possibility here or anywhere else of a change in LDR treatability groups and a resultant new waste.

Safety-Kleen shall explain the following;

- a. Whether the commingling or aggregation of wastes with different LDR statuses would constitute the generation of a new waste; and
- b. Whether segregating the sediments referenced in Section A.1.1 would constitute the generation of a new waste due a change in treatability group (referenced above).

The issue is relevant to waste characterization because the generator of a waste must create a manifest in accordance with 40 CFR 262 and perform a LDR status determination at the point of generation (POG) in accordance with 40 CFR 268.7.

5. The WAP suggests that a laboratory analysis was performed only four times on Safety-Kleen wastes in the period between 1997 and 1999 (i.e., four different waste streams were analyzed once). This information was gleaned from WAP Section A.2, which proposes to perform no analytical waste characterization at the point of generation because "the composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications". This Section also proposes no verification characterization will be performed at the Farmington facility because "with such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible." Annual characterization data from Attachment A-1 demonstrates four laboratory analyses. Safety-Kleen shall explain whether this observation is accurate.
6. In general, NMED considers the waste characterization commitments in the Albuquerque Safety-Kleen facility (SKAL) permit application, dated July 27, 2001, to be more detailed and thus preferable. Specific examples are provided below.
7. The WAP fails to recognize that before wastes are stored they must be characterized as to whether they are authorized wastes (i.e., included in the Part A portion of the permit application or not otherwise prohibited by the permit).
8. Safety-Kleen shall submit a copy of applicable Safety-Kleen Standard Operating Procedures (SOPs) as related to the characterization and sampling of hazardous wastes.

SKFA WAP Section Specific Comments:

1. Section A.1 - The second sentence inaccurately states that the specifications for SKFA's "products" are provided in Attachment A.1. Please explain how the table of annually waste stream characterization relates to SKFA product. NMED is interested in product characterization due to its association with related wastes. (See SKFA WAP Section Specific Comment 5.c).

2. Section A.1 - The second sentence references the table in Attachment A.1. Is this table representative of SKFA's documentation in response to the existing annual waste characterization permit requirement found in Permit Conditions II.C and Attachment A, Section A.3? If so, please explain why the table does not provide waste characterization information for wastes resulting from the dry cleaner service for SKFA.
3. Section A.1 - The second sentence references the tables in Attachment A.1. There are few other references to the tables in the text portion of the WAP. Safety-Kleen shall elaborate on the purpose of the tables. At a minimum, Safety-Kleen must answer the following questions;
 - a. Is the Attachment meant as an example of the data needed to fulfill the following requirements;
 - i. to repeat initial analysis of wastes to ensure that the analysis is accurate and up to date as required by 40 CFR 264.13 (b) (4); and
 - ii. SKFA Operating Permit Condition II.C, together with the Waste Analysis Plan (Permit Attachment A), Section A.3, commit to analyzing each waste type "at least once each calendar year".
 - b. Is Attachment A.1 meant to identify all applicable parameters to be analyzed for each hazardous waste as required by 40 CFR 264.13 (b) (1)? Is there a reason why this analysis data does not include other possible hazardous constituents as referenced at 40 CFR 268.40 (a)?
 - c. The WAP states that the Attachment data represents the "specifications for the products". It is NMED's understanding that the data represents constituent concentrations before the reclamation process. SKFA must provide a complete chemical description of all products resulting in wastes stored at the facility, including a description in chemical variability.
 - d. The tables demonstrate that for a particular waste type (e.g., waste aqueous cleaners), wastes from different SK service centers during a particular period of time (e.g., 1998-1999) had widely ranging hazardous characteristic constituent and other physical property values. Is SKFA implying that all wastes with hazardous characteristic constituent and other physical property values that fall within the maximum and minimum values presented on the Tables are the same wastes and can be aggregated or consolidated without requiring a new manifest?

- e. The tables all include a value for the 90th percentile of the upper confidence limit (UCL) for the 50th percentile. The WAP does not explain what this data is used for. SW-846 Chapter 9, Section 9.1.1.1 discusses the use of UCLs to evaluate the degree of sampling accuracy and precision of multiple samples of a single waste stream to determine whether it is hazardous. The tables represent numerous waste streams and thus are something very different than what is discussed in SW-846. SKFA must clarify.
- f. Safety-Kleen must explain the significance of the table notation "non-detect" (ND) when the detection limit of the analysis was significantly higher than the regulatory limit. The inappropriate ND occurs on numerous tables but is a particular problem on the table for waste dry cleaner bottoms – semi-volatile analysis. Safety-Kleen must explain why NMED should not make it a permit requirement that all analysis be performed to ensure that the method detection limit (MDL) be below the applicable regulatory limit, or that Safety-Kleen be required to record one-half the MDL instead of ND.
- g. Safety-Kleen must explain whether the "site" column necessarily indicates the Safety-Kleen service centers that shipped wastes to a recycling center and the number of shipments in a particular period (i.e., did SKFA not ship any dry cleaner, paint, or photographic wastes during the referenced periods?). Section A.1.1 (a) suggests that spent solvent is removed from the storage tank on a monthly basis yet this is not reflected in the table.
- h. The tables reference the following 11 different wastes;
 - i. Waste aqueous cleaners
 - ii. Waste dry cleaner filter powder
 - iii. Waste dry cleaner bottoms
 - iv. Waste immersion cleaner
 - v. Paint waste (other)
 - vi. Waste paint gun cleaner
 - vii. Waste parts washer solvent (105)
 - viii. Waste parts washer solvent (105/150)
 - ix. Waste premium gold parts washer solvent (150)
 - x. Waste parts washer sludge
 - xi. Waste parts washer tank bottoms

Safety-Kleen must explain why all of these wastes are not referenced in the Section A.1 of the WAP.

- 9. Section A.1.1 - The section in general describes wastes resulting from the parts washer service and applies characteristic waste codes to all the wastes but does not apply any of

the listed waste codes to the wastes. Attachment A.1 demonstrates that the wastes contain significant concentrations of trichloroethylene, tetrachloroethylene, and methyl ethyl ketone. These chemicals are all solvents in F001, F002 or F005 wastes. Safety-Kleen shall explain why the wastes resulting from parts washer service are not described as carrying a "F" code as the dry cleaner and paint wastes do. Furthermore, Safety-Kleen must explain why NMED should not require through the permit that wastes resulting from the parts washer service (see Section A.1.1) be analyzed on a periodic basis for the presence of all constituents of concern in the F001-F005 listed wastes referenced at 40 CFR 268.48.

10. Section A.1.2 - Paragraph 1, last sentence, states, "... other types of dry cleaning waste (e.g., freon) will be managed on a transfer basis only". Section A.5.c states that "unique or non-standard waste streams" will also be managed on a "transfer basis" only. Section A.7 states that for waste "managed on a transfer basis, the Subpart CC regulations do not apply". Safety-Kleen shall thoroughly explain why NMED should not require, through the permit, that all waste managed at the facility be managed subject to the requirements of 40 CFR Parts 264, 268 and 270 as is required by 40 CFR 262.34 (b) of any generator who accumulates hazardous waste for more than 90 days.
11. Section A.1.2 - Paragraph 2, Sentence 1, refers to the distillation of wastes from dry cleaner service. Safety-Kleen shall specify where this distillation process occurs. The WAP implies distillation may be happening at the generator locations or the Farmington service center. If the distillation process is occurring at either of these locations, Safety-Kleen must explain whether the distillation process is a materials recovery process meeting the definition of treatment provided at 40 CFR 260.10, and thus requiring a permit.
12. Section A.1.4 - This section references three photographic/imaging wastes, yet implies that none of them can be considered a hazardous waste. Safety-Kleen shall significantly elaborate on the regulatory status of these wastes. Sentence 1 states, "some photographic imaging wastes managed at the facility are not solid wastes per 40 CFR 261.2 (c) because their hazardous constituent is reclaimed." Is Safety-Kleen referencing this regulation in relation to the photo fixer solution from which silver may be recovered?

NMED understands that the U.S. EPA has made solid waste determinations on a material-by-material basis (See RCRA Regulations and Keyword Index, 2000 Edition, published by Aspen Law and Business (Aspen 2000) and the RCRA Hotline Question and Answer #54 (RCRA-54)). Safety-Kleen shall provide these EPA determinations.

13. NMED feels that it may be appropriate to identify wastes in the permit that are not subject to the permit, but to be consistent, all such wastes must be identified. Please provide a list of all materials (non-products) stored at the facility that might be considered

by an inspector to be hazardous waste subject to the permit and that Safety-Kleen feels are not subject to 40 CFR Parts 264, 268 and 270 permitting conditions. Furthermore, because the photo fixer solution which would normally carry a D011 waste code is obviously prohibited from land disposal under the LDRs, the off-site shipment of this waste must be accompanied by a LDR notification form as required by 40 CFR 268.7 (a) (1). That notice shall include the following information (see RCRA-126);

- a. EPA Hazardous Waste Number (waste code);
 - b. The hazardous constituents and their corresponding treatment standards and all other applicable prohibitions set forth in 40 CFR 268.32;
 - c. The manifest number associated with the shipment of the waste; and
 - d. Waste analysis data where available.
14. Section A.2 - Paragraph 3, last sentence, states, "... procedures to verify waste characteristics occur at several check points in the management of the solvent". The WAP identifies three checkpoints; the QC procedures performed when Safety-Kleen services its clients, when the wastes are transferred into the storage tank, and the annual characterization performed at the reclamation center. If Safety-Kleen has additional procedures to verify waste characteristics they must be elaborated on in the WAP.
15. Section A.2 - Paragraph 3, first sentence, references HWMR 206.B.3 inappropriately. NMED believes the appropriate and applicable regulation is 20.4.1.500 NMAC (incorporating 40 CFR 264.13 (a) (3) (i)).
16. Section A.2 - The SKAL permit application contains the following commitments that shall be included in the SKFA application, or provide a reason as to why they/it should not be included:
- a. Questionable wastes received at the service center shall be analyzed before they leave the facility;
 - b. The Branch Manager will be notified of any contamination that may have occurred. Furthermore, NMED requires through its omnibus authority specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.32 (b) (2)) that Safety-Kleen commit in its WAP, to notifying the Hazardous Waste Bureau (HWB), Enforcement Program Manager of any contamination that may have occurred;
 - c. Training commitments; and

d. The procedures for wastes rejected at the time of service.

17. Section A.2 - The section implies that waste characterization will primarily be through acceptable knowledge (AK). Acceptable knowledge is defined in EPA guidance, "Waste Analysis at Facilities that Generate, Treat, Store, and Dispose of Hazardous Waste" dated April 1994, as process knowledge and prior sampling data performed before the effective date of RCRA regulations. Current sampling and analysis is the preferred method, and the Permittee shall obtain characterization by sampling and analysis whenever feasible.

Acceptable knowledge may be used as the sole method to characterize waste only when the waste is from processes that are well documented with supporting information that address all characterization requirements of the permit, including the requirement to determine the LDR status of the waste as well as the other DQOs referenced at General Comment #1. Safety-Kleen shall maintain written documentation supporting the use of AK for each waste stream. SKFA shall include in the record all specific AK documentation assembled and used in the AK process, whether or not it supports the decision to use AK.

18. Section A.2.1 - Paragraph 2 states that as part of the QC procedures, a Safety-Kleen sales representative makes a visual examination of the wastes prior to recovery. Safety-Kleen must commit in Section A.6 of the WAP, to include a record of each of these QC examinations in both SKFA's and SKAL's operating record.
19. Section A.2.1.c - Safety-Kleen must elaborate on the sampling technique(s) used to determine whether the contents of a waste drum deviate from the description in the section. Safety-Kleen shall also describe the sampling techniques used to characterize waste at the service center as referenced in last paragraph of Section A.2.1.c.
20. Section A.2.3 - This section addresses paint waste but makes no mention of waste abrasive blasting media used to remove paint. This is generally a waste stream created at paint shops that is generally characteristically hazardous for metals. Does Safety-Kleen manage abrasive blasting media?
21. Section A.3 - This section shall be amended with a description of the quality assurance procedures to be used when performing laboratory analyses (e.g., equipment calibration and maintenance, data reduction and validation, and records management). The section must also be amended with a commitment to ensure those procedures are adhered to and documented in the both the SKFA and SKAL operating record.
22. Section A.3, Table A-1 - Table A-1 inappropriately lists "TCLP" as a parameter (the parameter is toxicity characteristic, TCLP is a sample preparation method) and fails to

address paint and photo chemical wastes. The SKAL permit application Section A.3 has a preferable discussion of waste parameters.

23. Section A.3, Table A-1 - Table A-1 must be augmented with a parameter and its associated rationale regarding the determination of a waste's LDR status. In fact, "determination of a waste's LDR status" can be the rationale and "hazardous constituent concentration" might be the parameter. Safety-Kleen shall alter other tables accordingly.
24. Section A.3, Table A-2 - Table A-2 must clarify that TCLP is simply a sample preparation method (which is not necessary when a waste is in liquid form). To determine a waste's toxicity characteristic, it may be necessary to first perform a leaching procedure (TCLP) and then perform a total analysis. The table should also identify the test method(s) Safety-Kleen will use to measure inorganic constituents in a waste.
25. Section A.3, Table A-3 - Table A-3 references U.S. EPA's *Test Methods for the Evaluation of Solid Waste Physical/Chemical Methods*, SW846, Section 1.2.1.1. The current on-line version of SW846 available at <http://www.epa.gov/epaoswer/hazwaste/test/main.htm>, is not organized with sample collection methodologies at Section 1.2.1.1. Please reference the appropriate section of the on-line version. Furthermore, SW846 does say at Section 3.3.4, *Sample Collection*, that "The procedures describing how the sampling operations are actually performed in the field should be specified. A simple reference to standard methods is not sufficient, unless a procedure is performed exactly as described in the published method." Safety-Kleen shall amend the WAP accordingly.
26. Section A.3, Table A-3 - Table A-3 states that the sampling device to be used for solvent tank bottoms is the same device to be used for spent solvents. This device is the Copliwasa tube. SW846 Chapter 9, Section 9.2.2.3, states, "... the Coliwasa is a device employed to sample free-flowing liquids and slurries ...". Safety-Kleen shall explain how effective the Coliwasa is at sampling tank bottoms.
27. Section A.3, Table A-4 - Table A-4 states that the frequency of analysis for all wastes will be "at least annually". The SKAL permit application WAP, Section A.3.1, and the SKFA current operating permit WAP, commit to performing an abbreviated analysis on "every load received at the recycle center". If this is in fact standard Safety-Kleen procedure, it shall be referenced in the SKAL and SKFA WAPs.
28. Section A.4 - The section must recognize and reference the permit modification procedures at 20.4.1.900 NMAC (incorporating 40 CFR 270.42), *Permit modification at the request of the Permittee*.

29. Section A.5 - The section fails to address all applicable LDR notification requirements. Safety-Kleen must specifically commit to ensuring that all hazardous wastes stored at the facility, regardless of where the wastes are generated, are characterized for all applicable LDR notification requirements as identified at General Comment #2.
30. Section A.5 - The section shall be augmented to commit to maintaining in the SKFA and SKAL operating records, a copy of all LDR status notifications, including those for wastes generated onsite and for wastes received from off-site generators, as required by 40 CFR 264.73 (15) and (16). Additionally, please explain what is meant by the term "receiving facility" as used in the last paragraph of Section A.5.
31. Section A.5.b - NMED is unfamiliar with the waste type abbreviations "MS" and "IC". Please elaborate in the WAP.
32. Section A.6 - The section lists information to be kept in the facility operating record including numerous inappropriately listed non-waste characterization items that are not referenced elsewhere in the application. Safety-Kleen must relocate this information in a more appropriate location within the SKAL and SKFA applications.
33. Section A.6, Item 1 - The section inappropriately references a regulation as "Pt. V. sec.264, Appendix I". NMED believes the appropriate reference should be 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Appendix I). That regulation (which is applicable to SKFA and SKAL) requires, in part, the inclusion of a description of the process that produces a waste. NMED requires Safety-Kleen to include in its application a commitment to characterize the waste generating process as outlined at Appendix II.
34. Section A.6, Item 10 - The section references where LDR notifications are maintained. Safety-Kleen shall clarify the phrase "resource recovery (May 1994) branch manager's office". NMED requires that the LDR records be kept at the facility for inspection purposes.
35. Section A.7 - The section is titled "Waste Determination for Subpart BB and CC Compliance" but does not address characterizing wastes for their Subpart BB applicability by measuring their total organic concentration by weight. Safety-Kleen must amend the SKAL and SKFA WAPs accordingly.

Appendix I

Data Quality Objectives (DQOs)

Waste characterization data obtained through WAP implementation shall be used to ensure that the Permittee meets regulatory obligations at permitted hazardous waste storage units. A portion of the DQOs that shall be met for all waste characterization will be to comply with the following applicable Resource Conservation and Recovery Act (RCRA) regulatory requirements:

1. To determine all information which must be known to treat, store and dispose of the wastes in accordance with New Mexico's Hazardous Waste Regulations, 40 CFR 264.13 (a) (1);
2. To determine if the waste is hazardous 40 CFR 262.10 (c) and 40 CFR 262.11;
3. To ascertain the hazardous constituents in a waste stream to identify all applicable hazardous waste codes and all underlying hazardous constituents in accordance with 40 CFR 262.11, 40 CFR 268.7 (a) (2), and 40 CFR 268.9 (a);
4. To ascertain whether the waste must be treated before it can be land disposed in accordance with 40 CFR 268.7 and 40 CFR 268.9;
5. To ascertain whether a routine waste generating process has changed sufficiently to create a new waste stream and alternative regulatory requirements pursuant to 40 CFR 264.13 (a) (3) (i), 40 CFR 268.7 (a) (3) (iii), and 40 CFR 268.7 (b) (3) (ii);
6. To facilitate appropriate waste packaging for transportation in accordance with 40 CFR 262.10 (h);
7. To ascertain the presence and concentration of wastes constituents that might cause unlawful air emissions in accordance with 40 CFR 270.25 (a), 40 CFR 264.179, 40 CFR 264.200, 40 CFR 264.13 (b) (6), 40 CFR 264.601 (c) (1), 40 CFR 264.1050, and 40 CFR 264.1082;
8. To ensure that wastes are not inappropriately diluted to avoid LDR treatment requirements in accordance with 40 CFR 268.3;
9. To determine the presence of prohibited materials in accordance with 40 CFR 268.50 (f);
10. To determine the presence of free liquids in wastes in accordance with 40 CFR 270.15 (b) (1), 40 CFR 264.13 (b) (6);

11. To ascertain waste/waste and waste/container compatibility characteristics in accordance with 40 CFR 270.15, 40 CFR 270.16, 40 CFR 264.172, 40 CFR 264.177, and 40 CFR 264.199; and
12. To ascertain waste ignitability and reactivity characteristics in accordance with 40 CFR 270.16 (j), 40 CFR 264.17 (a), and 40 CFR 264.198 (a).

Appendix II

Waste Process Information

The Permittee shall obtain process knowledge documentation from the generator that is explicitly relevant and traceable to each waste stream. The following information presents process knowledge the Permittee are required to obtain:

1. Area(s) and/or building(s) from which the waste stream was or is generated;
2. Waste stream volume and time period of generation;
3. Description of waste generating process; and
4. Material inputs or other information that identifies the chemical content of the waste stream and the physical waste form.

OVERNIGHT DELIVERY
RETURN RECEIPT REQUESTED

March 9, 2003

Mr. Steve Pullen
Permits Management Program
State of New Mexico Environment Department
Hazardous Waste Bureau
2905 Rodeo Park Drive East, Building 1
Santa Fe, New Mexico 87505-6303

Re: Notices of Deficiency (NOD) for Safety-Kleen Farmington and Safety-Kleen Albuquerque Facilities

Dear Mr. Pullen:

Safety-Kleen Systems, Inc. (S-K) operates service centers in Farmington, New Mexico (4210A Hawkins Road) and Albuquerque (2720 Girard NE) for temporary accumulation and storage of hazardous wastes, prior to transporting offsite for reclamation, treatment or disposal. RCRA Permit Renewal Applications were submitted to the New Mexico Environment Department/Hazardous Waste Bureau (NMED/HWB).

In a letter (Notice of Deficiency) dated November 15, 2002, NMED/HWB required additional information. A response to the NMED/HWB NOD and the required information is provided with this correspondence. Each of the NMED/HWB items is summarized below for convenience. A response providing the supplemental information follows each of the NMED requests.

NMED/HWB (SKFA Specific) Item No. 1.

Section A.1 – The second sentence inaccurately states that the specifications for SKFA's "products" are provided in Attachment A.1.

S-K Response No. 1.

The omission of information about Safety-Kleen products was an oversight. Please find enclosed, MSDSs for the relevant Safety-Kleen parts washer service and paint service products. These MSDSs include more information than required by OSHA (40 CFR 1910.1200).

NMED/HWB (SKFA Specific) Item No. 2.

Section A.1 – The table referenced in Attachment A.1 does not include waste characterization information for wastes resulting from the dry cleaner service for SKFA.

S-K Response No. 2.

It appears to have been an administrative omission, not to include dry cleaner waste characterization data. Please find attached the most recent full waste characterization package with summary tables including dry cleaner data.

NMED/HWB (SKFA Specific) Item No. 3.

Section A.1 – Safety-Kleen must answer the following questions;

- a. Is the attachment meant as an example needed to fulfill the following requirements:
 - i. To repeat analysis to ensure that the analysis is accurate and up to date as required by 40 CFR 264.13(b)(4); and
 - ii. SKFA Operating Permit Condition II.C together with the Waste Analysis Plan (Permit Attachment A), commitment to analyzing each waste type "at least once per year?
- b. Is Attachment A.1 meant to identify all applicable parameters to be analyzed for each hazardous waste as required by 40 CFR 264.13(b)(1)? Is there a reason why this analysis data does not include other possible hazardous constituents as referenced at 40 CFR 268.40(a)?
- c. SKFA must provide a complete chemical description of all products resulting in wastes stored at the facility, including a description in chemical variability.
- d. The tables demonstrate that for a particular waste type, wastes from different SK service centers had widely ranging hazardous characteristic constituent and other physical property values. Is Safety-Kleen implying that all wastes with hazardous characteristic constituent physical property values that fall within the maximum and minimum values represented in the Tables are the same wastes and can be aggregated or consolidated without requiring a new manifest?
- e. The tables all include a value for the 90th percentile of the upper confidence limit (UCL) for the 50th percentile. SW-846 Chapter 9, Section 9.1.1.1 discusses the use of UCLs to evaluate the degree of sampling accuracy and precision of multiple samples of a single waste stream to determine whether it is hazardous. The tables represent numerous waste streams and thus are something very different than what is discussed in SW-846. SKFA must clarify.
- f. Safety-Kleen must explain the significance of the table notation "non-detect" (ND) when the detection limit of the analysis is significantly higher than the regulatory limit. The inappropriate ND occurs on numerous tables but is a particular problem for waste dry cleaner bottoms – semi-volatile analysis. Safety-Kleen must explain why NMED should not make it a permit requirement that all analysis be performed to ensure that the method detection limit (MDL) be below the applicable regulatory limit, or that Safety-Kleen be required to record one-half the MDL instead of ND.
- g. Safety-Kleen must explain whether the "site" column necessarily indicates the safety-Kleen service centers that shipped wastes to a recycling center and the number of shipments in a particular period.
- h. The tables reference the following 11 different wastes;
 - i. Waste aqueous cleaners
 - ii. Waste dry cleaner filter powder
 - iii. Waste dry cleaner bottoms
 - iv. Waste immersion cleaner
 - v. Paint waste (other)
 - vi. Waste paint gun cleaner
 - vii. Waste parts washer solvent (105)
 - viii. Waste parts washer solvent (150)
 - ix. Waste premium gold parts washer solvent (150)
 - x. Waste parts washer sludge
 - xi. waste parts washer tank bottoms.

Safety-Kleen must explain why all these wastes are not referenced in section A.1 of the WAP.

S-K Response No. 3:

- a.
 - i. This attachment represents the sampling done in one year to represent waste managed by Safety-Kleen throughout the year. This process is performed to characterize waste managed by Safety-Kleen. When significant process changes occur, analysis will be performed to recharacterize the waste.
 - ii. Safety-Kleen characterizes its wastes at least annually. The attachment represents one year's data. This process is completed each year to on waste streams managed by Safety-Kleen.
- b. The purpose of the attachment is to summarize the data collected to characterize Safety-Kleen's wastes and indicate the waste codes that characterization indicates are appropriate for the waste stream. During the process of characterizing the waste streams, hazardous constituents are also revealed. Hazardous constituents that are expected to occur in the waste streams, based on the same laboratory analyses as the characterization, are then reflected in the Land Disposal Restriction Notifications (LDRs).
- c. It was an error to indicate that waste characterization represents product specification. Please find attached, MSDSs for the relevant Safety-Kleen products. These MSDSs contain information beyond that required by OSHA.
- d. The attachment is not meant to imply that wastes from various sources with varying chemical and physical properties may be aggregated or consolidated without requiring a new manifest. The attachment identifies waste generated with essentially similar raw materials in essentially similar processes. The attachment indicates that there is some variability in the waste generated based on the operator of the process. For example (page 88 of the attached annual characterization package, samples 2015441 and 2015462), an operator in Albuquerque, NM might have used their parts washer more than a operator in Omaha, NE. By using the parts washer more, more oil and grease was added, raising the flash point. In the same example, the operator in Omaha may have cleaned a carburetor in the parts washer, introducing gasoline and thus, benzene. Regardless of day-to-day variations in the use of the parts washers, operators use parts washers to clean automotive parts, essentially the same process with the same raw materials.
- e. Please see "d." above.
- f. Please see "d." above.
- g. The "site" column indicates the Safety-Kleen site whose customer's waste the sample represents. The sampling is not meant to represent each shipment of hazardous waste. For example, spent solvent is removed from the facility storage tank on an as needed basis, perhaps once per month. The tank bottoms samples listed in the annual waste recharacterization table represent a sampling of tank
- h. The entries in the annual waste recharacterization represent wastes handled by Safety-Kleen throughout the country. Not a of these wastes are managed to a significant degree at the Safety-Kleen Farmington facility. For this reason, not all wastes are included in the permit application, and only some of these wastes would be stored at the Safety-Kleen Farmington facility.

NMED/HWB (SKFA Specific) Item No. 9.

Safety-Kleen shall explain why the wastes resulting from parts washer service are not described as carrying a "F" code as the dry cleaner and paint wastes do and why Safety-Kleen should not analyze for all constituents of concern in the F001 – F005 Listed wastes referenced in 40 CFR 268.48.

S-K Response No. 9.

Mr. Steve Pullen
March 9, 2002
Page 4

The description of wastes carrying a "F" code is dependant on the presence in the spent solvent before use of 10 percent or more of any of the constituents listed as constituents of F001 through F005 wastes. The parts washer solvent is less than 10 percent of each and less than ten percent of all those constituents. The case is different with both dry cleaner solvent and with paint waste.

The solvents used in these process are more than ten percent of one or several of the constituents listed as part of F001 through F005. Hazardous waste codes F001 through F005 are not appropriate for parts washer solvent. Please see the attached MSDSs for lacquer thinner and parts washer solvents (Safety-Kleen products).

NMED/HWB (SKFA Specific) Item No. 10.

Why should Safety-Kleen Farmington not manage all wastes at the facility according to 40 CFR Parts 264, 268, and 270 as required by 40 CFR 262.34(b)?

S-K Response No. 10.

The phrase, "transfer basis", may have been misunderstood. All wastes managed b y the facility are managed as required by 40 CFR 262.34(b). Some customers generate wastes that Safety-Kleen is not permitted to store. For these wastes, the customer may profile the waste at a TSDF permitted to manage them. Once the waste profile has been approved at the TSDF, Safety-Kleen Farmington may transport that waste to the designated facility, complying with all applicable requirements of 40 CFR 263.

NMED/HWB (SKFA Specific) Item No. 11.

Section A.1.2 – Paragraph 2, sentence 1 refers to the distillation of wastes from dry cleaner service. Safety-Kleen must explain where such distillation occurs and whether this meets the definition of treatment provided at 40 CFR 260.10, thus requiring a permit.

S-K Response No. 11.

Dry cleaners use solvents rather than water to clean clothes. To be cost effective and protective of the environment, by not wasting resources, dry cleaning equipment typically includes distillation as a part of the cleaning equipment. This activity takes place only at dry cleaners. This activity does not meet the definition of treatment at 40 CFR 260.10 as the material involved is not a solid waste. Please see 40 CFR 261.4(a)(8)

NMED/HWB (SKFA Specific) Item No. 12.

Is Safety-Kleen referencing 40 CFR 261.2(c) in relation to the photofixer solution from which silver may be recovered?

S-K Response No. 12.

No, Safety-Kleen is not referencing 40 CFR 261.2(c) in relation to the photofixer solution from which silver may be recovered. The Safety-Kleen facility transports photo waste some of which is solid waste and not hazardous waste. The photofixer solution is managed as a hazardous waste with waste code D011.

NMED/HWB (SKFA Specific) Item No. 13.

Mr. Steve Pullen

March 9, 2002

Page 5

Please provide a list of all materials (non-products) stored at the facility that might be considered to be hazardous waste subject to the permit and that Safety-Kleen feels are not subject to 40 CFR 264, 268, and 270 permitting conditions. Also, photofixer must be accompanied by a LDR notification.

S-K Response No. 13.

Safety-Kleen may transport some hazardous wastes (as allowed in 40 CFR 263) without otherwise managing these wastes. Safety-Kleen believes that an inspector would agree that waste transported to meet the requirements of 40 CFR 263 are not subject to 40 CFR 264, 268, and 270 permitting conditions at the transport facility. Safety-Kleen agrees that photofixer is a hazardous waste and subject to LDR requirements. These requirements will be met.

NMED/HWB (SKFA Specific) Item No. 14.

If Safety-Kleen has additional procedures to verify waste characteristics they must be elaborated on in the WAP.

S-K Response No. 14.

There are no additional procedures in place to verify waste characteristics. However, any information that becomes known to Safety-Kleen that effects the waste characterization information will be considered, regardless of how the information comes to Safety-Kleen.

NMED/HWB (SKFA Specific) Item No. 15.

Section A.2 – Paragraph 3, first sentence, references HWMR 206.B.3 inappropriately. NMED believes the appropriate and applicable reference is 20.4.1.500 NMAC (incorporating 40 CFR 264.13(a)(3)(I)).

S-K Response No. 15.

Safety-Kleen agrees that the regulatory cite is in error. The reference has been corrected.

NMED/HWB (SKFA Specific) Item No. 16.

Section A.2 – The SKAL permit application contains several commitments that should be included in the SKFA application.

S-K Response No. 16.

Safety-Kleen agrees. Those same commitments have been included in the SKFA permit application, specifically in the WAP, enclosed.

NMED/HWB (SKFA Specific) Item No. 17.

Safety-Kleen shall include in the record all specific acceptable knowledge (AK) documentation assembled and used in the AK process, whether or not it supports the decision to use AK.

S-K Response No. 17.

Mr. Steve Pullen

March 9, 2002

Page 6

Safety does use knowledge of the raw materials and processes that create hazardous wastes as a starting point in understanding the nature of the hazardous waste. However, analytical testing is used to determine waste codes and hazardous constituents in the waste.

NMED/HWB (SKFA Specific) Item No. 18.

Safety-Kleen must commit to include a record of the visual examination of wastes prior to recovery made by Safety-Kleen sales representatives.

S-K Response No. 18.

Safety-Kleen does make a record of this visual inspection of wastes and commits to continue to do so.

NMED/HWB (SKFA Specific) Item No. 19.

Safety-Kleen must elaborate on the sampling technique(s) used to determine whether the contents of a waste drum deviate from the description in the section. Safety-Kleen shall also describe the sampling techniques used to characterize waste at the service center as referenced in the last paragraph of Section A.2.1.c.

S-K Response No. 19.

This section has been modified. These modifications along with previously submitted characterization procedures describe in more detail the sampling techniques used to determine the acceptability of the material.

NMED/HWB (SKFA Specific) Item No. 20.

Does Safety-Kleen manage abrasive blasting media?

S-K Response No. 20.

Safety-Kleen does not manage abrasive blasting media as one of its core waste streams. However, if a customer properly profiles abrasive blasting media waste at a disposal facility, Safety-Kleen may act as a transporter only, transporting the properly manifested waste to a designated facility.

NMED/HWB (SKFA Specific) Item No. 21.

Section A.3 – This section shall be amended with a description of the quality assurance procedures to be used when performing laboratory analyses. The section must also be amended with a commitment to ensure those procedures are adhered to and documented in the both of SKFA and SKAL operating record.

S-K Response No. 21.

Neither Safety-Kleen Farmington, nor Safety-Kleen Albuquerque operate a laboratory. All analyses are performed by contract laboratories following EPA protocol.

NMED/HWB (SKFA Specific) Item No. 22.

Mr. Steve Pullen

March 9, 2002

Page 7

Section A.3, Table A-1 inappropriately lists TCLP as a parameter. The SKAL permit application Section A.3 has a preferable discussion of the waste parameters.

S-K Response No. 22.

As it is Safety-Kleen's intention to operate all facilities to the same standard, the SKAL discussion has been included in the SKFA permit application. See the SKFA WAP, attached.

NMED/HWB (SKFA Specific) Item No. 23.

Safety_Kleen must include parameter and rational to determine waste LDR status.

S-K Response No. 23.

Tables A-1 and A-2 have been updated to meet this requirement.

NMED/HWB (SKFA Specific) Item No. 24.

Safety_Kleen must identify TCLP as a sample preparation method, not an analytical method.

S-K Response No. 24.

Table A-2 has been updated to meet this requirement.

NMED/HWB (SKFA Specific) Item No. 25.

Please reference the current section of SW-846 for Sample Collection. Also, provide detailed information about sampling procedures and techniques.

S-K Response No. 25.

Table A.3 has been modified to meet this requirement. Also, Safety-Kleen training course, ET-143 "Sampling Hazardous Materials and Wastes" is attached.

NMED/HWB (SKFA Specific) Item No. 26.

Safety_Kleen must explain how effective the Coliwasa is at sampling tank bottoms.

S-K Response No. 26.

The Coliwasa may not be the most effective means of sampling tank bottoms. Please see Safety-Kleen training course ET-143, "Sampling Hazardous Materials and Wastes", attached. Employees are required to adhere to training provided.

NMED/HWB (SKFA Specific) Item No. 27.

If it is in fact standard Safety-Kleen procedure to sample every load at the recycle center, the WAP shall so.

S-K Response No. 27.

Mr. Steve Pullen

March 9, 2002

Page 8

While it is standard procedure to sample every load at the recycle center, it may be inappropriate to describe that procedure in the branch (service center) WAPs as the WAPs at the recycle centers (i.e. SK-Denton, TX, SK-Reedley, CA, etc.) are controlled at those site and by those states' regulatory agencies.

NMED/HWB (SKFA Specific) Item No. 28.

Section A.4 must recognize and reference 20.4.1.900 NMAC (incorporating 40 CFR 270.42).

S-K Response No. 28.

This change has been made to Section A.4.

NMED/HWB (SKFA Specific) Item No. 29.

Safety-Kleen must commit that all wastes stored at the facility are characterized for applicable LDR notification requirements.

S-K Response No. 29.

This change has been made to Section A.5.

NMED/HWB (SKFA Specific) Item No. 30.

Safety-Kleen must commit to maintaining the LDR notice in the facility record. Also, Safety-Kleen should explain what is meant by "receiving facility" in the last paragraph of Section A.5

S-K Response No. 30.

This change has been made to Section A.5. "Receiving facility" means, "designated facility" as defined in 40 CFR 260.10.

NMED/HWB (SKFA Specific) Item No. 31.

Safety-Kleen must elaborate on the meaning of the abbreviations, "MS" and "IC", in the WAP

S-K Response No. 31.

"MS" means mineral spirits and "IC" means immersion cleaner. These abbreviations have been removed from the WAP.

NMED/HWB (SKFA Specific) Item No. 32.

Safety-Kleen must relocate non-waste characterizations items for the facility record elsewhere in the permit application.

S-K Response No. 32.

Safety-Kleen believes the information is appropriately listed here as the record includes information related to the proper storage of the waste. Safety-Keen will move the information to whichever section(s) NMED desires. Safety-Kleen will maintain the required records regardless of the section of the permit application they appear in.

NMED/HWB (SKFA Specific) Item No. 33.

Section A.6 inappropriately references "Pt. V. sec. 264, Appendix I". Also, Safety-Kleen must commit to characterize the waste generating process as outlined at Appendix II (sic).

S-K Response No. 33.

This inappropriate reference has been corrected and now appropriately commits to this requirement.

NMED/HWB (SKFA Specific) Item No. 34.

Section A.6, Item 10 stated that LDR notifications will be maintained at the "branch manager's office". NMED requires that LDR records be maintained at the facility for inspection purposes.

S-K Response No. 34.

Section A.6, Item 10 has been restated to clarify this commitment.

NMED/HWB (SKFA Specific) Item No. 35.

Safety-Kleen must characterize wastes for Subpart BB applicability.

S-K Response No. 35.

The WAP has been modified to meet this requirement.

If you have any questions, comments, or concerns, please contact me (602-821-2422) or Mike Crawford (505-884-2277).

Sincerely,

David Ashley
EHS Manager
Safety-Kleen Corporation

WASTE ANALYSIS PLAN

ABSTRACT

| Waste Description | EPA Waste Code No. | Facility Capacity ¹ (gallons) | Annual Amount ² |
|--|-------------------------------|---|----------------------------|
| Spent Solvents | D001 ³ | 12,000 | 50 |
| Bottom Sediment From the Tank and Ancillary Equipment | D001 ³ | N/A | 2 |
| Spent Immersion Cleaner | D001 ³ | 4,464 | 3 |
| Dry Cleaning Waste | D001, F002 ³ | 6 | |
| Paint Waste | F003, F005, D001 ³ | 4,464 | |
| Photo Chemical Wastes | D011 | 4,464 | |

NOTES: 1 The facility capacity is in gallons.

2 The annual amount is in thousands of gallons.

3 and may also include D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043

4 The total amount of drummed waste stored in the warehouse will not exceed 3,820 gallons.

The Facility shall store only wastes it is authorized to store. That is, Safety-Kleen will only store wastes included in Part A of the application for hazardous waste permit and not otherwise prohibited by the permit. Safety-Kleen will not store any hazardous waste for more than one year.

These waste streams are characterized annually as described in the "Statistical Analysis of Annual Waste Characterization Data", attached and incorporated herein by reference. (The most recent data are also included.) The testing and sampling methodology is as described in A.3, below. The data generated in this process is used to assign waste codes, if any, for each waste stream. The data generated in the annual recharacterization (AR) is also used to assist recycle centers in recycling or treating the waste streams. Recycle centers also rely on their own waste analysis plans to generate data to recycle materials and or dispose of waste. If while providing service to a customer if there is suspicion that the waste does not meet the acceptance criteria, the waste will not be picked up and the customer must provide information explaining what is in the waste and how the waste was adulterated. Please see the text below in this waste analysis plan.

Providing service to Safety-Kleen customers is dependent on a review of the customer business. If the business is a typical generator of that waste stream (for example, a garage generating parts washer waste), then limited review is performed. If the business is not a typical generator of that waste stream or if the business has other processes on site, a more detailed review of the business is performed and a certification from the customer is required stating the waste will be as described without adulterants. For example, laboratory analysis of that customer's waste may be required.

In this AR process, regulated hazardous constituents and reasonably expected underlying hazardous constituents (UHC)s are also discovered. UHC which is discovered in the annual recharacterisation will be assumed to expected throughout the waste stream. The applicable constituent concentration or technology based treatment standards for the wastes and / or individual hazardous constituents will be identified, if required by regulation, on the LDR

generated from this data. The LDRs generated in this process also identify whether the waste must be treated before being land disposed when required by regulation.

AR data is used to update subpart BB and Subpart CC plans (see these plans elsewhere in this permit application). It is anticipated that minor changes in the waste streams are unlikely to significantly change in air emissions.

Recycle centers test every shipment of waste for PCBs. If a shipment is discovered to contain PCBs, the source of the PCBs is traced and appropriate 40 CFR 761 requirements are implemented. Any equipment contaminated by PCBs is removed from service decontaminated cleaned before being put into service.

The Safety-Kleen transportation department is responsible for selecting packaging for Safety-Kleen waste streams, in addition to their responsibility for company compliance with Federal, State, and local transportation regulations and rules. The transportation department has selected packaging based on past waste recharacterizations and continue to review AR and other data to maintain compliance with material packaging requirements.

A.1 DESCRIPTION OF WASTES

Several types of waste result from the servicing of Safety-Kleen customers and the maintenance of the service center. It should be noted that the solvents managed at this facility are incompatible with strong oxidizers and reactive metals, none of which are present in the containers, container storage area, or the concrete sealant. The solvents are also compatible with one another. Analytical data for the wastes and specifications for the products are in Attachment A-1 and qualitative descriptions follow.

A.1.1 Wastes Resulting From the Parts of Washer Service

Used solvents from parts washers is accumulated in a 12,000 gallon aboveground, storage tank via the return and fill station. Containers of used material are poured into a dumpster at the return and fill station which in turn empties into the tank. This waste handling method results in several types of solvent waste:

- a. Used solvent - The used solvent is removed from the tank by a tanker truck on a scheduled basis. About 5,000 gallons are removed every month. This waste is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- b. Bottom sediment in the tank - Approximately once every two years, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- c. Dumpster Sediment - Sediment may also accumulate in the drum washers in the return/fill station. The sediment is manually removed and placed in containers. The dumpster sediment is representative of the waste codes described in items a and b above.
- d. Used Aqueous Parts Cleaning Solvent - may be bulked at the service center into containers that meet DOT specifications or may be co-mingled with the other solvent into the used solvent tank. It may be toxic using the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- e. Immersion Cleaner - is a different type of solvent that is not placed in the aboveground storage tank. Containers of immersion cleaner typically remain in the drum in which it was originally used until it is received at the recycle center. Drums are placed in the drum storage area of the warehouse and are stacked no more than two-high in the drum storage area of the warehouse.

The immersion cleaner is a non-halogenated hydrocarbon mixture and may exhibit the toxic characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.

A.1.2 Wastes Resulting From the Dry Cleaner Service

Dry cleaning wastes consist of used filter cartridges, powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in containers meeting DOT specifications. The containers are then palletized, stacked two-high and placed in the container storage area of the warehouse. Approximately 95% of the dry cleaning solvent used is perchloroethylene (F002 and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and the remaining 5% is trichloro-trifluoroethane (F002) and toxic using the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043).

A.1.3 Wastes Resulting From the Paint Service

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and may be toxic as per the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043). The wastes are collected in containers which meet DOT requirements at the customer's place of business and containers are then palletized and stored in an enclosed concrete masonry building (the H-3 Flammable Storage Building).

A.1.4 Photographic/Imaging Wastes

Some photographic imaging wastes managed by the facility are not solid wastes per 40 CFR 261.2(c) because their hazardous constituent is reclaimed. Others are managed under the provisions of Subpart F of 40 CFR 266 – Recyclable Materials Utilized for Precious Metals Recovery. Imaging waste consists typically of three waste streams. Photo fixer solution is an aqueous solution used to etch photo film during processing. This material is characteristic for silver (D011). Safety-Kleen is able to recover the silver from the solution. Used Photo developer is an aqueous solution that exhibits no hazardous waste characteristics but may not be allowed to discharge into public wastewater treatment systems in some communities. Silver collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste as per 40 CFR 260.30(c) and are managed as a non-regulated material.

A.2 QUALITY CONTROL PROCEDURES

The used solvents are the primary feed stocks for the generation of Safety-Kleen solvent products. As a result, quality control of the used solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The service center collects used solvents from approximately 1,100 customers, most of who are small quantity generators, and an estimated 14,000 drums containing recoverable solvents are returned to the service center each year for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

Furthermore, as discussed earlier in the Facility Description, all the materials collected at the service center are managed at all times in a closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers as described in Section A.2.1. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

However, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR (a)(3)(i)), Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated. It is Safety-Kleen's practice that suspected non-conforming material must not be

accepted until a full analysis has been conducted. If a container with questionable contents is returned to the service center, a sample will be taken and analysis will be performed at the recycling center, Safety-Kleen Tech Center (Elk Grove Village, Illinois) or other qualified lab according to the procedures outlined in Section A.3 of this attachment. The Branch Manager will be notified of any contamination that may have occurred.

Safety-Kleen trains personnel to verify the physical characteristics of the wastes at several points in the management of the solvent. These procedures are described briefly below.

Safety-Kleen controls the use and management of its solvents by:

1. Limiting the solvents stored to those compatible with one another and their containers;
2. Limiting the uses of each type of solvent for (example, dry cleaning waste is only collected from dry cleaner shops);
3. Determining the customer's type of business (i.e., the SIC code is recorded) and the purpose for which the customer will use the machine;
4. Training customers to use the machines properly;
5. Training employees to inspect the physical characteristics of used solvent and determine whether it is acceptable;
6. When waste is collected from a customer, indicate on the service document whether the used solvent meets Safety-Kleen's acceptance criteria;
7. Marking each container with the customer's name, address, and EPA I.D. number (if available). This information remains on containerized waste until it is accepted at the reclamation facility;
8. Keeping a record of each incoming and outgoing shipment in the operating log; and

Safety-Kleen's customers sign a service document containing the following information:

- a. the name, address and EPA I.D. number of the facility to which the waste is being shipped;
- b. the customer's name, address and EPA I.D. number (if available); and
- c. the description and amount of Safety-Kleen solvent waste generated.

In addition, each incoming and outgoing shipment is recorded in the facility's operating log.

If a waste is rejected at the time of service, the customer will be given a choice as to whether he will dispose of the waste himself or require Safety-Kleen's assistance. If he requests Safety-Kleen's assistance, a sample will be drawn using a Coli-wasa tube or similar sampling device to ensure representative samples. The sample will be analyzed for flash point and volatile organic compounds. If this analysis does not adequately define the constituents, additional analyses will be performed as necessary (e.g., semi-volatile organic compounds, PCBs, etc.).

The laboratory sends waste analyses results to the service center. If through the additional analysis the waste is determined to be acceptable at the branch, it will be relabeled, manifested and then managed with the other wastes. If it is determined through the additional analysis to not be acceptable, the waste will either be: (a) managed at the Service Center on a 10 day transfer basis and manifested to a properly permitted reclamation or disposal facility, or (b) manifested and shipped directly to a properly permitted reclamation or disposal facility. The analytical results from the additional characterization analysis will be used to appropriately manage the waste. The Branch Manager has the right to refuse any further service to a business which has returned waste that does not meet acceptable criteria.

A.2.1 Qualitative Waste Analysis

a. General Inspection Procedures:

Safety-Kleen visually inspects each drum of waste when it is collected at the customer's location. Safety-Kleen examines the waste for volume, appearance, consistency and odor and is intimately familiar with the characteristics of the waste it receives. Based on the known waste characteristics, Safety-Kleen has established the specific acceptance criteria set forth below, to be used by Safety-Kleen personnel in their visual inspections. These inspection procedures allow Safety-Kleen to ensure that the waste being picked up meets appropriate acceptance criteria.

If a particular drum of waste does not meet the acceptance criteria, the Safety-Kleen service representative will either (1) sample the waste for testing at a Safety-Kleen laboratory to determine whether the waste has been contaminated; or (2) reject the waste. In the event the waste is not sampled, Safety-Kleen will notify the generator's State Agency that is authorized to implement the RCRA hazardous waste management program (or EPA if the RCRA program has not been delegated to the State).

If the waste is sampled for further analysis, the service representative will collect a sample, then seal the drum and label it as hazardous waste. The drum is left with the customer pending the results of the laboratory tests. The laboratory testing initially involves analyzing the suspect waste for flash-point and the presence of volatile organic compounds. Pending those results, additional constituents may also be analyzed. The costs of any sampling and testing performed as a result of the waste failing to meet the acceptance criteria, will be borne by the customer.

If the laboratory analysis reveals that the sampled waste is not contaminated, Safety-Kleen will accept the waste from the customer. If the laboratory confirms that the waste is contaminated, the generator will be responsible for securing an alternate means of disposal or they may contract with Safety-Kleen to handle the waste on a ten-day transfer basis.

b. Waste Specific Criteria:

The following is a description of the specific acceptance criteria for each waste stream.

1. Used solvent:

The acceptance criteria for determining by visual inspection whether used solvent has been contaminated are volume, odor and color, the most significant of which is volume. If the volume of waste in a given drum exceeds the specified level, the Safety-Kleen service representative will conduct an inquiry of the customer's operation and handling procedures. Contingent on the customer's responses, the solvent may be accepted, a sample of the waste may be collected for laboratory testing as described above, or the waste may be rejected.

In addition to the volume criterion, the odor of the used solvent may typically indicate whether the waste has been contaminated. Used solvent has a distinctive odor. The service representatives are expressly instructed not to deliberately sniff the waste. However, if the solvent has been contaminated the service representative may notice a difference in the odor when he services the machine.

The used solvent is also visually inspected for its color. Unused solvent typically has a clear or greenish tint. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. In the case of a print shop, the solvent may be clear, green, brown, black, or many colors. Therefore, if the used solvent does not appear to be the expected color, the service representative will sample the waste for possible contamination as described above, or will reject the waste.

2. Immersion Cleaner:

The criteria for the inspection of used immersion cleaner are volume and color. If the volume of waste exceeds the specified level a sample will be tested for contamination following the procedures described above or the waste will be rejected.

Unused immersion cleaner is amber in color. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. If the used immersion cleaner does not appear to be the expected color, the service representative will either sample the waste for possible contamination as described above, or reject the drum of waste.

3. **Dry Cleaner Wastes:**

Dry cleaner wastes normally consist of used filter cartridges, powder residue, and still bottoms.

a. **Used Filter Cartridges:**

Used filter cartridges are placed in containers meeting DOT specifications. It is obvious to the service representative whether the items in the drums are filter cartridges. The drums may also contain approximately one inch of liquid which should either be clear or have a light brownish tint. If the amount of the liquid is greater than approximately one inch or if the liquid is a color other than light brown, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

b. **Powder Residue:**

The criteria for the acceptance of powder residue are consistency and color, the former being the more significant criterion of the two. A drum of powder residue should not contain any liquid. As the name implies, it will be dry or "powdery". If there is any liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

The powder residue is also inspected for color and should appear to be grayish-black. If the residue is not grayish-black in color, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

- c. **Still Bottoms:**
The criteria for the acceptance of dry cleaning still bottoms are consistency and color. The waste should have a highly viscous, tar-like consistency. If the consistency of the waste is too thin or if there is more than one inch of free liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or will be rejected.

In addition to consistency, the still bottom waste is inspected for color. The waste should appear dark brown or black in color. If the waste is a different color, a service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

4. **Paint Wastes:**

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

- a. **Lacquer Thinner Waste:**
The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in pails which meet DOT requirements. The paint gun cleaning machine operates as a closed system where by there should never be a combined volume of more than the expected amount of solvent in the two collection pails. The solvent is pumped from a tube in a left hand pail (facing the machine) through the machine into the right hand pail. The left hand pail starts with clean solvent which will be pumped out as the machine is used to clean the spray guns. If a service representative discovers more than the expected amount of solvent in the two pails, or there is an overfill from the right hand pail, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

b. **Paint Waste:**

b.1 **Liquid**

The significant criterion for the inspection of paint waste is consistency. The waste should contain no more than 30 percent solids. The service representative will insert a Colliwasa or similar sampling device into the drum. The sampling device should glide easily down to the bottom of the drum. The service representative will handle this waste as a Class 3 flammable waste. If there is resistance to the insertion of the glass tube, it is assumed that the level of solids is in excess of 30 percent and the service representative will reject the waste.

The contents of the glass tube are also visually examined for consistency and water content. The material should be a "free flowing" liquid, but should not contain a significant amount of water. If there is more than approximately 10 inches of water in the 3 foot tube (the water and paint will separate in the tube and thus can be measured) the waste will be rejected.

b.2 **Solid:**

For waste containing more than 30 percent solids the service representative will handle the waste as a Class 4 flammable waste.

5. **Photographic/Imaging Waste**

Photographic/Imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects

the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

A.3 WASTE ANALYSES AT THE RECYCLE CENTER OR QUALIFIED LABORATORY

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure a product quality. The following section summarizes the waste analyses practiced at the recycle center for the hazardous materials returned from the Albuquerque branch. For each waste type stored at the branch, at least the following analyses must be performed annually (annual re-characterization analysis). If a particular waste stream is not managed at the service center during the previous year, no re-characterization analysis is performed. Copies of the results for the annual analyses must be maintained at the branch office for the life of the permit. A copy of the most recent re-characterization analysis is contained in Attachment A-1.

A.3.1 Solvents

- Flash point (must be greater than 90°F).

If the flashpoint is unacceptable, the Albuquerque Branch Manager will be notified immediately and the load will receive appropriate special handling. If the results are acceptable, the following tests will be performed:

- Volatile Organic Analysis, using EPA Methods 8015, 8021, 8260, or approved equivalents.
- Physical appearance, including bottom sediment and water content
- Specific gravity
- pH
- Distillation performance

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately.

In addition to the tests listed above, which will be performed on a representative sample from every load received at the recycle center from the Albuquerque service center, a full Toxicology Characteristic Leaching Procedure (TCLP) analysis for all 40 constituents, (except for pesticides and herbicides) will be performed at least once each calendar year.

A.3.2 Solvent Tank Bottom Sludge and Free Water

- Flash point (Must be greater than 90°F).
- Analysis for content of lead, cadmium, and chromium.
- pH

As described above for solvent, a full TCLP analysis (except for the pesticides and herbicides) will be performed on a representative sample at least once each calendar year.

A.3.3 Immersion Cleaner Solvent

Containers of waste immersion cleaner are typically characterized at the recycle center using the following criteria:

- Flash point
- Physical appearance
- Specific gravity
- Percent water
- Volatile Organic Analysis (using EPA methods 8015, 8021, 8260 or approved equivalents)

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately. As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of immersion cleaner at least once each calendar year.

A.3.4 Dry Cleaning Solvent/Still Bottoms

- Physical appearance
- Volatile Organic Analysis for Perchloroethylene (using EPA methods 8015, 8021, 8260 or approved equivalents)
- Specific gravity

If any of these tests yield unacceptable results or indicate contamination outside the normal range, the Branch Manager will be notified immediately.

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of dry cleaning waste at least once each calendar year.

A.3.5 Paint Waste

Paint wastes are generally characterized at the recycle center using the following criteria:

- Metals
- Flash points
- Physical appearance
- Specific gravity
- Percent water
- Volatile organic analysis (using EPA methods 8015, 8021, 8260, or approved equivalents)

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of paint waste at least once each calendar year.

A.4 WASTE ANALYSIS PLAN UPDATE

This waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revision of the plan is typically the responsibility of the Safety-Kleen corporate or regional compliance offices. Any revision to this plan will be in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.42)

A.5 LAND BAN NOTIFICATION/CERTIFICATION FORMS

In accordance with 40 CFR 268.7(a)(2), Safety-Kleen provides a one time written notice for wastes banned for land disposal with the initial shipment. No further notification is necessary unless the waste changes. Safety-Kleen will provide the written notice for wastes banned from landfills as follows:

1. Printing the Notice language on manifests - such as for core-business customers to branch shipments; or
2. Special forms for each regularly handled waste types (e.g., parts washer solvents, immersion cleaner, dry cleaning wastes, etc); or
3. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis in accordance with 40 CFR 263.12.

The notice is required paperwork for all Safety-Kleen waste types. Further, all wastes stored at the facility will have been characterized and appropriate notification made of LDR requirements, regardless of where the waste was generated and a copy of the required notice maintained in the facility record. Shipments lacking the proper Notice will not be accepted by any Safety-Kleen facility. When a shipment with the proper Notice is received, the notice is kept in the files of the receiving facility with the manifest or with the pre-print if a manifest is not used.

A.6 OPERATING LOG RECORD

Safety-Kleen maintains an operating log record on site which includes the following information as it becomes available:

1. A description and the quantity of each hazardous waste received, and the method and date of its storage as required by Pt. V. Sec. 264, Appendix I;
2. The location of hazardous waste within the facility and quantity;
3. Records and results of waste analyses performed;
4. Summary reports and details of all incidents that require implementing the contingency plan;
5. Records and results of inspections;
6. Monitoring, testing or analytical data and corrective action where required;
7. For off-site facilities, Notices to generators as specified in 264.12(b);
8. Closure and post-closure cost estimates;
9. A certification by the permittee no less often than annually, that the permittee has a program in place to reduce the volume and toxicity of hazardous waste; and
10. The land ban notices and requirements. These records are kept on file at the facility.

A.7 WASTE DETERMINATION FOR SUBPART BB AND CC COMPLIANCE

For purposes of waste determination, this facility utilizes knowledge of the wastes described in Section A.1, A.2 and A.3 above. For those hazardous wastes which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the owner/operator may use knowledge of the waste based on information included in manifests, shipping papers, or waste certification notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment A-1 (waste characterization analytical results), as required in 40 CFR 264.1063(d) and 264.1083. Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart CC standards.

Table A-1

Parameters And Rationale For Hazardous Waste Analysis

| Hazardous Waste | Parameter* | Rationale |
|---------------------------|--|---|
| 1. Spent Solvents | Flash Point | Ignitable Characteristic (D001) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 3. Used Immersion Cleaner | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,1,2,2-trifluoroethane | Contains this ingredient (F002) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Flash Point | Ignitable Characteristic (D001) |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

* Earlier sample analyses indicated the parameters listed are the only ones of concern.

Table A-2

Parameters And Test Methods

| Parameter | Test Method | Reference |
|---|---|--|
| Flash Point | Setaflash closed cup tester | U.S. EPA SW 846, Third Ed., Method 1020 (ASTM Method D327-78) or an equivalent method. |
| Hydrocarbons, Volatile and Semivolatile Organic Compounds LDR Constituents | Gas Chromatography (GC) and/or Mass Spectroscopy | U.S. EPA Methods 8010, 8015, 8020, 8120, 8240, and/or 8270 or equivalent methods. |
| Toxicity Characteristics | TCLP if necessary, followed by 1310 or (3010, 7760) then 6010 and 1310 then 7470. | 40 CFR 261, Appendix II; 55 FR 11798 (March 29, 1990) |

Table A-3

Methods To Sample Hazardous Wastes

| Hazardous Waste | Reference for Sampling | Description of Sampling Method | Sampler |
|----------------------------|--|--|--|
| 1. Spent Solvents | Sampling a tank "Samples & Sampling Procedures for Hazardous Waste Streams" EPA - 600/2-80-018 and Safety-Kleen training, ET-143, "Sampling Hazardous Materials and Wastes". | Test Methods for the Evaluation of Solid Waste Physical/ Chemical Methods, SW846, U.S. EPA Chapter One, et. seq. And Safety-Kleen Training ET-143, "Sampling Hazardous Materials and Wastes" | Coliwasa Tube, Weighted Bottle Sampler, Pond Sampler, Trier, Large Trier, Auger, Grain Thief, or Scoop as appropriate. |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 | Same as number 1 |
| 3. Spent Immersion Cleaner | Same as number 1 | Same as number 1 | Same as number 1 |
| 4. Dry Cleaning Wastes | Same as number 1 | Same as number 1 | Same as number 1 |

Table A-4
Frequency of Analysis

| Hazardous Waste | Analysis* | Frequency |
|---------------------------|--|-------------------|
| 1. Spent Solvents | Flash Point | At least annually |
| | TCLP | At least annually |
| 2. Solvent Tank Bottoms | Flash Point | At least annually |
| | TCLP | At least annually |
| 3. Used Immersion Cleaner | TCLP | At least annually |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,1,2,2-trifluoroethane | At least annually |
| | TCLP | At least annually |
| | Flash Point | At least annually |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

* Past analyses have indicated the parameters listed are the only ones of concern.

ATTACHMENT A-1
ANNUAL RE-CHARACTERIZATION DATA

WASTE ANALYSIS PLAN

ABSTRACT

| Waste Description | EPA Waste Code No. | Facility Capacity ¹ (gallons) | Annual Amount ² |
|----------------------------------|-------------------------------|---|----------------------------|
| Used Solvents | D001 ³ | 12,000 | 143 |
| Tank/Dumpster Bottom Sediment | D001 ³ | N/A | 3 |
| Used Immersion Cleaner | See Below ³ | 6,990 | 3 |
| Dry Cleaning Waste | F002 ³ | Included with Used Immersion Cleaner | 6 |
| Used Solvent (aqueous) | See Below ³ | Included with Used Immersion Cleaner | 3 |
| Paint Waste | D001, F003, F005 ³ | 9,650 | 14 |
| Photo Chemical Wastes | D011 | Included with Used Immersion Cleaner | 3 |

¹ The facility capacity is in gallons.

² The annual amount is in thousands of gallons.

³ and may include D004, D005, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, D043.

The Facility shall store only wastes it is authorized to store. That is, Safety-Kleen will only store wastes included in Part A of the application for hazardous waste permit and not otherwise prohibited by the permit. Safety-Kleen will not store any hazardous waste for more than one year.

These waste streams are characterized annually as described in the "Statistical Analysis of Annual Waste Characterization Data", attached and incorporated herein by reference. (The most recent data are also included.)

The testing and sampling methodology is as described in A.3, below. The data generated in this process is used to assign waste codes, if any, for each waste stream. The data generated in the annual recharacterization (AR) is also used to assist recycle centers in recycling or treating the waste streams. Recycle centers also rely on their own waste analysis plans to generate data to recycle materials and or dispose of waste. If while providing service to a customer if there is suspicion that the waste does not meet the acceptance criteria, the waste will not be picked up and the customer must provide information explaining what is in the waste and how the waste was adulterated. Please see the text below in this waste analysis plan.

Providing service to Safety-Kleen customers is dependent on a review of the customer business. If the business is a typical generator of that waste stream (for example, a garage generating parts washer waste), then limited review is performed. If the business is not a typical generator of that waste stream or if the business has other processes on site, a more detailed review of the business is performed and a certification from the customer is required stating the waste will be as described without adulterants. For example, laboratory analysis of that customer's waste may be required.

In this AR process, regulated hazardous constituents and reasonably expected underlying hazardous constituents (UHC)s are also discovered. UHC which is discovered in the annual recharacterisation will be assumed to expected throughout the waste stream. The applicable constituent concentration or technology based treatment standards for the wastes and / or individual hazardous constituents will be identified, if required by regulation, on the LDR generated from this data. The LDRs generated in this process also identify whether the waste must be treated before being land disposed when required by regulation.

AR data is used to update subpart BB and Subpart CC plans (see these plans elsewhere in this permit application). It is anticipated that minor changes in the waste streams are unlikely to significantly change in air emissions.

Recycle centers test every shipment of waste for PCBs. If a shipment is discovered to contain PCBs, the source of the PCBs is traced and appropriate 40 CFR 761 requirements are implemented. Any equipment contaminated by PCBs is removed from service decontaminated cleaned before being put into service.

The Safety-Kleen transportation department is responsible for selecting packaging for Safety-Kleen waste streams, in addition to their responsibility for company compliance with Federal, State, and local transportation regulations and rules. The transportation department has selected packaging based on past waste recharacterizations and continue to review AR and other data to maintain compliance with material packaging requirements.

A.1 DESCRIPTION OF WASTES

Several types of waste result from the servicing of Safety-Kleen customers and the maintenance of the service center. It should be noted that the solvents managed at this facility are incompatible with strong oxidizers and reactive metals, none of which are present in the containers, container storage area, or the concrete sealant. The solvents are also compatible with one another. Analytical data for the wastes and specifications for the products are in Attachment A-1 and qualitative descriptions follow.

A.1.1 Wastes Resulting From the Parts of Washer Service

Used solvents from parts washers is accumulated in a 12,000 gallon underground, storage tank via the return and fill station. Containers of used material are poured into a dumpster at the return and fill station which in turn empties into the tank. This waste handling method results in several types of solvent waste:

- a. Used solvent - The used solvent is removed from the tank by a tanker truck on a scheduled basis. About 5,000 gallons are removed every month. This waste is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- b. Bottom sediment in the tank - Approximately once every two years, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- c. Dumpster Sediment - Sediment may also accumulate in the drum washers in the return/fill station. The sediment is manually removed and placed in containers. The dumpster sediment is representative of the waste codes described in items a and b above.
- d. Used Aqueous Parts Cleaning Solvent - may be bulked at the service center into containers that meet DOT specifications or may be co-mingled with the other solvent into the used solvent tank. It may be toxic using the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.
- e. Immersion Cleaner - is a different type of solvent that is not placed in the underground storage tank. Containers of immersion cleaner typically remain in the drum in which it was originally used until it is received at the recycle center. Drums are placed in the drum storage area of the warehouse and are stacked no more than two-high in the drum storage area of the warehouse.

The immersion cleaner is a non-halogenated hydrocarbon mixture and may exhibit the toxic characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040 D041, D042, and D043.

A.1.2 Wastes Resulting From the Dry Cleaner Service

Dry cleaning wastes consist of used filter cartridges, powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in containers meeting DOT specifications. The containers are then palletized, stacked two-high and placed in the container storage area of the warehouse. Approximately 95% of the dry cleaning solvent used is perchloroethylene (F002 and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and the remaining 5% is trichloro-trifluoroethane (F002) and toxic using the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043).

A.1.3 Wastes Resulting From the Paint Service

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and may be toxic as per the characteristic leaching procedure (D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043). The wastes are collected in containers which meet DOT requirements at the customer's place of business and containers are then palletized and stored in an enclosed concrete masonry building (the H-3 Flammable Storage Building).

A.1.4 Photographic/Imaging Wastes

Some photographic imaging wastes managed by the facility are not solid wastes per 40 CFR 261.2(c) because their hazardous constituent is reclaimed. Others are managed under the provisions of Subpart F of 40 CFR 266 – Recyclable Materials Utilized for Precious Metals Recovery. Imaging waste consists typically of three waste streams. Photo fixer solution is an aqueous solution used to etch photo film during processing. This material is characteristic for silver (D011). Safety-Kleen is able to recover the silver from the solution. Used Photo developer is an aqueous solution that exhibits no hazardous waste characteristics but may not be allowed to discharge into public wastewater treatment systems in some communities. Silver collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste as per 40 CFR 260.30(c) and are managed as a non-regulated material.

A.2 QUALITY CONTROL PROCEDURES

The used solvents are the primary feed stocks for the generation of Safety-Kleen solvent products. As a result, quality control of the used solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The service center collects used solvents from approximately 1,100 customers, most of who are small quantity generators, and an estimated 14,000 drums containing recoverable solvents are returned to the service center each year for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

Furthermore, as discussed earlier in the Facility Description, all the materials collected at the service center are managed at all times in a closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers as described in Section A.2.1. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

However, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR (a)(3)(i), Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated. It is Safety-Kleen's practice that suspected non-conforming material must not be

accepted until a full analysis has been conducted. If a container with questionable contents is returned to the service center, a sample will be taken and analysis will be performed at the recycling center, Safety-Kleen Tech Center (Elk Grove Village, Illinois) or other qualified lab according to the procedures outlined in Section A.3 of this attachment. The Branch Manager will be notified of any contamination that may have occurred.

Safety-Kleen trains personnel to verify the physical characteristics of the wastes at several points in the management of the solvent. These procedures are described briefly below.

Safety-Kleen controls the use and management of its solvents by:

1. Limiting the solvents stored to those compatible with one another and their containers;
2. Limiting the uses of each type of solvent for (example, dry cleaning waste is only collected from dry cleaner shops);
3. Determining the customer's type of business (i.e., the SIC code is recorded) and the purpose for which the customer will use the machine;
4. Training customers to use the machines properly;
5. Training employees to inspect the physical characteristics of used solvent and determine whether it is acceptable;
6. When waste is collected from a customer, indicate on the service document whether the used solvent meets Safety-Kleen's acceptance criteria;
7. Marking each container with the customer's name, address, and EPA I.D. number (if available). This information remains on containerized waste until it is accepted at the reclamation facility;
8. Keeping a record of each incoming and outgoing shipment in the operating log; and

Safety-Kleen's customers sign a service document containing the following information:

- a. the name, address and EPA I.D. number of the facility to which the waste is being shipped;
- b. the customer's name, address and EPA I.D. number (if available); and
- c. the description and amount of Safety-Kleen solvent waste generated.

In addition, each incoming and outgoing shipment is recorded in the facility's operating log.

If a waste is rejected at the time of service, the customer will be given a choice as to whether he will dispose of the waste himself or require Safety-Kleen's assistance. If he requests Safety-Kleen's assistance, a sample will be drawn using a Coliwasa tube or similar sampling device to ensure representative samples. The sample will be analyzed for flash point and volatile organic compounds. If this analysis does not adequately define the constituents, additional analyses will be performed as necessary (e.g., semi-volatile organic compounds, PCBs, etc.).

The laboratory sends waste analyses results to the service center. If through the additional analysis the waste is determined to be acceptable at the branch, it will be relabeled, manifested and then managed with the other wastes. If it is determined through the additional analysis to not be acceptable, the waste will either be: (a) managed at the Service Center on a 10 day transfer basis and manifested to a properly permitted reclamation or disposal facility, or (b) manifested and shipped directly to a properly permitted reclamation or disposal facility. The analytical results from the additional characterization analysis will be used to appropriately manage the waste. The Branch Manager has the right to refuse any further service to a business which has returned waste that does not meet acceptable criteria.

A.2.1 Qualitative Waste Analysis

a. General Inspection Procedures:

Safety-Kleen visually inspects each drum of waste when it is collected at the customer's location. Safety-Kleen examines the waste for volume, appearance, consistency and odor and is intimately familiar with the characteristics of the waste it receives. Based on the known waste characteristics, Safety-Kleen has established the specific acceptance criteria set forth below, to be used by Safety-Kleen personnel in their visual inspections. These inspection procedures allow Safety-Kleen to ensure that the waste being picked up meets appropriate acceptance criteria.

If a particular drum of waste does not meet the acceptance criteria, the Safety-Kleen service representative will either (1) sample the waste for testing at a Safety-Kleen laboratory to determine whether the waste has been contaminated; or (2) reject the waste. In the event the waste is not sampled, Safety-Kleen will notify the generator's State Agency that is authorized to implement the RCRA hazardous waste management program (or EPA if the RCRA program has not been delegated to the State).

If the waste is sampled for further analysis, the service representative will collect a sample, then seal the drum and label it as hazardous waste. The drum is left with the customer pending the results of the laboratory tests. The laboratory testing initially involves analyzing the suspect waste for flash-point and the presence of volatile organic compounds. Pending those results, additional constituents may also be analyzed. The costs of any sampling and testing performed as a result of the waste failing to meet the acceptance criteria, will be borne by the customer.

If the laboratory analysis reveals that the sampled waste is not contaminated, Safety-Kleen will accept the waste from the customer. If the laboratory confirms that the waste is contaminated, the generator will be responsible for securing an alternate means of disposal or they may contract with Safety-Kleen to handle the waste on a ten-day transfer basis.

b. Waste Specific Criteria:

The following is a description of the specific acceptance criteria for each waste stream.

1. Used solvent:

The acceptance criteria for determining by visual inspection whether used solvent has been contaminated are volume, odor and color, the most significant of which is volume. If the volume of waste in a given drum exceeds the specified level, the Safety-Kleen service representative will conduct an inquiry of the customer's operation and handling procedures. Contingent on the customer's responses, the solvent may be accepted, a sample of the waste may be collected for laboratory testing as described above, or the waste may be rejected.

In addition to the volume criterion, the odor of the used solvent may typically indicate whether the waste has been contaminated. Used solvent has a distinctive odor. The service representatives are expressly instructed not to deliberately sniff the waste. However, if the solvent has been contaminated the service representative may notice a difference in the odor when he services the machine.

The used solvent is also visually inspected for its color. Unused solvent typically has a clear or greenish tint. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. In the case of a print shop, the solvent may be clear, green, brown, black, or many colors. Therefore, if the used solvent does not appear to be the expected color, the service representative will sample the waste for possible contamination as described above, or will reject the waste.

2. Immersion Cleaner:

The criteria for the inspection of used immersion cleaner are volume and color. If the volume of waste exceeds the specified level a sample will be tested for contamination following the procedures described above or the waste will be rejected.

Unused immersion cleaner is amber in color. As the solvent is used, it turns brown in color. The more it is used, the darker brown it becomes, until it is almost black. If the used immersion cleaner does not appear to be the expected color, the service representative will either sample the waste for possible contamination as described above, or reject the drum of waste.

3. Dry Cleaner Wastes:

Dry cleaner wastes normally consist of used filter cartridges, powder residue, and still bottoms.

a. Used Filter Cartridges:

Used filter cartridges are placed in containers meeting DOT specifications. It is obvious to the service representative whether the items in the drums are filter cartridges. The drums may also contain approximately one inch of liquid which should either be clear or have a light brownish tint. If the amount of the liquid is greater than approximately one inch or if the liquid is a color other than light brown, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

b. Powder Residue:

The criteria for the acceptance of powder residue are consistency and color, the former being the more significant criterion of the two. A drum of powder residue should not contain any liquid. As the name implies, it will be dry or "powdery". If there is any liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

The powder residue is also inspected for color and should appear to be grayish-black. If the residue is not grayish-black in color, the service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

c. **Still Bottoms:**

The criteria for the acceptance of dry cleaning still bottoms are consistency and color. The waste should have a highly viscous, tar-like consistency. If the consistency of the waste is too thin or if there is more than one inch of free liquid in the drum, the waste will be sampled for contamination in accordance with the procedures described above, or will be rejected.

In addition to consistency, the still bottom waste is inspected for color. The waste should appear dark brown or black in color. If the waste is a different color, a service representative will sample the waste for contamination in accordance with the procedures described above, or will reject the waste.

4. **Paint Wastes:**

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

a. **Lacquer Thinner Waste:**

The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in pails which meet DOT requirements. The paint gun cleaning machine operates as a closed system where by there should never be a combined volume of more than the expected amount of solvent in the two collection pails. The solvent is pumped from a tube in a left hand pail (facing the machine) through the machine into the right hand pail. The left hand pail starts with clean solvent which will be pumped out as the machine is used to clean the spray guns. If a service representative discovers more than the expected amount of solvent in the two pails, or there is an overfill from the right hand pail, the waste will be sampled for contamination in accordance with the procedures described above, or the waste will be rejected.

b. **Paint Waste:**

b.1 **Liquid**

The significant criterion for the inspection of paint waste is consistency. The waste should contain no more than 30 percent solids. The service representative will insert a Colliwasa or similar sampling device into the drum. The sampling device should glide easily down to the bottom of the drum. The service representative will handle this waste as a Class 3 flammable waste. If there is resistance to the insertion of the glass tube, it is assumed that the level of solids is in excess of 30 percent and the service representative will reject the waste.

The contents of the glass tube are also visually examined for consistency and water content. The material should be a "free flowing" liquid, but should not contain a significant amount of water. If there is more than approximately 10 inches of water in the 3 foot tube (the water and paint will separate in the tube and thus can be measured) the waste will be rejected.

b.2 **Solid:**

For waste containing more than 30 percent solids the service representative will handle the waste as a Class 4 flammable waste.

5. **Photographic/Imaging Waste**

Photographic/Imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects

the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

A.3 WASTE ANALYSES AT THE RECYCLE CENTER OR QUALIFIED LABORATORY

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure a product quality. The following section summarizes the waste analyses practiced at the recycle center for the hazardous materials returned from the Albuquerque branch. For each waste type stored at the branch, at least the following analyses must be performed annually (annual re-characterization analysis). If a particular waste stream is not managed at the service center during the previous year, no re-characterization analysis is performed. Copies of the results for the annual analyses must be maintained at the branch office for the life of the permit. A copy of the most recent re-characterization analysis is contained in Attachment A-1.

A.3.1 Solvents

- Flash point (must be greater than 90°F).

If the flashpoint is unacceptable, the Albuquerque Branch Manager will be notified immediately and the load will receive appropriate special handling. If the results are acceptable, the following tests will be performed:

- Volatile Organic Analysis, using EPA Methods 8015, 8021, 8260, or approved equivalents.
- Physical appearance, including bottom sediment and water content
- Specific gravity
- pH
- Distillation performance

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately.

In addition to the tests listed above, which will be performed on a representative sample from every load received at the recycle center from the Albuquerque service center, a full Toxicology Characteristic Leaching Procedure (TCLP) analysis for all 40 constituents, (except for pesticides and herbicides) will be performed at least once each calendar year.

A.3.2. Solvent Tank Bottom Sludge and Free Water

- Flash point (Must be greater than 90°F).
- Analysis for content of lead, cadmium, and chromium.
- pH

As described above for solvent, a full TCLP analysis (except for the pesticides and herbicides) will be performed on a representative sample at least once each calendar year.

A.3.3 Immersion Cleaner Solvent

Containers of waste immersion cleaner are typically characterized at the recycle center using the following criteria:

- Flash point
- Physical appearance
- Specific gravity
- Percent water
- Volatile Organic Analysis (using EPA methods 8015, 8021, 8260 or approved equivalents)

If any of these tests yield unacceptable results or indicate solvent contamination outside the normal range, the Branch Manager will be notified immediately. As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of immersion cleaner at least once each calendar year.

A.3.4 Dry Cleaning Solvent/Still Bottoms

- Physical appearance
- Volatile Organic Analysis for Perchloroethylene (using EPA methods 8015, 8021, 8260 or approved equivalents)
- Specific gravity

If any of these tests yield unacceptable results or indicate contamination outside the normal range, the Branch Manager will be notified immediately.

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of dry cleaning waste at least once each calendar year.

A.3.5 Paint Waste

Paint wastes are generally characterized at the recycle center using the following criteria:

- Metals
- Flash points
- Physical appearance
- Specific gravity
- Percent water
- Volatile organic analysis (using EPA methods 8015, 8021, 8260, or approved equivalents)

As described above, a full TCLP test (except for pesticides and herbicides) will be performed on a representative sample of paint waste at least once each calendar year.

A.4 WASTE ANALYSIS PLAN UPDATE

This waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revision of the plan is typically the responsibility of the Safety-Kleen corporate or regional compliance offices. Any revision to this plan will be in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.42)

A.5 LAND BAN NOTIFICATION/CERTIFICATION FORMS

In accordance with 40 CFR 268.7(a)(2), Safety-Kleen provides a one time written notice for wastes banned for land disposal with the initial shipment. No further notification is necessary unless the waste changes. Safety-Kleen will provide the written notice for wastes banned from landfills as follows:

1. Printing the Notice language on manifests - such as for core-business customers to branch shipments; or
2. Special forms for each regularly handled waste types (e.g., parts washer solvents, immersion cleaner, dry cleaning wastes, etc); or
3. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis in accordance with 40 CFR 263.12.

The notice is required paperwork for all Safety-Kleen waste types. Further, all wastes stored at the facility will have been characterized and appropriate notification made of LDR requirements, regardless of where the waste was generated and a copy of the required notice maintained in the facility record. Shipments lacking the proper Notice will not be accepted by any Safety-Kleen facility. When a shipment with the proper Notice is received, the notice is kept in the files of the receiving facility with the manifest or with the pre-print if a manifest is not used.

A.6 OPERATING LOG RECORD

Safety-Kleen maintains an operating log record on site which includes the following information as it becomes available:

1. A description and the quantity of each hazardous waste received, and the method and date of its storage as required by Pt. V. Sec. 264, Appendix I;
2. The location of hazardous waste within the facility and quantity;
3. Records and results of waste analyses performed;
4. Summary reports and details of all incidents that require implementing the contingency plan;
5. Records and results of inspections;
6. Monitoring, testing or analytical data and corrective action where required;
7. For off-site facilities, Notices to generators as specified in 264.12(b);
8. Closure and post-closure cost estimates;
9. A certification by the permittee no less often than annually, that the permittee has a program in place to reduce the volume and toxicity of hazardous waste; and
10. The land ban notices and requirements. These records are kept on file at the facility.

A.7 WASTE DETERMINATION FOR SUBPART BB AND CC COMPLIANCE

For purposes of waste determination, this facility utilizes knowledge of the wastes described in Section A.1, A.2 and A.3 above. For those hazardous wastes which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the owner/operator may use knowledge of the waste based on information included in manifests, shipping papers, or waste certification notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment A-1 (waste characterization analytical results), as required in 40 CFR 264.1063(d) and 264.1083. Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart CC standards.

Table A-1

Parameters And Rationale For Hazardous Waste Analysis

| Hazardous Waste | Parameter* | Rationale |
|---------------------------|--|---|
| 1. Spent Solvents | Flash Point | Ignitable Characteristic (D001) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 3. Used Immersion Cleaner | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,1,2,2-trifluoroethane | Contains this ingredient (F002) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Flash Point | Ignitable Characteristic (D001) |
| | Hazardous Constituent Concentration | Determination of Waste's LDR Status |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

* Earlier sample analyses indicated the parameters listed are the only ones of concern.

Table A-2

Parameters And Test Methods

| Parameter | Test Method | Reference |
|--|---|--|
| Flash Point | Setaflash closed cup tester | U.S. EPA SW 846, Third Ed., Method 1020 (ASTM Method D327-78) or an equivalent method. |
| Hydrocarbons, Volatile and Semivolatile Organic Compounds LDR Constituents | Gas Chromatography (GC) and/or Mass Spectroscopy | U.S. EPA Methods 8010, 8015, 8020, 8120, 8240, and/or 8270 or equivalent methods. |
| Toxicity Characteristics | TCLP if necessary, followed by 1310 or (3010, 7760) then 6010 and 1310 then 7470. | 40 CFR 261, Appendix II; 55 FR 11798 (March 29, 1990) |

Table A-3

Methods To Sample Hazardous Wastes

| Hazardous Waste | Reference for Sampling | Description of Sampling Method | Sampler |
|----------------------------|--|--|--|
| 1. Spent Solvents | Sampling a tank "Samples & Sampling Procedures for Hazardous Waste Streams" EPA - 600/2-80-018 and Safety-Kleen training, ET-143, "Sampling Hazardous Materials and Wastes". | Test Methods for the Evaluation of Solid Waste Physical/ Chemical Methods, SW846, U.S. EPA Chapter One, et. seq. And Safety-Kleen Training ET-143, "Sampling Hazardous Materials and Wastes" | Coliwasa Tube, Weighted Bottle Sampler, Pond Sampler, Trier, Large Trier, Auger, Grain Thief, or Scoop as appropriate. |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 | Same as number 1 |
| 3. Spent Immersion Cleaner | Same as number 1 | Same as number 1 | Same as number 1 |
| 4. Dry Cleaning Wastes | Same as number 1 | Same as number 1 | Same as number 1 |

Table A-4

Frequency of Analysis

| Hazardous Waste | Analysis* | Frequency |
|---------------------------|--|-------------------|
| 1. Spent Solvents | Flash Point | At least annually |
| | TCLP | At least annually |
| 2. Solvent Tank Bottoms | Flash Point | At least annually |
| | TCLP | At least annually |
| 3. Used Immersion Cleaner | TCLP | At least annually |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,2,2-trifluoroethane | At least annually |
| | | At least annually |
| | TCLP | At least annually |
| | Flash Point | At least annually |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

* Past analyses have indicated the parameters listed are the only ones of concern.

1.0 FACILITY DESCRIPTION

ABSTRACT

CORPORATE HEADQUARTERS: Safety-Kleen Systems, Inc.
1301 Gervais Street
Columbia, SC 29201
(803) 933-4200

RESPONSIBLE OFFICIALS: Mike Crawford
Branch Manager

FACILITY ADDRESS: Safety-Kleen Systems, Inc. (7-008-21)
4210 A Hawkins Road
Farmington, New Mexico 87401

TELEPHONE NUMBER: (505) 327-9070

U.S. EPA I.D. NUMBER: NMD 980698849

GEOGRAPHIC LOCATION: 36° 44' 20" N
108° 14' 11" W

OWNER: COMET Corporation
1215 Brentwood Circle
Farmington, New Mexico 87401
(303) 884-2602 (505) 325-3743 (June 1992)

DATE OPERATIONS BEGAN: January 1, 1981

DESCRIPTION OF ACTIVITIES: This facility is an accumulation point for spent solvents generated by Safety-Kleen customers, the majority of whom are small quantity generators. All wastes are ultimately shipped to a Safety-Kleen recycling facility or a contract reclaimer and then returned to the Company's customers as product.

PROPERTY DESCRIPTION: 0.80 acres with the following structures:

- a. one building with offices and a warehouse for container storage;
- b. two aboveground storage tanks (one for product and one for spent solvent) with concrete diking; and
- c. one loading dock with a solvent return and fill station.

FACILITY TYPE: Storage in an aboveground tank (S02) and in containers (S01)

| STORAGE UNIT | CAPACITY (GAL.) | SECONDARY CONTAINMENT (GAL.) | MATERIAL TO BE STORED |
|----------------------|--------------------|---------------------------------|---|
| Tank | 12,000 | 18,266 | Spent Solvent (D001) ¹ |
| Container Storage | 3,820 | 382 | Spent Immersion Cleaner ¹ Dry Cleaning Waste (F002) ¹ Sediment from Tank Bottoms or Ancillary Equipment ¹ Aqueous Parts Washer Solvents ¹ Paint Wastes (D001, F002, F005) ¹ Photo Imaging Wastes (D011) ² |

Notes: ¹ Waste may also include the following waste codes: D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043

² Photo imaging wastes may not be considered a hazardous or solid waste if the hazardous constituent (silver) is reclaimed.

1.0 FACILITY DESCRIPTION

1.1 Description Of Business Activity

Safety-Kleen Systems, Inc. is an international service-oriented company whose customers are primarily engaged in automotive repair, industrial maintenance and dry cleaning. The company has been operating since 1968 offering solvent collection and reclamation services for its customers, more than 99% of whom generate less than 1000 kilograms (2200 pounds) per month.

Currently, Safety-Kleen offers several services, which involve the accumulation and storage of spent solvent at the Farmington Service Center. These wastes are shipped from the service center to a Safety-Kleen recycle center or to an independent reclaimer and are then returned to customers as usable product. A unique feature of this system is that Safety-Kleen retains ownership of the parts cleaning machines and the solvent. This "closed loop" system allows the Company to maintain control of the solvent except while it is in use at the customer's place of business. A description of typical services Safety-Kleen provides its customers is provided.

1.1.1 Parts Cleaner Service

The original service offered by the Company in 1968 was the parts cleaner service and it remains the primary business activity. This service involves the leasing of a small parts degreasing unit which consists of a sink affixed to a DOT-approved container (typically a 16- or 30 gallon drum) that contains Safety-Kleen Parts Washer Solvent. On a regularly scheduled basis, a Safety-Kleen sales representative cleans and inspects the parts washer machine and replaces the container of used solvent with one of clean product. Each sales representative performs about fifteen of these services per day, collecting the containers of used solvent on a route van.

At the end of each day, the solvent is transferred from the drums to a storage tank at the service center and containers of product are prepared for the next day's services. Periodically, a tanker truck is dispatched from one of the recycle centers to deliver a load of clean solvent and collect the spent solvent at the service center. Two-thirds of the solvent used by Safety-Kleen customers has been reclaimed with the remainder being purchased from a vendor.

Spent material is poured into the dumpster/drum washer in the return and fill station. It is then pumped into the used parts washer solvent storage tank. The sediment which accumulates in the bottom of the dumpster/drum washer is removed manually, drummed and stored in the return and fill station according to the satellite accumulation requirements of 40 CFR 262.34(b). The drummed sediment is manifested off-site prior to the expiration of the 90-day time frame for accumulation of hazardous waste.

Safety-Kleen has also established a parts cleaner service for users who own their machines. This service, known as the Customer Owned Machine Service, provides a solvent reclamation service to these customers regardless of machine model. The used solvent is pumped (using a hand pump) from the customer owned machine to a standard Safety-Kleen container which

meets DOT requirements (typically a 16 or thirty gallon container) by a Safety-Kleen sales representative. The waste solvent is stored in the same manner as the waste solvent collected from the leased parts cleaner machines. The sales representative then refills the customer-owned machine with Safety-Kleen parts washer solvent.

A second type of parts washer, the immersion cleaner, is available for the removal of varnish and gum from such things as carburetors and transmissions. This machine consists of an immersible basket with an agitator affixed to a DOT-approved container (typically a 16 gallon drum). The immersion cleaner is non-halogenated hydrocarbon mixture. The spent solvent remains in the drum after delivery to the service center where it is stored in a contained area of the warehouse. Periodically, a box trailer truck is dispatched from a recycle center to deliver containers of fresh solvent and collect the containers of spent immersion cleaner solvent for reclamation.

1.1.2 Dry Cleaner Service

In 1984, Safety-Kleen began offering a service for the collection of filter cartridges and still bottoms contaminated with dry cleaning solvents (usually perchloroethylene). These wastes are containerized on the customer's premises and are periodically collected by a sales representative. The containerized waste is accumulated in the container storage area prior to shipment to a Safety-Kleen recycle center contract reclaimer or other permitted facility. About 35% of this waste is returned to dry cleaners as usable product.

1.1.3 Paint Waste Collection Service

In 1986, a paint waste reclamation program was initiated to service automobile body repair businesses. Waste containing various thinners and paints are collected in DOT-approved containers on the customer's premises. The sales representative collects these containers and stores them in the container storage area of the warehouse. These wastes are periodically transported to a reclaimer and the regenerated solvent is distributed to Safety-Kleen customers for use as product.

1.1.4 Imaging/Photochemical Service

Imaging waste consists typically of three waste streams. Photo fixer solution is used to etch photo film during processing. This material is characteristic for silver (D011). Safety Kleen is able to recover the hazardous constituent from the photo fixer solution. Used photo developer is an aqueous solution used to neutralize the etching effects of the photo fixer. This material exhibits no hazardous characteristics but may not be discharged into public wastewater treatment system in some communities. Silver collection canisters are sent to a recycle center for silver reclamation. These canisters do not meet the definition of a solid waste per 40 CFR 260.30(c) and are managed as a non-regulated material.

The Imaging/Photochemical wastes are placed in containers at the customer's place of business. Several of these wastes are not considered hazardous or solid wastes because the hazardous constituent may be reclaimed. However, the sales representative collects these containers and stores them in the container storage area of the warehouse. The

imaging/photochemical wastes are then re-manifested and periodically sent to a Safety-Kleen recycle center, contract reclaimer or other permitted treatment facility.

1.2 Description Of The Facility

The Farmington service center has been operating as a storage facility since January 1, 1981. The facility consists of the following structures:

- a. 1,530 square foot warehouse with offices and a container storage area;
- b. two nominal 12,000 gallon aboveground storage tanks, with diking used for storage of product and waste solvents; and
- c. a solvent return and fill station with a loading dock, wet dumpster, drum washer (non-regulated, continued use unit), and secondary containment.

Descriptions of the surrounding area and of waste management practices at the service center follow. Applicable maps and facility drawings are in Attachment E.

1.2.1 Regional Description

The Farmington Service Center is located 600 feet northeast of the intersection of Troy King Road and West Main Street (U.S. Hwy 550) in San Juan County. This area is zoned industrial and to the best of Safety-Kleen's knowledge, no easements, title, deed, or usage restrictions exist which may conflict with operations at this site.

The western part of San Juan County is the Navajo Indian reservation. Eastern San Juan County, the location of Farmington, has a total area of 2,182,520 acres or 3,410 square miles. The total population of the area is approximately 50,000 with about 34,000 in Farmington. The major industries in Farmington are involved in the development of gas, oil and coal resources. Abundant rangeland contributed to the growth of the area through cattle raising and farming, however, this industry has largely declined.

Farmington has a continental climate with an average annual precipitation of 6 inches and total annual snowfall of 9 inches. The average temperature in winter is 44° F and the average summer temperature is 71° F. The average daily temperature range is 33 degrees. An average of 40 thunderstorms occur each year and prevailing winds are east-west.

San Juan County is in the San Juan Basin part of the Navajo section of the Colorado Plateau physiographic province. This area is a structural depression containing deep Tertiary till on rocks of late Cretaceous age. Farmington is located in the alluvial fan in the entrenched San Juan and Animas Rivers. The service center is not in the flood plain of either river. The elevation at the site is 5,470 feet above sea level. The San Juan River provides the principal drainage route for the area and the Animas River is its main tributary.

The soil in the area of the service center is the Avalon sandy loam. This is a deep well-drained soil on mesas and plateaus which formed in alluvial and eolian material derived from sandstone and shale. This soil is moderately permeable with slopes ranging from 5 to 8 percent.

The city of Farmington obtains its water primarily from the Animas River through two pump stations. Pump station 1 is located about two miles east of Farmington and pump station 2 and the Bee Line reservoir are several miles northeast of Farmington. Standby water is obtained from a pump station several miles south of Farmington on the San Juan River. The service center obtains water from the city of Farmington via a 6" water line on Hawkins Road. A drop inlet to the city storm sewer system is located approximately 500 feet west of the service center. Sewage is collected in a septic tank.

There are no known oil or gas wells within a mile of the service center. No parks, schools, wetlands, or critical habitats exist within one mile of the service center.

The non-building areas of the facility are paved with asphalt, concrete or gravel, as noted on the Site Plan in Attachment E. The majority of the vehicular traffic and loading/unloading operations occur at and near the return and fill station and this area is paved with asphalt and concrete. The entrance to the facility is on Hawkins Road which is the major access road to the facility. The access road was designed in accordance with engineering criteria appropriate for sustaining the traffic volume and loading for the industrial activities in this area. The route van that daily travels the routes between the service center and its customers uses the two-lane approach driveway. The trucks dispatched from the recycle center to deliver and pick up fresh and used solvents perform these activities at the aboveground tank area.

This permit application has been organized similar to the previous permit application to maintain consistency. The remaining sections of this permit application (Waste Analysis Plan, Preparedness, and Prevention Plan, etc.) are included in attachments A through H. Relevant information associated with each attachment is presented at the end of each respective attachment.

WASTE ANALYSIS PLAN

ABSTRACT

| Waste EPA Waste Description | Facility Code Nos. | Annual Capacity ¹ | Amount ² |
|--|-------------------------------|---------------------------------|---------------------|
| Spent Solvents | D001 ³ | 12,000 | 50 |
| Bottom Sediment From the Tank and Ancillary Equipment | D001 ³ | N/A | 2 |
| Spent Immersion Cleaner | D001 ³ | 4,464 | 3 |
| Dry Cleaning Waste | D001, F002 ³ | | 6 |
| Paint Waste | F003, F005, D001 ³ | 4,464 | |
| Photo Chemical Wastes | D011 | 4,464 | |

NOTES:

¹ The facility capacity is in gallons.

² The annual amount is in thousands of gallons.

³ and may also include D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043

⁴ The total amount of drummed waste stored in the warehouse will not exceed 3,820 gallons.

WASTE ANALYSIS PLAN

A.1 Description Of Wastes

Several types of waste representing core Safety-Kleen Products result from the servicing of Safety-Kleen customers and the maintenance of the service center. Analytical data for the wastes and specifications for the products are in Attachment A.1 and qualitative descriptions follow.

A.1.1 Wastes Resulting From the Parts Washer Service

Used solvents from parts washers is accumulated in a nominal 12,000 gallon aboveground storage tank via the return and fill station. Containers of spent material (typically 16- and 30-gallon containers) are poured into a drum washer/dumpster at the return and fill station which in turn empties into the tank. Five types of parts washer waste are generally produced as a result of the parts washer service.

- a. Spent Solvent--The spent solvent is removed from the tank by a tanker truck on a scheduled basis. About 5,000 gallons are removed every month. This waste is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.
- b. Bottom Sediment in the Tank--Periodically, it is necessary to remove sediment and other heavy material from the bottom of the tank. A Safety-Kleen vacuum truck is generally used for this purpose. The sediment is ignitable (D001) and may exhibit the toxicity characteristic of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.
- c. Drum Washer/Dumpster sediment--Sediment also accumulates in the bottom of the drum washers/dumpsters in the return and fill station. This sediment is removed manually with a shovel, containerized and the containers are stored in the Container Storage Area of the warehouse. Containers are properly labeled to indicate their contents. The chemical composition of this waste is very similar to that of the bottom sediment from the tank and therefore, carries the same EPA hazardous waste codes.
- d. Immersion Cleaner--remains in the container in which it was originally packaged and used until it is ultimately received at the recycle center. The immersion cleaner is a non-halogenated hydrocarbon mixture and may exhibit the toxicity characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043. The containers are properly labeled, placed on pallets and are stacked no more than 2 pallets high in the CSA of the warehouse.

- e. Aqueous Parts Cleaner Solvents: This waste may be placed into the used parts cleaner solvent tank as discussed above, bulked onsite in larger DOT approved containers and stored in the CSA, or remain in the container in which it was originally used. The aqueous parts cleaner may exhibit the toxicity characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043.

A.1.2 Wastes Resulting From the Dry Cleaner Service

Dry cleaning wastes consist of spent filter cartridges, separator water powder residue from diatomaceous or other powder filter systems and still bottoms. These wastes are packaged on the customer's premises in containers which meet DOT requirements (typically black 16-, 30-, or split 30-gallon containers). The containers are then palletized, stacked two-high and placed in the container storage area of the warehouse. Approximately 90% of the dry cleaning solvent used is perchloroethylene (F002 and D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043) and 5% is trichlorotrifluoroethane (F002) and may exhibit the toxicity characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043 and 5% is mineral spirits which would add the waste code D001. Other types of dry cleaning wastes (e.g. freon) will be managed on a transfer basis only.

Dry cleaner separator water is generated during the distilling of the used perchloroethylene. Perchloroethylene and water are separated during distilling. Separator water is typically less than 10 % perchloroethylene and is being handled as an F002 waste.

A.1.3 Paint Wastes

Paint wastes consist of various lacquer thinners (D001, F003, and F005) and paints. Paint wastes may also exhibit the toxic characteristics of D004, D005, D006, D007, D008, D009, D010, D011, D018, D019, D021, D022, D023, D024, D025, D026, D027, D028, D029, D030, D032, D033, D034, D035, D036, D037, D038, D039, D040, D041, D042, and D043. The waste is collected in DOT-approved containers at the customer's place of business. The containers are then transported to the facility and stored in the container storage area of the warehouse.

A.1.4 Photographic/Imaging Wastes

Some photographic imaging wastes managed by the facility are not solid wastes per 40 CFR 261.2(c) because their hazardous constituent is reclaimed. Others are managed under the provisions of Subpart F of 40 CFR 266 – Recyclable Materials Utilized for Precious Metals Recovery. Imaging waste consists typically of three waste streams. Photo fixer solution is an aqueous solution used to etch photo film during processing. This material is characteristic for silver (D011). Safety-Kleen is able to recover the silver from the solution. Used Photo developer is an aqueous solution that exhibits no hazardous waste characteristics but may not be allowed to discharge into public wastewater treatment systems in some communities. Silver

collection canisters are sent to a recycle center for reclamation. These canisters do not meet the definition of a hazardous waste as per 40 CFR 260.30(c) and are managed as a non-regulated material.

A.2 Quality Control Procedures

The used solvents are the primary feed stocks for the generation of Safety-Kleen solvent products. As a result, quality control of the spent solvents is necessary to ensure that reclamation occurs in the safest and most efficient manner possible. The service center collects spent solvents from approximately 400 customers, most of whom are small quantity generators, and containers of recoverable solvents are returned to the service center for shipment to a reclaimer. With such large numbers of waste generators and waste shipments, performing detailed analyses at the service center is economically and logistically infeasible.

Furthermore, as discussed earlier in the Facility Description, the materials collected at the service center are managed at all times in the closed loop system and are usually collected from a company with a single process. The composition and quality of these materials are known and Safety-Kleen's operating experiences have shown that the collected materials rarely deviate from company specifications. As an additional safeguard, Safety-Kleen personnel are instructed to inspect all materials before returning them to the service centers. This mode of operation has been proven to safeguard the recycling process and maintain a quality product.

In accordance with HWMR 206.B.3, however, Safety-Kleen will perform physical and chemical analysis of a waste stream when it is notified or has reason to believe that the process or operation generating the waste has changed, or when the result of inspection indicates that the waste collected does not match that designated on the manifest or shipping documents. It is Safety-Kleen's practice that suspected non-conforming material must not be accepted until a full analysis has been done or the material must be rejected. Procedures to verify waste characteristics occur at several check points in the management of the solvent.

A.2.1 Parts Washer Service

Prior to leasing a parts cleaning machine, the customer's business activity is reviewed. Where the possibility exists for contamination of the parts washer solvents (e.g., pesticide, herbicide or pharmaceutical operations), the process is reviewed to insure that the solvent is protected from the potential sources of contamination.

Sales representatives are instructed to visually examine the spent solvents when the machines are serviced, noting the quantity, odor and appearance of the material recovered as follows:

- a. The quantity of used solvent in the containers—Normally the 16-gallon containers of spent mineral spirits contains approximately nine gallons of liquid, the 30-gallon drum about nineteen gallons and the 16-gallon containers of spent immersion cleaner about four and one-half gallons. When the amount of liquid is substantially different from the expected quantity, an inquiry of the customer's operation and handling procedures is

made. Contingent on the customer's responses, the solvent is accepted or left with the customer until analysis is completed to determine its acceptability.

- b. The odor of the liquid in the container—Should the odor of the liquid in the drum be different from that of the mineral spirits or immersion cleaner, the container is set aside for further action as described in item 'a'.
- c. The appearance of the liquid in the container—The used mineral spirits should be greenish-brown in color and float on water. The immersion cleaner is a single-phase liquid, which is dark brown in color. Liquids in the containers which deviate from the above descriptions, or which contain substantial amounts of water, high density solvent and/or oil at the bottom should be set aside for further action as described in item 'a'.

At the service center, the sales representative or the warehouseman again observes the quantity, odor and appearance of the solvent prior to emptying the solvent into the wet drum washer. Containers with questionable contents are set aside and the customer is questioned. Pending their response, the drum is accepted, returned to the customer, or properly disposed of at the customer's expense. The immersion cleaner containers are never opened at the service center, so additional verification is not possible until it reaches the recycle center.

A.2.2 Dry Cleaner Waste Collection Service

The dry cleaning wastes are collected from facilities where one process is managed and the possibility of cross-contamination from other chemicals or wastes is minimal. The containers are picked up by the sales representative and delivered to the service center and stored in the container storage area. The containers are not reopened until they reach the recycle center.

A.2.3 Paint Wastes

Safety-Kleen handles both lacquer thinner waste generated from the paint gun cleaning process and paint waste.

- a. Lacquer thinner waste: The significant criterion for determining whether lacquer thinner waste will be accepted is volume. The solvent is provided to customers in 5-gallon containers. The paint gun cleaning machine operates as a closed system whereby there should never be a combined volume of more than 7 ½ gallons of solvent in the containers. If a service representative discovers more than a total of 7 ½ gallons of solvent in the two containers, the waste will be rejected or sampled for analysis to determine its acceptability.
- b. Paint Waste: Paint wastes are collected from the facilities where one process is managed and the possibility of cross contamination from other chemicals or wastes is minimal. The contents of the containers are verified by the sales representative when he or she services the customer and the containers are not reopened until they reach the recycle center.

A.2.4 Photographic/Imaging Waste

Photographic/imaging waste is collected from facilities where one process is managed and the possibility of cross contamination is minimal. The sales representative inspects the contents of the containers of photographic/imaging waste when the sales representative services the customer. The pH and silver content of the waste is checked at the time of service, and the waste is also inspected visually.

A.3 Waste Analyses At The Recycle Center

Analyses performed at the Safety-Kleen recycle centers are undertaken to safeguard the recycling process and to assure the product quality. Each waste stream is re-characterized on an annual basis. If a particular waste stream was not handled at the facility during the previous year, no re-characterization analysis of the waste will be performed. The following tables summarize a typical waste analysis plan practiced at the recycle centers for the hazardous materials returned from the Farmington service center:

| | |
|-----------|---|
| Table A-1 | Parameters and Rationale for Hazardous Waste Analyses |
| Table A-2 | Parameters and Test Methods |
| Table A-3 | Methods Used to Sample Hazardous Wastes |
| Table A-4 | Frequency of Analysis |

These tables are included at the end of this waste analysis plan.

A.4 Waste Analysis Plan Update

This waste analysis plan will be modified when a new waste product is collected or when sampling and material management methods change. Revisions to the waste analysis plan will be provided to the facility manager and training will be conducted for appropriate personnel.

A.5 Land Ban Notification/Certification Forms

In accordance with 40 CFR 268.7, Safety-Kleen will provide notification/certification for wastes banned from landfills as follows:

- a. Printing the Notice language on the manifests - such as for core-business customers to branch shipments; or
- b. Special forms for each regularly handled waste type (e.g., MS, IC, perc, freon); or

- c. A general form that must be completed for unique or non-standard waste streams. These wastes will only be handled on a transfer basis, in accordance with 40 CFR 263.12.

The Notice is required paperwork for all Safety-Kleen waste types. Shipments lacking the proper Notice will not be accepted by any Safety-Kleen facility. When a shipment with the proper Notice is received, the Notice is kept in the files of the receiving facility with the manifest or with the pre-print if a manifest is not used.

A.6 Operating Log Record

Safety-Kleen maintains an operating log record on site which includes the following information as it becomes available:

- 1) A description and the quantity of each hazardous waste received, and the method and date of its storage as required by Pt. V. sec. 264, Appendix I;
- 2) The location of each hazardous waste within the facility and the quantity;
- 3) Records and results of waste analyses performed;
- 4) Summary reports and details of all incidents that require implementing the contingency plan;
- 5) Records and results of inspections;
- 6) Monitoring, testing or analytical data and corrective action where required;
- 7) For off-site facilities, Notices to generators as specified in 264.12(b);
- 8) All closure and post-closure cost estimates;
- 9) A certification by the permittee no less often than annually, that the permittee has a program in place to reduce the volume and toxicity of hazardous waste;
- 10) The land ban notices and requirements. These records are kept on file in the resource recovery (May 1994) branch manager's office.

A.7 Waste Determination for Subpart BB and CC Compliance

For purposes of waste determination, this facility utilizes knowledge of the wastes described in Section A.1, A.2 and A.3 above. For those hazardous wastes which are managed on a transfer basis, the Subpart CC regulation does not apply. However, the owner/operator may use knowledge of the waste based on information included in manifests, shipping papers, or waste

certification notices to confirm waste determination for the generator or the ultimate receiving facility.

Based upon this knowledge, it has been determined that all wastes managed in tanks or containers at this facility may display an average volatile organic concentration of greater than 500 ppmw at the point of waste origination. Documentation of this knowledge is provided in Attachment A.1 (waste characterization analytical results), as required in 40 CFR 264.1063(d) and 264.1083. Therefore, hazardous wastes managed in tanks or containers at this facility shall be managed in accordance with the applicable Subpart CC standards.

Table A-1

Parameters And Rationale For Hazardous Waste Analysis

| Hazardous Waste | Parameter | Rationale |
|---------------------------|--|---|
| 1. Spent Solvents | Flash Point | Ignitable Characteristic (D001) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| 2. Solvent Tank Bottoms | Same as number 1 | Same as number 1 |
| 3. Used Immersion Cleaner | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| 4. Dry Cleaning Wastes | Perchloroethylene, 1,1,2-trichloro-1,1,2,2-trifluoroethane | Contains this ingredient (F002) |
| | TCLP | Contains components which exceed the limits listed in 40 CFR 261.24 |
| | Flash Point | Ignitable Characteristic (D001) |

Notes: TCLP = Toxicity Characteristic Leaching Procedure.

Earlier sample analyses indicated the parameters listed are the only ones of concern.

Farmington, NM

ATTACHMENT B
SECURITY MEASURES

October 4, 2000

C:\Documents and Settings\hwb_js01\Desktop\SK\Permit Renewal Application - Farmington.doc

Farmington, NM

SECURITY MEASURES

The facility is secured with a six-foot high chain link fence topped by three strands of barbed wire. All access gates are locked when the facility is unoccupied. Warning signs in English, Navajo and Spanish are placed on all sides of the fence stating "Caution – Hazardous Waste Area – Unauthorized Personnel Keep Out" which are visible from twenty-five feet. In addition, outdoor lights are on sensing devices that activate at low light conditions.

The office/warehouse building is secured with locks on all doors and warning signs are posted at all entrances to work and waste storage areas.

The tanks are enclosed in the secured, fenced area. The tank pump controls are outside the return and fill station. The pumps are not activated unless mineral spirits product or waste is being added to or removed from the tanks by Safety-Kleen personnel. The container storage area is also locked unless occupied by Safety-Kleen personnel. As a result the tanks and container storage area are accessible only by Safety-Kleen personnel. In addition, warning signs are posted on the return and fill station.

GANDY MARLEY, INC.

TRIASSIC PARK WASTE DISPOSAL FACILITY

OPERATING PERMIT

PERMIT PART 1

GENERAL PERMIT CONDITIONS

HIGHLIGHTS

This Part sets forth the standards and conditions that every owner/operator of a hazardous waste storage, treatment, and/or disposal facility (TSDF) is required to meet, in order to manage, store, and dispose hazardous waste in a manner protective of human health and the environment under the New Mexico Hazardous Waste Act (the HWA) and the Resource Conservation and Recovery Act (RCRA).

1.1 EFFECT OF PERMIT

The Secretary of the New Mexico Environment Department (the Secretary) issues this permit to Gandy Marley, Inc., the owner and operator of the Triassic Park Waste Disposal Facility (Environmental Protection Agency (EPA) I.D. No. NM0001002484). This Permit authorizes Gandy Marley (the Permittee) to treat, store, and dispose of off-site hazardous waste at the Triassic Park Waste Disposal Facility (the Facility), and establishes the general and specific standards for these activities, pursuant to the New Mexico Hazardous Waste Act, NMSA 1978, 74-4-1 to 74-4-14 (Repl. Pamp. 2000) and the New Mexico Hazardous Waste Management Regulations, 20.4.1. NMAC.

Compliance with this Permit during its term shall constitute compliance, for purposes of enforcement, with Subtitle C of RCRA, and/or the HWA, and/or their implementing regulations. Compliance with this Permit shall not constitute a defense to any order issued or any action brought under Sections 74-4-10.E, 74-4-10.1, or 74-4-13 of the HWA; Sections 3008(a), 3013, 7002(a)(1)(B), or 7003 of RCRA; the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), 42 U.S.C. 9601 et seq.; or any other law providing for protection of public health or the environment. This Permit does not convey any property rights or any exclusive privilege, nor authorize any injury to persons or property, any invasion of other private rights, or any infringement of State or local laws or regulations. [20.4.1.900 NMAC (incorporating 40 CFR 270.4(a) and 270.30(g))]

1.2 PERMIT ACTIONS

1.2.1 Term of Permit

This Permit shall be effective for a fixed term not to exceed ten years from the effective date of issuance as specified in the Permit certificate. [20.4.1.900 NMAC (incorporating 40 CFR 270.50(a))]

1.2.2 Permit Renewal

The Permittee may request a renewal of this Permit by submitting an application for a new Permit at least 180 calendar days before the expiration date of this Permit. In reviewing any application for a Permit renewal, the Secretary shall consider improvements in the state of control and measurement technology and changes in applicable regulations. [20.4.1.900 NMAC (incorporating 40 CFR 270.10(h) and 270.30(b))]

1.2.3 Permit Modification, Suspension, and Revocation

This Permit may be modified, suspended, and/or revoked for cause as specified at Section 74-4-4.2 of the HWA and 20.4.1.900 NMAC (incorporating 40 CFR 270.41, 270.42, and 270.43). The filing of a request by the Permittee for a Permit modification, suspension, or revocation, or the notification of planned changes or anticipated noncompliance, shall not stay any Permit Condition. [20.4.1.900 NMAC (incorporating 40 CFR 270.41)]

1.2.4 Transfer of Permit

The Permittee shall not transfer this Permit to any person except after providing notice to the Secretary and receiving approval from the Secretary for this action. The prospective new owner or operator shall file a disclosure statement with the Secretary prior to the transfer as required by Section 74-4-4.7 of the HWA and 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(3)). The Secretary may require modification or revocation and reissuance of this Permit in accordance with 20.4.1.900 and 20.4.1.901 NMAC (incorporating 40 CFR 270.40(b) and 270.41(b)(2)).

Before transferring ownership or operation of the Facility during its active life or post-closure care period, the Permittee shall notify the new owner or operator in writing of the requirements of 20.4.1.900 NMAC (incorporating 40 CFR Part 270). [20.4.1.500 NMAC (incorporating 40 CFR 264.12(c))]

1.2.5 Permit Review

The Secretary shall review this Permit no later than five years after the effective date of the Permit, and shall modify the Permit as necessary, pursuant to Section 74-4-4.2 of the HWA and 20.4.1.900 NMAC (incorporating 40 CFR 270.41 and 270.50(d)). Such modification shall not extend the effective term of the Permit as specified at Permit Condition 1.2.1.

1.3 SEVERABILITY

The provisions of this Permit are severable, and if any provision of this Permit or the application of any provision of this Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this Permit shall not be affected thereby. [40 CFR 124.16(a)(1) and (a)(2)]

1.4 DEFINITIONS

If, subsequent to the issuance of this Permit, federal or State regulations are promulgated which redefine any of the terms defined below, the Secretary may, at his or her discretion, apply the new definition to this Permit by modifying the Permit. [20.4.1.900 NMAC (incorporating 40 CFR 270.41(a)(3))]

For purposes of this Permit, terms used herein shall have the same meanings as those in the HWA, RCRA, and their implementing regulations unless this Permit specifically provides otherwise. Where a term is not defined in the HWA, RCRA, pursuant regulations, EPA guidelines or publications, or this Permit, the meaning associated with such a term is defined by a standard dictionary reference or the generally accepted scientific or industrial meaning of the term.

- *Action leakage rate (ALR)* means the maximum design flow rate that a leak detection system can remove without the fluid head on the bottom liner exceeding one foot. [20.4.1.500 NMAC (incorporating 40 CFR 264.222(a) and 264.302(a))]
- *Area of Concern (AOC)* means any area may have a release of hazardous waste or hazardous constituents, which is not from a solid waste management unit and is suspected or determined by the Secretary to pose a threat to human health or the environment.
- *Debris* means solid material exceeding a 60 millimeter particle size that is intended for disposal and that is: a manufactured object; or

plant or animal matter; or natural geologic material. However, the following materials are not debris: any material for which a specific treatment standard is provided in 20.4.1.800 NMAC (incorporating 40 CFR 268, Subpart D), namely, lead acid batteries, cadmium batteries, and radioactive lead solids; process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges, or air emission residues; and intact containers of hazardous waste that are not ruptured and that retain at least 75 percent of their original volume. A mixture of debris that has not been treated to the standards provided by 20.4.1.800 NMAC (incorporating 40 CFR 268.45) and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume, based on visual inspection. [20.4.1.800 NMAC (incorporating 40 CFR 268.2(g))]

- *Evaporation pond* for purposes of this Permit means the Surface Impoundment at the Triassic Park Waste Disposal Facility.
- *Facility* for purposes of this Permit means the Triassic Park Waste Disposal Facility, including all contiguous land, and structures, other appurtenances, and improvements on the land used for the management of hazardous waste.
- *Free liquids* means liquids that readily separate from the solid portion of a waste under ambient temperature and pressure. [20.4.1.100 NMAC (incorporating 40 CFR 260.10)]
- *Hazardous constituent or constituents* means those constituents listed at 20.4.1.200 NMAC (incorporating 40 CFR 261, Appendix VIII). [20.4.1.800 NMAC (incorporating 40 CFR 268.2(b))]
- *Hazardous waste* means any hazardous waste identified at 20.4.1.200 NMAC (incorporating 40 CFR 261.3).
- *HWA* means the New Mexico Hazardous Waste Act, NMSA 1978, 74-4-1 to 74-4-14, the state statute governing hazardous waste management.

- *In light liquid service* (in light material service) means that the piece of equipment contains or contacts a waste stream where the vapor pressure of one or more of the organic components in the stream is greater than 0.3 kilopascals (kPa) at 20° C, the total concentration of the pure organic components having a vapor pressure greater than 0.3 kPa at 20° C is equal to or greater than 20 percent by weight, and the fluid is a liquid at operating conditions. [20.4.1.500 NMAC (incorporating 40 CFR 264.1031)]
- *Land Disposal Restrictions (LDR)* means the restrictions on the land disposal of hazardous waste in section 3004(b) through (m) of RCRA, 42 U.S.C. § 6924(b) through (m), and the NMAC 20.4.1.800 (incorporating 40 C.F.R. part 268).
- *Leachate* means any liquid, including any suspended components in the liquid that has percolated through or drained from hazardous waste. [20.4.1.100 NMAC (incorporating 40 CFR 260.10)]
- *Leak detection system (LDS)* means a system capable of detecting the failure of either the primary or secondary containment structure or the presence of a release of hazardous waste or accumulated liquid in the secondary containment structure. Such a system must employ operational controls (e.g., daily visual inspections for releases into the secondary containment system of aboveground tanks) or consist of an interstitial monitoring device designed to detect continuously and automatically the failure of the primary or secondary containment structure or the presence of a release of hazardous waste into the secondary containment structure. [20.4.1.100 NMAC (incorporating 40 CFR 260.10)]
- *Nonwastewaters* mean wastes that do not meet the criteria for wastewaters provided at 20.4.1.500 NMAC (incorporating 40 CFR 268.2(f)). [20.4.1.800 NMAC (incorporating 40 CFR 268.2(d))]
- *Permittee* means Gandy Marley, Inc., 1109 East Broadway, P.O. Box 827, Tatum, Chaves County, New Mexico 88267.

- *Permitted unit* means any unit treating, storing or disposing of hazardous wastes and required to have a permit. [20.4.1.900 NMAC (incorporating 40 CFR 270.1(c))]
- *RCRA* means the federal Resource Conservation and Recovery Act, 42 U.S.C. 6901 to 6992k, the federal statute governing hazardous waste management.
- *Regulated unit* means a surface impoundment, waste pile, land treatment unit, or landfill that receives hazardous waste after July 26, 1982. Regulated units must undergo monitoring for the purposes of detecting, characterizing and responding to releases to the uppermost aquifer. [20.4.1.500 NMAC (incorporating 40 CFR 264.90(a)(2))]
- *Release* means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing of any hazardous waste or hazardous constituent into the environment, including the abandonment or discarding of barrels, containers, and other closed receptacles containing a hazardous waste or hazardous constituent. [61 FR 19442]
- *Remediation waste* means all solid and hazardous wastes, and all media (including ground water, surface water, soils, and sediments) and debris which contain listed hazardous wastes, or which themselves exhibit a hazardous waste characteristic, that are managed for the purpose of implementing corrective action requirements in compliance with RCRA, Sections 3004(v) and 3005(c)(3), and 20.4.1.500 NMAC (incorporating 40 CFR 264.101).
- *Secretary* means the Secretary of the New Mexico Environment Department or his or her designee. [20.4.1.101.B.8 NMAC]
- *Soil* means unconsolidated earth material composing the superficial geologic strata (material overlying bedrock), consisting of clay, silt, sand, or gravel size particles as classified by the U.S. Natural Resources Conservation Service, or a mixture of such materials with liquids,

sludges or solids which is inseparable by simple mechanical removal processes and is made up primarily of soil by volume based on visual inspection. Any deliberate mixing of prohibited hazardous waste with soil that changes its treatment classification (i.e., from waste to contaminated soil) is not allowed under the dilution prohibition of 20.4.1.800 NMAC (incorporating 40 CFR 268.3). [20.4.1.800 NMAC (incorporating 40 CFR 268.2(k))]

- *Solid Waste Management Unit (SWMU)* means any discernable unit at which solid wastes have been placed at any time, and from which the Secretary determines there may be a risk of a release of hazardous constituents, irrespective of whether the unit was intended for the management of solid or hazardous wastes. Placement of solid waste includes one time and accidental events that were not remediated, as well as any unit or area at which solid waste has been routinely and systematically placed.
- *Underlying hazardous constituent (UHC)* means any constituent listed in 20.4.1.800 NMAC (incorporating 40 CFR 268.48, Table UTS - Universal Treatment Standards), except fluoride, selenium, sulfides, vanadium, and zinc, which can reasonably be expected to be present at the point of generation of the hazardous waste at a concentration above the constituent-specific UTS treatment standards. [20.4.1.800 NMAC (incorporating 40 CFR 268.2(i))]
- *Unit* means, but is not limited to, for purposes of this Permit, any hazardous waste container area, tank storage area, tank treatment area, surface impoundment, or landfill.
- *Vadose zone* means the geologic profile extending from the ground surface to the upper surface of the uppermost water-bearing formation and includes localized areas of saturation such as perched water and capillary fringe regions. [20.9.1.105.CH NMAC]
- *Wastewaters* means wastes that contain less than one percent by weight total organic carbon (TOC) and less than one percent by weight total

suspended solids (TSS). [20.4.1.800 NMAC
(incorporating 40 CFR 268.2(f))]

**1.5 DUTIES AND REQUIREMENTS {TC \L1 "1.5 DUTIES
AND REQUIREMENTS }**

1.5.1 Duty to Comply {tc \l2 "1.5.1 Duty to Comply }

The Permittee shall comply with all conditions in this Permit, except to the extent and for the duration such noncompliance is authorized in an Emergency Permit, as specified at 20.4.1.900 NMAC (incorporating 40 CFR 270.61). Any Permit noncompliance, except under the terms of an Emergency Permit, constitutes a violation of the HWA and/or RCRA and may subject the Permittee, its successors and assigns, officers, directors, employees, parents, or subsidiaries, to an administrative or civil enforcement action, including civil penalties and injunctive relief under Sections 74-4-10 or 74-4-10.1 of the HWA, or Sections 3008(a) and (g) or 7002(a)(1)(A) of RCRA; to Permit modification, suspension, or revocation, or denial of a Permit application or modification request under Section 74-4-4.2 of the HWA; to citizen suit under Section 7002(a) of RCRA; to criminal fines or imprisonment under Section 74-4-11 of the HWA, or Sections 3008(d), (e), or (f) of RCRA; or to a combination of the foregoing. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(a))]

**1.5.2 Need to Halt or Reduce Activity Not a Defense {tc
\l2 "1.5.4 Need to Halt or Reduce Activity Not
a Defense }**

It shall not be a defense for the Permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Permit. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(c))]

1.5.3 Continuation of Expiring Permit

If the Permittee has submitted a timely and complete application for renewal of this Permit in accordance with Permit Condition 1.2.2 and 20.4.1.900 NMAC (incorporating 40 CFR 270.10 and 270.13 through 270.27), and, through no fault of the Permittee, the Secretary has not issued a new Permit on or before the expiration date of this Permit, the terms and conditions of this Permit remain in effect until the effective date of the Secretary's issuance or denial of the new Permit. [20.4.1.900 NMAC (incorporating 40 CFR 270.51)]

1.5.4 Duty to Mitigate {tc \12 "1.5.5 Duty to Mitigate }

In the event of noncompliance with this Permit, the Permittee shall take all reasonable steps to minimize releases of hazardous waste or hazardous constituents to the environment, and shall carry out such measures as are reasonable to prevent significant adverse impacts on human health or the environment. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(d))]

1.5.5 Proper Operation and Maintenance {tc \12 "1.5.6 Proper Operation and Maintenance }

The Permittee shall at all times properly operate and maintain all units and systems of treatment and control (and related appurtenances) which are installed or used by the Permittee to achieve compliance with the conditions of this Permit. Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls, including appropriate quality assurance/quality control procedures. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(e))] This provision requires the operation of back-up or auxiliary units or similar systems only when necessary to achieve compliance with the conditions of this Permit.

1.5.6 Duty to Provide Information{tc \12 "1.5.7 Duty to Provide Information }

The Permittee shall furnish to the Secretary, within a reasonable time as specified by the Secretary, any relevant information which the Secretary may request to determine whether cause exists for modifying, suspending, or revoking this Permit, to determine compliance with this Permit, to determine whether corrective action may be necessary, or otherwise to enforce the provisions of the HWA or RCRA. [NMSA 74-4-4.3; 20.4.1.500 NMAC (incorporating 40 CFR 264.74(a))]

The Permittee shall also furnish to the Secretary, upon request, copies of records required to be kept by this Permit. [NMSA 74-4-4.3; 20.4.1.900 NMAC (incorporating 40 CFR 270.30(h))]

Permit Condition 1.5.6 shall not be construed to limit, in any manner, the Secretary's authority under Section 74-4-4.3 of the HWA, Section 3007(a) of RCRA, or other applicable laws.

1.5.7 Disclosure Statement

If any information required to be included in the disclosure statement provided by the Permittee to comply with Section 74-4-4.7 of the HWA changes, or if any information is added after filing the statement, the Permittee shall provide that information to the Secretary within 30 calendar days after the change or addition. Failure to provide such information in a timely manner may constitute the basis for the revocation of this Permit.

1.5.8 Inspection and Entry{tc \12 "1.5.8 Inspection and Entry }

The Permittee shall allow the Secretary, or his or her authorized representatives, upon the presentation of credentials and other documents as may be required by law, the following entry and inspection authority, as required by NMSA 47-4-4.3 and 20.4.1.900 NMAC (incorporating 40 CFR 270.30(i)):

1.5.8.a Entrance to Premises {tc \13 "1.5.8.a Entrance to Premises }

To enter at reasonable times into the Permittee's premises where a regulated facility or activity is located or conducted, or where records must be kept under the conditions of this Permit;

1.5.8.b Access to Records{tc \13 "1.5.8.b Access to Records }

To have access to and copy, at reasonable times, any records that shall be kept under the conditions of this Permit;

1.5.8.c Inspection{tc \13 "1.5.8.c Inspection }

To inspect at reasonable times any units, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Permit; and

1.5.8.d Sampling {tc \13 "1.5.8.d Sampling }

To sample or monitor at reasonable times, for the purposes of assuring Permit compliance, determining the need for corrective action, or as otherwise authorized by the HWA or RCRA, any substances or parameters, including wastes, soil, and groundwater, at any location.

Permit Condition 1.5.8 shall not be construed to limit, in any manner, the Secretary's authority under Section 74-4-4.3 of the HWA, Section 3007(a) of RCRA, or other applicable laws.

**1.5.9 Reporting Requirements{tc \12 "1.5.9
 Reporting Requirements }**

**1.5.9.a Reporting Planned Changes{tc \13 "1.5.9.a
 Reporting Planned Changes }**

The Permittee shall give notice to the Secretary, as soon as possible, of any planned physical alterations or additions to the Facility. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(1))]

**1.5.9.b Reporting Anticipated Noncompliance {tc \13
 "1.5.9.b Reporting Anticipated Noncompliance }**

The Permittee shall give advance written notice to the Secretary of any planned physical changes to the Facility or any permitted activities that may result in noncompliance with Permit requirements. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(2))]

**1.5.9.c Certification of Construction or Modification {tc
 \13 "1.5.9.c Certification of Construction or
 Modification }**

The Permittee shall not accept hazardous waste at the Facility, or, if the Facility is being modified, the Permittee shall not accept, treat, store, or dispose of hazardous waste in the modified portion of the Facility, until the following conditions have been satisfied:

**1.5.9.c.i Submittal of Construction Certification and As-
Built Specifications {tc \14 "1.5.9.c.i
 Submittal of certification and as-built
 specifications }**

The Permittee has submitted to the Secretary, by certified mail, hand delivery, or special delivery service, a letter signed by the Permittee and an independent professional engineer registered in New Mexico stating that the Facility has been constructed or modified as required by this Permit, in accordance with Permit Condition 1.10; and

**1.5.9.c.ii Inspection by the Secretary {tc \14 "1.5.9.c.ii
 Inspection by the Secretary }**

The Secretary has inspected the newly constructed Facility or the modified portion of the Facility and:

- finds it is in compliance with the conditions of this Permit; or

- has waived the inspection; or,
- within 15 calendar days from the date of submission of the letter required under Permit Condition 1.5.9.c.i, has not notified the Permittee of his or her intent to inspect. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(2))]

**1.5.9.d Twenty-Four Hour and Subsequent Reporting {tc \13
"1.5.9.d Twenty-Four Hour and Subsequent
Reporting }**

**1.5.9.d.i Oral Report {tc \14 "1.5.9.d.i Oral report
}**

As required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(6)), within 24 hours from the time the Permittee becomes aware of any noncompliance that may endanger human health or the environment, the Permittee shall report orally to the Secretary the following:

- information concerning release of any hazardous waste that may cause an endangerment to public drinking water supplies; and
- any information of a release or discharge of hazardous waste, or of a fire or explosion from the Facility, which could threaten the environment or human health outside the Facility.

**1.5.9.d.ii Description of Occurrence {tc \14 "1.5.9.d.ii
Description of occurrence }**

The description of the occurrence and its cause shall include, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(6)(ii)):

- name, address, and telephone number of the Permittee;
- name, address, and telephone number of the Facility;
- date, time, and type of incident;
- name and quantity of materials involved;
- the extent of injuries, if any;

- an assessment of actual or potential hazards to the environment and human health outside the Facility, where this is applicable; and
- the estimated quantity and disposition of recovered material that resulted from the incident.

**1.5.9.d.iii Written Submission {tc \14 "1.5.9.d.iii
Written submission }**

The Permittee shall provide a written submission within five calendar days from the time the Permittee becomes aware of the noncompliance. The written submission shall contain, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(6)(iii)):

- a description of the noncompliance and its cause;
- the period(s) of the noncompliance, including exact date(s) and time(s), and, if the noncompliance has not been corrected, the anticipated time it is expected to continue; and
- steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

The Secretary may extend the time for submission of a written report to 15 days.

**1.5.9.e Contingency Plan Implementation {tc \13 "1.5.9.e
Contingency Plan Implementation }**

If Permit Attachment C, *Contingency Plan*, is implemented, the Permittee shall comply with the reporting requirements of Permit Condition 2.11.6 and 20.4.1.500 NMAC (incorporating 40 CFR 264.56(j)).

**1.5.9.f Other Noncompliance {tc \13 "1.5.9.f Other
Noncompliance }**

The Permittee shall report to the Secretary all other instances of noncompliance not otherwise required to be reported in Permit Condition 1.5.9 in the Quarterly Report required at Permit Condition 2.12.2.b. The report shall contain the information listed at Permit Condition 1.5.9.d. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(10))]

**1.5.9.g Other Information {tc \13 "1.5.9.g Other
Information }**

Whenever the Permittee becomes aware that the Permittee failed to submit any relevant facts in the Permit Application, or submitted incorrect information in the Permit Application or in any report to the Secretary, the Permittee shall promptly submit such facts or information in writing to the Secretary. [20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(11))]

1.5.10 Obligation for Corrective Action

Corrective action required pursuant to 20.4.1.500 NMAC (incorporating 40 CFR 264.101) shall continue under this Permit for any period necessary to comply with the requirements specified at Parts 9 and 10 of this Permit.

**1.6 SIGNATORY REQUIREMENT {TC \L1 "1.6 SIGNATORY
REQUIREMENT }**

The Permittee shall sign and certify all applications or reports submitted to or requested by the Secretary, or required by this Permit, in accordance with and using the certification language specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.11 and 270.30(k)).

**1.7 REPORTS AND NOTIFICATIONS SUBMITTED TO THE
SECRETARY{TC \L1 "1.7 REPORTS AND
NOTIFICATIONS SUBMITTED TO THE SECRETARY }**

The Permittee shall submit two copies of all reports and notifications required by this Permit by certified mail, hand delivery, or special delivery service. Submissions shall be sent to:

Chief, Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East
Building 1
Santa Fe, New Mexico 87505-6303

Telephone Number: 505/428-2512
Facsimile Number: 505/428-2567

**1.8 CONFIDENTIAL INFORMATION {TC \L1 "1.8
CONFIDENTIAL INFORMATION }**

The Permittee may claim confidentiality for any information submitted to or requested by the Secretary or required by this

Permit to the extent authorized by Section 74-4-4.3(D) of the HWA and 20.4.1.900 NMAC (incorporating 40 CFR 270.12).

**1.9 DOCUMENTS TO BE MAINTAINED AT THE FACILITY {TC \L1
"1.9 DOCUMENTS TO BE MAINTAINED AT THE
FACILITY }**

**1.9.1 {tc \l2 "1.9.1 Documents to be Maintained
untCompletion of Closure }Documents to be
Maintained until Completion of Closure**

The Permittee shall maintain at the Facility, until final completion of closure as specified at Permit Part 8 has been approved by the Secretary, the following documents and all current amendments, revisions, and modifications to these documents:

- Permit Attachment B, *Procedures to Prevent Hazards* (Permit Condition 2.10)
- Permit Attachments C, *Contingency Plan*, including summary reports and details of all incidents that require implementation of the Contingency Plan; C1, *Emergency Equipment*; C2, *Emergency Coordinators*; C3, *Cooperating Local Authorities*; and C4, *Evacuation Plans*. [20.4.1.500 NMAC (incorporating 40 CFR 264.53(a)) and Permit Condition 2.11.2]
- Permit Attachments D, *Inspection Procedures*; and D1, *Inspection Schedules and Checklists*. [20.4.1.500 NMAC (incorporating 40 CFR 264.15(b)(2)) and Permit Condition 2.7]
- Permit Attachment E, *Personnel Training*, and personnel training documents and records. [20.4.1.500 NMAC (incorporating 40 CFR 264.16(d) and (e)) and Permit Condition 2.8]
- Permit Attachments F, *Waste Analysis Plan*; F1, *Rationale for Analytical Parameter Selection*; F2, *Waste Profile Form*; and F3, *Chain-of-Custody Form*. [20.4.1.500 NMAC (incorporating 40 CFR 264.13(b)) and Permit Condition 2.5.1]
- The Operating Record. [20.4.1.500 NMAC (incorporating 40 CFR 264.73) and Permit Condition 2.12.1.a]

- Permit Attachment J, *Action Leakage Rate and Response Action Plan*. (Permit Condition 2.10.7)
- Permit Attachment N, *Operations and Maintenance Plan*. (Permit Condition 2.10.8)
- Permit Attachments O, *Closure Plan*; O1, *Compliance Schedules for Closure*; and O2, *Financial Assurance for Closure*. (Permit Conditions 8.1.1 and 8.3.1(d))

1.9.2 Documents to be Maintained until Completion of Post-Closure Care {tc \12 "1.9.2 Documents to be Maintained until Completion of Post-Closure Care }

The Permittee shall maintain at the Facility or other appropriate location approved by the Secretary, until completion of post-closure care as specified at Permit Part 8 has been approved by the Secretary, the following documents and all amendments, revisions, and modifications to these documents:

- Permit Attachments P, *Post-Closure Care Plan*; and P1, *Financial Assurance for Post-Closure Care*. (Permit Conditions 8.2.1 and 8.3.1.d)

1.10 COMPLIANCE SCHEDULE {TC \L1 "1.10 COMPLIANCE SCHEDULE }

The Permittee shall submit documents, plans, certifications, and as-built specifications under this Permit to the Secretary for approval in accordance with the schedule provided in Table 1-1, *Compliance Schedule*, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.33). Written notification of compliance or noncompliance with any item identified in the schedule shall be submitted according to the schedule date. Submittal of a required item according to the schedule constitutes notification of compliance.

All plans and schedules required to be submitted by the conditions of this Permit are, upon approval of the Secretary, incorporated into this Schedule of Compliance by reference and become an enforceable part of this Permit. Any noncompliance with such approved plans shall be termed noncompliance with this Permit. Extension of the due dates for submittals may be granted by the Secretary in accordance with 20.4.1.900 NMAC (incorporating 40 CFR 270.41 and/or 270.42).

TABLE 1-1

COMPLIANCE SCHEDULE

| PERMIT CONDITION | DOCUMENT/INFORMATION | DUE DATE |
|-----------------------------|--|---|
| 1.5.9.c.i | Submittal of Construction Certification and As-Built Specifications | 30 days prior to first receipt of waste |
| 2.10.6 | Notification of Agreements with Local Authorities | 30 days prior to first receipt of waste |
| 2.11.5 | Updated Contingency Plan | 15 days prior to first receipt of waste |
| 2.11.5.a | List of Emergency Coordinators | 15 days prior to first receipt of waste |
| 2.11.5.c | Evacuation Plan | 15 days prior to first receipt of waste |
| 2.18.1.b | Documentation of Liability Coverage for Sudden Accidental Occurrences | 60 days prior to first receipt of waste |
| 2.18.2.b | Documentation of Liability Coverage for Nonsudden Accidental Occurrences | 60 days prior to first receipt of waste |
| 4.7.3.a | Tank Installation Certification | 30 days prior to first receipt of waste |
| 5.7.3.a | Surface Impoundment CQA Certification | 30 days prior to the first receipt of waste |
| 7.2.1 | Vadose Zone Monitoring Wells | Prior to the first receipt of waste |

| PERMIT CONDITION | DOCUMENT/INFORMATION | DUE DATE |
|---------------------|--|--|
| 10.2 | Facility Corrective Action Work Plan | Within 180 days of the effective date of this Permit |
| 10.3.2.a | Background Soil Concentrations Work Plan | 30 calendar days prior to the first receipt of waste |

New Mexico Environment Department
March 2002

Triassic Park Waste Disposal Facility
Final RCRA Permit No. NM0001002484

PERMIT PART 2

GENERAL FACILITY CONDITIONS {TC \L1 "PERMIT PART 2 GENERAL FACILITY CONDITIONS }

HIGHLIGHTS

This Part contains the standards and conditions covering general Facility requirements for the Triassic Park Waste Disposal Facility (the Facility). The Facility is located on approximately 480 acres in Chaves County, New Mexico, T11S, R31E, Sections 17 and 18. By road, it is approximately 43 miles east of Roswell and 36 miles west of Tatum.

The Facility is a commercial Resource Conservation and Recovery Act (RCRA) Subtitle C hazardous waste treatment, storage, and disposal operation. The Facility is permitted to store hazardous waste in the Drum Handling Unit, the Roll-Off Container Storage Unit, and the Liquid Waste Storage Tanks; treat hazardous waste by evaporation in the Surface Impoundment and by solidification in the Stabilization Bins; and dispose of hazardous waste in the Landfill. Permit Conditions for these permitted units are contained at Permit Parts 3 through 6. Other units at the Facility are operated as 90-day generator storage units or satellite accumulation points. These units are not permitted under this Permit but are regulated under RCRA. These units are identified at Permit Part 10, Table 10-1.

Permit Conditions for vadose zone monitoring in lieu of ground water monitoring are contained at Permit Part 7. Conditions for closure of the Facility and for post-closure care for the Landfill are contained at Permit Part 8. Permit Parts 9 and 10 contain conditions for corrective action.

General information regarding the Facility and Facility operations is contained at Permit Attachments A, *General Facility Description and Process Information*; L, *Engineering Report*, Section 2.1, *General Facility Design Elements*; and L1, *Engineering Drawings*. The Facility layout is provided at Permit Attachment L1, Drawing No. 4.

Hazardous wastes which may be managed, treated, stored, and disposed by the Permittee at this Facility are listed at Permit Part 2, Table 2-1, *Permitted Hazardous Wastes*, by U.S. Environmental Protection Agency (EPA) Hazardous Waste Number as

identified at 20.4.1.200 NMAC (incorporating 40 CFR 261, Subparts C and D). The Facility may also manage certain polychlorinated biphenyl (PCB)-contaminated wastes.

1.1 CONSTRUCTION AND OPERATION

The Permittee shall construct, maintain, and operate the Facility as specified at Permit Attachments A, Section 2.0, *Treatment, Storage, and Disposal*; L; L1; L2, *Specifications for the Landfill, Surface Impoundment and Associated Facilities Liner and Cover System Construction*; M, *Construction Quality Assurance Plan for Landfill, Surface Impoundment and Associated Facilities Construction*; and N, *Operations and Maintenance Plan*; and as required by 20.4.1 NMAC (incorporating 40 CFR 260 through 273) and this Permit. The Permittee shall follow the specifications contained at Permit Attachments L; L1; L2; and M; for construction of the Surface Impoundment and the Landfill, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.19) and this Permit. The Permittee shall ensure that the construction, maintenance, and operation of the Facility minimizes the possibility of a fire, explosion, or any unplanned, sudden, or nonsudden release of hazardous waste to air, soil, ground water, or surface water which could threaten human health or the environment, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.31).

1.2 RUN-ON/RUN-OFF CONTROLS

The Permittee shall construct the Stormwater Detention Basin and Facility run-on diversion ditches and run-off collection ditches as specified at Permit Attachments L, Section 2.1.4, *Facility Storm Water Control*; and L1.

1.3 PERMITTED AND PROHIBITED WASTE SOURCES

1.3.1 Hazardous Waste from Sources Located Outside of the United States

The Permittee shall accept hazardous waste from a generator of hazardous waste located outside of the United States of America (i.e., foreign waste) in accordance with Permit Condition 2.3.2, *Hazardous Waste from an Off-site Source*, Permit Condition 2.5.3.e, *Waste Acceptance from Foreign Generators*, and shall notify both the Regional Administrator of the U.S. Environmental Protection Agency and the Secretary in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.12(a)(1)).

**1.3.2 Hazardous Waste from an Off-Site Source{tc \12
"2.3.2 Hazardous Waste from an Off-Site
Source }**

The Permittee shall accept hazardous waste from off-site sources [i.e., generators of hazardous waste located within the United States of America, but outside the boundary of the Facility, as defined at 20.4.1.900 NMAC (incorporating 40 CFR 270.2)], in accordance with Permit Attachment F, *Waste Analysis Plan*, Sections 4.3, *Pre-Acceptance Procedures for Off-Site Waste*, and 4.4, *Procedures for Incoming Waste Acceptance*.

**1.3.3 Hazardous Waste Generated at the Facility{tc \12
"2.3.3 Hazardous Waste Generated at the
Facility }**

The Permittee shall manage hazardous waste generated at the Facility in accordance with Permit Attachments A, Section 2.0; F, Section 4.5.6, *Waste Analysis Requirements for Waste Generated On-Site*; and L; and this Permit.

**1.4 PERMITTED AND PROHIBITED WASTE {TC \L1 "2.4
PERMITTED AND PROHIBITED WASTE }**

**1.4.1 Permitted Waste {tc \12 "2.4.1 Permitted
Waste }**

1.4.1.a Permit Application, Part A

The Permittee shall accept only the hazardous wastes identified at Permit Attachment K, *Permit Application - Part A*; and listed at Table 2-1 of this Permit Part.

1.4.1.b Other Permitted Waste

1.4.1.b.i Certain PCB-Contaminated Liquids

The Permittee may accept non-ignitable liquids containing PCBs in concentrations of less than 50 parts per million (ppm) in accordance with 20.4.1.800 NMAC (incorporating 40 CFR 268.5(h)(2)(vi) and 268.50(f)).

1.4.1.b.ii Certain PCB-Contaminated Soils

The Permittee may accept soils containing PCBs in concentrations of less than 50 ppm.

1.4.1.b.iii Bulk PCB-Contaminated Remediation waste

The Permittee may accept bulk PCB-contaminated remediation waste subject to concentration limits described in Part Condition 2.4.1.b.ii. PCB-contaminated remediation waste includes, but is not limited to, the following non-liquid PCB-contaminated remediation wastes: soil, sediments, dredged materials, muds, PCB sewage sludge, and industrial sludge. (40 CFR 761.61(a)(4)(i) and 761.3)

1.4.1.c Acceptance of Waste on an Emergency Basis

The Permittee may accept hazardous waste that is not identified at Permit Conditions 2.4.1.a or 2.4.1.b or that is prohibited at Permit Condition 2.4.2 only if the waste has been approved for receipt by the Secretary on an emergency basis and the Facility has obtained an Emergency Permit in accordance with Permit Condition 1.5.1 and as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.61).

1.4.2 Prohibited Waste Streams

1.4.2.a General Prohibition

The Permittee is prohibited from accepting, storing, treating, or disposing the following wastes at the Facility: the wastes not listed in Permit Attachment K, *Permit Application - Part A*; and the wastes specified at Permit Attachment F, Section 4.1.2, *Prohibited Waste*.

Wastes prohibited from acceptance at the Facility include, but are not limited to:

- **certain hazardous debris.** - Hazardous debris means debris that contains a hazardous waste listed in 20.4.1.200 NMAC (incorporating 40 CFR 261, Subpart D), or that exhibits a characteristic of hazardous waste identified in 20.4.1.200 NMAC (incorporating 40 CFR, 261 Subpart C). The Permittee shall not accept hazardous debris that does not meet the LDR treatment standards;
- **certain lab packs.** - Lab packs which contain wastes [identified at 20.4.1.800 NMAC (incorporating 40 CFR 268, Appendix IV)] excluded from lab packs under the alternative treatment

standards contained at 20.4.1.800 NMAC
(incorporating 40 CFR 268.42(c));

- **certain liquids containing PCBs.** - Ignitable liquids containing PCBs or liquids with PCB concentrations greater than or equal to 50 ppm;
- **certain soils containing PCBs.** - Soils with PCB concentrations greater than or equal to 50 ppm, except for those soils (and other solids) defined as bulk PCB-contaminated remediation waste;
- **compressed gases.** - Gases stored at pressures higher than atmospheric;
- **dioxin-contaminated waste.** - Dioxin-containing wastes listed at 20.4.1.800 NMAC (incorporating 40 CFR 268.31) (i.e., wastes with EPA Hazardous Waste Nos. F020, F021, F022, F023, F026, F027, and F028);
- **explosives.** - Any substance or article, including a device, which is designed to function by explosion (i.e., an extremely rapid release of gas and heat) or which, by chemical reaction within itself, is able to function in a similar manner even if not designed to function by explosion;
- **infectious waste.** - Infectious waste, defined at 20.9.1.105.AL NMAC (Oct. 1995), means a limited class of substances that carry a probable risk of transmitting disease to humans, including but not limited to:
 - (1) microbiological laboratory wastes, including cultures and stocks of infectious agents from clinical research and industrial laboratories, and disposable culture dishes and devices used to transfer, inoculate and mix cultures;
 - (2) pathological wastes, including human or animal tissues, organs, and body parts, removed during surgery, autopsy, or biopsy;

- (3) disposable equipment, instruments, utensils, and other disposable materials which require special precautions because of contamination by highly contagious diseases;
 - (4) human blood and blood products, including waste blood, blood serum, and plasma;
 - (5) used sharps, including hypodermic needles, syringes, scalpel blades, Pasteur pipettes and broken glass; and
 - (6) contaminated animal carcasses, body parts, and bedding, especially those intentionally exposed to pathogens in research, in the production of biologicals or the "in vitro" testing of pharmaceuticals;
- **medical wastes.** - Medical wastes include infectious/biologic/pathogenic solid waste generated in the diagnosis, treatment, or immunization of human beings or animals, in research pertaining thereto, or in the production or testing of biologicals;
 - **radioactive/nuclear wastes.** - Radioactive/ nuclear wastes mean naturally-occurring radioactive materials (NORM) defined in 20.3.1.14 NMAC; or other naturally-occurring materials which contain radioactivity concentrations, as specified at Permit Attachment F1, *Rationale for Analytical Parameter Selection*, above the concentration levels regulated under 20.3.1.14 NMAC; or materials regulated under the Atomic Energy Act of 1954, as amended (including source, special nuclear materials, and byproduct materials as defined in 10 CFR 1003);
 - **uncharacterized wastes.** - Uncharacterized wastes cannot be accepted at the Facility except by special provision and direction from the Secretary (e.g., emergency clean-up operations) under an Emergency Permit, or until full characterization has been performed.

**1.4.2.b Prohibited Waste at Specific Units{tc \13 "2.4.2.b
Prohibition of certain volatile organic
concentrations }**

1.4.2.b.i 40 CFR, Subparts BB and CC

The Permittee is prohibited from managing, treating, storing, or disposing of hazardous wastes subject to the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264, Subparts BB and CC), in the Liquid Waste Storage Tank Area, the Stabilization Building, and the Surface Impoundment.

The Permittee is prohibited from storing hazardous wastes subject to the Container Level 3 standards contained at 20.4.1.500 NMAC (incorporating 40 CFR 264.1086(e)) in the Container Storage Areas.

1.4.2.b.ii Land Disposal Restrictions

The Permittee is prohibited from treating or disposing any hazardous waste in the Surface Impoundment or the Landfill respectively that does not meet the Land Disposal Restrictions (LDR) treatment standards contained at 20.4.1.800 NMAC (incorporating 40 CFR Part 268).

1.5 WASTE ANALYSIS PLAN

**1.5.1 General Waste Analysis Requirements {tc \12 "2.5.1
General Waste Analysis Requirements }**

The Permittee shall keep a copy of Permit Attachments F; F1; F2, *Waste Profile Form*; and F3, *Chain-of-Custody Form*; at the Facility, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.13), until the completion of closure has been approved by the Secretary.

The Permittee shall follow the waste analysis procedures required by 20.4.1.500 NMAC (incorporating 40 CFR 264.13) and 20.4.1.800 NMAC (incorporating 40 CFR 268.7), and specified at Permit Attachment F. The Permittee shall use analytical methods contained at Permit Attachment F; or methods contained in *Test Methods for the Evaluation of Solid Waste, Physical/Chemical Methods* (EPA Publication SW-846, latest edition). Alternative SW-846 methods may be approved by the Secretary through permit modification under 20.4.1.900 NMAC (incorporating 40 CFR 270.42).

At a minimum, the Permittee shall maintain proper functional instruments, use approved sampling and analytical methods, verify the validity of sampling and analytical procedures, and perform correct calculations.

1.5.2 Specific Waste Analysis Requirements

The Permittee shall perform the following waste analyses as presented at Permit Attachment F, Section 4.5, *Waste Analysis*:

- pre-shipment characterization of a representative sample from each waste stream prior to shipment as described at Permit Condition 2.5.2.a;
- fingerprint analysis of a select portion of waste upon arrival and continued fingerprint analysis of waste as specified at Permit Condition 2.5.2.b;
- annual re-analysis as specified at Permit Condition 2.5.2.c;
- additional analysis as specified at Permit Condition 2.5.2.d; and
- characterization of waste generated on-site as specified at Permit Condition 2.5.2.e.

Analytical parameters for each waste analysis requirement are specified at Permit Conditions 2.5.2.a through 2.5.2.e and shall be selected, as applicable, to meet waste characterization requirements, and to ensure compliance with LDR treatment standards and with regulations and operational limits as specified at Permit Attachment F.

The Permittee shall use analytical methods contained at Permit Attachment F, Tables 4-1 through 4-3; or in EPA publication SW-846. If the Permittee wishes to use an alternative method, the Permittee shall demonstrate to the Secretary that such alternative method is equivalent to the approved method contained in Permit Attachment F or EPA publication SW-846.

1.5.2.a Representative Sample Analysis

Following Permittee approval of the Waste Profile Form and associated characterization information and prior to initial acceptance of a waste stream, the Permittee shall obtain a representative waste stream sample from the generator for each

waste stream. The Permittee shall submit the representative sample to a qualified laboratory other than that used by the generator for analysis as described at Permit Attachment F, Sections 4.3.3, *Representative Sample Assessment*, and 4.5.2, *Representative Sample Analysis*. Representative sample analysis shall include, at a minimum, testing for each hazardous waste code contained in the waste stream and parameters listed in Permit Attachment F, Table 4-1, *Parameters and Methods for Pre-Acceptance Representative Sample Analysis*; as well as applicable parameters listed in Tables 4-2, *Tests and Analytical Methods for Fingerprint Samples* and 4-3, *Additional Tests and Analytical Methods*; as required to ensure complete analysis. Additional parameters not listed in Tables 4-2 and 4-3 may also be selected. The Permittee shall assess these data as required at Permit Condition 2.5.3.a.ii.

1.5.2.b Fingerprint Sampling and Analysis

Fingerprint sampling and analysis shall be performed upon acceptance of each waste stream shipment and prior to storage, treatment, or disposal, as specified at Permit Attachment F, Sections 4.4.3.1, *Fingerprint Test Procedure*, and 4.5.4, *Fingerprint Analysis*. All waste, except for debris waste, is subject to fingerprint sampling and analysis upon waste acceptance. Fingerprint analyses shall include, at a minimum, the parameters listed at Permit Attachment F, Table 4-2, and shall be sampled and analyzed following protocols and analytical frequencies specified at Permit Attachment F, Section 4.4.3.1. Reduction in fingerprint sampling and analysis frequency shall occur in accordance with waiver provisions presented at Permit Attachment F, Section 4.4.3.1, or through Permit modification. If discrepancies between fingerprint analysis and waste stream characterization information exist upon completion of discrepancy resolution as presented at Permit Attachment F, Section 4.4.4.1, *Discrepancy Resolution*, the waste shall be rejected by the Permittee. The Permittee shall ensure that the generator re-assumes responsibility for the rejected waste or shall ensure proper disposal of the waste at an appropriate facility within 30 days of the waste rejection.

1.5.2.c Annual Sampling and Analysis

The Permittee shall obtain a representative sample analysis from each off-site generator prior to initial acceptance of a waste stream, in accordance with Permit Condition 2.5.2.a, and annually thereafter, as specified at Permit Attachment F, Section 4.5.3, *Annual Analysis*. The annual analysis shall include, at a

minimum, parameters presented at Permit Attachment F, Table 4-1, in addition to any parameters included during analysis of the pre-shipment representative sample of the waste stream and additional parameters identified by the Permittee. If the annual analysis indicates waste stream changes such that the hazardous waste code assignment and/or LDR determination is modified, a new Waste Profile Form shall be obtained from the generator. The annual analysis shall be conducted as part of the Facility quality assurance program, as specified at Permit Attachment F, Section 4.4.3.2, *Annual Analysis Procedure*.

1.5.2.d Additional Sampling and Analysis

Additional sampling and analysis shall be performed to assess chemical characteristics of wastes in specific management units as specified at Permit Attachment F, Section 4.5.5, *Additional Analysis for Specific Management Units*. Sampling and analysis required for specific management units include, but are not limited to, the following:

- **storage units.** - Wastes managed in the Drum Storage Building, Roll-Off Container Storage Area, and the Liquid Waste Storage Tanks shall undergo pre-acceptance representative sample analysis, annual analysis, and initial and on-going fingerprint sample analysis as described at Permit Attachment F, Section 4.5.5.2, *Waste Analysis Requirements Specific to Storage Units*. Ignitability, reactivity, and incompatibility of each waste stream shall be determined using procedures listed at Permit Attachment F, Table 4-2; and as addressed at Permit Attachment F1;
- **Surface Impoundment.** - Wastes placed in the Surface Impoundment shall undergo pre-acceptance representative sample analysis as specified at Permit Attachment F, Section 4.5.5.3, *Waste Analysis Requirements Specific to the Surface Impoundment*. Compatibility, ignitability, and reactivity determination shall also be performed for wastes placed in the Surface Impoundment, as specified at Permit Attachment F, Section 4.5.5.3; and as addressed at Permit Attachment F1. Waste removed from the Surface Impoundment shall undergo analysis to ensure continued LDR compliance as

specified at Permit Attachment F, Section 4.5.5.3.;

- **Stabilization Tanks.** - Wastes placed in the Stabilization Tanks shall be analyzed as specified at Permit Attachment F, Section 4.5.5.4, *Waste Analysis Requirements Specific to the Stabilization Tanks*, and shall be characterized to ensure compatibility with the tank liner and previous wastes placed in the Stabilization Tanks. This may be accomplished through pre-acceptance representative sample analysis for wastes placed directly into the Stabilization Tanks, or through analysis performed on waste removed from the Surface Impoundment.

A second representative sample of any waste requiring stabilization shall be collected and shall be used for bench-scale testing to determine treatability. Bench-scale tests shall also be conducted as part of the representative sample analysis for incoming waste streams that are directly placed in the Stabilization Tanks. After stabilization, wastes shall be re-tested to ensure LDR requirements are met prior to placement into the Landfill. Compatibility, ignitability, and reactivity determination shall also be performed as specified at Permit Attachment F1; and

- **Landfill.** - Waste analysis for landfilled wastes is specified at Attachment F, Section 4.5.5.5, *Waste Analysis Requirements Specific to the Landfill*. All waste placed directly into the Landfill shall undergo pre-acceptance representative sample analysis as specified at Permit Condition 2.5.2.a. In addition to fingerprint analysis performed on all incoming waste as required at Permit Condition 2.5.2.b, a minimum of 10 percent of incoming wastes that are to be directly landfilled shall be sampled to verify conformance with LDR requirements, as specified at Permit Attachment F1, Section 4.5.5.5.

1.5.2.e Waste Analysis Requirements for Waste Generated On-Site

The Permittee shall comply with the waste analysis requirements for waste generated on-site specified at Permit Attachment F, Section 4.5.6.

1.5.2.f Compatibility Analysis

The Permittee shall include a compatibility determination on all pre-acceptance representative sample analyses, annual analyses, and additional sampling analyses conducted as required at Permit Conditions 2.5.2.a, 2.5.2.c, and 2.5.2.d; and at Permit Attachment F1; to ensure that potentially incompatible wastes are not stored, treated, or disposed in the same location.

1.5.3 Waste Acceptance Criteria{tc \12 "2.5.2 Waste Management }

The Permittee shall ensure that all waste managed at the Facility meets the criteria for acceptance and management specified at Permit Attachment F, Section 4.2, *Criteria for Waste Management at the Facility*; these criteria include characterization to acquire all the information that must be known to treat, store, or dispose of the waste as required by 20.4.1.500 NMAC (incorporating 40 CFR 264) and 20.4.1.800 NMAC (incorporating 40 CFR 268).

1.5.3.a Waste Acceptance from Off-Site Generators {tc \13 "2.5.2.a Waste acceptance from off-site generators }

The Permittee shall accept hazardous waste from off-site generators only in accordance with Permit Attachment F, Sections 4.3 and 4.4; and Permit Attachment N, Section 3.0, *Operations*.

1.5.3.a.i Waste Profile Form

The Permittee shall use the Waste Profile Form contained at Permit Attachment F2. The Permittee shall acquire a completed Waste Profile Form and accompanying characterization information from the generator for each new waste stream, as specified at Permit Attachment F, Section 4.3.1, *Waste Characterization Information Provided by the Generator*. The Permittee shall ensure that the generator submits a new Waste Profile Form for each new waste stream and for an existing waste stream if it is significantly modified.

The Permittee shall evaluate information provided by the generator as specified at Permit Attachment F, Sections 4.3, and 4.3.2, *Paperwork Evaluation*. If acceptable knowledge information is used, the information provided must be traceable (e.g., the information provided for a selected drum must be traceable back to the process which produced it) and auditable (i.e., "auditable" records mean those records that are readily available, that can be correlated to specific waste shipments or specific containers of waste, and that verify the characterization of such wastes).

Any revision of the Waste Profile Form and associated characterization information shall be accomplished through Permit modification.

1.5.3.a.ii Representative Sample Evaluation

Following Permittee approval of the Waste Profile Form and associated characterization information, the Permittee shall obtain a representative waste stream sample, which the Permittee shall submit to a qualified laboratory other than that used by the generator for analysis. The Permittee shall assess these data with respect to the Waste Profile Form and characterization information, as specified at Permit Attachment F, Section 4.3.3.

Discrepancy analysis shall include, but not be limited to, items listed at Permit Attachment F, Section 4.3.3.1, *Major Discrepancies*. If a major discrepancy is identified, the Permittee shall require the generator to submit a sampling plan for generator analysis of the waste. The generator's sampling plan must be consistent with EPA guidance, as specified at Permit Attachment F, Section 4.3.3.1, and must address the discrepant information in accordance with Permit Attachment F, Sections 4.3.3.1, *Major Discrepancies*, and 4.3.3.2, *Minor Discrepancies*. The sampling plan shall be documented in the Facility Operating Record within 15 days after receipt and approval by the Facility. The Permittee shall determine whether additional sampling is necessary to ensure that the elements listed at Permit Attachment F, Section 4.3.3.3, *Additional Waste Acceptance Conditions*, are appropriately addressed.

1.5.3.b Incoming Waste Acceptance

Incoming waste shipments shall be evaluated in accordance with Permit Attachment F, Section 4.4. If manifest discrepancies or discrepancies noted during visual examination are not resolved within 90 days of identifying the discrepancy, waste will not be

accepted for storage or disposal, and the waste will either be returned to the sender or disposed at an appropriate permitted Facility by the Permittee.

The Permittee shall ensure that a generator shipping hazardous debris or contaminated soil to the Facility has first complied with the certification requirements identified in the Table contained at 20.4.1.800 NMAC (incorporating 40 CFR 268.7).

1.5.3.c Air Emissions Requirements

The Permittee shall comply with the air emissions testing requirements contained at Permit Conditions 2.15.1.b, 2.15.2.b, and 2.15.2.c.

1.5.3.d Other Waste Management Requirements {tc \13 "2.5.2.b Other waste management requirements }

The Permittee shall ensure that all waste analyses, reports, documentation, notifications, and certifications required under 20.4.1.800 NMAC (incorporating 40 CFR 268.7) are provided by off-site generators or off-site treatment facilities that ship waste to the Facility, including, where appropriate, the certification requirement for treatment of hazardous debris.

1.5.3.e Waste Acceptance from Foreign Generators

The Permittee shall accept hazardous waste from foreign generators in accordance with, in addition to all of the requirements for off-site generators, Permit Attachment F4, *Waste Characterization Using Acceptable Knowledge*, and Permit Attachment F, Section 4.7.4, *Laboratory Requirements for Foreign Generators* as required in part by the Final Order from the Secretary dated March 18, 2002, through his authority stipulated at 20.4.1.900 (incorporating 40 CFR 270.32(b)(2)).

1.5.4 Sampling Plan

1.5.4.a Facility Sampling Plan

The Permittee shall follow the procedures specified at Permit Attachment F, Section 4.6, *Sampling Plan*. Modifications to this Sampling Plan are expected to be necessary, and revised sampling methods shall be EPA-approved methodologies included in the EPA publication, SW-846. Alternative SW-846 methods may be approved by the Secretary through permit modification under 20.4.1.900 NMAC (incorporating 40 CFR 270.42).

The modification may also include changes to the individual sampling and analysis protocols specific to individual waste streams presented in Attachment F, Section 4.6, which identify the fingerprint analysis to be used and sampling and analytical requirements prior to acceptance of an individual waste stream, as specified at Permit Attachment F, Section 4.3.4, *Notification and Approval of Waste Shipment*.

1.5.5 Laboratory Quality Assurance/Quality Control Plan

The Permittee shall follow the Laboratory QA/QC Plan described at Permit Attachment F, Section 4.7.2, *Facility Laboratory QA/QC Plan*.

1.5.6 Individual Sampling and Analysis Protocols

The Permittee shall also develop and place into the Operating Record individual sampling and analysis protocols specific to individual waste streams identifying the fingerprint analysis to be used and sampling and analytical requirements prior to acceptance of an individual waste stream, as specified at Permit Attachment F, Section 4.3.4.

**1.5.7 Quality Assurance Objectives {tc \12 "2.5.4
Quality Assurance Objectives }**

The Permittee shall review, validate, and verify all analytical data; reconcile analytical results with data quality objectives; satisfy data reporting requirements; and identify, document, and report all nonconformances and operational variances to the Secretary.

**1.5.8 Quality Control Checks {tc \12 "2.5.5 Quality
Control Checks }**

The Permittee shall take additional samples as quality control checks as specified at Permit Attachment F, Section 4.7.2.3, *Laboratory QA/QC Samples*. Upon request, the Permittee shall split samples with NMED.

**1.5.9 Disposal of Laboratory Samples {tc \12 "2.5.6
Disposal of Laboratory Samples }**

The Permittee shall dispose of on-site laboratory samples with compatible waste batches.

**1.5.10 Contract Laboratory Requirements {tc \12 "2.5.7
Contract Laboratory Requirements }**

The Permittee shall inform each contract laboratory in writing that it shall operate under the waste analysis conditions set forth at Permit Attachment F, Section 4.7.3, *Requirements for Off-Site Laboratories*.

1.6 SECURITY {TC \L1 "2.6 SECURITY }

The Permittee shall comply with the security provisions specified at Permit Attachment B, *Procedures to Prevent Hazards*, Section 5.1, *Security Provisions to Prevent Hazards*. [20.4.1.500 NMAC (incorporating 40 CFR 264.14)]

1.6.1 Means to Control Entry {tc \12 "2.6.1 Means to Control Entry }

Access to the Facility shall be only through a controlled access point that is manned by security guards, as specified at Permit Attachment B, Section 5.1.1, *Barrier and Means to Control Entrance*; as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.14(b)(2)(ii)).

1.6.2 Barriers {tc \12 "2.6.2 Barriers }

In order to prevent unknowing entry and minimize the possibility for unauthorized entry of persons, livestock or wildlife, the Facility shall have the following barrier as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.14(b)(2)(i)). The active portion of the Facility shall be bounded by a six-foot chain link fence topped with a three strand barbed wire access barrier with two access gates located in the northern portion of the Facility. The fence shall have metal flashing around its base constructed to protrude a minimum of 18-inches above ground and a minimum of 10-inches below ground. The fence shall be regularly maintained to ensure proper barriers..

1.6.3 Warning Signs {tc \12 "2.6.3 Warning Signs }

Warning signs in English and Spanish, e.g., "DANGER, NO UNAUTHORIZED PERSONNEL, KEEP OUT", and "PELIGRO, NO PERMITIDA LA ENTRADA SIN AUTORIZACION", shall be posted at the road entry point to the Facility and every 50 feet along the perimeter fence, as specified at Permit Attachment B, Section 5.1.2, *Warning Signs*. These bilingual signs shall be legible from a distance of 25 feet and shall also be visible from any approach

to the Facility. In addition, the warning signs shall be posted at each entrance to an active portion of the Facility, and in sufficient numbers to be seen from any approach to each active portion, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.14(c)).

**1.7 GENERAL INSPECTION REQUIREMENTS {TC \L1 "2.7
GENERAL INSPECTION REQUIREMENTS }**

The Permittee shall keep Permit Attachments D, *Inspection Procedures*; and D1; at the Facility until final closure of the Facility.

**1.7.1 Inspection Frequencies {tc \L2 "2.7.1
Inspection Frequencies }**

**1.7.1.a Inspection Schedules {tc \L3 "2.7.1.a
Inspection schedules }**

The Permittee shall implement the Inspection Schedules contained at Permit Attachment D1, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.15(b)).

**1.7.1.b Additional Inspection Requirements {tc \L3
"2.7.1.b Additional inspection requirements }**

The Permittee shall inspect areas subject to spills, such as loading and unloading areas, daily when in use, as required by 20.1.500 NMAC (incorporating 40 CFR 264.15(b)(4)).

**1.7.1.c Testing and Maintenance of Emergency Equipment {tc
\L2 "2.10.2 Testing and Maintenance of
Equipment }**

The Permittee shall inspect the monitoring equipment, safety and emergency equipment, security devices, and operating and structural equipment identified at Permit Attachment C1, *Emergency Equipment*, to detect any malfunctions and deterioration, operator errors, and discharges, as specified at Permit Attachment D, *Inspection Procedures*, Section 5.2.8, *Safety and Emergency Response Equipment Inspection Procedures*; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.33); in order to assure proper operation in time of emergency.

18

which they are employed, as specified at Permit Attachments E and F, Section 4.6.5.1, *Training Requirements for Personnel Responsible for Sampling Collection* and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16).

**1.8.2 Personnel Training Procedures {tc \12 "2.8.2
 Personnel Training Procedures }**

The Personnel Training Program shall include the material and procedures outlined at Permit Attachment E, Section 7.2, *Training Content and Frequency*, and shall otherwise comply with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.16(a)(3)).

The Permittee shall ensure that Facility personnel successfully complete the Personnel Training Program within six months after their employment at the Facility, or to their assignment to a new position at the Facility, whichever is later. Employees shall not work in unsupervised positions until they have successfully completed the training requirements for their positions, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(b)).

Facility personnel shall take part in an annual review of the initial training required for their positions, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(c)).

**1.8.3 Recordkeeping - Personnel Training Documents and
 Records {tc \12 "2.8.3 Recordkeeping -
 Personnel Training Documents and Records }**

The Permittee shall maintain training documents and personnel training records, as specified at Permit Attachment E, Section 7.3, *Record Keeping*, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(d)). Training documents and personnel training records shall be kept until completion of closure or for at least three years from the date an employee last worked at the Facility, whichever is earlier, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.16(e)).

**1.9 SPECIAL PROVISIONS FOR IGNITABLE, REACTIVE, OR
 INCOMPATIBLE WASTE**

1.9.1 Precautions

The Permittee shall manage ignitable, reactive, or incompatible wastes as specified at Permit Attachment B, Section 5.5, *Precautions to Prevent Ignition or Reaction of Ignitable*,

Reactive, or Incompatible Wastes; and shall otherwise comply with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.17(a) and (b)).

**1.9.2 Recordkeeping - Precautions for Ignitable,
Reactive, or Incompatible Waste{tc \12 "2.9.2
 Recordkeeping - Precautions for Ignitable,
Reactive, or Incompatible Waste }**

The Permittee shall document compliance with Permit Condition 2.9.1 in the Operating Record, in accordance with Permit Condition 2.12.1.a; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(3)).

1.10 PREPAREDNESS AND PREVENTION

The Permittee shall maintain Permit Attachment B at the Facility until final completion of closure, as specified by Permit Part 8, has been approved by the Secretary.{tc \11 "2.10
PREPAREDNESS AND PREVENTION }

**1.10.1 Required Equipment{tc \12 "2.10.1 Required
Equipment }**

At a minimum, the Permittee shall maintain at the Facility the equipment identified at Permit Attachment C1, *Emergency Equipment*, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.32).

**1.10.2 Access to Communications or Alarm System {tc \12
"2.10.3 Access to Communications or Alarm
System }**

The Permittee shall maintain access to the communications or alarm system as specified at Permit Attachment B, Section 5.3, *Preparedness and Prevention Procedures*; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.34).

1.10.3 Roadways {tc \12 "2.10.4 Roadways }

The Permittee shall maintain roadways within the Facility as specified at Permit Attachment L, Section 2.1.3, *Facility Traffic Plan*, to allow the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment in an emergency.

1.10.4 Arrangements with Local Authorities {tc \12
"2.10.5 Arrangements with Local Authorities }

The Permittee shall maintain preparedness and prevention arrangements with State and local authorities, contractors, and other governmental agencies, at a minimum as specified at Permit Attachment C, *Contingency Plan*, Sections 6.3.1.1, *Life-Threatening Situations*, and 6.3.4, *Off Site Notification and Evacuation Criteria*, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.37(a) and 264.52(c)). The Permittee shall maintain these documents at appropriate locations at the Facility.

1.10.5 Notification of Agreements with Local Authorities
{tc \12 "2.10.6 Notification of Agreements
with Local Authorities }

The Permittee shall submit signed copies of the preparedness and prevention agreements with local authorities listed at Permit Attachment C3, *Cooperating Local Authorities*, or documentation of refusal to enter into preparedness and prevention agreements, to the Secretary 30 days prior to initiation of operations at the Facility, in accordance with Permit Condition 1.10, and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.37(b)).

If a local authority with which the Permittee has an agreement terminates the agreement, Permittee shall document the termination in the Operating Record and shall provide a copy of this documentation and alternative emergency response arrangements to the Secretary within 15 days.

1.10.6 Response Action Plan

The Permittee shall keep Permit Attachment J, *Action Leakage Rate and Response Action Plan*, at the Facility until completion of closure for the Facility is approved by the Secretary.

1.10.7 Operations and Maintenance Plan

The Permittee shall keep Permit Attachment N, *Operations and Maintenance Plan*, at the Facility until completion of closure is approved by the Secretary.

1.11.1 Implementation of Contingency Plan(tc \l2 "2.11.1
Implementation of Plan }

If the Permittee implements the Contingency Plan as a result of a spill or release to the environment and after 30 calendar days the Permittee has not been able to remove all contaminated soil or water to appropriate action levels, in accordance with Permit Condition 9.2, the Permittee shall comply with the requirements of either Permit Part 9 or 10, as appropriate. The Permittee may submit for the Secretary's approval a one time, 30 day extension to the above 30 calendar days compliance period.

The Permittee shall maintain copies of the Contingency Plan and all revisions and amendments to the Contingency Plan at all document locations throughout the Facility until the completion of closure for the Facility is approved by the Secretary. The Permittee shall also submit a copy of the Contingency Plan and current revisions and amendments thereto to all federal, State, and local entities that may be called upon to provide emergency services and/or with which the Permittee has preparedness and prevention arrangements, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.53). As a part of the submittal to all federal, State, and local entities, the Permittee shall also submit Permit Attachment A, *General Facility Description and Information*.

The Permittee shall review and immediately amend, when necessary, the Contingency Plan as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.54). The Permittee shall submit all revisions and amendments to the Plan to the Secretary through a Permit modification before implementation of such revisions and

amendments as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.42).

**1.11.4 Emergency Coordinator {tc \12 "2.11.4
 Emergency Coordinator }**

A trained Emergency Coordinator (EC) or an alternate EC, as identified at Permit Attachment C, Section 6.1, *General Responsibilities of the Emergency Coordinator*, shall be available 24 hours a day, seven days a week, in case of an emergency. The EC or alternate EC shall be thoroughly familiar with the Contingency Plan and shall have the authority to commit the resources needed to implement the Contingency Plan, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.55).

In the event of an imminent or actual emergency, the EC shall implement the emergency procedures specified at 20.4.1.500 NMAC (incorporating 40 CFR 264.56) and Permit Attachment C.

**1.11.5 Updated Contingency Plan {tc \12 "2.11.5
 Submittals to the Secretary }**

The Permittee shall submit an updated Contingency Plan to the Secretary for approval at the time of Facility certification, as specified at Permit Attachment C and in accordance with Permit Condition 1.10. The updated Contingency Plan shall include, at a minimum, the following.

**1.11.5.a List of Emergency Coordinators {tc \13 "2.11.5.a
 List of emergency coordinators }**

The Permittee shall submit to the Secretary an updated list of the names, addresses, and phone numbers of all persons designated to act as ECs 15 days prior to initiation of operations, in accordance with Permit Condition 1.10; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.52(d)).

This updated list of ECs shall be inserted as replacement pages into this Permit at Permit Attachment C2, *Emergency Coordinators*.

The Permittee shall inform the Secretary in writing of changes to the list of ECs and telephone numbers within 15 calendar days from the date of the changes, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.52(d)).

1.11.5.b Emergency Response Team Members

The Permittee shall submit to the Secretary a list of the names and qualifications of all individuals qualified as members of the on-site emergency response team discussed at Permit Attachment B, *Procedures to Prevent Hazards*, Section 5.4.6. This list shall be provided to the Secretary 15 days prior to initiation of operations at the site.

1.11.5.c Evacuation Plan

The Permittee shall include in the updated Contingency Plan a finalized, building- or unit-specific evacuation plan for Facility personnel where there is a possibility that evacuation could be necessary. This plan shall describe evacuation routes, and alternate evacuation routes in cases where the primary routes could be blocked by releases of hazardous waste or fires. The plan shall include a clear map of the evacuation routes, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.52(f)).

This plan shall be inserted as replacement pages at Permit Attachment C4, *Evacuation Plans*.

1.11.6 Reporting and Recordkeeping - Contingency Plan Implementation {tc \12 "2.11.7 Reporting and Recordkeeping - Contingency Plan Implementation }

Whenever the Contingency Plan is implemented, the Permittee shall note the time, date, and details of the incident in the Operating Record and submit a written report to the Secretary within 15 calendar days, as specified at Permit Attachment C, Section 6.4.2, *Required Reports and Notification*; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.56(j)).

1.12 RECORDKEEPING AND REPORTING {TC \L1 "2.12 RECORDKEEPING AND REPORTING }

1.12.1 Recordkeeping Requirements {tc \12 "2.12.1 Recordkeeping Requirements }

The Permittee shall maintain at the Facility all the records, data, certifications, and other information listed at Table 2-2, *Recordkeeping Requirements*. Records kept shall include, but are not limited to, the following.

**1.12.1.a Operating Record {tc \13 "2.12.1.a Operating
record }**

The Permittee shall maintain a written Operating Record at the Facility as required by this Permit and 20.4.1.500 NMAC (incorporating 40 CFR 264.73). The Operating Record shall include all information required at 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)). Information placed in the Operating Record shall be kept until final closure of the Facility is approved by the Secretary, except as noted elsewhere in this Permit.

**1.12.1.b Facility Notification to Off-Site Generators {tc
\13 "2.12.1.b Required notification to off-
site generators }**

The Permittee shall keep a copy of the written notice to off-site generators that the Facility has the appropriate permit(s), and will accept the waste the generator is shipping, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.12(b)).

**1.12.1.c Generator Notifications and Certifications {tc \13
"2.12.1.c Generator notifications and
certifications }**

The Permittee shall keep copies of the notices, and the certifications and demonstrations if applicable, required of the generator or the Permittee, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(11) through (b)(16)).

**1.12.1.d Manifest Records {tc \13 "2.12.1.d Manifest
records }**

The Permittee shall retain at the Facility a copy of each manifest received from an off-site generator of hazardous waste accepted at the Facility for a period of at least three years, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.71(b)(5)).

**1.12.1.e Waste Analysis for Waste Acceptance{tc \13
"2.12.1.e Waste analyses }**

The Permittee shall maintain waste analysis records and copies of all certifications, demonstrations, and other documents relevant to waste analyses required for waste acceptance (including both pertinent Facility records and records from off-site generators) in the Operating Record, as required by 20.4.1.500 NMAC

(incorporating CFR 264.73(b)(3)) and 20.4.1.800 NMAC
(incorporating 40 CFR 268.4(a) and 268.7).

1.12.1.f Recordkeeping - 40 CFR 264, Subpart BB Exemption

The Permittee shall record in a log, for use in determining exemption from the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264, Subpart BB), all the information required at 20.4.1.500 NMAC (incorporating 40 CFR 264.1064(k)). The documentation to determine exemption shall be kept with, or made readily available with, the Operating Record for a period of three years.

1.12.1.g Recordkeeping - 40 CFR 264, Subpart CC Exemption

The Permittee shall record in a log, for use in determining exemption from the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264, Subpart CC), all the information required at 20.4.1.500 NMAC (incorporating 40 CFR 264.1089(f)). The documentation to determine exemption shall be kept with or made readily available with the Operating Record for a period of three years.

1.12.1.h Recordkeeping - 40 CFR 264, Subpart CC Compliance

The Permittee shall maintain at the Facility the information required under Permit Condition 3.4.

1.12.1.i Waste Stream Tracking

Information on each hazardous waste stream (including underlying hazardous constituents) managed at the Facility shall be recorded in the Waste Tracking System described at Permit Attachment F1, Section 4.8, *Waste Tracking*, and maintained in the Operating Record or at another location approved by the Secretary until completion of post-closure care has been approved by the Secretary, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(1)).

The information to be maintained shall describe the waste, the hazard characteristics, the basis for hazard designation, and the date deposited in the Landfill, the grid location within the landfill, and shall include the laboratory report results (if chemical analysis is used) detailing the chemical and physical analysis of the waste. The information provided for each waste stream shall be complete for each movement of the waste from acceptance through storage, treatment, and disposal at the

Facility, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264, Appendix I);

**1.12.1.j Waste Minimization Program {tc \13 "2.12.1.g
 Waste minimization program }**

The Permittee shall annually, by December 1 for the previous year ending September 30, enter into the Operating Record a certified statement specifying that the Permittee has a program in place, in accordance with Permit Condition 2.13, to reduce the volume and toxicity of hazardous wastes generated by the Facility's operation to the degree determined by the Permittee to be economically practicable; and the proposed method of treatment, storage, or disposal is that practicable method currently available to the Permittee which minimizes the present and future threat to human health and the environment, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(9)).

A current description of the program shall also be maintained in the Operating Record;

**1.12.1.k Monitoring Records {tc \13 "2.12.1.h
 Monitoring records }**

1.12.1.k.i Monitoring Information

The Permittee shall retain records of all monitoring information, including all calibration and maintenance records, and all original strip chart recordings for continuous monitoring instrumentation, for a period of at least three years from the date of the sample, measurement, or record, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(2)). This period may be extended by the Secretary at any time.

The Permittee shall retain monitoring records for the Surface Impoundment Leak Detection and Removal System (LDRS) and Vadose Zone Monitoring System (VZMS) and associated water level elevations until the completion of Surface Impoundment closure, or if necessary post-closure, is approved by the Secretary, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.226(d)(1)).

The Permittee shall retain records for the Landfill Leachate Collection and Removal System (LCRS), LDRS, and VZMS until the completion of post-closure care for the Landfill is approved by the Secretary, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.303(c)(1));

1.12.1.k.ii Record Information

Records for monitoring information shall include, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(3)):

- the date, exact place, and time of sampling or measurements;
- the name of the individual(s) who perform the sampling or measurements;
- the date(s) analyses are performed;
- the name and address of the laboratory that performed the analyses;
- the name of the individual(s) who perform the analyses;
- the analytical techniques or methods used; and
- the result of such analyses;

1.12.1.l Corrective Action Records {tc \13 "2.12.1.i Corrective action records }

For a unit undergoing corrective action under Permit Parts 9 or 10, the Permittee shall retain, until completion of the corrective action has been approved by the Secretary, records of all monitoring information, waste analyses, and all other pertinent data and information used to prepare the appropriate documents required for the action by this Permit, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(j)(2) and 270.31(b)).

1.12.1.m Grid "Cell" Map

The Permittee shall maintain the grid "cell" map of the Landfill and location identification of the waste placed in the Landfill in the Operating Record, in accordance with Permit Conditions 6.7.1.a; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.73(b)(2) and 264.309).

29

- quantities of hazardous wastes stored, treated, and/or disposed in the Landfill (including waste generated on-site), by EPA Hazardous Waste Number;
- a discussion of spills and releases which have occurred during the reporting period, and subsequent actions taken;
- any variances or discrepancies from this Permit;
- monitoring results, including raw data, of the monitoring of the LCRS and LDRS at the Surface Impoundment and Landfill, of the monitoring of the VZMS, and all other monitoring requirements of this Permit, as required by 20.4.1.900 NMAC (incorporating 40 CFR 270.30(1)(4) and 270.31(c)); and
- a summary of operation and maintenance activities for the VZMS, in accordance with Permit Condition 7.6, and for the LCRS and LDRS, at the Surface Impoundment and Landfill.

The report shall also include a discussion of planned activities for the upcoming three-month period, including any necessary changes or modifications in operating activities approved under this Permit.

**1.12.2.c Waste Minimization Program Certification {tc \13
"2.12.2.c Waste minimization program
certification }**

The Permittee shall submit a copy of the annual certified statement regarding the Waste Minimization Program required at Permit Condition 2.13 to the Secretary by December 1 for the previous year ending September 30, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.75(i)).

**1.12.2.d Reporting - Noncompliance with the 40 CFR 264, CC
Exemption**

The Permittee shall report to the Secretary each occurrence, within 15 calendar days of the time the Permittee becomes aware of the occurrence, whenever hazardous waste is placed in a waste management unit in noncompliance with the exemption from the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264,

Subpart CC) provided at Permit Condition 2.15.2.a; as specified at Permit Attachment G, *Air Quality*; and as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.1090(a)).

**1.13 WASTE MINIMIZATION PROGRAM {TC \L1 "2.13 WASTE
MINIMIZATION PROGRAM }**

The Permittee shall institute a program, as specified at Permit Attachment A, Section 9.0, *Waste Management*, to reduce the volume and toxicity of hazardous wastes generated at the Facility to the degree determined by the Permittee to be economically feasible. Suggested criteria for the program include:

- (1) any written policy or statement that outlines goals, objectives, and/or methods for source reduction and recycling of hazardous waste at the Facility;
- (2) any employee training or incentive program designed to identify and implement source reduction and recycling opportunities;
- (3) any source reduction and/or recycling measures implemented in the last five years or planned for the near future;
- (4) an itemized list of the dollar amounts of capital expenditure (plant and equipment) and operating costs devoted to source reduction and recycling of hazardous waste;
- (5) factors that have prevented source reduction and/or recycling;
- (6) an investigation of additional waste minimization efforts that could be implemented at the Facility. This investigation would analyze the potential for reducing the quantity and toxicity of each waste stream through recycling and all other appropriate means. The analysis would include an assessment of the technical feasibility, cost, and potential waste reduction for each option;
- (7) a flow chart or matrix detailing all hazardous wastes produced by quantity, type, and building or area;

- (8) a demonstration of the need to use those processes which produce a particular hazardous waste due to a lack of alternative processes or available technology which would produce less hazardous waste;
- (9) a description of the waste minimization methodology employed for each related process at the Facility which shows whether source reduction or recycling is being employed; and
- (10) a description of the changes in volume and toxicity of waste actually achieved during the year in comparison to previous years.

**1.14 TRANSPORTATION OF HAZARDOUS WASTE {TC \L1 "2.14
 TRANSPORTATION OF HAZARDOUS WASTE }**

**1.14.1 Transportation of Hazardous Waste to the Facility
 {tc \l2 "2.14.1 Transportation of Hazardous
 Waste to the Facility }**

**1.14.1.a Manifest Requirements {tc \l3 "2.14.1.a
 Manifest requirements }**

The Permittee shall comply with the manifest requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.71).

**1.14.1.b Manifest Discrepancies {tc \l3 "2.14.1.b
 Manifest discrepancies }**

Upon discovering a significant discrepancy, as identified at Permit Attachment F, Section 4.4, and at 20.4.1.500 NMAC (incorporating 40 CFR 264.72(a)), between the quantity or type of waste designated on the manifest and the quantity or type of waste actually received at the Facility, the Permittee shall attempt to reconcile the discrepancy with the generator or transporter. If the discrepancy is not resolved within 90 days after receiving the waste, the Permittee shall immediately submit to the Secretary a letter describing the discrepancy and attempts to resolve it, and a copy of the manifest, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.72(b)).

33

**1.14.3 Decontamination of Equipment and Vehicles {tc \13
"2.14.2.c Decontamination of equipment and
vehicles }**

The Permittee shall ensure that any vehicles or equipment which have come in contact with hazardous waste in any storage or treatment area and/or which have been in contact with hazardous waste in the Landfill are sufficiently decontaminated prior to their further movement to prevent contamination of uncontaminated areas of the Facility as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.31)). Wash water generated from truck or equipment decontamination shall be collected, tested, and treated, and disposed as specified at Permit Attachment F, Section 4.5.6.

1.15 AIR QUALITY PROTECTION

1.15.1 40 CFR, Subpart BB

1.15.1.a Compliance and Exemption

The Permittee shall manage waste with an organic concentration of at least 10 percent by weight in compliance with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264.1050(b)(1)). Waste with an organic concentration of less than 10 percent by weight is exempt from the requirement to comply with 20.4.1.500 NMAC (incorporating 40 CFR, Subpart BB).

Alternatively, the Permittee may elect to demonstrate compliance with this Permit Condition through compliance with a New Source Air Emissions Permit, to the extent that the documentation required under the New Source Air Emissions Permit duplicates the documentation required under this Permit Condition, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1064(m)).

1.15.1.b Waste Determination

The Permittee shall use the test methods contained at 20.4.1.500 NMAC (incorporating 40 CFR 264.1063(d)), to make a determination of compliance with Permit Conditions 2.4.2.b.i and 2.15.1.a for each waste stream managed at the Facility, as specified at Permit Attachment F1, Section 4.5.1.3, *Additional Analysis to Ensure Compliance with Regulatory and Operational Limits*.

1.15.2 40 CFR, Subpart CC

1.15.2.a Compliance and Exemption

The Permittee shall manage waste with an average volatile organic concentration equal to or greater than 500 parts per million by weight (ppmw) at the point of waste origination in compliance with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264, Subpart CC). Waste with an average volatile organic concentration less than 500 ppmw at the point of waste origination is exempt from the requirement to comply with 20.4.1.500 NMAC (incorporating 40 CFR 264, Subpart CC), in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1082(c)(1)).

Alternatively, the Permittee may elect to demonstrate compliance with this Permit Condition by documentation of compliance with a New Source Air Emissions Permit, to the extent that the documentation required under the New Source Air Emissions Permit duplicates the documentation required under this Permit Condition, in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1089(h)).

1.15.2.b Initial Waste Determination

The Permittee shall use the test methods contained at 20.4.1.500 NMAC (incorporating 40 CFR 264.1083) to make an initial determination of compliance with Permit Conditions 2.4.2.b.i and 2.15.2.a for each waste stream managed at the Facility, as specified at Permit Attachment F1, Section 4.5.1.3. The initial determination shall be made before the first time a waste stream is placed in a permitted unit, and thereafter the determination for that waste stream shall be reviewed as necessary once every 12 months following the date of the initial determination, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.1082(c)(1)).

1.15.2.c Waste Determination after Process Change

The Permittee shall perform a new waste determination of compliance with Permit Conditions 2.4.2.b.i and 2.15.2.a for any waste stream whenever changes to the source generating the waste stream are reasonably likely to cause the average volatile concentration of the waste stream to increase to a level that is equal to or greater than the applicable volatile organic limit, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.1083(b)(1)(ii)).

1.15.2.d Waste Determination by the Secretary

The Secretary may at any time perform or request the Permittee to perform a waste determination for the average volatile organic concentration at the point of waste origination for a hazardous waste that is exempted from the requirements of 20.4.1.500 NMAC (incorporating 40 CFR 264, Subpart CC), in accordance with 20.4.1.500 NMAC (incorporating 40 CFR 264.1082(d)).

**1.16 GENERAL CLOSURE REQUIREMENTS {TC \L1 "2.17
GENERAL CLOSURE REQUIREMENTS }**

The Permittee shall close the Facility, or any permitted unit at the Facility, as specified at Permit Attachment O, *Closure Plan*; and as required by Permit Part 8 and 20.4.1.500 NMAC (incorporating 40 CFR 264.110 through 264.116).

**1.17 {TC \L2 "2.17.3 NOTIFICATION OF CLOSURE }{TC
\L2 "2.17.6 CERTIFICATION OF COMPLETION OF
CLOSURE }GENERAL POST-CLOSURE CARE REQUIREMENTS
{TC \L1 "2.18 GENERAL POST-CLOSURE CARE
REQUIREMENTS }**

The Permittee shall conduct post-closure care for the Landfill, or any other permitted unit that must be closed as a landfill, as specified at Permit Attachment P, *Post-Closure Care*; and as required by Permit Part 8 and 20.4.1.500 NMAC (incorporating 40 CFR 264.117 through 264.120).

1.18 LIABILITY COVERAGE

1.18.1 Sudden Accidental Occurrences

**1.18.1.a Liability Coverage Requirements for Sudden
Accidental Occurrences**

The Permittee shall have and maintain liability coverage for sudden accidental occurrences in the amount of one million dollars (\$1,000,000) per occurrence, with an annual aggregate of at least two million dollars (\$2,000,000), exclusive of legal defense costs, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.147(a)).

**1.18.1.b Documentation of Liability Coverage for Sudden
Accidental Occurrences**

The Permittee shall demonstrate to the Secretary, for approval, continuous compliance with the liability coverage required under Permit Condition 2.18.1.a, in accordance with Permit Condition 1.10, at least 60 days before receiving hazardous waste for management, treatment, storage, or disposal at the Facility, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.147(f)(4)). This liability coverage shall be effective before the first receipt of hazardous waste at the Facility.

1.18.2 Nonsudden Accidental Occurrences

**1.18.2.a Liability Coverage Requirements for Nonsudden
Accidental Occurrences**

The Permittee shall have and maintain liability coverage for nonsudden accidental occurrences in the amount of three million dollars (\$3,000,000) per occurrence, with an annual aggregate of at least six million dollars (\$6,000,000), exclusive of legal defense costs, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.147(b)).

**1.18.2.b Documentation of Liability Coverage for Nonsudden
Accidental Occurrences**

The Permittee shall demonstrate to the Secretary, for approval, continuous compliance with the liability coverage required under Permit Condition 2.18.2.a, at least 60 days before receiving hazardous waste for management, treatment, storage, or disposal at the Facility, in accordance with Permit Condition 1.10. The liability coverage shall be as required at 20.4.1.500 NMAC (incorporating 40 CFR 264.147(b)).

This liability coverage shall be effective before the first receipt of hazardous waste at the Facility, in accordance with Permit Condition 1.10.

**1.19 FINANCIAL INCAPACITY OF OWNERS OR OPERATORS,
GUARANTORS, OR FINANCIAL INSTITUTIONS**

1.19.1 Bankruptcy

The Permittee shall notify the Secretary by certified mail of the commencement of bankruptcy, and the name of any guarantor, within

ten days after commencement of the proceeding, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.148(a)).

1.19.2 Other Financial Assurance

The Permittee shall establish other financial assurance or liability coverage within 60 days from the date the trustee or institution issuing the surety bond, letter of credit, or insurance policy declares bankruptcy; otherwise the Permittee shall be deemed to be without the required financial assurance, as required by 20.4.1.500 NMAC (incorporating 40 CFR 264.148(b)).

1.20 FINANCIAL RESPONSIBILITY

The Permittee shall maintain financial assurance for both closure and post-closure costs and comply with all applicable requirements of 20.4.1.500 NMAC (incorporating 40 CFR Part 264, Subpart H), and Permit Condition 8.3.

-
- 1 Wastes exhibiting the characteristics of ignitability, reactivity, corrosivity, and/or toxicity
 - 2 Wastes from non-specific sources
 - 3 Wastes from specific sources
 - 4 Discarded commercial chemical products, off-specification species, container residues, and spill residues thereof
 - 5 P Code wastes identified as toxic wastes
 - 6 Only those ignitable, corrosive, or reactive wastes that can be treated by permitted methods at the Facility prior to placement in the Landfill shall be accepted.

PERMIT ATTACHMENT F**WASTE ANALYSIS PLAN**

**Modified from the Permit Application, Volume I,
Sections 4.0 through 4.5 and 4.5.2 through 4.9**

4.0 WASTE ANALYSIS PLAN

The Triassic Park Hazardous Waste Disposal Facility (the facility) is a commercial facility that receives hazardous waste generated off-site for treatment, storage, and disposal. This waste analysis plan establishes facility requirements for accepting and characterizing hazardous waste generated both off-site and on-site. The waste analysis plan requirements are established in the 1995 New Mexico Hazardous Waste Management Regulations at 20 NMAC 4.1.500 incorporating 40 CFR 264.13, 20 NMAC 4.1.800 incorporating 40 CFR 268.7, and 20 NMAC 4.1.900 incorporating 40 CFR 270.14(b)(3). The most recent revision of this waste analysis plan will be maintained at the facility as part of the facility Operating Record. The facility will continually upgrade the waste analysis plan with regard to the Land Disposal Restrictions (LDR) regulations contained in 40 CFR 268.

Section 4.1 identifies wastes which will be accepted at the facility and wastes which are prohibited. Section 4.2 lists criteria for waste acceptance and management. Sections 4.3 and 4.4 contain pre-acceptance procedures for initial acceptance of hazardous waste received from off-site generators and management procedures for incoming shipments of waste. The various waste analysis protocols that will be required at the facility are contained in Section 4.5. Sampling and analytical methods and protocols for quality assurance/quality control (QA/QC) are discussed in Sections 4.6 and 4.7. Section 4.8 explains the facility's waste tracking system. Section 4.9 summarizes notification, certification, and recordkeeping requirements related to waste analysis.

4.1 PERMITTED AND PROHIBITED WASTE

Section 4.1.1 identifies hazardous waste permitted for acceptance at the facility. Hazardous waste prohibited at the facility is identified in Section 4.1.2.

4.1.1 Permitted Waste

The facility will treat, store, and/or dispose only those hazardous wastes listed in Part A of the facility permit application. Only hazardous waste which meets the Land Disposal Restrictions (LDR) treatment standards identified in 40 CFR 268, Subpart D, or can be treated at the facility to meet these standards, will be accepted. These treatment standards are applicable to both primary contaminants and underlying constituents.

4.1.2 Prohibited Waste

The Facility will not accept the following wastes from off-site generators:

- **dioxin-contaminated wastes.** - Wastes listed in 40 CFR 268.31 as adopted by 20 NMAC 4.1.800;

This submittal supersedes all previous information.

- **certain PCB-contaminated liquids.** - Ignitable PCB-contaminated liquids or liquids with PCB concentrations greater than or equal to 50 ppm;
- **certain PCB-contaminated soils.** - Soils with PCB concentrations greater than or equal to 500 ppm will not be accepted at the facility, except for those soils (or other wastes) which are PCB bulk product waste or PCB remediation waste (40 CFR 761). The facility may obtain a permit from EPA for management of Toxic Substances Control Act (TSCA) wastes in order to accept other wastes containing PCB concentrations greater than 500 ppm. A copy of this permit will be transmitted to the New Mexico Environment Department (NMED) before such waste is accepted;
- **organic liquids/sludges.** - Liquids/sludges with organic concentrations at levels that make them subject to the treatment, storage, and disposal requirements described in 40 CFR 264 Subpart AA or CC; and that have not been treated, prior to receipt at the facility, to applicable LDR treatment standards (40 CFR 264 Subpart AA and CC as adopted by 20 NMAC 4.1.500);
- **explosives.** - Any substance or article, including a device, which is designed to function by explosion (i.e., an extremely rapid release of gas and heat) or which, by chemical reaction within itself, is able to function in a similar manner even if not designed to function by explosion;
- **radioactive/nuclear materials.** - Materials regulated by the NMED or the New Mexico Oil Conservation Division and defined in 20 NMAC 3.1 Subpart 14, or materials regulated under the Atomic Energy Act of 1954, as amended (including source, special nuclear materials and byproduct materials as defined in 10 CFR 20.1003);
- **medical waste.** - Waste including infectious/biologic/pathogenic solid waste generated in the diagnosis, treatment, or immunization of human beings or animals, in research pertaining thereto, or in the production or testing of biologicals. This also includes infectious waste as defined in NMAC 9.1.105.AL.;
- **Packing house and killing plant offal.** - Defined as a special waste by 20 NMAC 9.1.105. BZ;
- **certain hazardous debris.** - Hazardous debris which has not been treated, prior to receipt at the facility, to meet the LDR treatment standards;
- **certain lab packs.** - Lab packs which contain wastes [identified in 40 CFR 268, Appendix IV (adopted by reference in 20 NMAC 4.1.800)] excluded from lab packs under the alternative treatment standards of 40 CFR 268.42(c) (adopted by reference in 20 NMAC 4.1.800);
- **compressed gases.** - Gases stored at pressures higher than atmospheric; and
- **unknown or unidentified waste.** - These wastes cannot be accepted at the Facility except by special provision and direction from the NMED Secretary (e.g., emergency clean-up operations) or until full characterization has been performed.

This submittal supersedes all previous information.

4.2. CRITERIA FOR WASTE MANAGEMENT AT THE FACILITY

Waste managed at the facility must meet the facility's criteria for acceptance and management. Waste analysis (or, in some cases, acceptable process knowledge (AK)) will be used to ensure determination of:

- complete characterization of the waste;
- compliance with LDR treatment standards, including, where applicable, underlying constituents. If the waste stream does not meet the LDR treatment standards, the waste will be rejected if the facility does not have the appropriate treatment capability to bring it into compliance;
- compliance with the facility's regulatory and operational limits (e.g., the waste is not included in the permitted wastes listed in Part A of this application or the waste does not meet other operational boundaries established by this WAP).

The criteria to be used to evaluate acceptable knowledge (AK) validity, appropriateness, and adequateness will include:

- Relationship of wastes generated to process information;
- Availability of supporting analytical data and results;
- Correlation of waste material with processes/product chemistry;
- Process line variability with respect to waste generation;
- Waste alteration/treatment activities and resulting waste characterization; and
- Any other relevant information to assess acceptability of information.

4.3 PRE-ACCEPTANCE PROCEDURES FOR OFF-SITE WASTE

Before a waste stream is accepted, all off-site generators will be required to provide a complete waste characterization (Section 4.3.1). After evaluating the paperwork supplied by the generator (Section 4.3.2), the facility will send a representative sample of the waste to a laboratory for analysis and will evaluate the analytical results (Section 4.3.3). Finally, the facility will notify the generator that the facility will accept the waste stream (Section 4.3.4).

4.3.1 Waste Characterization Information Provided by the Generator

The activities associated with pre-acceptance of off-site waste streams are shown in Figure 4-1. The generator must provide the following waste characterization information for each waste stream:

- a completed Waste Profile Form signed by an authorized agent of the generator. An example of a Waste Profile Form is contained in Permit Attachment F2. This form may be changed if the facility believes that more information is warranted or if there are changes in regulations governing the facility;

- other documentation that supports the information presented on the Waste Profile Form (e.g., Material Safety Data Sheets);
- a description of the process that generated the waste;
- a completed Land Disposal Restriction Notification;
- all other supporting data required by 40 CFR 268.7;
- all required certifications;
- waste analysis data used to characterize the waste and/or process knowledge documentation; and
- a representative sample of the waste, of adequate volume for analysis.

Insert Figure 4-1, Pre-Acceptance Procedure for First Time Waste

This submittal supersedes all previous information.

If waste analysis is used to characterize the waste, the generator must supply, at a minimum, the following waste analysis data for each representative sample:

- identification of the sample medium (e.g., aqueous, sludge, soil);
- information about waste stratification
- brief description of the sampling strategy, including
 - a description of the sampling technique (i.e., biased or random);
 - rationale for selection of the number and location of samples;
 - a description of the statistical approach, if any; and
 - the sample type (i.e., grab or composite);
- identification of the analytical methods that were used and the rationale for the selection of these parameters;
- final laboratory reports including case narratives, waste analyses, and quality assurance/quality control analyses; and
- identification of the laboratory which performed the waste analyses.

The facility will evaluate the way each representative sample was obtained in order to determine whether it is truly representative of the waste stream. The facility will evaluate the information provided by the supplier and will use the documents listed below for guidance.

- The Sampling Plan, Section 4.6 of this document
- Standard Practice for Sampling Waste and Soil for Volatile Organics (American Society for Testing and Materials (ASTM) D4547-91)
- Test Methods for the Evaluation of Solid Waste, Physical/Chemical Methods, Part III (US Environmental Protection Agency Publication SW-846, latest edition)
- RCRA Sampling Procedures Handbook (EPA Region VI)

In certain cases, generators may meet waste analysis requirements by supplying "acceptable knowledge". Acceptable knowledge includes process knowledge and waste analysis (Permit Attachment F4 identifies acceptable knowledge requirements for foreign generators). Process knowledge includes detailed information of a waste obtained from existing published or documented waste analysis data or studies on hazardous wastes generated by processes similar to that which generated the waste, or industry or trade association hazardous waste profile studies, or EPA documents. Examples of waste streams where process knowledge may be adequate for characterization are K-listed wastes (hazardous wastes from specific sources), which are identified by comparing the specific process that generated the waste to those processes listed in 40 CFR 261.32. The application of process knowledge is appropriate where the physical/chemical make-up of the waste is well known and consistent. Process knowledge is often used in conjunction with physical and analytical analysis.

This submittal supersedes all previous information.

Foreign Generators shall, in addition to all of the above requirements, analysis wastes at an accredited laboratory in accordance with Section 4.7.4, *Laboratory Requirements for Foreign Generators*, and shall characterize all waste streams in accordance with Permit Attachment F4, *Waste Characterization Using Acceptable Knowledge*.

This submittal supersedes all previous information.

4.3.2 Paperwork Evaluation

The facility will evaluate all of the waste characterization paperwork to determine if it adequately represents the physical and chemical characteristics of the waste stream and whether the waste stream is appropriate for management at the facility. As part of the pre-shipment process, the facility will work with the off-site waste generator to ensure that all necessary waste analyses and waste characterization information are provided to meet the applicable requirements for acceptance.

If waste analysis was used to characterize the waste, the facility will evaluate the data to determine that:

- appropriate extraction and preservation techniques were used;
- appropriate sampling strategies were used;
- appropriate sample types were collected (e.g., to demonstrate compliance with the LDR treatment standards, hazardous waste regulations require that grab samples be collected for nonwastewaters and composite samples be collected for wastewaters);
- appropriate parameters were selected for analysis;
- appropriate analytical methods were used;
- recommended holding times were met;
- detection limits were below applicable standards (e.g., the LDR standards); and
- the quality of the analytical data is adequate for making a waste determination based on an evaluation of the final laboratory reports.

If the data supplied are not adequate to provide a complete characterization of the waste stream, the facility will either require additional information from the generator or will not agree to accept the waste.

All of the waste characterization information supplied by the generator will be maintained in the facility's Operating Record. In addition, the facility's evaluation of this information and the results of the independent analysis will be maintained in the Operating Record.

4.3.3 Representative Sample Assessment

After evaluation and approval of the sample representativeness and waste characterization data paperwork, the representative sample submitted by the generator will be analyzed by a qualified laboratory other than the one used by the generator. Based upon the facility evaluation of the information supplied by the generator, the facility will inform the laboratory of the medium type (e.g., liquid, aqueous, solid) and appropriate parameters for analysis. The rationale for selection will be maintained in the facility Operating Record.

The generator's Waste Profile Form will be compared with the results of the laboratory analysis of the representative sample and with the facility's permit to ensure that the waste is acceptable for storage, treatment, and/or disposal at the facility. Should there be a discrepancy between the analytical results and the generator information, the facility will contact the generator to resolve the discrepancy. The generator will

not be authorized to ship the waste until all discrepancies are resolved. If the discrepancies cannot be resolved with the information provided by the generator, the facility will request a new Waste Profile Form and any additional information that may be required to characterize the waste adequately. In addition, the facility may require the generator to submit additional samples of the waste for analysis. If the generator cannot supply adequate information to provide a complete characterization of the waste stream the facility will not accept the waste. The generator will submit a new Waste Profile Form for each new waste stream and for an existing waste stream if it is modified significantly.

4.3.3.1 Major Discrepancies

Major discrepancies include the following:

- analytical results indicating that the generator applied an incomplete or wrong waste code to the waste stream;
- analytical results indicating that the generator submitted incomplete or wrong information on the LDR Notification Form;
- analytical results including constituents or underlying hazardous characteristics that are not explained by a description of the process; and
- other information indicating that the waste stream is not characterized properly.

In the event of a major discrepancy, the facility will reject the paperwork and require the generator to analyze the waste in accordance with a sampling plan that is consistent with the guidance in EPA document SW-846, *Test Methods for the Evaluation of Solid Waste, Physical/Chemical Methods*, Chapter 9. The facility will require the generator to resubmit the waste characterization information listed in Section 4.3.1 and one or more additional representative samples for analysis.

4.3.3.2 Minor Discrepancies

Minor discrepancies include any other waste characterization discrepancy (e.g., discrepancies which do not question hazardous waste code assignments, waste treatment, or the presence of prohibited items). In the event of a minor discrepancy, the facility will work with the generator to resolve the discrepancy. For example, uncertainties regarding whether sorbents are present will be handled as minor discrepancies. The facility will contact the generator if the Waste Profile Form does not indicate whether a sorbent was added to the waste, or it indicates that a sorbent was added but does not specify the name and type of sorbent and whether it is biodegradable. If the generator cannot provide this documentation, the waste must be tested to determine if it contains a biodegradable sorbent. If the waste is determined to contain a biodegradable sorbent, it will be stabilized prior to disposal or rejected.

4.3.3.3 Additional Waste Acceptance Conditions

In addition to complete characterization of the waste, the facility will also evaluate the waste to ensure that it can be managed at the facility. Waste analysis will be conducted where necessary to ensure:

This submittal supersedes all previous information.

- the waste is not prohibited (e.g., the waste is included in Part A of this application, is not listed in Section 4.1 as a prohibited waste, or does not exceed allowable PCB concentrations or include dioxins);
- the LDR treatment standards contained in 40 CFR, 268, Subpart D, including the standards for underlying hazardous constituents, are met;
- the general requirements contained in 40 CFR 264.17 for ignitable, reactive, and/or incompatible waste are met;
- the special requirements for bulk and containerized liquids contained in 40 CFR 264.314 are met; and
- the waste does not contain biodegradable sorbents, as required in 40 CFR 264.314(e).

All major and minor discrepancies, discrepancy resolutions, and compliance with the additional waste acceptance conditions listed above will be documented in writing and maintained in the facility Operating Record.

4.3.4 Notification and Approval of Waste Shipment

After the facility determines that the waste stream meets the pre-acceptance requirements, the facility will send a written notification to the generator. This notification will include:

- a statement that the waste is acceptable for shipment;
- a unique identifier number for the waste stream, assigned by the facility (see Section 4.10);
- instructions to put the unique identifier number on all shipment paperwork and all future waste characterization data that are submitted for the waste stream;
- a requirement to notify the facility at least 24 hours before shipping, so that the facility can ensure that there are sufficient resources and capacity to manage the shipment when it arrives;
- a statement that the facility reserves the right to delay shipments beyond the 24-hour time-frame;
- instructions to ensure safe management of the waste (e.g., packaging or labeling requirements not otherwise required by regulations);
- if the generator has treated the waste prior to shipment to meet applicable LDR treatment standards, a requirement that the generator develop and follow a written waste analysis plan which describes the procedures used; and
- a requirement that the generator retain on-site a copy of all notices, certifications, demonstrations, waste analysis data, and other documentation produced pursuant to characterization of the waste stream for five years from the date that the waste was last sent to the facility.

Once the facility has completed pre-acceptance requirements and has determined that a waste stream is acceptable for shipment, the on-site laboratory will be notified in writing. The notification will include the waste type, waste stream identifier, physical form, packaging, and how the waste is to be managed. This information will be used by the laboratory as follows:

- the waste stream identifier will be used to track the samples in relation to the waste stream;
- the waste type and management methods (storage, solidification, evaporation, and/or disposal) will be used to help determine the analytical methods that will be employed for fingerprint analysis; and
- the physical form and packaging will determine the most applicable sampling methods.

Using this information, the on-site laboratory will designate a sampling and analytical protocol specific to each waste stream as described in Section 4.6. The unique identifier number for the waste stream will be used to track all activities for the waste stream. Individual shipments from within the waste stream will receive an additional identifier to enable the facility to tie information back to the specific shipment as well as to the waste stream.

4.4 PROCEDURES FOR INCOMING WASTE ACCEPTANCE

The activities associated with incoming waste shipments (typically, in drums, roll-off boxes, vacuum trucks, and tanker trucks) are shown in Figure 4-2. These procedures will be used for both initial shipment of a waste stream as well as for waste streams that have previously been accepted by the facility from the same generator and process. The facility will review the waste shipment paperwork and resolve paperwork discrepancies (Section 4.4.1), and visually inspect the waste inside the containers and roll-off boxes (Section 4.4.2). Waste analyses for incoming shipments consist of fingerprint analysis and an annual analysis to update characterization of the waste stream (Section 4.4.3). Based on the facility's evaluation of the waste stream, a determination to accept or reject the waste will be made (Section 4.4.4).

4.4.1 Paperwork Review

Upon receipt of a waste shipment, the truck will be routed to a parking area outside the facility gate while documents are reviewed. The facility will:

- review all paperwork for completeness to verify that all required documentation is present and signed as necessary;
- compare the information in the manifest, the Waste Profile Form, the LDR Notification Form, and pre-acceptance waste characterization information for consistency;
- compare the number of containers, the volume or weight of the waste, and the waste labels on each container with the manifest for consistency; and
- review all paperwork to verify that the unique identifier number for the waste stream is on all the waste shipment paperwork and all accompanying waste characterization data.

If the facility determines that the paperwork is complete and consistent, the waste shipment will be routed to the truck sampling station, a staging area inside the facility gate.

This submittal supersedes all previous information.

Insert Figure 4-2, Incoming Waste Shipment Procedures

This submittal supersedes all previous information.

If the facility determines that the paperwork is incomplete or inconsistent, the waste shipment will be routed to a segregated, secure area inside the facility gate pending resolution of the discrepancies. An attempt will be made to resolve discrepancies with the waste generator or transporter within 24 hours. In those instances where a discrepancy with the manifest cannot be resolved within 15 days of receiving the waste, a letter will be submitted to NMED describing the discrepancy and the attempts made to reconcile it. A copy of the manifest or shipping paper at issue also will be provided to NMED, as specified in 40 CFR 264.72(b). If the facility is unable to resolve the manifest discrepancies, the waste will not be accepted.

The facility will resolve significant manifest discrepancies in accordance with 40 CFR 264.72. Manifest discrepancies are differences between the quantity or type of hazardous waste designated on the manifest and the quantity or type of hazardous waste contained in the shipment received at the facility.

Significant discrepancies in quantity are:

- ♦ **bulk waste.** - Variations greater than 10 percent in weight; and
- **batch waste.** - Any variation in piece count, such as a discrepancy of one drum in a truckload.

Significant discrepancies in type are obvious differences which can be discovered by inspection or waste analysis, such as waste solvent substituted for waste acid, or toxic constituents not reported on the manifest or shipping paper.

All discrepancy resolutions will be documented in writing and maintained in the facility Operating Record. If manifest discrepancies are not resolved within 90 days of identifying the discrepancy, waste will not be accepted for storage or disposal, and the waste will either be returned to the sender or disposed at an appropriate off-site facility.

4.4.2 Visual Inspection

After all paperwork discrepancies have been resolved, the facility will physically open and inspect the waste inside drums and roll-off boxes for color, similar physical appearance (e.g., single phase, bi-layer, multi-layer), and physical state (e.g., solid, semi-solid, or liquid). This information will be compared with the waste characterization information provided by the generator and the physical appearance of the representative sample. If the color and/or viscosity of bulk wastes (solids and sludges) appear inconsistent, the facility may elect to perform additional chemical tests, i.e., composite samples would be taken from within the different areas of coloration or viscosity.

The facility will inspect a minimum of 10 percent of all drums of each waste stream per shipment (but not less than one drum per waste stream), and each roll-off container or tanker truck.

The facility will physically open all containers of hazardous debris and inspect the contents to ensure that the waste shipment matches the waste that is expected. Prior to acceptance of hazardous debris the facility will require the generator to provide a certification that the waste has been treated in accordance with the requirements defined for the treatment of hazardous debris in 40 CFR 268. Hazardous debris is visually inspected because it is exempted from the representative sample waste analysis requirements discussed in Section 4.7.2. This visual inspection will ensure that the waste stream matches the description provided by the generator.

Certain loads may not be sampled, at the discretion of the facility manager or laboratory supervisor, for environmental and safety reasons (e.g., severe weather which causes unsafe working conditions). In these cases, the generator or his agent will be required to provide a signed certification that the load conforms to the Waste Profile Form. This variance from established procedure will be documented in the facility Operating Record.

If a discrepancy is found, the facility will contact the waste generator for resolution (see Section 4.4.1). The results of visual inspections and all discrepancy resolutions will be documented in writing and maintained in the facility Operation Record. If discrepancies noted during visual examination are not resolved within 90 days of identifying the discrepancy, waste will not be accepted for storage or disposal, and the waste will either be returned to the sender or disposed off-site at an appropriate facility.

4.4.3 Waste Analysis for Incoming Shipments

Waste analysis for incoming shipments consists of fingerprint tests (Section 4.5.4) and an annual analysis to ensure correct characterization of each waste stream (Section 4.5.3).

4.4.3.1 Fingerprint Test Procedure

Fingerprint testing is an abbreviated analysis and is used to confirm that an incoming shipment of waste received at the facility is the actual waste expected and that it matches the expected chemical content for that waste. Fingerprint analysis will be conducted on each waste stream in each shipment prior to shipment acceptance. Fingerprint analysis will be conducted generally for parameters that will give information that can be used to help verify that a waste stream received from off-site matches the expected characteristics of the waste.

While the incoming shipment is staged at the sampling station, laboratory personnel, or other trained personnel, will review the sampling and laboratory requirements for the specific waste stream. After completion of this review, sampling personnel will obtain the necessary samples in the manner prescribed by the Sampling Plan and applicable laboratory requirements. Sampling will be conducted in accordance with approved site operating procedures. These procedures will detail the sampling requirements, sample labeling, chain-of-custody requirements, any necessary sample preservation requirements, and other sampling components (see Section 4.6).

Each waste stream in each shipment will be sampled in accordance with the following sampling rate, at a minimum:

- **bulk waste.** - One sample will be collected from each shipment of bulk waste (one shipment of bulk waste is considered to be one truck load or one roll-off box). If, upon visual inspection, the color and viscosity of solids or sludges appear inconsistent, the Facility may elect to obtain additional samples. These samples would be composites from within the different areas of color or viscosity; and
- **batch waste.** - One sample will be collected from each ten waste drums in each waste stream in each shipment. If there are less than ten waste drums in the waste stream, one drum will be sampled. One sample will be collected from each drum if the waste appears to be inconsistent with the pre-acceptance waste characterization data.

The facility can increase this sampling rate for any reason. For example, the facility may decide to collect additional samples if the waste appears to be inconsistent with the pre-acceptance characterization data. In some instances, the facility may elect to waive one or more analyses under the following conditions:

- the transported waste is a portion of a continuously shipped, well documented waste stream, such as waste produced from a consistent, non-variable process or contaminated soils from a specific remedial action;
- the waste has been approved for receipt by NMED on an emergency basis; or
- facility personnel at the point of generation sampled, or oversaw the sampling of, the waste, and the fingerprint test/supplemental analyses have been conducted. (In cases where a generator is sending very large or continual shipments, the facility may elect to station personnel at the point of generation to obtain samples prior to or during loading of the waste).

Prior to waiving sampling and analysis requirements, however, the facility will request a variance from NMED and will not dispose of the waste until NMED approval is received.

4.4.3.2 Annual Analysis Procedure

As part of the facility's QA/QC procedures (see Section 4.7), the representative sample analysis for each waste stream from each generator will be repeated annually. Repeating this pre-acceptance procedure will ensure that the analysis is accurate and up-to-date and that the waste stream has remained within the operational bounds of the facility. This annual analysis will be performed by an independent laboratory. This analysis will be repeated more frequently if the facility believes, or has been informed by the generator, that the process generating the waste stream has changed. In the case of a change in the waste generation process the waste stream will be managed as a new waste stream in accordance with the requirements of this waste analysis plan.

4.4.4 Acceptance/Rejection Determination

4.4.4.1 Discrepancy Resolution

Upon completion of the fingerprint analysis, a determination will be made as to whether or not the wastes are consistent with the pre-acceptance waste characterization information and within acceptance limits of the facility and specific management units. If any of the analyses determine the waste is not within the operational acceptance limits for a specific management unit, the waste will not be accepted by the facility for that unit. If the results of the analysis conflict with the waste profile information, the facility may take any or all of the following actions:

- resample the waste, if necessary, and perform a second fingerprint test. The facility manager has discretion to accept the waste if the second fingerprint results match those on the waste profile sheet. The discrepancy between results will be explained and included in the facility Operating Record for that waste stream or shipment;
- perform further characterization as necessary to verify the composition of the waste by sending a sample to a qualified independent analytical laboratory; and/or

- reject the entire waste shipment or the nonconforming portion of the shipment.

If discrepancies between fingerprint analysis and waste stream characterization information exist upon completion of discrepancy resolution, the waste will be rejected by the facility. The facility will return the rejected waste to the generator or ensure proper disposal of the waste at an appropriate off-site facility within 30 days of the waste rejection.

4.4.4.2 Shipment Acceptance Procedures

Once the decision has been made to accept a waste shipment, the appropriate papers will be signed for the generator, and the waste stream will be transported by truck to an appropriate management unit.

4.5 WASTE ANALYSIS

Tables 4-1 through 4-3 specify parameters which will be analyzed to ensure that all criteria for waste acceptance and management are met. The facility will use approved SW-846 or ASTM analytical methods, or other approved method. If an alternative method not contained in SW-846 is to be used, the facility will demonstrate that such alternative method is equivalent to the approved method contained in SW-846 or this waste analysis plan. Alternative methods will be submitted to the Secretary at least 15 days prior to the sample collection event.

Permit Attachment F1, Section 4.5.1, identifies the rationale for selecting parameters and analytical methods which will be used to test hazardous waste managed at the facility. Requirements for the pre-acceptance analysis of a representative sample of waste generated off-site and for the annual analysis are discussed in Sections 4.5.2 and 4.5.3, respectively. Section 4.5.4 contains requirements for fingerprint testing. Section 4.5.5 contains waste analysis requirements specific to storage, treatment, and disposal units. Section 4.5.6 contains requirements for waste analysis of waste generated on-site.

TABLE 4-1
PARAMETERS AND METHODS FOR PRE-ACCEPTANCE REPRESENTATIVE SAMPLE ANALYSIS

| Waste Parameters | Extraction/Sample Preparation | Method ¹ |
|--------------------------------|-------------------------------|---|
| Volatile Organic Compounds | 5021 5031 5032 5035 | 8260 |
| Semivolatile Organic Compounds | 3510 3520 | 8270 |
| Organochlorine Pesticides | 3510 3520 | 8081/8270 |
| PCBs | 3520 | 8082/8080 |
| TCLP: Organics | 1311 | 8260/8270/8080/8150 |
| Chlorinated Herbicides | 81512 | 8151 |
| Reactive Cyanide | | 9014 |
| Reactive Sulfide | | 9034 |
| Water | | ASTM C566 |
| Ignitability | | 1010/1030 |
| Flashpoint | | 1010/1020A |
| Corrosivity to metals | | 1110 pH paper pH electrometer 9040A/9041A/9045A |
| pH | | 9040A/9041A/9045A |
| Dioxins | | 8280 |
| Total Metals | 3000 1311 | 6000 series 7000 series |
| Liner Compatibility Tests | | 9090A |
| Extractable volatiles | 3500 | 8260 |
| Extractable semivolatiles | 3500 | 8270 |
| Physical appearance | | ASTM D4979 |
| Radioactivity | | Industry standard survey technique (e.g., scintillation detector) |

Notes: ¹Most current revision of SW-846 will be used.
²Method 8151 contains the extraction, cleanup, and determinative procedures for these analytes.

This submittal supersedes all previous information.

TABLE 4-2
TESTS AND ANALYTICAL METHODS FOR FINGERPRINT SAMPLES

| Test | Method and Description | Qualitative or Quantitative |
|-------------------------------|--|-----------------------------|
| Flammability Potential Screen | ASTM D4982 | Qualitative |
| Free Liquids | Paint filter test, penetrometer, or visual/9095 | Qualitative |
| Ignitability | Match test, Pansky-Martens closed cup or Set-a-flash 1010/1020A | Qualitative |
| Miscibility | 50/50 mixture with water | Qualitative |
| Water Mix | ASTM D5058 Test Method C | Qualitative |
| Chlorinated Solvents | Colorimetric test or Beilstein test | Quantitative |
| Cyanide | Electrode or colorimetric test (ASTM D5049 Test Method B) | Quantitative |
| PCBs | Colorimetric test/8080 | Quantitative |
| Specific Gravity | Hydrometer/Method dependent on material composition and physical state | Quantitative |
| Sulfide screen | ASTM 4978 | Quantitative |

TABLE 4-3
ADDITIONAL TESTS AND ANALYTICAL METHODS

| Test | Reference | Description |
|---|------------------------------|--|
| Paint Filter Test | EPA 9095 | This test will determine the free liquids that are contained within the waste matrix and will be used as a control parameter for wastes that are to be landfilled. |
| Heavy Metals | 6010A/7470 | This test determines the concentration of heavy metals. |
| Free Cyanides | APHA 412G, H | This test determines if cyanides could potentially be reactive under acidic conditions. |
| Toxicity Characteristic Leaching Procedure ¹ | Extraction Method 1311/3010A | Determines if waste, or stabilized waste, contains level of restricted constituents above BDAT treatment standards. |
| Total Organic Halogens | EPA 9020 | Determines if the waste potentially contains LDR constituents above BDAT standards for ☐California List☐ wastes. |
| PCBs | Colorimetric test/ EPA 8080 | Determines if PCBs are contained in the waste matrix and determines the concentration. |
| IR Scan | ASTM D2621, D4053 | Determines the presence of organics and provides a rough estimate of their concentration. |
| ¹ Analytical method chosen is dependent upon constituent being determined (i.e., Organics 8260, 8270, 8080). | | |

This submittal supersedes all previous information.

4.5.2 Representative Sample Analysis

The facility will select parameters for analysis to ensure that the criteria for waste acceptance identified in Section 4.2 are met. The analysis will include, at a minimum, testing for each hazardous waste contained in the waste stream, as identified by EPA hazardous waste code, and for each underlying hazardous constituent, as identified in 40 CFR 268.48, Table 4-1, *Parameters and Methods for Representative Sample Analysis*. Additionally, parameters on Tables 4-2, *Tests and Analytical Methods for Fingerprint Analysis*, and 4-3, *Additional Tests and Analytical Methods*, will be included, as applicable.

For foreign wastes, in addition to the conditions specified above, representative sample analysis for each waste stream shall include testing for all constituents listed in 40 CFR 268.48 using practical quantitation limits capable of measuring the standards specified in 268.48. The results of this test will be used to perform the comparison with the generator's Waste Profile Form specified in the *Representative Sample Assessment* Section (Waste Analysis Plan Condition 4.3.3). Testing for all constituents listed in 40 CFR 268.48 shall not be required for the annual analyses.

Hazardous debris, as defined in 40 CFR 268.2(g), that has already been treated to meet the LDR treatment standards as described in 40 CFR 268.45 does not have to meet the representative sample analysis requirements if the facility determines that the generator provided waste characterization information that demonstrates that the proper EPA Hazardous Waste Numbers were applied and indicates whether or not the LDR treatment standards have been met.

4.5.3 Annual Analysis

The representative sample analysis for each waste stream from each generator will be repeated annually at an independent laboratory not used by the generator (see Section 4.4.3.2).

4.5.4 Fingerprint Analysis

Fingerprint samples will be analyzed for all parameters listed on Table 4-2, and may include tests for physical appearance, pH, and radioactivity. Additional fingerprint parameters will be selected based on the pre-acceptance waste characterization data, shipment paperwork, physical form of the waste, and the visual inspection of the contents of containers and bulk waste. The facility will follow the additional parameter selection process described in Section 2.2 of the EPA guidance document, *Waste Analysis at Facilities That Generate, Treat, Store, and Dispose of Hazardous Wastes* (EPA, OSWER 9938.4-03, April 1994).

Because the facility already knows the detailed chemical and physical properties of a waste, additional necessary and appropriate fingerprint or spot check parameters can be chosen easily, since the purpose of the fingerprint is only to verify that the waste fingerprint analysis will include, at a minimum, the parameters received is the waste expected. These parameters will be analyzed at the on-site laboratory. Analyses which are not within the on-site laboratory's capability will be sent to an independent laboratory for analysis.

Fingerprint analysis will also include parameters as necessary to ensure that the waste is within the facility regulatory and operational acceptance limits (see Table 4-3). To select these additional sample parameters, the facility will consider:

- compliance with applicable regulatory and permit requirements. (This may require selection of parameters not reported by the generator);
- identification of incompatible and inappropriate wastes; and
- process and design considerations.

As noted, fingerprint analysis helps the facility minimize the potential to receive waste that is unacceptable. Therefore, the level of additional analysis required for a waste shipment is a function of facility knowledge about the waste generation process and the waste generator. The facility may elect to perform additional fingerprint tests to achieve a higher level of confidence that a full waste characterization is achieved. If discrepancies are noted between the received waste and the Waste Profile Form, the waste will be further analyzed using additional fingerprint parameters. Discrepancies that can result in the facility requiring additional analysis include non-conformance with the results of required testing or a change in color, texture, liquid content, or other characteristics that can be observed upon receipt.

The facility will follow the additional parameter selection process described in Section 2.2 of the EPA guidance document, *Waste Analysis at Facilities That Generate, Treat, Store, and Dispose of Hazardous Wastes* (EPA, OSWER 9938.4-03, April 1994).

4.5.5 Additional Analysis for Specific Management Units

4.5.5.1 Overview of Waste Management Procedures in Permitted Hazardous Waste Management Units

Upon completion of the fingerprint analysis, and supplemental analyses if conducted, waste will be transferred to the appropriate staging area. Prior to interim or final disposition of the waste, however, additional analyses may be required to ensure that requirements for permitted hazardous waste management units are met.

Analysis necessary for specific management units is generally conducted as part of the pre-acceptance procedure (see Section 4.7.2). Appropriate parameters will be selected from Tables 4-2 and 4-3. The facility will use a combination of process knowledge and analytical results to obtain the information needed prior to placing waste in one of the management units. The facility may elect to use other EPA approved analytical methods if it is felt that information other than that obtainable by these methods is needed to manage the waste safely.

All hazardous waste management units will have specific ignitability, reactivity, and compatibility requirements which must be met. Acceptable knowledge or waste analysis will be used to determine whether a waste stream is ignitable, reactive, or incompatible with other wastes when stored or mingled. In addition, acceptable knowledge or waste analysis will be used to determine whether the waste stream is compatible with the container or tank in which it is placed, or with the liner of the evaporation pond or landfill. Specific ignitability, reactivity, and compatibility tests will be conducted as part of the representative sample analysis, and may be repeated in the fingerprint test, for wastes assigned to specific management units. Management of these wastes is discussed in Vol. I, Section 5.5 of this application. Ignitability, reactivity, and compatibility determination is discussed in Section 4.5.1.2.

The facility will conduct compatibility tests as part of the representative sample analysis procedure on an incoming waste stream specific to each management unit and specific to other waste streams with which it

This submittal supersedes all previous information.

may be combined. Special requirements for specific management units are discussed in Sections 4.5.5.2 through 4.5.5.5.

4.5.5.2 Waste Analysis Requirements Specific to Storage Units.

Wastes will be stored in the drum storage building, the roll-off container storage area, and the liquid waste storage tanks. Waste characterization is accomplished through the representative sample analysis, the yearly update of the representative sample analysis, and on-going fingerprint analysis. The ignitability, reactivity, and incompatibility of each waste stream will be determined using procedures listed in Table 4-2 to ensure that stored waste is compatible with other wastes and with the container or tank in which it is placed. Spills or releases of hazardous waste and/or fluids removed from the leak detection systems will be tested to determine if the recovered material is hazardous.

Procedures from Table 4-3 will be used to determine whether a hazardous waste stored in containers must comply with the requirements of 40 CFR 264, Subpart CC. If it must comply, the container will be managed to meet Container Level 1 and Level 2 standards as appropriate. Waste which must comply with the requirements of 40 CFR 264, Subpart CC, will not be placed in storage tanks.

The facility will ensure that containers are either at least 90 percent full when placed in the landfill, or are crushed, shredded, or similarly reduced in volume to the maximum practical extent.

4.5.5.3 Waste Analysis Requirements Specific to the Evaporation Pond

Liquid waste streams may be placed in the evaporation pond for drying before they are sent to the stabilization tanks for solidification. Following evaporation of the pond liquids, sludge will be removed from the bottom with trash pumps or hand excavation equipment.

Waste will be characterized by representative sample analyses and fingerprint analyses, using the parameters listed on Tables 4-1 through 4-3, as applicable, before it is placed in the evaporation pond. A determination of ignitability, reactivity, and incompatibility with other wastes with which the waste may be combined and with the pond liner will be made. It will also be tested to ensure that the LDR standards are met and that the waste placed in the pond does not contain volatile organic concentrations equal to or greater than 500 ppmw.

Because evaporation in the pond may change the chemical composition of the waste, or different waste streams may be combined in the pond, analysis to ensure that the LDR standards are met will be conducted on a waste stream after it leaves the pond. Applicable knowledge will be used to determine appropriate parameters for analysis. If, after treatment, a waste displays a characteristic for the first time, the characteristic waste code will be added to the LDR Notification Form and facility records. The waste will be retreated, if necessary, to meet the characteristic treatment standard before land disposal.

Dilution of restricted wastes will not be used as a substitute for adequate treatment for non-toxic hazardous characteristic waste. If toxic characteristic wastes and listed wastes are amenable to the same type of treatment and aggregation is a part of treatment, then the aggregation step does not constitute impermissible dilution.

4.5.5.4 Waste Analysis Requirements Specific to the Stabilization Tanks

Waste treated in the stabilization tanks is characterized to determine the hazardous constituents contained in the waste and to ensure that waste placed in the stabilization tank is compatible with the tank liner and with the previous waste type treated. Acidic or caustic material may be neutralized by the stabilization process.

In addition to the representative sample provided by the generator during the pre-acceptance period, a second representative sample of any waste requiring stabilization prior to placement in the landfill (or a sample of waste coming from the evaporation pond for stabilization) must be supplied. This sample will be used for bench-scale testing to determine regulated constituent leaching based on varying admixtures and ratios (i.e., to determine treatability of wastes). The stabilization process will result in a dry and structurally stable material that is suitable for compaction and landfilling.

Bench-scale tests will be conducted as part of the representative sample analysis for incoming waste streams which will go directly to the stabilization tanks, or for a waste stream from the evaporation pond. Selection of treatment reagents and quantities will be established according to the waste profile and the post-treatment LDR requirements. Stabilization agents that will be tested include, but are not limited to, lime, fly ash, and Portland cement.

The waste will also be treated to ensure that it does not contain volatile organic concentrations equal to or greater than 500 ppmw.

The EPA universal treatment standard (see 40 CFR 268.48) will be met for wastes treated on-site. Waste streams that carry more than one characteristic or listed EPA Hazardous Waste Number will be treated to the most stringent treatment requirements for each hazardous waste constituent, including underlying hazardous constituents. When wastes with different treatment standards are combined solely for the purpose of treatment, the most stringent treatment specified will be met for each hazardous constituent in the combined waste.

After stabilization, wastes will be retested prior to placement in the landfill to determine whether they meet LDR requirements. If LDR requirements are not met, the waste will be retreated. After testing, stabilized waste will be placed in roll-off containers and placed on the roll-off pad until cured.

4.5.5.5 Waste Analysis Requirements Specific to the Landfill.

The stabilized waste will be retested prior to placement in the landfill to determine whether it meets LDR standards as set forth in 40 CFR 268, Subpart D. 40 CFR 268.40 states that a waste identified in the table "Treatment Standards for Hazardous Wastes" may be land disposed only if it meets the requirements found in the table. For each waste, the table identifies one of three types of treatment standard requirements:

- All hazardous constituents in the waste or in the treatment residue must be at or below the values found in the table for that waste ("total waste standards"); or
- The hazardous constituents in the extract of the waste or in the extract of the treatment residue must be at or below the values found in the table ("waste extract standards"); or
- The waste must be treated using the technology specified in the table ("technology standard") which are described in detail in 40 CFR 268.42, Table 4-1.

In cases where treatment standards are based on concentrations in the waste extract, the facility will use toxicity characteristic leaching procedures (TCLP, see 40 CFR 261, Appendix II) to determine if the waste meets the standards. The sampling and analysis protocols outlined in Sections 4.5 through 4.7 of this permit application will apply to all wastes to ensure compliance with LDR standards. Parameters for analysis will be determined by the characterization of the waste before analysis. All information obtained to document LDR compliance will be maintained in the facility Operating Record.

In addition to other required procedures and analyses, on an annual basis the facility will randomly sample and analyze a minimum of 10 percent of incoming waste streams that are to be directly landfilled to verify conformance with the LDR requirements. These additional samples will be analyzed for the specific regulated hazardous constituents contained in the hazardous waste stream. The data generated from these samples, in conjunction with the generator-supplied data, will be used to verify conformance with the LDR requirements.

Facility personnel, either at the facility or at the point of generation, will collect these samples. The samples will be split into a minimum of two aliquots. One will be retained and the other analyzed for conformance with the applicable LDR requirements. If the results of the analysis indicate that the waste does not conform with the applicable LDR requirements, the retained sample will be analyzed, generator-supplied information re-evaluated, and an evaluation made of the potential for the waste's variability based on the process that generates the waste stream.

The retained sample will subsequently be analyzed, the generator-supplied information re-evaluated, and an evaluation made of the potential for the waste's variability based on the process that generated the waste stream. These factors, along with an evaluation of the QA/QC data from the laboratory (both the generator's and the facility's), will be used to determine if the subject waste stream is eligible for continued disposal at the facility or if additional treatment is necessary prior to disposal. Disposal of the waste stream will be discontinued until the discrepancy regarding compliance with the LDR requirements has been resolved and the generator has demonstrated that its on-going program for compliance with LDR requirements is adequate.

Procedures to meet LDR standards for specific wastes include the following:

This submittal supersedes all previous information.

- **lab packs.** - Prior to disposal, hazardous wastes contained in lab packs will be treated to meet applicable treatment standards for each waste type identified. Procedures to determine applicable treatment requirements, and the subsequent treatment of lab wastes to applicable standards, will be consistent with procedures implemented for other waste types. Lab packs will also be analyzed to ensure that they do not contain hazardous wastes listed in 40 CFR 264, Appendix IV. In cases where hazardous lab pack wastes are combined with non-hazardous lab pack wastes prior to or during treatment, the entire mixture will be treated to meet the most stringent treatment standard for each hazardous constituent before being disposed of in the landfill;
- **ignitable or reactive wastes.** - Ignitable or reactive hazardous waste will be tested to ensure that it will not be placed in the landfill until the waste has been rendered non-ignitable or non-reactive by treatment;
- **characteristic wastes.** - Generator process knowledge and/or analytical data will be used to determine whether characteristic wastes meet the applicable treatment standards or to demonstrate that the waste has been treated by the appropriate specified treatment technology. In accordance with 40 CFR 268.41, where treatment standards are based on concentrations in the waste extract, generators shipping waste to the facility will determine if their wastes meet treatment standards;
- **bulk liquids.** All hazardous wastes will be tested for the presence of free liquids (paint filter test) to ensure that no free liquids are placed in the landfill. No containers holding free liquids will be placed in the landfill unless the container is in a lab pack, or the container was designed to hold liquid for use other than storage, such as a battery or capacitor, or the container is very small, such as an ampule;
- **Reactive wastes.** - Reactive wastes will not be placed in the landfill until they have been rendered nonreactive by treatment;
- **Incompatible wastes.** - Incompatible wastes will be sufficiently separated when placed in the landfill to ensure that they do not combine to cause adverse reactions. These wastes will be managed to ensure that they meet the requirements specified in 40 CFR 264.313 and 274.17. This management includes placing incompatible wastes in non-adjacent landfill grids and treatment of potentially noncompatible wastes prior to landfilling;
- **hazardous debris.** - Hazardous debris will not be treated at the facility. Therefore, the facility will only accept hazardous debris that has been treated and certified to meet the LDR treatment standards specified in 40 CFR 268.45(b) or (c) by the generator prior to shipment to the facility; and
- **listed waste.** - Listed waste will not be placed in the landfill until it has been shown to meet the requirements of 40 CFR 268.40.

4.5.6 Waste Analysis Requirements for Waste Generated On-Site

4.5.6.1 Overview of Waste Generated on-Site

The facility is expected to generate some waste on-site through waste treatment, day-to-day facility operations, leachate, or releases of hazardous waste to the environment (see Table 4-4).

| Table 4-4 Potential On-Site Waste Generation Areas/Activities | | |
|--|--|-------------|
| Area | Method of Generation | Waste Form* |
| Landfill | LEACHATE COLLECTED IN THE LEACHATE COLLECTION SYSTEM | L, SL |
| Evaporation Pond | Leachate collected in the leachate collection system | L, SL |
| Evaporation Pond | Sludges generated as a result of the cleaning and repair of the liner system | L, SL |
| Truck Wash | Decontamination rinse water | L, SL |
| Stormwater Retention Basin | Contaminated rain water | L, SL |
| Liquid Waste Storage Area | Decontamination rinse water | L |
| Stabilization Area | Decontamination rinse water | L, SL |
| Operations | Personal Protective Equipment (PPE) contaminated during routine and non-routine operations | S |
| Site Operations | Spill residues primarily from waste handling operations. Sampling activities. | L, SL, S |
| *L-liquid, SL-sludge, S-solid | | |

Waste generated on-site will be assumed to be RCRA-regulated until process knowledge and/or sampling and analysis can be used to determine the actual nature of the waste. Sampling and analysis will be accomplished in accordance with the requirements this waste analysis plan.

The facility will select waste analysis parameters to confirm the identity of waste streams generated at the facility. The selection of waste analysis parameters will typically be based on knowledge of the physical and chemical processes that produced the waste stream. If there is doubt as to the specific source, the facility will use the waste tracking system to identify all possible sources and to develop a list of specific parameters for laboratory analysis. Acceptable knowledge and analytical testing as necessary will be used to ensure compliance with LDR requirements and provide waste compatibility and other information to determine appropriate waste management activities.

After analysis, the waste will be returned to the unit from which it came or sent to another appropriate unit. The facility will ensure that all on-site generated waste sent to the landfill meets all LDR treatment standards.

Treated waste is considered newly generated waste because hazardous waste treatment at the facility will result in a change in the physical and/or chemical character or composition of the waste. Treated waste will be recharacterized, using waste analysis or acceptable knowledge as appropriate and it will be tested to ensure that LDR treatment standards are met before disposal in the landfill. Waste analysis requirements are discussed in Section 4.5.5.5.

Day-to-day operations at the facility will produce some waste on-site from day-to-day operations (e.g., paint and paint strippers, laboratory chemicals and equipment, vehicle maintenance). This waste will be characterized using acceptable knowledge, or waste analysis if the source cannot be definitively determined. If it is hazardous waste, it may be sent to the evaporation pond or stabilization tanks for treatment as appropriate, and disposed in the landfill. If it is not hazardous waste, it will be sent off-site for disposal.

This submittal supersedes all previous information.

A **release** is defined as "any spilling, leaking, pouring, emitting, emptying, discharging, injecting, pumping, escaping, leaching, dumping, or disposing of hazardous waste (including hazardous constituents) into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing hazardous wastes or hazardous constituents)". Management protocols for releases generated on-site are discussed below:

- **spills and leaks.** - Spills and leaks may occur during ordinary facility operations (e.g., release of fluid from a leaking drum to the cell trench and sump in the drum handling unit, a spill at any loading or unloading area, or overtopping at the evaporation pond).

Provisions for the detection, characterization, and management of spills and leaks are discussed in Vol. I, Sections 2.0, 5.4.2, 6.3.5.2, and 6.3.7 of this application. If spills and/or leaks are identified during inspections, the materials will typically be removed from the system, characterized, and managed appropriately. If necessary, the contaminated area will be sampled to ensure that all contaminated materials are removed.

- **decontamination rinse water.** - Personal protection equipment (PPE), as well as other equipment (e.g., trucks, sampling equipment, industrial absorbents used during spill or leak clean-up, emergency equipment), may become contaminated during the course of site operations such as the handling of wastes, the transfer of waste to another unit, or emergency operations. The water used to rinse this equipment will be analyzed to determine if it is a hazardous waste and if the equipment has been adequately decontaminated. Provisions for the detection, characterization, and management of decontamination rinse water are discussed in Vol. I, Sections 5.2.5 and 5.2.10, and Vol III, Section 9.1.2, of this application. Rinse water will be removed to the truck wash area. Rinse water and residues will be chemically analyzed and handled in an appropriate manner;
- **run-on/run-off.** - Facility stormwater control is provided by a network of surface run-on and run-off diversion channels and collection and detention basins (see Vol III, Drawing 25 of this application). To control the run-off from the facility, several collection channels and culverts will be built to divert discharges from storm events to a stormwater retention basin (see Section 2.7 of the Operations and Maintenance Plan, submitted separately). Procedures for management of run-on/run-off are discussed in Volume I, Sections 2.5.1.6, 2.6.1.4, and 5.4.2. Contaminated water will be characterized, treated in the evaporation pond and/or stabilization bins, and disposed of in the landfill in compliance with appropriate regulations. Sampling will be conducted upstream of the stormwater retention basin to determine the point where hazardous constituents were introduced into the stormwater. Appropriate corrective actions will be implemented to prevent further contamination during future stormwater events.
- **investigation derived wastes.** - IDW may include drill muds, cuttings, and well installation purge waters associated with the investigation of spills and releases; purge waters, soils and other materials from regularly scheduled sampling activities associated with waste management units and the vadose zone monitoring system; and contaminated PPE. All IDW will be assumed to be hazardous waste until site or material specific information becomes available. IDW will be stored near the point of generation in appropriately labeled containers for no greater than 90 days and will be appropriately analyzed to determine whether it is either a characteristic or listed hazardous waste. Analysis of materials associated with the IDW may be used also to characterize the IDW. An example of associated analysis for purge waters from the vadose zone monitoring system would be the final analytical results for the samples collected to satisfy regularly scheduled monitoring requirements.

- **contaminated soil.** - Soil means unconsolidated earthen material consisting of clay, silt, sand or gravel size particles as classified by the US Natural Resource Conservation Service, or a mixture of such materials with liquids, sludges or solids which is inseparable by simple mechanical removal processes and is made primarily of soil by volume based on visual inspection. Contaminated soil is soil impacted by a hazardous constituent release. Soil may become impacted by a release either at the surface or subsurface. If the contaminated soil exists at the surface, the appropriate response is described in the Contingency Plan in the Permit Application. If the contaminated soil exists subsurface, the appropriate response will be developed by NMED as permit conditions. Contaminated soils that are managed as hazardous wastes will be analyzed and managed in accordance with the alternative LDR treatment standards for contaminated soil contained in 40 CFR 268.49.
- **air emissions.** - Procedures for detection of hazardous gases and volatile organic at the landfill are discussed in Vol. I, Sections 2.5.1.8 and 6.2.2 of this application. Procedures to minimize wind dispersal of dust throughout the facility are identified in Section 5.4.8. This section also discusses pollution control systems in the stabilization unit to minimize the release of particulate to the atmosphere. The facility will apply to NMED for a new source air emissions permit before start-up of operations.
- **Leachate.** - Leachate collected from the storage units or the stabilization building is treated as a spill or release. Leachates, as used here refer to landfill and evaporation pond fluids. The definition of leachate is in 40 CFR 260.10, collected from the Leachate Collection and Removal System, the Leak Detection system, or the Vadose Zone Monitoring System sumps.

Leak detection and removal/vadose zone monitoring for evaporation pond leachate is discussed in Vol. 1, Sections 2.6.1.2 and 2.6.4.3 of this application. Procedures for the removal of evaporation pond leachate are discussed in Section 2.5.4.3. Leachate will be removed by vacuum truck on a regular basis, combined with leachate from the landfill and treated in the stabilization tanks to remove free liquids and to ensure that LDR treatment standards are met.

Leak detection and removal/vadose zone monitoring for landfill leachate is discussed in Vol. 1, Sections 2.5.1.3, 2.5.1.4, and 2.5.1.5. Leachate generated from the landfill will be pumped out of the unit sumps into the temporary leachate storage tank. It will then be tested to assure compliance with LDR requirements defined in 40 CFR 268 for F039 listed wastes.

Leachate will be transferred daily from both the landfill and the surface impoundment sumps and combined in temporary storage tanks for management purposes. The combined leachate will be analyzed monthly for the F039 underlying hazardous constituents to determine whether it meets LDR treatment standards and can undergo evaporation in the surface impoundment prior to stabilization.

Leachate may also be collected from the Vadose Zone Monitoring Wells. These wells will be monitored monthly; if any fluids are present they will be sampled and analyzed for all F039 constituents. Biennially, the wells will be analyzed for all the Ground Waste Monitoring List identified in 40 CFR 264, Appendix IX.

Leachate sampling and analysis will follow the sampling and analytical procedures and recordkeeping requirements contained in the Vadose Zone Monitoring System Work Plan and this section.

This submittal supersedes all previous information.

4.6 SAMPLING PLAN

The Sampling Plan is based upon the guidance provided in Chapter 9 of SW-846. The overall plan takes into account the regulatory and scientific objectives identified in this waste analysis plan. Based upon these objectives, the sampling strategy ensures that the data collected will minimize the potential for accepting waste that is unsuitable for management at the facility. Modifications to the Sampling Plan to include detailed sampling protocols specific to the site activities will likely be required to reflect the sampling to be performed during operation of the facility.

The sampling program will take into account the different types of waste constituents and the various waste matrices that may be encountered. By taking these variables into account, the facility will identify the protocols by which sample locations will be selected and the methods most appropriate for collecting samples from the different waste streams.

The latest revision of SW-846 methods (ASTM) or other approved methods will be used, and site procedures will be revised as necessary to incorporate new requirements.

General sampling methods and collection techniques are discussed in section 4.6.1. Section 4.6.2 contains specific sampling procedures. Section 4.6.3 and 4.6.4 provide information on sample location and sample type, respectively. Section 4.6.5 discusses sampling quality assurance/quality control (QA/QC) procedures. Sections 4.6.6 and 4.6.7 present requirements regarding sample preservation, volume and holding times and for equipment decontamination, respectively.

4.6.1 Sampling Methods

Sampling methods will follow Appendix I of 40 CFR, Part 261 unless a more appropriate method is identified. Table 4-5, *Sampling Methods*, lists general waste matrices and appropriate sampling methods that will be used at the facility. Matrices that will be sampled include containerized liquid, viscous liquids/sludges, crushed/powdered material, rock/rock-like material, soil, and fly-ash-like material. The methods and equipment used for sampling wastes will vary with the form and consistency of the material to be sampled. Also, these matrices will be sampled using a variety of sampling tools (see Table 4-5), including the Coli-wasa (containerized liquid/viscous liquid), dipper (containerized liquid/viscous liquid), thief (containerized liquid/viscous liquid), weighted bottle (containerized liquid), scoop (sludge, powdered material, rock/soil material, fly-ash material), shovel (powdered material, rock/soil material), auger (soil/fly-ash-like material) and tube sampler (fly-ash like material and liquids). The facility will select the appropriate sampling method from Table 4-5 based upon the sample matrices, chemical constituents within the sample, and sampling conditions. If a sampling method not presented on Table 4-5 would be more appropriate for the specific matrices to be sampled given site-specific conditions or if the procedures presented below must be modified, an alternative method will be used. If an alternative method is used, the sampling method will be well documented, justified, placed in the Operating Record, and approved by NMED prior to implementation.

| TABLE 4-5 SAMPLING METHODS | | |
|------------------------------------|-----------------|---|
| Waste Matrix | Sampling Method | Sampling Equipment |
| Extremely viscous liquid or sludge | ASTM D140-70 | Coli-wasa, dipper, scoop, thief |
| Crushed or powdered material | ASTM D346-75 | Scoop, shovel, tube sampler |
| Soil or rock-like material | ASTM D420-69 | Scoop, shovel, auger |
| Soil-like material | ASTM D1452-65 | Scoop, shovel, tube sampler |
| Fly ash-like material | ASTM D2234-76 | Tube sampler, trier, auger, scoop, shovel |

This submittal supersedes all previous information.

| | | |
|-----------------------|--------|--|
| Containerized liquids | SW-846 | Coliwasa, tube sampler, weighted bottle, dipper, thief |
|-----------------------|--------|--|

Sampling equipment will be compatible with waste, and are generally made of glass, steel, or Teflon. Stainless steel is more suitable for sampling solids and soils, while glass and Teflon are more suitable for liquids.

4.6.1.1 Sampling with a Coliwasa

The Coliwasa is used to collect extremely viscous liquid or sludge samples, as well as containerized liquid samples. The Coliwasa provides a representative sample of layered and homogenous liquid materials, and the sampler consists of glass, plastic, or metal tube with an end closure that can be opened and closed while the tube is submerged in the sample material. The following general process will be used to sample with the Coliwasa:

1. Clean/Decontaminate Coliwasa
2. Adjust sampler's mechanisms to ensure that the stopper provides tight closure. Open sampler.
3. Lower sampler into waste so that liquid level inside and outside the sampler remain the same.
4. When sampler hits the base of the material to be sampled, the sample tube is pushed down to close and sampler and lock the stopper.
5. Withdraw the Coliwasa from the waste and place sample into the appropriate sample container.

Note that only plastic Coliwasas constructed of Teflon should be used to sample organics. Glass coliwesas are not used to sample hydrofluoric acid liquids, and if solids are present at the base of the sampled matrix, an alternative sample device will be used to obtain a representative sample of the solid phase.

4.6.1.2 Sampling with a Dipper

Dippers are used to collect liquid samples and free-flowing slurries. The dipper consists of a glass, plastic, or stainless steel beaker or similar container typically clamped, as necessary, to the end of a pole which serves as a handle. The following process will be used to sample with the dipper:

1. Clean/Decontaminate the dipper
2. Insert dipper into the liquid to be sampled, preferably through the entire sample container, if possible.
3. Remove dipper and place sample into the appropriate sample container.

4.6.1.3 Sampling with a Thief Sampler

This submittal supersedes all previous information.

A thief sampler may be used to collect viscous liquid/sludge samples or to sample small dry granules. Thiefs typically consist of two slotted concentric tubes of stainless steel; the outer tube has a conical tip allowing the sampler to penetrate the sample material, while the inner tube is rotated to open/close the sampler. The following general process will be used to sample with a Thief sampler:

1. Clean/Decontaminate the sampler
2. Insert closed thief into material to be sampled. Rotate the inner tube to open the thief; collect sample.
3. Withdraw the thief, and remove inner tube, transferring sample to sampler container.

4.6.1.4 Sampling with a Weighted Bottle

The weighted bottle is used to sample liquids and free-flowing slurries that are relatively homogeneous. The sampler consists of a glass or plastic bottle with a sinker, stopper, and line that is used to lower/raise the bottle within the sampler matrix. The following general process will be used to sample with a weighted bottle:

1. Clean/Decontaminate the sampler
2. Assemble weighted bottle sampler
3. Lower the sampler to the desired depth and remove stopper
4. Allow bottle to fill
5. Raise sampler and cap (sampler can serve as the sample container).

Nonfluorocarbon plastic bottles should not be used to sample organics. Before sampling, ensure that sample line, sinker, and other equipment are compatible with waste materials (i.e. waste will not corrode sampling equipment).

4.6.1.5 Sampling with a Scoop/Shovel

Scoops/shovels are used to sample rock/soil-like, solid or powdered matrices. The following general process will be used to sample with scoops/shovels:

1. Clean/decontaminate the sampler
2. Obtain a full cross section of the waste material using the scoop or shovel that is large enough to contain the waste collected in one cross sectional sweep.

4.6.1.6 Sampling with an Auger

Augers are used to sample relatively hard packed solid waste material or soils. Augers are spiral drilling blades attached to metal shafts which are "turned" downward through sample material, allowing sample to exit the sample matrix by moving upward along the auger spirals. The following general process will be used to sample with an auger:

1. Clean/Decontaminate the sampler
2. Drill downward, using the auger, into the waste material, capturing waste moving upward along the auger blades in the appropriate sample container.

This submittal supersedes all previous information.

4.6.1.7 Sampling with a Tube Sampler

Tube samplers are used to collect soil/solid samples, and are generally glass or steel tubing that can be inserted into relatively compact matrix. (Modified tube samplers, however, can be used for liquid sampling.) Following insertion of the tube, and tube is extracted with the sample contained in the inserted tube. The following general process will be used to sample with the tube sampler:

1. Clean/Decontaminate the sampler
2. Lower/insert the tube into the waste to the desired depth.
3. When the desired depth is reached, slowly withdraw the tube, taking care to retain as much sample with the tube as possible.
4. Extract sample into the appropriate sample container.

4.6.2. Sample Collection Procedures

This section discusses the general sampling procedures for each type of sample to be collected at the facility, as presented in Table 4-6. It is recognized that the specific sampling that will take place at the facility may differ from general procedures included herein, and approval by NMED is required before revisions are implemented. Additionally, selection of sample locations (Section 4.6.2.8) and sample types (Section 4.6.2.9) for on-site samples to be collected are addressed.

| TABLE 4-6 ON-SITE SAMPLE COLLECTION ACTIVITIES | | | |
|---|---|--|--|
| Sample Type | Matrix | Collection frequency | Comments |
| Fingerprint Sample | All incoming liquid, sludge and solid; debris waste will not be fingerprinted | One/shipment for bulk shipments 1/10 drums for drummed waste | Table 4-2 defines base fingerprint analysis required |
| Annual Sample | All incoming liquid, sludge and solid; debris waste will not be fingerprinted | One sample annually for each waste that underwent representative sampling prior to initial shipment | Table 4-1 defines base representative analysis required. Sampling will be performed at the generator site. |
| Spills/releases | Spilled waste and contaminated material (sludge, liquid, soil) | Each release | For Hazardous Waste determination |
| Evaporation pond output | Waste sludge and liquid as it is removed from pond | Each waste transferal | To determine LDR status |
| Stabilization Tank Input | Evaporation pond and offsite sludge and liquid leachate. | Each input | For bench scale testing to determine stabilization |
| Stabilization Tank Output | All tank output (sludge, liquid and solidified solid) | Each output | To determine LDR status |
| Landfill input | All incoming sludge and solidified solid waste to landfill except debris | Each input to landfill from Stabilization Tank and Evaporation Pond Random sampling of waste directly landfilled. | To determine LDR status. May use results from Stabilization Tank Output/ Evaporation pond analysis. |

This submittal supersedes all previous information.

| | | | |
|---------------|---|---|--|
| On-Site Waste | 1 Treated waste 2 Day-to-day (Truck Wash, etc) operations 3 Releases 4 Run-on/run-off 5 Investigation-derived waste 6 soil 7 air 8 Leachate/sludges from Evaporation Pond and Landfill | 1,2 When acceptable knowledge is not available 3,4 See Vol II Appendices 5 Each container 6 Contingency Plan 7 See Vol II Appendices 8 Placed in temporary leachate storing tanks; sampled monthly | To determine hazardous/LDR status See Table 4-5 for specific waste matrices generated by On-Site Activities |
|---------------|---|---|--|

4.6.2.1 Fingerprint Sampling

Fingerprint sampling will be conducted for all in-coming waste, except for debris waste (each container of debris waste will be visually inspected, however, as will each drum and roll-off, regardless of waste matrix). Matrices that will undergo fingerprint sampling include sludges, solids, and liquids, arriving in containers such as tanker trucks, roll-offs, and drums/containers. Refer to Table 4-6 and Section 4.4.3.1 for sampling frequency and waste analysis.

Tanker trucks delivering bulk liquids will be sampled through an access hatch, with a vertical sample collected using a Coliwasa or other appropriate sampling device (see Section 4.6.1). Trucks delivering bulk solid material (e.g. in roll-offs) will be sampled using solid sampling equipment, such as a scoop (see Section 4.6.1).

A surface sample will be collected from the front 1/3 area of the truck, middle 1/3 are, and rear 1/3 area of the bulk; samples will then be composited (see Section 4.6.4). Vertical waste composition will be determined, as possible, by collecting an additional sample from more than approximately 2 feet below the surface of the waste at each of the three sample locations using the appropriate sample collection tool (e.g. auger); these three samples will be composited with the first three samples. All loads will be visually inspected during unloading. If the load exhibits different color, texture, or wetness, samples from these areas will also be collected and included in the composite sample.

Sample methodology for drummed waste will depend on the sample matrix, but will likely include liquid sample collection using a Coliwasa and solid sampling using a scoop or auger. A single sample, collected through as much depth of the drummed waste as possible, will be collected. The location of samples collected is discussed in Section 4.6.3.

The facility will detail the sampling method used for fingerprint waste sample collection, including but not limited to sample collection technique, sample type, sample representativeness, sample volume, sample containers, sample preservation, chain-of-custody, etc., and will place this information in the Operating Record.

4.6.2.2 Annual Sampling

Wastes that underwent representative sampling prior to initial waste shipment will undergo annual sampling to confirm waste composition. The facility will assess the representative sampling procedure prior to initial waste acceptance, and this same representative sampling procedure will be used for annual sampling. Annual sampling will follow the representative sampling process performed prior to initial waste shipment; if the

process is modified, the facility will assess the sampling process to ensure collection of a representative sample, and place this assessment in the Operating Record.

4.6.2.3 Spills/Releases

See Section 4.6.2.7

4.6.2.4 Evaporation Pond Output

Evaporation Pond output will consist of liquids and sludges/solids of varying viscosity/degree of solidification. This waste is then transferred, as appropriate, to stabilization tanks, and/or the landfill. Each waste transfer will be sampled with a single grab sample selected from the waste transferred at the midpoint/middle of sample transfer, if the waste is homogenous. Alternatively, if the waste is heterogeneous, a composite sample may be collected in the transfer vessel using a tube sampler or other appropriate sample devise, with the extracted sample then composited. If modification to these sampling methods to meet waste/site-specific requirements occurs, all information pertaining to the modified method will be detailed in the Operating Record. Samples will be analyzed to assess continued waste LDR compliance. The facility will detail the sampling method used for each output waste, including but not limited to sample collection technique, sample type, sample representativeness, sample volume, sample containers, sample preservation, chain of custody, etc., and will place this information in the Operating Record. Note that leachate and waste sludge may be generated within/below the Evaporation Pond, however, these are considered "on-site" generated waste and are discussed in Section 4.6.2.7.

4.6.2.5 Stabilization Tank Input/Output

Stabilization Tank input wastes include liquid (e.g. leachate) and sludges. Output includes sludges, liquid, and solidified sludge. Input samples are to be sampled primarily for bench-scale testing to assess solidification techniques. Sampling methodology will be dependent upon the matrix sampled, but must include at least one grab sample from the input waste container/stream of sufficient volume to perform bench-scale assessments (assuming a homogenous waste stream). A composite sample will be collected if the stream is heterogeneous in nature. Output waste must be sampled to ensure continued compliance with LDR requirements; see Section 4.6.2.4 for output sampling methodologies. The facility will detail the sampling method used for each input/output waste, including but not limited to sample collection technique, sample type, sample representativeness, sample volume, sample containers, sample preservation, chain of custody, etc., and will place this information in the Operating Record.

4.6.2.6 Landfill Input

All incoming waste to the landfill will be sampled to ensure continued compliance with LDR requirements. For waste originating from the stabilization tank or evaporation pond, output sampling will fulfill this requirement. For wastes directly placed in the Landfill from offsite sources, and on an annual basis, the facility will randomly sample and analyze a minimum of 10 percent of incoming waste streams that are to be directly landfilled to verify conformance with the LDR requirements. These additional samples will be analyzed for the specific regulated hazardous constituents contained in the hazardous waste stream. The data generated from these samples, in conjunction with the generator-supplied data, will be used to verify conformance with the LDR requirements. Sampling procedures will follow those presented in Sections 4.6.2.1 and 4.6.2.4, as applicable.

4.6.2.7 On-Site Generated Waste

Several wastes may be generated on-site that require sampling and analysis (see Table 4-4). Specifically, treated waste, day-to-day generated waste (e.g. truck wash, liquid waste storage area, and stabilization area decontamination rinse, personal protective equipment), releases of wastes, run-on/run-off, investigation-derived waste, contaminated soil, air emissions, and leachate/sludges from the evaporation pond/landfill are considered on-site generated waste.

Leachate/sludges from the evaporation pond and landfill will be placed in temporary storage tanks and/or the stabilization tank. Sampling of leachate/sludges must occur prior to emplacement in the stabilization tanks and/or evaporation pond, and will entail either sampling required of input to these units, or collection of a representative sample from the temporary holding tank using the appropriate sampling devise (e.g. Coli-wasa, weighted sampling bottle). Also see Sections 4.6.2.5 and 4.6.2.6.

4.6.3 Selection of Sample Locations

The facility will collect samples from containers and roll-off boxes using either random (i.e., probability) or biased (i.e., authoritative) sampling methods. Random sampling methods will be used to select drummed containers for fingerprint analysis. All other on-site sampling, except for annual sampling of waste directly landfilled (i.e. 10 percent of the waste) requires sampling of each load, bulk container, or waste transfer, and random selection of waste containers to be sampled is therefore not applicable. However, the facility will collect random samples from within the waste to be sampled for non-fingerprint or annual analysis (e.g. leachate, landfill input) if the wastes are expected to be fairly homogeneous waste streams. A biased sampling method will be used to select roll-off/tanker waste sample locations. (Biased samples will be collected if the wastes are expected to be or are found to be heterogeneous.) For some waste streams, the facility may use both sampling techniques, as determined appropriate by the facility and justified in the Operating Record.

With random sampling, every unit in a population (e.g., every drum from a given waste stream in a shipment) has a theoretically equal chance of being selected for sampling. Consequently, data generated by these samples are unbiased estimators of the range of concentrations in a population. If a sufficient number of samples are taken, they would be representative of the average concentrations within the entire population. For example, in the case of drums, those drums to be fingerprint sampled will be numbered, and numbers will be randomly drawn to determine those containers that will be sampled.

With biased sampling, a preference is given to selecting only certain units in a population. This technique requires the sampler to use discretion and to have knowledge of the waste. The sampler selects the sample locations from areas where contamination is known or suspected (e.g., the sampler could collect a biased sample from areas where there is layering or differences in color or consistency). Also, the facility may use a field screening instrument to bias the sample location, (e.g., a photoionization detector could be used to select locations having higher volatile organic concentrations). EPA-approved ASTM method D140-70 identifies the procedure for estimating the number of containers that should be sampled. Samples collected from roll-offs, for example, may include biased sampling if areas of obvious discoloration, and other pertinent information, are noted.

The facility will document the sampling technique that is used to locate each waste sample collected pursuant to this waste analysis plan. The facility will maintain this information in the facility Operating Record.

4.6.4 Sample Types

Samples of the waste will be collected as either composite or grab samples. It is possible that the facility may modify or augment the procedures discussed below for the collection of composite and grab samples before the facility becomes operational; if so, these revisions will be approved by NMED prior to implementation.

In composite sampling, a number of samples are initially collected from a waste and combined into a single sample which is then analyzed for the constituents of concern. Composite sampling is a valid method for homogeneous samples and tends to minimize the between-sample variation, much like the maximization of the physical size of a sample. This has the effect of reducing the number of samples that must be analyzed to verify the contents of a waste shipment. Composite samples can also be obtained from a waste that has stratified; however, a composite would only be made from samples obtained from the same strata within the waste. Composite samples will be taken with clean sampling equipment and samples will be blended before analysis. Composite sampling will be used to obtain samples of wastewaters. Grab sampling will be used to obtain samples of nonwastewaters and heterogeneous wastes.

4.6.5 Sampling QA/QC

QA sampling procedures will be conducted in accordance with the guidance provided in the EPA document SW-846 and EPA's waste analysis plan guidance manual, *Waste Analysis at Facilities that Generate, Treat, Store and Dispose of Hazardous Waste*. The QA requirements will be applicable to on-site sampling (e.g., leachate collection system samples, truck rinsate, waste removed from the evaporation pond) as well as to the sampling of incoming waste shipments. This program is necessary to ensure that decisions regarding the acceptance and disposition of waste are based on sound, statistically valid, and documented data. Additional QA procedures associated with sampling and analysis determined prior to initiation of on-site sampling will be included in the Operating Record.

The sampling QA program will include the following:

- training requirements for personnel responsible for sample collection;
- chain-of-custody protocols for tracking samples;
- QA review of procedures to ensure proper use of equipment;
- protocols for equipment maintenance;
- identification of required sampling techniques for specific media;
- field sampling QC procedures; and
- documentation of sampling locations.

Deviations from the approved sampling program, sampling methods, or chemical analytical methods will be documented and reviewed by personnel responsible for site QA. NMED will be notified in writing of the QA exceptions within seven days of the occurrence and measures will be taken to correct the problems as soon as practicable.

4.6.5.1 Training Requirements for Personnel Responsible for Sample Collection

All personnel and supervisory staff responsible for collecting waste samples for screening and chemical analysis will be trained in the use of all sampling methods and equipment used at the site.

4.6.5.2 Chain-of-Custody Protocols for Tracking Samples

The integrity of the sampling/analytical scheme will be maintained by following chain-of-custody procedures from the point of sample collection through analytical data reporting to sample disposal. The possession and handling of samples will be traceable from the time of collection through analysis and final disposition.

A sample is considered to be in a person's custody if it is:

- in a person's physical possession;
- in view of the person after taking possession; or
- secured in a container sealed by the responsible person so that it cannot be tampered with during transport to the designated destination or during storage after being secured by that person in an area of restricted access.

The sampler will place a sample label on each sample container. The label will include the following information:

- sample number, a unique identifier that is traceable to the waste stream and shipment;
- name of collector (sampler);
- date and time of collection; and
- place of collection.

Labels will be affixed to sample containers prior to or at the time of sampling and will be filled out at the time of collection.

Sample chain-of-custody seals will be required if the sample is designated to leave the possession of facility personnel for transport to an analytical laboratory. The seal will include the same information as the sample label. The seal will be attached in such a way that it is necessary to break it in order to open the sample container. In addition, chain-of-custody seals will be affixed to sample storage containers in a similar manner in order to prevent tampering prior to shipment from the facility to off-site analytical laboratories. Samples and storage containers which require seals must be sealed prior to leaving the possession of facility personnel.

To establish the documentation necessary to trace sample possession from the time of collection, a chain-of-custody record will be filled out and will accompany every sample. A sample chain-of-custody record is provided in Vol. II of this application.

If the sample is to be shipped off-site for analysis, it will be accompanied by a sample analysis request sheet. The sample analysis request sheet will include the information necessary to identify the sample and the analyses requested by the facility. Samples shipped off-site for analysis will be packaged and shipped in accordance with DOT transportation requirements.

Laboratory samples will be maintained in a secure area and retained until holding times expire, as listed in SW-846, or three months, whichever comes earlier. After the holding time or three month holding period has expired, samples will be disposed at the facility with compatible waste batches. Records of the date the samples are removed from storage and the date and method of disposal will be maintained at the facility until completion of post-closure care. In cases where samples are not analyzed within their holding times, the facility will resample.

4.6.5.3 QA Review of Procedures to Ensure Proper Use of Equipment

Standard operating procedures will be developed for the use, decontamination, and storage of sampling equipment used to characterize waste shipped to the facility. The standard operating procedures will include the sampling equipment to be used, instructions for use, and the applications for use of the equipment for collection of samples from specific media and types of shipping containers. The procedures and QA standards for waste sample collection will be included in the standard operating procedures.

4.6.5.4 Protocols for Equipment Maintenance

The protocols for equipment maintenance will be included in the standard operating procedures. Protocols will be developed, as described in the preceding paragraph, for use, decontamination, and storage of equipment. Protocols for equipment maintenance will be included in the standard operating procedures. (See Section 4.6.7 for general decontamination requirements).

4.6.5.5 Identification of Required Sampling Techniques For Specific Media

The sampling methods and equipment used for collecting samples from specific media will be selected in accordance with the guidelines included in 40 CFR, Part 261, Appendix I, and in the EPA guidance manual, *Waste Analysis at Facilities That Generate, Treat, Store, and Dispose of Hazardous Waste*, Chapter 2. Alternative sampling methods may be used with prior approval of NMED.

4.6.5.6 Field Sampling QC Procedures

Blank and duplicate samples will be obtained during waste characterization sampling to confirm that sample collection and handling procedures meet the QA/QC standards outlined in the standard operating procedures and data quality objectives included in the facility sampling manual. Duplicate samples will be collected at a minimum frequency of 10 percent (one for every 10 samples). Field blanks and equipment blanks will be collected at a minimum frequency of 5 percent (one for every 20 samples). Trip blanks will be included with all sample kits where samples are sent to off-site laboratories for chemical analysis. The field QA samples are described below:

- **field blanks.** - Field blanks are prepared in the field by filling a clean container with pure de-ionized water and appropriate preservative (if required for a specific activity). Contaminants found may indicate airborne contamination, contaminated equipment, or cross-contamination during sampling. A minimum of one field blank will be collected for every 20 waste samples collected;
- **trip blanks.** - Trip blanks are sample containers that are prepared with an inert material such as de-ionized water and carried into and out of the field, but not opened at any time during the sampling event. Contaminants detected in the trip blank may indicate that the source where the sample was prepared or the container that transported the trip blank was contaminated. A trip blank will accompany all sample shipping containers sent from and to off-site laboratories;
- **equipment blanks.** - Equipment blanks are prepared in the field prior to sampling by running de-ionized water over sampling equipment and placing it into a clean sample container. Contamination in this type of sample will indicate that the sampling equipment is contaminated. A minimum of one equipment blank will be collected for every 20 waste samples collected; and

- **field duplicates.** - Field duplicates are independent samples that are taken from the same location at the same time and are used to measure the effectiveness of obtaining representative samples. A minimum of one field duplicate will be collected for every 10 waste samples collected.

4.6.5.7 Documentation of Sampling Activities

Sampling activities, including observations and field procedures, will be recorded on appropriate forms and kept on file at the facility. Copies of the completed forms will be maintained in a bound and sequentially numbered file. The record of waste stream sampling activities will include:

- the date;
- the time of arrival and departure;
- weather conditions (including estimated temperature and wind direction);
- the name of the sample collector;
- daily activities and times sampling was conducted;
- observations;
- a record of samples collected, with sample designations and locations specified;
- field monitoring data, including health and safety monitoring;
- a list of equipment used and calibration records, if appropriate;
- a list of additional data sheets completed; and
- the signature of personnel completing the field record.

Each sample collected during waste stream sampling activities will be identified by a unique sample designation. The sample designation will be included on the sample label. QA samples will be designated with a "Q" (QA/QC samples) at the end of the sample designation, followed by one of the following to indicate the type of QA sample:

- D. - "D" will be used for a duplicate sample;
- E. - "E" will be used for equipment rinsate blanks;
- F. - "F" will be used for field blank samples; or
- TB. - "TB" will be used for field trip blanks.

This coding will be used to assure that duplicates and blanks are submitted "blind" to the laboratory, but can still be easily tracked by the facility for QA purposes.

4.6.6 Sample Preservation, Volumes, and Holding

Table 4-7 presents general preservation, container, and holding time information for samples collected. SW-846 guidelines have been used to determine these general requirements, although these may be modified or augmented to account for waste-specific requirements, waste-container compatibility considerations, or additional waste parameters for analysis. Specific sample volumes and containers appropriate for the sampling event will be determined by the facility. Prior to any sampling event, sample container labels will be prepared and affixed to sample containers, and all sample containers will be certified clean by the supplying laboratory. Sample labels will identify, at a minimum, sample number, date, sampler, matrix, analyses to be

performed, and sample preservation. Once collected, samples will be placed immediately into the shipping container (i.e. cooler), and chain-of-custody documentation will be filled out (see section 4.6.5.2).

TABLE 4-7
GENERAL CONTAINER, HOLDING TIME, AND PRESERVATIVE REQUIREMENTS BY SAMPLE MATRIX

| INORGANICS | | | | | | |
|-----------------------------|-------------------|------------------------|----------------|----------------|--|--|
| Sample Matrix | Concentration | Fraction | Volume | Container Type | Preservative | Holding Times |
| Water | Low | Total metals | 1 liter | C, H, or L | Cool to 4C | 6 mos |
| | | Dissolved Metals | 1 liter | C or L | Filter on-site; HNO ₃ to pH<2 | 6 mos |
| | Medium | Total metals | 1 liter | C or L | Cool to 4C | 6 mos |
| | | Dissolved Metals | 1 liter | C or L | Filter on-site; HNO ₃ to pH<2 | 6 mos |
| Soil, Sediment, and Residue | Low/Medium Medium | Total Metals | 6 Oz | F or G | Cool to 4C | 6mos |
| ORGANICS | | | | | | |
| Sample Matrix | Concentration | Fraction | Volume | Container Type | Preservative | Holding Times |
| Water | Low | VOCs | 80 milli liter | B | HCL to pH <2, Cool to 4C | 14 if preserved |
| | | SVOCs | 2 liters | A,K, or H | HCL to pH <2, Cool to 4C | 7 days for extraction; 40 days after extraction to analysis |
| | | Petroleum Hydrocarbons | 2 liters | A, K, or H | HCL to pH <2, Cool to 4C | 7 days for extraction, 40 days after extraction to analysis |
| Soil, Sediment, and Residue | Low/Medium | VOCs | 240 ml | D | Cool to 4C | 14 days |
| | | SVOCs | 3 Oz | F or G | Cool to 4C | 14 days for extraction, 40 days after extraction to analysis |
| | | Petroleum Hydrocarbons | 3 Oz | F or G | Cool to 4C | 15 days for extraction, 40 days after extraction to analysis |

A= 80 oz amber glass bottle with teflon-lined black phenolic cap
 B= 40-ml glass vial with teflon backed silicon septum cap
 C= 1-L high density polyethylene bottle with poly-lined, poly cap
 D= 120-ml glass vial with teflon lined, white poly cap
 E= 16-oz wide-mouthed glass jar with teflon-lined, black ply cap Water
 F= 8 Oz wide mouthed glass jar with teflon-lined black poly cap Water
 G= 4 oz wide-mouth glass jar with teflon-lined, black poly cap Water
 H= 1-Liter amber glass bottle with teflon lined, black poly cap
 K= 4-L amber glass bottle with teflon-lined, black phenolic cap
 L= 500 ml high-density polyethylene bottle with poly-lined, baked ply cap

The above table is general in nature and may be modified or augmented, so long as the requirements are congruent with SW-846 requirements.

4.6.7 Equipment Decontamination

Sampling equipment will be decontaminated prior to use. Decontamination of sampling equipment typically includes initial scrubbing with a biodegradable commercial detergent, followed by a de-ionized water rinse.

This submittal supersedes all previous information.

The decontamination process will include wiping down of sampling equipment to remove surface residue, followed by detergent wash, rinse, a second detergent wash, and second rinse. Modifications to this process may be required to account for site/contaminant conditions, and may take place so long as the decontamination procedure is well documented and appropriate supporting information is placed in the Operating Record.

4.7 ANALYTICAL METHODS

Analytical methods which the facility will use for specific tests are identified in the waste analysis tables (Tables 4-1 through 4-3). All analytical methods used in conjunction with this waste analysis plan must be EPA-approved methods or methods required by hazardous waste regulations. If there is no equivalent EPA-approved method, an ASTM method or other approved method may be used. If the facility or a generator wishes to use alternate test methods, the facility or generator will first demonstrate to the NMED Secretary that the proposed method is equal or superior to the corresponding methods prescribed in 40 CFR 261 or 264, in accordance with 40 CFR 260.21.

An example of a non-EPA method required by hazardous waste regulations are the ASTM tests specified in 40 CFR 264.314(e)(2) to determine the presence of nonbiodegradable sorbents.

Section 4.7.1 identifies the duties of the laboratory manager. Section 4.7.2 identifies the contents of the laboratory QA/QC plan. Requirements for off-site laboratories used by the facility are contained in Section 4.7.3.

4.7.1 Duties of the Laboratory Manager

The on-site laboratory manager will have the following responsibilities to ensure an effective quality assurance program:

- ensuring that laboratory personnel are adequately trained to perform sampling and analytical procedures and in safety procedures;
- ensuring that equipment and instrumentation under his or her control are calibrated and functioning properly;
- coordinating internal and external assurance audits;
- reviewing procedures and QA plans of outside laboratories used. QA/QC practices will be considered during the selection of independent analytical laboratories. QA/QC practices that will be reviewed include written procedures, certification, internal and external audits, personnel training, and chain-of-custody procedures; and
- development, updating, and implementation of the laboratory QA plan.

4.7.2 Facility Laboratory QA/QC Plan

Prior to beginning operations, the facility will develop procedures which will comprise the laboratory QA/QC plan. The facility will develop a QA manual for operation of the on-site laboratory. The manual will be submitted to NMED for review.

The results of chemical analysis of waste samples generated by the on-site laboratory will not be used as part of the waste acceptance evaluation process prior to NMED's review of the QA manual.

The overall QA objective for measurement data is to ensure that data of known and acceptable quality are provided. All measurements will be made to yield accurate and precise results representative of the media and conditions measured. QA objectives for precision, accuracy, and completeness will be established for each measurement variable, where possible, and will be included in the QA manuals of the on-site and off-site laboratories where waste samples will be submitted for chemical analysis. The laboratory procedures, practices, and qualifications will be included in the QA manual for each laboratory.

The laboratory QA/QC plan will be based on guidance provided in EPA's *Requirements for Quality Assurance Project Plans for Environmental Data Operations* (EPA QA/R-5). As such, the plan will address the following key elements in compliance with EPA QA/R-5: project organization; laboratory quality assurance organization; data quality objectives and criteria; employee training and certification requirements; laboratory analytical methods; quality control requirements; laboratory equipment and instrumentation calibration, testing, inspection, and maintenance; QA/QC of suppliers and vendors; data acquisition requirements; data management; data review, validation and verification; and, reconciliation with quality objectives and criteria. These elements and other procedures which will be included in this plan are discussed in the following sections:

- laboratory quality assurance;
- equipment calibration;
- laboratory QA/QC samples;
- laboratory QC;
- analytical procedures; and
- laboratory maintenance.

4.7.2.1 Laboratory Quality Assurance

The facility laboratory and each off-site laboratory will maintain an internal quality assurance program, as documented in its laboratory quality assurance manual. The laboratories will use a combination of blanks, surrogates, duplicates, MS/MSD (matrix spike/matrix spike duplicate) and laboratory control samples, BS/BSD (blank spike/blank spike duplicate), to demonstrate analytical QA/QC. Control limits will be established for individual chemicals or groups of chemicals based on the long-term performance of the test methods. The specific procedures to be completed and the laboratory control limits will be included in the QA manual for each laboratory.

4.7.2.2 Equipment Calibration

The laboratory equipment calibration procedures, calibration frequency, and calibration standards will be in accordance with EPA (or equivalent method) specified test methodology requirements and will be documented in the laboratory's QA manual. All instruments and equipment used by the laboratory will be operated, calibrated, and maintained according to manufacturers' guidelines and recommendations. Operation, calibration, and maintenance will be performed by personnel who have been properly trained in these procedures. A routine schedule and record of instrument calibration and maintenance will be kept on file at the laboratory.

4.7.2.3 Laboratory QA/QC samples

Analytical procedures will be evaluated by analyzing reagent or method blanks, surrogates, MS/MSDs, BS/BSDs, and/or laboratory duplicates, as required or appropriate for each method. The laboratory QA/QC samples and frequency of analysis to be completed will be in accordance with EPA or equivalent method protocols and will be included in the QA manual for each laboratory.

The laboratory QA manuals and procedures will incorporate data quality objectives (DQOs) to verify that waste characterization data obtained by the methods established in this waste analysis plan meet regulatory requirements with regard to regulatory compliance and facility waste management requirements. The following DQOs are established for the sampling and analysis of waste managed by this facility;

- Identify and quantify the hazardous constituents in the waste to ensure compliance with 40 CFR 264 and the requirements of the facility permit, and
- Compare the contaminant concentrations in the waste with the specified characteristics of 40 CFR 261 in order that the waste may be managed in accordance with facility requirements.

To ensure that the laboratory data quality objectives are met, the following analyses will be completed in the laboratory to monitor the analytical process:

- **laboratory duplicate samples.** - Laboratory duplicate samples will be analyzed to monitor for intralaboratory precision of data generated. These samples will be analyzed at a rate of no less than five percent (one for every 20 samples) of the total samples with at least one replicate if fewer than 20 samples are analyzed for any particular parameter;
- **spiked samples (MS/BS).** - Spiked samples will be analyzed to monitor analytical precision. Spiked samples will be tested on no less than a five percent (one for every 20 samples) basis for any particular parameter. At least one spiked sample will be run if fewer than 20 samples are analyzed;
- **control charts.** - Control charts will be utilized to establish laboratory control limits to monitor and review the accuracy of the data generated as a result of spike analyses. Control limits reflect long-term data accuracy trends and will be modified as new data are acquired;
- **method/reagent blanks.** - Method/reagent blanks will be prepared using samples of purified water or reagents which will then subjected to the entire sample analytical procedure to monitor potential contamination of samples due to contamination in the laboratory or laboratory equipment. Method or reagent blanks will be included with each set of samples;
- **laboratory equipment blanks.** - Laboratory equipment blanks will be analyzed to monitor potential contamination of samples due to improper or ineffective cleaning of equipment. These samples will be analyzed at a rate of no less than five percent (one for every 20 samples) of the total samples;
- **quality control samples.** - QC samples will be analyzed to monitor for accuracy of data generated. EPA QC samples or samples purchased from a reputable independent source will be submitted to off-site laboratories as blind samples for chemical analysis of a set of selected analytes approved by NMED at the beginning of the facility operation and also at regular intervals during the facility operating life;

This submittal supersedes all previous information.

- **surrogates.** - Surrogates will be analyzed in accordance with EPA guidelines for organics analysis. Surrogate recovery is a measure of the effectiveness of the analytical process. Surrogates will be tested on no less than a five percent (one for every 20 samples) basis for any analysis of organic compounds;
- **calibration standards and devices.** - Calibration standards and devices will be used in accordance with the manufacturers' recommended guidelines to calibrate laboratory instrumentation; and
- **internal standards** - Internal standards prepared in the laboratory will be referenced against external standards to measure accuracy.

Laboratory QC procedures will be included in the laboratory QA manuals prepared by each laboratory.

4.7.2.4 Laboratory Quality Control

QC objectives for the analytical data are a means of checking and controlling the sources of error in analytical data results. The criteria for data evaluation include assessing the data accuracy, precision, completeness, representativeness, and comparability. The criteria are described below:

- **accuracy.** - Accuracy is a measure of the error between chemical analytical results and the true sample concentrations. Accuracy is a measure of the bias in a system and will be expressed as the percent recovery of spiked samples. Accuracy will be presented as percent recovery and will be calculated as follows:

$$\%R = (S-U) \times 100\%C_{sa}$$

where

%R = percent recovery

S = spike sample analytical result

U = sample analytical result

C_{sa} = known spike concentration

- The data quality objectives (DQOs) for accuracy for each analytical method will be presented in the laboratory QA manual;
- **precision.** - Precision is a measure of data variability. Variability can be attributed to sampling activities and/or chemical analysis. Relative percent difference (RPD) will be used to assess the precision of the sampling and analytical method and will be calculated as follows:

$$RPD = [|C_1 - C_2| / (C_1 + C_2) / 2] \times 100$$

where

RPD - relative percent difference

C₁ = larger of the two concentrations

C₂ = smaller of the two concentrations

- The DQOs for precision for each analytical method will be presented in the laboratory QA manual;

This submittal supersedes all previous information.

- **completeness.** - Completeness will be evaluated to assess whether a sufficient amount of valid data is obtained. Completeness is described as the ratio of acceptable measurements. Completeness will be calculated as follows:

$$C = (\text{Number of samples having acceptable data}) / (\text{total number of samples analyzed}) \times 100\%$$

where

C = completeness

- The DQOs for completeness will be presented in the laboratory QA manual;
- **representativeness.** - Representativeness is a qualitative parameter related to the degree to which the sample data represent the specific characteristics of concern. Procedures in sample collection will be implemented to assure representative samples, such as repeated measurements of the same parameter from the same waste stream in the same shipping container over several distinct sampling events. Any procedures or variations that may affect the collection or analysis of representative samples will be noted and the data qualified as appropriate; and
- **comparability.** - Comparability is a qualitative parameter related to whether similar sample data can be prepared. To assure comparability, analytical results will be reported in appropriate units for comparison with other data (such as past studies or clean-up standards), and the standard collection and analytical procedures included in this waste analysis plan will be implemented. Any procedures or variations that may affect comparability will be noted, and the data will be qualified as appropriate.

4.7.2.5 Analytical Procedures

Specific QA/QC procedures to be used for sampling, chain-of-custody, calibration, analytical methods, reporting, internal QC, audits, and preventative maintenance will be included in the laboratory QA manual.

Laboratory procedures and methods to be used will contain all of the information presented in the EPA document, SW-846, for each method. The format for each method will be similar to that used in SW-846. If there is no appropriate SW-846 method ASTM or other approved methods will be employed. The laboratory procedures and methods also will include the following:

- **scope.** - A description of the scope of applicability of the procedure;
- **principal.** - A brief description of the steps to be taken and/or the theory involved in the laboratory analysis;
- **interference.** - A description of known interfering agents that would cause difficulty in the laboratory analysis;
- **apparatus.** - A listing or description of equipment required to perform the laboratory analysis;
- **reagents.** - A listing of the reagents required, a description of the steps involved in preparing the reagents, and instructions on storage requirements and retention times;
- **procedures (instructions).** - An enumeration of the sequence of activities to be followed. The topics include sample preparation or pretreatment, sample storage requirements, instrument set-up,

standardization or calibration, sample analysis, calculations, and glassware-cleaning procedures. The procedure includes any precautions, explanation, or clarifications needed to properly perform the analysis. These include safety precautions, the frequency of standardization required, the acceptance criteria or procedures for determining the acceptability of standard curves, clarification or special techniques critical to the analysis, and the procedure the analyst uses to determine the reliability of sample results based on the standard curves;

- **quality control requirements.** - A listing of the QC checks to be performed and the acceptance criteria used to evaluate the QC data; and
- **reference.** - A listing of the publications from which the information was derived in preparing the laboratory method. All references pertain to these documents. As a rule, laboratory methods are derived from the following publications:
 - *Standard Methods for the Examination of Water and Wastewater*, American Public Health Association;
 - *Annual Book of Standards*, American Society for Testing and Materials;
 - *Methods for Chemical Analysis of Water and Waste*, US Environmental Protection Agency;
 - *Test Methods for Evaluating Solid Waste*, SW-846, US Environmental Protection Agency;
 - *National Functional Guidelines for Organics Data Review*, and
 - *Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses*.

Editions used will be those currently specified in 40 CFR, as updated.

4.7.2.6 Laboratory Maintenance

The analytical laboratory will have in place a procedure that details the steps to be taken to calibrate and standardize instruments to ensure that analytical data produced are accurate. Records of all calibrations, preventative maintenance, and service calls will be readily available from the laboratory files. Calibration procedures will follow the method procedures outlined in the EPA document, SW-846, or the *Annual Book of ASTM Standards*.

A procurement procedure that identifies methods to be used to document and control the purchase of materials, parts, and services will be implemented by the laboratory and will be presented in the laboratory QA manual. The procedure will include identifying the quality of laboratory chemicals and equipment, management approval of procedure items, inspection of shipments for compliance with requirements, and isolation of nonconforming items to be returned to vendors. The quality of all equipment will conform to the requirements specified in the most current edition of the EPA document, *Handbook of Analytical Quality Control in Water and Wastewater Laboratories*, the Federal Register, or other regulatory agency publications. This procurement procedure will serve to ensure that spare parts routinely required will be readily available.

4.7.3 Requirements for Off-Site Laboratories

The facility will document that the following conditions are met for each off-site laboratory performing waste analyses for the facility:

- the laboratory will not be the same laboratory that was used by the generator;
- the laboratory must be approved by the facility;
- the laboratory must use the analytical methods identified in Section 4.5;
- if there is more than one analytical method for a specific test identified in Section 4.5, the laboratory must follow the guidance in Chapter Two of the current version of EPA document SW-846 to determine the appropriate analytical method; and
- the laboratory must follow the QA/QC requirements described in this waste analysis plan.

4.7.4 Laboratory Requirements for Foreign Generators

The facility will ensure and document that laboratory analysis provided by foreign generators is performed by a laboratory accredited or certified for the appropriate hazardous waste field of testing (FOT) by an authority using the USEPA's National Environmental Laboratory Accreditation Conference standards.

4.8 WASTE TRACKING

To identify and track the waste managed at the facility, a facility-specific number will be assigned to each waste stream and to each shipment within that waste stream. Each waste shipment will be tracked using a unique alphanumeric designation. This designation will identify the generator, a sequential number specific to the shipment, substance and source and the delivery date (or, in the case of site-generated waste, the date the waste entered the system). An example is presented below:

ABC-0001-043099

where

ABC identifies the generator

0001 identifies the waste stream, source, and shipment

043099 is the date the waste was delivered.

The waste numbering system will assist in the tracking of waste as it moves through the facility. The number will be recorded on:

- all incoming paperwork from the generator;
- samples received from the generator;
- samples taken on site; and
- site-generated records.

The date will not be recorded until the waste actually arrives on site. This numbering system will allow the facility to track a specific waste with regard to analyses conducted, necessary treatment, and the final disposition of the waste. In addition, assigning a unique designation to each generator and a unique number

This submittal supersedes all previous information.

XI. Nature of Business (Provide a brief description)

TRIASSIC PARK WASTE DISPOSAL WILL ACCEPT RCRA HAZARDOUS WASTE AND TSCA PCB WASTE FROM OFF-SITE GENERATORS FOR TREATMENT AND PERMANENT DISPOSAL.

TEMPORARY ON-SITE STORAGE IN CONTAINERS AND TANKS IS PROVIDED PRIOR TO TREATMENT AND DISPOSAL.

XII. Process Codes and Design Capacities

A. PROCESS CODE - Enter the code from the list of process codes below that best describes each process (provided in all cases of the business. The two lines are provided for entering codes. If more lines are needed, attach a separate sheet of paper with the appropriate information. For "other" processes (LA, DM, SP, TM and XPS), describe the process (including its design capacity) in the space provided in Item XII.

B. PROCESS DESIGN CAPACITY - For each code entered in column A, enter the capacity of the process.

1. AMOUNT - Enter the amount, in a case where design capacity is not applicable (such as in a closed-loop system or an enclosed system) enter the total amount of waste for that process.
2. UNIT OF MEASURE - For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

C. PROCESS TOTAL NUMBER OF UNITS - Enter the total number of units used with the corresponding process code.

| PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY | PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY |
|--------------|-----------------------|---|--------------|--------------------------------------|---|
| 079 | Underground Injection | Gallons; Liters; Gallons Per Day; or Liters Per Day | 727 | Brewing, Maltng, Or Refining Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour |
| 080 | Landfill | Acres-foot or Hectares-meter | 728 | Thermal Oxidation | |
| 081 | Land Treatment | Acres or Hectares | 729 | Chloride Process | |
| 082 | Open Disposal | Gallons Per Day or Liters Per Day | 730 | Chloride Process | |
| 083 | Surface Impoundment | Gallons or Liters | 731 | Chloride Process | |
| 084 | Other Storage | Any Unit of Measure Listed Below | 732 | Chloride Process | |
| 085 | Storage | | 733 | Chloride Process | Cubic Yards or Cubic Meters |
| 086 | Container | Gallons or Liters | 734 | Chloride Process | |
| 087 | Tank | Gallons or Liters | 735 | Chloride Process | |
| 088 | Waste Pile | Cubic Yards or Cubic Meters | 736 | Chloride Process | |
| 089 | Surface Impoundment | Gallons or Liters | 737 | Chloride Process | |
| 090 | On-Pipe | Gallons or Liters | 738 | Chloride Process | Any Unit of Measure Listed Below |
| 091 | Containment Building | Cubic Yards or Cubic Meters | 739 | Chloride Process | |
| 092 | Other Disposal | Any Unit of Measure Listed Below | 740 | Chloride Process | |
| 093 | Treatment | | 741 | Chloride Process | |
| 094 | Tank | Gallons Per Day or Liters Per Day | 742 | Chloride Process | |
| 095 | Surface Impoundment | Gallons Per Day or Liters Per Day | 743 | Chloride Process | Short Tons Per Hour; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour |
| 096 | Incinerator | Short Tons Per Hour; Metric Tons Per Hour; Gallons Per Hour; Liters Per Hour; or Str's Per Hour | 744 | Chloride Process | |
| 097 | Other Treatment | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 745 | Chloride Process | |
| 098 | Buffer | Gallons or Liters | 746 | Chloride Process | |
| 099 | Cement Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 747 | Chloride Process | |
| 100 | Urea Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 748 | Chloride Process | Cubic Yards or Cubic Meters |
| 101 | Ammonia Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 749 | Chloride Process | |
| 102 | Phosphate Kiln | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 750 | Chloride Process | |
| 103 | Coal Oven | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 751 | Chloride Process | |
| 104 | Steel Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Str's Per Hour | 752 | Chloride Process | |
| 105 | Other | | 753 | Chloride Process | Any Unit of Measure Listed Below |
| 106 | Other | | 754 | Chloride Process | |
| 107 | Other | | 755 | Chloride Process | |
| 108 | Other | | 756 | Chloride Process | |
| 109 | Other | | 757 | Chloride Process | |

| UNIT OF MEASURE | UNIT OF MEASURE CODE | UNIT OF MEASURE | UNIT OF MEASURE CODE | UNIT OF MEASURE | UNIT OF MEASURE CODE |
|------------------|----------------------|----------------------|----------------------|-----------------|----------------------|
| Gallons | G | Short Tons Per Hour | D | Cubic Yards | Y |
| Gallons Per Hour | H | Metric Tons Per Hour | W | Cubic Meters | C |
| Gallons Per Day | U | Short Tons Per Day | N | Acres | A |
| Liters | L | Metric Tons Per Day | S | Acres-foot | F |
| Liters Per Hour | N | Pounds Per Hour | J | Hectares | H |
| Liters Per Day | V | Kilograms Per Hour | K | Hectares-meter | P |

XIV: Description of Hazardous Waste

- A. EPA HAZARDOUS WASTE NUMBER** - Enter the four-digit number from 40 CFR, Part 261 Subpart D of each listed hazardous waste you will handle. For hazardous wastes which are not listed in 40 CFR, Part 261 Subpart D, enter the four-digit number(s) from 40 CFR, Part 261 Subpart C that describes the characteristic and/or the toxic constituents of those hazardous wastes.
- B. ESTIMATED ANNUAL QUANTITY** - For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic constituent entered in column A estimate the total annual quantity of all the non-listed waste(s) that will be handled which possess that characteristic or constituent.
- C. UNIT OF MEASURE** - For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

| ENGLISH UNIT OF MEASURE | CODE | METRIC UNIT OF MEASURE | CODE |
|-------------------------|------|------------------------|------|
| POUNDS | P | KILOGRAMS | K |
| TONS | T | METRIC TONS | M |

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES**1. PROCESS CODES:**

For listed hazardous waste: For each listed hazardous waste entered in column A select the code(s) from the list of process codes contained in Item XV A, on page 2 to indicate how the waste will be stored, treated, and/or disposed of at the facility.

For non-listed hazardous waste: For each characteristic or toxic constituent entered in column A, select the code(s) from the list of process codes contained in Item XV A, on page 2 to indicate all the processes that will be used to store, treat, and/or dispose of all the non-listed hazardous waste(s) that possess that characteristic or toxic constituent.

NOTE: THREE SPACES ARE PROVIDED FOR ENTERING PROCESS CODES. IF MORE ARE NEEDED:

- Enter the first two as described above.
- Enter "00" in the extreme right box of Item XIV-C(2).
- Enter in the space provided on page 7, Item XIV-E, the line number and the additional code(s).

- 2. PROCESS DESCRIPTION:** If a code is not listed for a process that will be used, describe the process in the space provided on the form (D.2).

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER - Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described on the form as follows:

- Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B, C and D by entering the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
- In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "Included with above" and make no other entries in that line.
- Repeat step 2 for each EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM XIV (shown in line numbers X-1, X-2, X-3, and X-4 below): A facility will treat and dispose of an estimated 800 pounds per year of oil-based shavings from leather tanning and finishing operation. In addition, this facility will treat and dispose of three non-listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

| Line Number | A. EPA HAZARD WASTE NO. (Enter code) | | | | B. ESTIMATED ANNUAL QUANTITY OF WASTE | C. UNIT OF MEASURE (Enter code) | D. PROCESS | | | | | | | | | |
|-------------|--------------------------------------|---|---|---|---------------------------------------|---------------------------------|---------------------------|---|---|---|---|---|--|--|--|---------------------|
| | | | | | | | (1) PROCESS CODES (Enter) | | | | | (2) PROCESS DESCRIPTION (If a code is not listed in C(1)) | | | | |
| X 1 | 1 | K | 0 | 0 | 4 | 800 | P | T | 0 | 0 | 0 | 0 | | | | |
| X 2 | 2 | 0 | 0 | 0 | 2 | 400 | P | T | 0 | 0 | 0 | 0 | | | | |
| X 3 | 3 | 0 | 0 | 0 | 1 | 100 | P | T | 0 | 0 | 0 | 0 | | | | |
| X 4 | 4 | 0 | 0 | 0 | 2 | - | | | | | | | | | | Included with Above |

EPA ID Number (Enter from page 1)

N M 0 0 0 1 0 0 2 4 8 4

Secondary ID Number (Enter from page 1)

XV. Map

Attach to this application a topographic map, or other equivalent map, of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in this map area. See instructions for precise requirements.

XVI. Facility Drawing

All existing facilities must include a scale drawing of the facility (See instructions for more detail).

XVII. Photographs

All existing facilities must include photographs (aerial or ground-level) that clearly delineate all existing structures, existing storage, treatment and disposal areas; and sites of future storage, treatment or disposal areas (see instructions for more detail).

XVIII. Certification(s)

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

XIX. Comments

PART XIV - WASTES THAT DO NOT MEET LDR TREATMENT STANDARDS WILL BE MANAGED AT ONE OR MORE PERMITTED UNITS PRIOR TO LAND DISPOSAL.

Note: Mail completed form to the appropriate EPA Regional or State Office. (Refer to instructions for more information.)

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| D001 | Only those ignitable wastes which can be tested by prescribed methods prior to placement in the landfill. | 42,120 | T | D40, T01, S01, S02, T02 | |
| D002 | Only those corrosive wastes which can be tested by prescribed methods prior to placement in the landfill. | 42,120 | T | D40, T01, S01, S02, T02 | |
| D003 | Only those reactive wastes which can be tested by prescribed methods prior to placement in the landfill. | 42,120 | T | D40, T01, S01, S02, T02 | |
| D004 | Arsenic | 42,120 | T | D40, T01, S01, S02, T02 | |
| D005 | Beryllium | 42,120 | T | D40, T01, S01, S02, T02 | |
| D006 | Cadmium | 42,120 | T | D40, T01, S01, S02, T02 | |
| D007 | Chromium | 42,120 | T | D40, T01, S01, S02, T02 | |
| D008 | Copper | 42,120 | T | D40, T01, S01, S02, T02 | |
| D009 | Lead | 42,120 | T | D40, T01, S01, S02, T02 | |
| D010 | Mercury | 42,120 | T | D40, T01, S01, S02, T02 | |
| D011 | Selenium | 42,120 | T | D40, T01, S01, S02, T02 | |
| D012 | Silver | 42,120 | T | D40, T01, S01, S02, T02 | |
| D013 | Vanadium | 42,120 | T | D40, T01, S01, S02, T02 | |
| D014 | Zinc | 42,120 | T | D40, T01, S01, S02, T02 | |
| D015 | Chlorine | 42,120 | T | D40, T01, S01, S02, T02 | |
| D016 | Fluorine | 42,120 | T | D40, T01, S01, S02, T02 | |
| D017 | Hydrogen | 42,120 | T | D40, T01, S01, S02, T02 | |
| D018 | Carbon monoxide | 42,120 | T | D40, T01, S01, S02, T02 | |
| D019 | Carbon dioxide | 42,120 | T | D40, T01, S01, S02, T02 | |
| D020 | Chloroform | 42,120 | T | D40, T01, S01, S02, T02 | |
| D021 | Chlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| D041 | 2,4,5-Trichlorophenol | 42,120 | T | D001, T01, S01, S02, T02 | |
| D042 | 2,4,6-Trichlorophenol | 42,120 | T | D001, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERIZATION OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---------------------------------|------------------------------------|-----------------|-------------------------|---------------------|
| D043 | Vinyl chloride | 42,120 | T | D40, T01, S01, S02, T02 | |

| EPA CODE | CHARACTERIZATION OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| F001 | The following spent halogenated solvents used in degreasing: Trichloroethylene, tetrachloroethylene, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride, and chloroform. Fluorocarbon: All spent solvent mixtures. All spent solvents used in degreasing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or these solvents listed in F002, F004, and F005; and will become from the recovery of these spent solvents and spent solvent mixtures. | 42,120 | T | D40, T01, S01, S02, T02 | |
| F002 | The following spent halogenated solvents: Trichloroethylene, methylene chloride, tetrachloroethylene, 1,1,1-trichloroethane, carbon tetrachloride, 1,1,2-trichloroethane, 1,1,2,2-tetrachloroethane, perchloroethylene, and 1,1,2,2-tetrachloroethane. All halogenated solvent mixtures. All solvents used in degreasing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or these solvents listed in F001, F004, and F005; and will become from the recovery of these spent solvents and spent solvent mixtures. | 42,120 | T | D40, T01, S01, S02, T02 | |
| F003 | The following spent non-halogenated solvents: Xylene, toluene, ethyl acetate, methyl acetate, methyl isobutyl ketone, isobutyl acetate, cyclohexane, and hexane. All spent solvent mixtures. All solvents used in degreasing, before use, a total of ten percent or more (by volume) of one or more of the above non-halogenated solvents or these solvents listed in F001, F004, and F005; and will become from the recovery of these spent solvents and spent solvent mixtures. | 42,120 | T | D40, T01, S01, S02, T02 | |
| F004 | The following spent non-halogenated solvents: Grease and complex oils, and mineral oils. All spent solvent mixtures. All solvents used in degreasing, before use, a total of ten percent or more (by volume) of one or more of the above non-halogenated solvents or these solvents listed in F001, F002, and F005; and will become from the recovery of these spent solvents and spent solvent mixtures. | 42,120 | T | D40, T01, S01, S02, T02 | |
| F005 | The following spent non-halogenated solvents: Toluene, methyl ethyl ketone, carbon disulfide, hexane, pyridine, heptane, 2-methylhexane, and 2-methylpentane. All spent solvent mixtures. All solvents used in degreasing, before use, a total of ten percent or more (by volume) of one or more of the above non-halogenated solvents or these solvents listed in F001, F002, and F004; and will become from the recovery of these spent solvents and spent solvent mixtures. | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| R006 | Waste water treatment sludges from electroplating operations except from the following processes: (1) Sulfuric acid anodizing of aluminum; (2) tin plating on carbon steel; (3) zinc plating (sacrificial anodes) on carbon steel; (4) aluminum or zinc-phosphorus plating on carbon steel; (5) chromate/chromate treatment with tin, zinc and aluminum plating on carbon steel; and (6) chemical etching and etching of aluminum | 42,120 | T | D40, T01, S01, S02, T02 | |
| R007 | Spent cyanide plating bath solutions from electroplating operations | 42,120 | T | D40, T01, S01, S02, T02 | |
| R008 | Plating bath residues from the bottoms of plating baths from electroplating operations where cyanides are used in the process | 42,120 | T | D40, T01, S01, S02, T02 | |
| R009 | Spent etching and cleaning bath solutions from electroplating operations where cyanides are used in the process | 42,120 | T | D40, T01, S01, S02, T02 | |
| R010 | Quenching bath residues from oil baths from metal heat treating operations where cyanides are used in the process | 42,120 | T | D40, T01, S01, S02, T02 | |
| R011 | Spent cyanide solutions from oil bath post cleaning from metal heat treating operations | 42,120 | T | D40, T01, S01, S02, T02 | |
| R012 | Quenching water waste treatment sludges from metal heat treating operations where cyanides are used in the process | 42,120 | T | D40, T01, S01, S02, T02 | |
| R019 | Waste water treatment sludges from the chemical conversion coating of aluminum except from aluminum phosphating or aluminum that coating when such phosphating is an anodizing conversion coating process | 42,120 | T | D40, T01, S01, S02, T02 | |
| R004 | Process wastes, including but not limited to: (1) effluents, heavy metal, toxic, and reactor clean-out wastes from the production of certain chlorinated aliphatic hydrocarbons by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chains longer than ethyl and including fluoro, with varying amounts and positions of chlorine substitution. (2) Still bottom sludge and bottoms, wastewater treatment sludges, spent catalysts, and wastes listed in E261.31 or E261.32. | 42,120 | T | D40, T01, S01, S02, T02 | |
| R025 | Condensate, light ends, spent solvent and filter aids, and spent desiccant wastes from the production of certain chlorinated aliphatic hydrocarbons, by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chains longer than ethyl, with varying amounts and positions of chlorine substitution | 42,120 | T | D40, T01, S01, S02, T02 | |
| R026 | Residues resulting from the incineration of thermal treatment of soil contaminated with EPA Hazardous Waste Nos. R020, R021, R022, R029, R035, R037. | 42,120 | T | D40, T01, S01, S02, T02 | |
| R032 | Wastewater (ground water and surface water) contaminated with process contaminants, process residuals, process effluents, and spent desiccants from wood preserving processes generated at plants that currently use or have previously used chlorinated aliphatic hydrocarbons (excluding pentachloroethane) as preservatives for wood. The R032 waste can be found in Appendix 1, Part 40 CFR 261.33 of this chapter and where the preservative does not consist of halogenated aromatic hydrocarbons. The listing does not include R031 because solvent sludges from the treatment of wastewater from wood preserving processes that use preservatives and/or preservatives. | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| R004 | Wastewater (except those that have not come into contact with process contaminants), process residuals, process water, and other liquids from waste processing processes generated at plants that are currently in operation. This liquid does not include K001 bottom sediment sludge from the treatment of wastewater from waste processing processes that has contacted sulfur pentachlorophenol. | 42,120 | T | D40, T01, S01, S02, T02 | |
| R005 | Wastewater (except those that have not come into contact with process contaminants), process residuals, process water, and other liquids from waste processing processes generated at plants that are currently in operation. This liquid does not include K001 bottom sediment sludge from the treatment of wastewater from waste processing processes that has contacted sulfur pentachlorophenol. | 42,120 | T | D40, T01, S01, S02, T02 | |
| R007 | Wastewater (except those that have not come into contact with process contaminants), process residuals, process water, and other liquids from waste processing processes generated at plants that are currently in operation. This liquid does not include K001 bottom sediment sludge from the treatment of wastewater from waste processing processes that has contacted sulfur pentachlorophenol. | 42,120 | T | D40, T01, S01, S02, T02 | |
| R008 | Wastewater (except those that have not come into contact with process contaminants), process residuals, process water, and other liquids from waste processing processes generated at plants that are currently in operation. This liquid does not include K001 bottom sediment sludge from the treatment of wastewater from waste processing processes that has contacted sulfur pentachlorophenol. | 42,120 | T | D40, T01, S01, S02, T02 | |
| R009 | Wastewater (except those that have not come into contact with process contaminants), process residuals, process water, and other liquids from waste processing processes generated at plants that are currently in operation. This liquid does not include K001 bottom sediment sludge from the treatment of wastewater from waste processing processes that has contacted sulfur pentachlorophenol. | 42,120 | T | D40, T01, S01, S02, T02 | |

| EPA CODE | CHARACTERISTICS OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| K001 | Residue streams sludge from the treatment of wastewater from wood preserving processes that use cresols and/or pentachlorophenol | 42,120 | T | D40, T01, S01, S02, T02 | |
| K002 | Wastewater treatment sludge from the production of chrome yellow and orange pigments | 42,120 | T | D40, T01, S01, S02, T02 | |
| K003 | Wastewater treatment sludge from the production of methylene orange pigments | 42,120 | T | D40, T01, S01, S02, T02 | |
| K004 | Wastewater treatment sludge from the production of zinc yellow pigments | 42,120 | T | D40, T01, S01, S02, T02 | |
| K005 | Wastewater treatment sludge from the production of chromed green pigments | 42,120 | T | D40, T01, S01, S02, T02 | |
| K006 | Wastewater treatment sludge from the production of carbon oxide green pigments (anhydrous and hydrated) | 42,120 | T | D40, T01, S01, S02, T02 | |
| K007 | Wastewater treatment sludge from the production of iron blue pigments | 42,120 | T | D40, T01, S01, S02, T02 | |
| K008 | Over residues from the production of chrome oxide green pigments | 42,120 | T | D40, T01, S01, S02, T02 | |
| K009 | Distillation bottoms from the production of acetylacetyls from styrene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K010 | Distillation side runs from the production of acetylacetyls from styrene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K011 | Residue streams from the wastewater in paper in the production of acrylonitrile | 42,120 | T | D40, T01, S01, S02, T02 | |
| K012 | Residue streams from the wastewater in paper in the production of acrylonitrile | 42,120 | T | D40, T01, S01, S02, T02 | |
| K013 | Residue streams from the wastewater in paper in the production of acrylonitrile | 42,120 | T | D40, T01, S01, S02, T02 | |
| K014 | Residue streams from the wastewater in paper in the production of acrylonitrile | 42,120 | T | D40, T01, S01, S02, T02 | |
| K015 | Spill bottoms from the distillation of heavy chlorides | 42,120 | T | D40, T01, S01, S02, T02 | |
| K016 | Heavy ends or distillation residues from the production of sodium perchlorate | 42,120 | T | D40, T01, S01, S02, T02 | |
| K017 | Heavy ends (all bottoms) from the production of sodium perchlorate | 42,120 | T | D40, T01, S01, S02, T02 | |
| K018 | Heavy ends from the production of sodium perchlorate | 42,120 | T | D40, T01, S01, S02, T02 | |
| K019 | Heavy ends from the production of sodium perchlorate | 42,120 | T | D40, T01, S01, S02, T02 | |
| K020 | Heavy ends from the production of sodium perchlorate | 42,120 | T | D40, T01, S01, S02, T02 | |
| K021 | Aqueous spent catalytic waste from the production of sodium perchlorate | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| K002 | Distillation bottom tars from the production of phenolacetone from cumene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K003 | Distillation light ends from the production of phthalic anhydride from naphthalene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K004 | Distillation bottom tars from the production of phthalic anhydride from naphthalene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K005 | Distillation bottoms from the production of isocyanuric acid by the reaction of isocyanate | 42,120 | T | D40, T01, S01, S02, T02 | |
| K006 | Slipping still tails from the production of amyl ethyl pyridine | 42,120 | T | D40, T01, S01, S02, T02 | |
| K007 | Crystallizer and distillation residues from isobutene dicyclopentadiene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K008 | Spent catalyst from the hydrochloride reactor in the production of 1,1,1-trichloroethane | 42,120 | T | D40, T01, S01, S02, T02 | |
| K009 | Waste from the product mass stripper in the production of 1,1,1-trichloroethane | 42,120 | T | D40, T01, S01, S02, T02 | |
| K010 | Chlorine byproducts from the combined production of isobutene and perchloroethylene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K011 | Byproducts and sludge from the production of MMA and acrylic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| K012 | Wastewater treatment sludge from the production of chloroform | 42,120 | T | D40, T01, S01, S02, T02 | |
| K013 | Wastewater and scrub water from the chlorination of cyclopentadiene in the production of chloroform | 42,120 | T | D40, T01, S01, S02, T02 | |
| K014 | Slurry solids from the reaction of isocyanuric acid in the production of chloroform | 42,120 | T | D40, T01, S01, S02, T02 | |
| K015 | Wastewater treatment sludge generated in the production of cyclohexane | 42,120 | T | D40, T01, S01, S02, T02 | |
| K016 | Still bottoms from solvent recovery distillation in the production of chloroform | 42,120 | T | D40, T01, S01, S02, T02 | |
| K017 | Wastewater treatment sludge from the production of chloroform | 42,120 | T | D40, T01, S01, S02, T02 | |
| K018 | Wastewater from the washing and stripping of pyrene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K019 | Water salts from the distillation of diethylphosphorylchloride acid in the production of pyrene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K020 | Wastewater treatment sludge from the production of pyrene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K021 | Wastewater treatment sludge from the production of pyrene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K022 | Slurry solids of chloroform residues from the distillation of isocyanuric acid in the production of 1,1,1-trichloroethane | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTICS OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE (Tons) | TYPE OF WASTE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|---|---------------|-------------------------|---------------------|
| K043 | 2,6-Dichlorophenol waste from the production of 2,4-D | 42,120 | T | D40, T01, S01, S02, T02 | |
| K044 | Wastewater treatment sludge from the manufacturing and processing of explosives | 42,120 | T | D40, T01, S01, S02, T02 | |
| K045 | Spent carbon from the treatment of wastewater containing explosives | 42,120 | T | D40, T01, S01, S02, T02 | |
| K046 | Wastewater treatment sludge from the manufacturing, formulation and loading of lead-based initiating compounds | 42,120 | T | D40, T01, S01, S02, T02 | |
| K047 | Exhausted water from TNT operations | 42,120 | T | D40, T01, S01, S02, T02 | |
| K048 | Dissolved air flotation (DAF) from the petroleum refining industry | 42,120 | T | D40, T01, S01, S02, T02 | |
| K049 | Slip oil separator residue from the petroleum refining industry | 42,120 | T | D40, T01, S01, S02, T02 | |
| K050 | Heat exchanger bundle cleaning sludge from the petroleum refining industry | 42,120 | T | D40, T01, S01, S02, T02 | |
| K051 | API separator sludge from the petroleum refining industry | 42,120 | T | D40, T01, S01, S02, T02 | |
| K052 | Tank bottoms (united) from the petroleum refining industry | 42,120 | T | D40, T01, S01, S02, T02 | |
| K060 | Asphaltic mill lime sludge from rolling operations | 42,120 | T | D40, T01, S01, S02, T02 | |
| K061 | Emulsion control dust/sludge from the primary production of steel in electric furnaces | 42,120 | T | D40, T01, S01, S02, T02 | |
| K062 | Spent pickle liquor generated by steel finishing operations of facilities within the iron and steel industry (SIC Codes 331 and 332) | 42,120 | T | D40, T01, S01, S02, T02 | |
| K064 | Acid plant blowdown sludge resulting from the pickling of blowdown slurry from primary copper production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K065 | Surface impoundment solids contained in and dredged from surface impoundments at primary lead smelting facilities | 42,120 | T | D40, T01, S01, S02, T02 | |
| K066 | Sludge from treatment of process wastewater/water acid plant blowdown from primary zinc production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K069 | Exhaustion control dust/sludge from secondary lead smelting. (Note: This listing is added administratively for sludge generated from secondary acid scrubber systems. The way will result in effect until further administrative action is taken. If EPA takes further action affecting this entry, EPA will publish a notice of the action in the Federal Register.) | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| ATA CODE | CHARACTERISTICS OF CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | DATE OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| K071 | Brine purification waste from the mercury cell process in chlorine production, where separately preprecipitated brine is used | 42,120 | T | D40, T01, S01, S02, T02 | |
| K073 | Chlorinated hydrocarbon waste from the purification step of the diaphragm cell process using graphite anodes in chlorine production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K083 | Distillation bottoms from selling production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K084 | Wastewater treatment residues generated during the production of veterinary pharmaceuticals from acetone or organosolvent components | 42,120 | T | D40, T01, S01, S02, T02 | |
| K085 | Distillation or fractionation column bottoms from the production of chlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K086 | Solvent wastes and sludges, caustic wastes and sludges, or water wastes and sludges from cleaning jobs and equipment used in the formulation of ink from pigments, dyes, resins, and materials containing chlorobenzene and ink | 42,120 | T | D40, T01, S01, S02, T02 | |
| K087 | Decane tank or sludge from selling operations | 42,120 | T | D40, T01, S01, S02, T02 | |
| K088 | Spent raffinate from primary chlorobenzene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K090 | Distillation control sludge or sludge from benzenechlorobenzene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K091 | Distillation control sludge or sludge from benzenechlorobenzene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K092 | Distillation light ends from the production of phenolic isobutylide from ortho-xylene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K094 | Distillation bottoms from the production of phenolic isobutylide from ortho-xylene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K095 | Distillation bottoms from the production of 1,3-dichlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K096 | Heavy ends from the heavy ends column from the production of 1,3-dichlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K097 | Vacuum stripper discharge from the chlorobenzene chlorinator in the production of chlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K098 | Unreacted percent wastewater from the production of benzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K099 | Unreacted wastewater from the production of 2,4-D | 42,120 | T | D40, T01, S01, S02, T02 | |
| K100 | Waste handling solution from acid leaching of emission control desulfurizer from secondary lead smelting | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OF CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| K101 | Distillation residues from the distillation of acetone-based compounds in the production of veterinary pharmaceuticals from acetone or organic-acetone compounds | 42,120 | T | D40, T01, S01, S02, T02 | |
| K102 | Residue from the use of activated carbon for decolorization in the production of veterinary pharmaceuticals from acetone or organic-acetone compounds | 42,120 | T | D40, T01, S01, S02, T02 | |
| K103 | Process residues from solvent extraction from the production of acetone | 42,120 | T | D40, T01, S01, S02, T02 | |
| K104 | Condensed wastewater streams generated from chlorobenzene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K105 | Separated aqueous stream from the reaction product washing step in the production of chlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K106 | Wastewater treatment sludge from the secondary cell process in chlorobenzene production | 42,120 | T | D40, T01, S01, S02, T02 | |
| K107 | Column bottoms from product separation from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D40, T01, S01, S02, T02 | |
| K108 | Condensed column overheads from product separation and condensed reactor vent gases from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D40, T01, S01, S02, T02 | |
| K109 | Spent filter cake from product purification from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D40, T01, S01, S02, T02 | |
| K110 | Condensed column overheads from intermediate separation from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D40, T01, S01, S02, T02 | |
| K111 | Product wastewater from the production of chlorobenzene via nitration of toluene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K112 | Reaction by-product water from the drying column in the production of chlorobenzene via hydrogenation of nitrobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K113 | Condensed liquid light ends from the purification of nitrobenzene in the production of chlorobenzene via hydrogenation of nitrobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K114 | Wetends from the purification of nitrobenzene in the production of chlorobenzene via hydrogenation of nitrobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K115 | Heavy ends from the purification of nitrobenzene in the production of chlorobenzene via hydrogenation of nitrobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| WASTE CODE | CHARACTERISTICS OF CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | LOCATION OF WASTE | PROCESS CODES | PROCESS DESCRIPTION |
|------------|---|------------------------------------|-------------------|-------------------------|---------------------|
| K116 | Organic condensate from the solvent recovery column in the production of sodium diisocyanate via phosphorylation of phosgene | 42,120 | T | D40, T01, S01, S02, T02 | |
| K117 | Wastewater from the reactor vent gas scrubber in the production of ethylene diamine via bromination of ethane | 42,120 | T | D40, T01, S01, S02, T02 | |
| K118 | Spent absorption solids from purification of ethylene diamine in the production of ethylene diamine via bromination of ethane | 42,120 | T | D40, T01, S01, S02, T02 | |
| K119 | Process wastewater (including wastewater, solvent, and wastewater) from the production of ethylenediamine | 42,120 | T | D40, T01, S01, S02, T02 | |
| K124 | Reactor vent scrubber water from the production of ethylenediamine | 42,120 | T | D40, T01, S01, S02, T02 | |
| K125 | Filtration, evaporation, and centrifugation solids from the production of ethylenediamine | 42,120 | T | D40, T01, S01, S02, T02 | |
| K126 | High-purity acid and floor sweepings in milling and packaging operations from the production of ethylenediamine | 42,120 | T | D40, T01, S01, S02, T02 | |
| K131 | Wastewater from the reactor and spent sulfuric acid from the acid dryer from the production of methyl bromide | 42,120 | T | D40, T01, S01, S02, T02 | |
| K132 | Spent absorbent and wastewater separator solids from the production of methyl bromide | 42,120 | T | D40, T01, S01, S02, T02 | |
| K136 | Sulfur streams from the purification of ethylenediamine in the production of ethylene diamine via bromination of ethane | 42,120 | T | D40, T01, S01, S02, T02 | |
| K141 | Process residues from the recovery of coal tar, including, but not limited to, collecting pump residues from the purification of water from coal tar, the recovery of water from coal tar, and the recovery of water from coal tar (this listing does not include 2007 electronic waste recycling operations) | 42,120 | T | D40, T01, S01, S02, T02 | |
| K143 | The process and residues from the production of cable from coal or from the recovery of cable by-products from coal | 42,120 | T | D40, T01, S01, S02, T02 | |
| K145 | Process residues from the recovery of light oil, including, but not limited to, those generated in stills, distillers, and wash oil recovery units from the recovery of cable by-products produced from coal | 42,120 | T | D40, T01, S01, S02, T02 | |
| K146 | Wastewater pump residues from light oil including, but not limited to, intercepting or combustion pump residues from the recovery of cable by-products produced from coal | 42,120 | T | D40, T01, S01, S02, T02 | |
| K148 | Residues from wastewater collection and recovery operations from the recovery of cable by-products produced from coal | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| K147 | Tar mixture wash residues from coal tar refining | 42,120 | T | D40, T01, S01, S02, T02 | |
| K148 | Residues from coal tar distillation, including but not limited to, still bottoms | 42,120 | T | D40, T01, S01, S02, T02 | |
| K149 | Distillation bottoms from the production of alpha-(or methyl-) chlorinated solvents, vinyl-chlorinated solvents, brominated solvents, and compounds with mixtures of these functional groups (this waste does not include still bottoms from the distillation of heavy alcohols) | 42,120 | T | D40, T01, S01, S02, T02 | |
| K150 | Organic residuals, including spent carbon adsorbents, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha-(or methyl-) chlorinated solvents, vinyl-chlorinated solvents, brominated solvents, and compounds with mixtures of these functional groups | 42,120 | T | D40, T01, S01, S02, T02 | |
| K151 | Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of wastewater from the production of alpha-(or methyl-) chlorinated solvents, vinyl-chlorinated solvents, brominated solvents, and compounds with mixtures of these functional groups | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| P000 | Phenol, 2-(1-methyl-1-propyl)-4,6-dinitro-, Discrete | 42,120 | T | D40, T01, S01, S02, T02 | |
| P001 | Calcium cyanide, Calcium cyanide Ca(CN) ₂ | 42,120 | T | D40, T01, S01, S02, T02 | |
| P002 | Carbon disulfide | 42,120 | T | D40, T01, S01, S02, T02 | |
| P003 | Acetaldehyde, chloro-, Chloroacetaldehyde | 42,120 | T | D40, T01, S01, S02, T02 | |
| P004 | Benzenesulfonate, 4-chloro-, p-Chlorobenzenesulfonate | 42,120 | T | D40, T01, S01, S02, T02 | |
| P005 | Thionam, 2-chloro-2-thio-1,1-dimethyl-3-thioammonium chloride | 42,120 | T | D40, T01, S01, S02, T02 | |
| P006 | Propionitrile, 3-chloro-, 3-Chloropropionitrile | 42,120 | T | D40, T01, S01, S02, T02 | |
| P007 | Benzene, (chloromethyl)-, Benzyl chloride | 42,120 | T | D40, T01, S01, S02, T02 | |
| P008 | Copper cyanide, Copper cyanide Cu(CN) ₂ | 42,120 | T | D40, T01, S01, S02, T02 | |
| P009 | Quaternary (ammonium cyanide salts), and intermediate specified | 42,120 | T | D40, T01, S01, S02, T02 | |
| P010 | Hydrocyanic acid, Cyanogen | 42,120 | T | D40, T01, S01, S02, T02 | |
| P011 | Cyanogen chloride (DNCN), Cyanogen chloride | 42,120 | T | D40, T01, S01, S02, T02 | |
| P012 | 2-Cyanoethyl 4,6-dinitrophenyl, Phenyl 2-cyanoethyl 4,6-dinitro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| P013 | Dichlorophenylamine, Arsenous dichloride, phenyl- | 42,120 | T | D40, T01, S01, S02, T02 | |
| P014 | Dichloro, 2,7,3,6-tetrachloro-2,3,6-trichloro, 1,4,5,6,7,8-hexachloro-1,2,3,4,5,6,7,8-octachloro-, (1,4,5,6,7,8-hexachloro-2,3,6-trichloro-2,3,6-trichloro-1,2,3,4,5,6,7,8-octachloro-) | 42,120 | T | D40, T01, S01, S02, T02 | |
| P015 | Acetic acid, Diethylamine | 42,120 | T | D40, T01, S01, S02, T02 | |
| P016 | Dichloro-, Phosphorochloric acid, O-Octadecyl 1,5-[2-(ethoxyethoxy)] ester | 42,120 | T | D40, T01, S01, S02, T02 | |
| P017 | O,O-Diethyl O-ethyl phosphorothioate, Phosphorothioic acid, O,O-diethyl O-ethyl ester | 42,120 | T | D40, T01, S01, S02, T02 | |
| P018 | Phosphoric acid, diethyl 4-ethylphosphonate, Diethyl p-ethylphosphonate | 42,120 | T | D40, T01, S01, S02, T02 | |
| P019 | Phosphoric acid, 1,2-bis(methylamino)-4-[1-cyanoethyl]-3-(methoxyamino)ethyl- | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| RFA CODE | CHARACTERISTIC OF CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| P067 | Acetates, 2-methyl-, 1,2-Propanediols | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P068 | Methyl isocyanates, Hydroxides, methyl- | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P069 | 2-Methoxyethanol, Propionitrile, 2-hydroxy-2-methyl- | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P070 | Proposed, 2-methyl-2-(methylthio)-, O-[(methylthio)-methylthio] oxime, Aldicarb | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P071 | Phosphotriethyl ester, O,O'-dimethyl O-(4-methylphenyl) ester, Methyl parathion | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P072 | Thiourea, 1-methylthio-, ethyl-N-propylthiourea | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P073 | Nickel carbonyl Ni(CO) ₄ , (T-4)-, Nickel carbonyl | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P074 | Nickel cyanide, Nickel cyanide Ni(CN) ₂ | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P075 | Nicotinic acid, Pyridine, 3-(1-methyl-2-pyrrolidinyl)-, (D-), & salts | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P076 | Nitric oxide, Nitrogen oxide NO | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P077 | p-Nitroaniline, Benzene, 4-nitro- | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P078 | Nitrogen dioxide, Nitrogen oxide NO ₂ | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P081 | 1,2,3-Propanetriol, Trialkane, Nitroglycerin | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P082 | N-Nitrosodimethylamine, Methoxyamine, Nitrosyl-N-nitroso- | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P084 | N-Nitrosodimethylamine, N-nitrosodimethylamine, N-nitrosodimethylamine | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P085 | Diphosphoric acid, octamethyl-, Octamethylpyrophosphate | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P087 | Cyanide salts CuO ₂ , (T-4)-, Cyanide cyanide | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P088 | Butadiene, 2-methyl-2,3-dicyanobut-2-ene, 2,3-dicyanobut-2-ene | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P089 | Phosphoric acid, O,O'-dimethyl O-(4-methylphenyl) ester, Phosphine | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P092 | Phosphoric acid, Methyl-, (acetoxy)-dimethyl- | Q, 120 | T | D60, T01, S01, S02, T02 | |
| P093 | Thiourea, phosph-, Phosphothiourea | Q, 120 | T | D60, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| P004 | Phosphorothioic acid, O,O-dimethyl-S-[(methylthio)methyl] ester; Phosmus | 42,120 | T | D40, T01, S01, S02, T02 | |
| P005 | Phosgene, Carbonyl dichloride | 42,120 | T | D40, T01, S01, S02, T02 | |
| P006 | Phosphine, Hydrogen phosphide | 42,120 | T | D40, T01, S01, S02, T02 | |
| P007 | Phosphorus, Phosphorothioic acid, O-[4-[(dimethyl-amino)methyl]phenyl] O,O-dimethyl ester | 42,120 | T | D40, T01, S01, S02, T02 | |
| P008 | Potassium cyanide, Potassium cyanide KCN | 42,120 | T | D40, T01, S01, S02, T02 | |
| P009 | Potassium silver cyanide, Argentocyanide, KAg(CN) ₂ , potassium | 42,120 | T | D40, T01, S01, S02, T02 | |
| P101 | Red oil cyanide, Propionitrile | 42,120 | T | D40, T01, S01, S02, T02 | |
| P102 | Resorcinol alcohol, 2-Pyrogallol-1-ol | 42,120 | T | D40, T01, S01, S02, T02 | |
| P103 | Selenic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| P104 | Silver cyanide Ag(CN), Silver cyanide | 42,120 | T | D40, T01, S01, S02, T02 | |
| P105 | Sodium azide | 42,120 | T | D40, T01, S01, S02, T02 | |
| P106 | Sodium cyanide, Sodium cyanide Na(CN) | 42,120 | T | D40, T01, S01, S02, T02 | |
| P108 | Strychnine-10-ene, 8-ene, Strychnine, 8-ene | 42,120 | T | D40, T01, S01, S02, T02 | |
| P109 | Thiophosphoric acid, isopropyl ester, Tripropylthiophosphorothioic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| P110 | Phosphorus, triethyl-, Triethylphosphine | 42,120 | T | D40, T01, S01, S02, T02 | |
| P111 | Triethyl phosphorothioic acid, triethylphosphorothioic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| P112 | Tetraethylenesulfone, Tetraethylenesulfone | 42,120 | T | D40, T01, S01, S02, T02 | |
| P113 | Thiolic acid, Thiocyanic acid, Thiocyanic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| P114 | Thiophosphoric acid, diisopropyl ester, Triisopropyl phosphorothioic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| P115 | Thiophosphoric acid, diisopropyl ester, Triisopropyl phosphorothioic acid | 42,120 | T | D40, T01, S01, S02, T02 | |
| P116 | Thiophosphoric acid, diisopropyl ester, Triisopropyl phosphorothioic acid | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| SWA CODES | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|-----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| P118 | Methanol, ethylene, Trichloroethylene | 43,120 | T | D40, T01, S01, S02, T02 | |
| P119 | Vanadic acid, ammonium salt, Ammonium vanadate | 43,120 | T | D40, T01, S01, S02, T02 | |
| P120 | Vanadium oxide V_2O_5 , Vanadium pentoxide | 43,120 | T | D40, T01, S01, S02, T02 | |
| P121 | Zinc cyanide $Zn(CN)_2$, Zinc cyanide | 43,120 | T | D40, T01, S01, S02, T02 | |
| P122 | Zinc phosphide Zn_3P_2 when present at concentrations greater than 10% | 43,120 | T | D40, T01, S01, S02, T02 | |
| P123 | Toxaphene | 43,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| WPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| U001 | [1,1'-Biphenyl]-4,4'-diamine, Benzidine | 42,120 | T | D40, T01, S01, S02, T02 | |
| U002 | Benzaldehyde | 42,120 | T | D40, T01, S01, S02, T02 | |
| U003 | Benzonitrile, Benzonitrile (6-chlorobenzonitrile) | 42,120 | T | D40, T01, S01, S02, T02 | |
| U004 | Dichloromethane, Ethane, 1,1'-[methylenebis(methylene)]bis(2-chloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U005 | Ethane, 1,1'-methylenebis(2-chloro-), Dichloromethyl ether | 42,120 | T | D40, T01, S01, S02, T02 | |
| U006 | Chlorophenol, Naphthalene, N,N'-bis(2-chloromethyl)- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U007 | Dichloromethyl ether, Propane, 2,2'-methylenebis(2-chloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U008 | 1,2-Bis(methylenebis(2-chloro-))bis(2-chloromethyl) ether, Dichloromethyl phthalate | 42,120 | T | D40, T01, S01, S02, T02 | |
| U009 | Methanol, Isopropanol, Methyl bromide | 42,120 | T | D40, T01, S01, S02, T02 | |
| U010 | Benzene, 1,2,3,4-tetrahydro-4-benzopyran, 4-benzopyran, phenyl ether | 42,120 | T | D40, T01, S01, S02, T02 | |
| U011 | n-Butyl alcohol, 1-butanol | 42,120 | T | D40, T01, S01, S02, T02 | |
| U012 | Calcium chromate, Chromic acid H ₂ CrO ₄ , calcium salt | 42,120 | T | D40, T01, S01, S02, T02 | |
| U013 | Carbon tetrachloride, Carbonic chloride | 42,120 | T | D40, T01, S01, S02, T02 | |
| U014 | Calcium, Acetaminophen, n-chloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U015 | Chlorobenzene, Benzene, 4-chlorobenzene, 4-bis(2-chloromethyl)benzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| U016 | Chlorobenzene, 4-chlorobenzene, 4,7-Methylenebis(2-chlorobenzene), 1,2,4,5,6,7,8-octachloro-2,3,5,6-tetrahydro-1,4-benzodioxane | 42,120 | T | D40, T01, S01, S02, T02 | |
| U017 | Benzene, chloro-, Chlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| U018 | Chlorobenzene, Benzene, 4-chlorobenzene, 4-chlorobenzene, 4-chlorobenzene, 4-chlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| U019 | p-Chloro-aniline, Phenol, 4-chloro-3-methyl- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U021 | Epichlorohydrin, Chlorine, (chloromethyl)- | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED AMOUNT OF WASTE | DATE OF MEASUREMENT | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|---------------------------|---------------------|-------------------------|---------------------|
| U002 | Isobutene, 2-chloroethoxy-, 2-chloroethyl vinyl ether | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U003 | Isobutene, chloro-, Vinyl chloride | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U004 | Chlorobenzene, Methanol, Trichloro- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U005 | Methanol, chloro-, Methyl chloride | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U006 | Chloroethyl methyl ether, Methanol, chloroethoxy- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U007 | Isobutene, Chloroethoxy-, Naphthalene, 2-chloro- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U008 | o-Chlorophenol, Phenol, 2-chloro- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U009 | 4-Chloro-4-nitrophenol, Hydrochloric acid, 4-chloro-3-methyl-, Hydrochloric acid | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U010 | Chloroform | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U011 | Chloroform | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U012 | Chloroform (Chloroform), Phenol, methyl- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U013 | Chloroform, 2-methyl- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U014 | Phenol, (1-methyl)ethoxy-, Chloroform | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U015 | Cyclohexanone, Phenol, methyl- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U016 | Cyclohexanone, Phenol, methyl- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U017 | Cyclohexanone | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U018 | Cyclohexanone, 2,4,6-trichlorophenyl-2-amine, N,N-bis(2-chloroethyl) methoxy-, 2-oxide | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U019 | 5,12-Naphthoquinone, 2-oxo-10- (1-oxo-2,3,6-trimethyl-4-oxo-1,4-dihydro-2H-pyran-2-yl)-, 3,3,10-trimethyl-4,8,11-trimethoxy-1-methoxy-, (R,R)-, (S,S)-, Diastereoisomers | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U020 | Dioxin, Benzene, 1,1'-di-2,2-dichloroethoxy/dioxin [4-chloro- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U021 | Dioxin, Benzene, 1,1'-di-2,2-dichloroethoxy/dioxin [4-chloro- | Q, 120 | T | D00, T01, S01, S02, T02 | |
| U022 | Dioxin, Cyclohexanone, 2,4,6-trichlorophenyl-2-amine, N,N-bis(2-chloroethyl) methoxy-, 2-oxide | Q, 120 | T | D00, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| U063 | Dioxin/Aroclor | 42,120 | T | D40, T01, S01, S02, T02 | |
| U064 | Benzofluoranthene, Fluoranthene | 42,120 | T | D40, T01, S01, S02, T02 | |
| U065 | 1,2-Dichloro-3-chlorophenyl, Propane, 1,2-dichloro-3-chloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U066 | Benzene, 1,2-dichloro-, Benzene, 1,2-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U067 | Methane, chloro-, Methane, chloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U068 | Dibenzyl phosphine, 1,2-bis(methylphosphoryl) ethane, dibenzyl ester | 42,120 | T | D40, T01, S01, S02, T02 | |
| U069 | 6-Dichlorocyclohexane, Benzene, 1,2-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U070 | 1,2-Dichloroethane, Benzene, 1,2-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U071 | 1,2-Dichloroethane, Benzene, 1,2-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U072 | Benzene, 1,4-dichloro-, p-Dichlorobenzene | 42,120 | T | D40, T01, S01, S02, T02 | |
| U073 | 3,3'-Dichlorodiphenyl, 1,1'-Bis(2,4,6-trichlorophenyl) ethane, 3,3'-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U074 | 1,4-Dichlorobenzene, 2-benzene, 1,4-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U075 | Methane, dichloroethane-, Dichloroethane | 42,120 | T | D40, T01, S01, S02, T02 | |
| U076 | Benzene, dichloro-, Benzene, 1,1-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U077 | Benzene, dichloro-, Benzene, 1,2-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U078 | 1,1-Dichloroethane, Benzene, 1,1-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U079 | 1,2-Dichloroethane, Benzene, 1,2-dichloro-, (R) | 42,120 | T | D40, T01, S01, S02, T02 | |
| U080 | Methane, dichloro-, Methane, chloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U081 | 2,4-Dichlorophenyl, Phenol, 2,4-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U082 | 2,6-Dichlorophenyl, Phenol, 2,6-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U083 | Propane, 1,2-dichloro-, Propylene dichloride | 42,120 | T | D40, T01, S01, S02, T02 | |
| U084 | 1,3-Dichloropropane, 1-Propane, 1,3-dichloro- | 42,120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| HAZ CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| U008 | 1,4-Dioxane, 1,4-Dichlorobenzene | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U009 | 1,2-Dichloroethane, Hydrocarbons, 1,2-Dibromochloroethane | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U010 | Dibromofluorides, 1,2-Dibromodichloroethane, N-propyl | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U011 | Di-n-propylamine, 1-Propenamine, N-butyl-N-propyl | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U012 | Acetic acid ethyl ester, Ethyl acetate | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U013 | Ethyl acetate, 2-Propenoic acid, ethyl ester | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U014 | Ethylacetate, 2-Propenoic acid, ethyl ester, Carbonic acid, 1,2-ethanedithiol, salts & esters | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U015 | Ethylene oxide, Oxidant | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U016 | Ethylacetate, 2-Propenoic acid, ethyl ester | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U017 | Ethyl acetate, Ethanol, 1,1'-oxybis | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U018 | Ethyl acetate, 2-Propenoic acid, 2-methyl-, ethyl ester | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U019 | Ethyl acetate, 2-Propenoic acid, 2-methyl-, ethyl ester | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U020 | Formaldehyde | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U021 | Malonic, trichloro-, Trichloromethylmethane | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U022 | Monochloro | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U023 | Formic acid | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U024 | Perfluoro, Penta | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U025 | 2,4-Dichloropentadiene, Perfluoro | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U026 | Chloroethylene, Octamethylcyclotrisiloxane | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U027 | Butene, Isobutene, Hexamethylcyclotrisiloxane | Q, 120 | T | D40, T01, S01, S02, T02 | |
| U028 | 1,3-Butadiene, 1,1,2,3,4,4-hexachloro-, Hexachlorocyclopentadiene | Q, 120 | T | D40, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTICS OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| U150 | Methylol, L-Phenylmethane, 4-Dimethylamino-2-methyl- | 42,120 | T | D40, T01, S01, S02, T02 | |
| U151 | Mercury | 42,120 | T | D40, T01, S01, S02, T02 | |

TRIASSIC PARK WASTE DISPOSAL FACILITY

Gandy Marley, Inc.
Tatum, New Mexico

REQUEST FOR SUPPLEMENTAL INFORMATION
TRIASSIC PARK PERMIT APPLICATION

May 1999

RCRA Permits Management Program, Hazardous and Radioactive Materials Bureau (RPMP/HRMB) staff of the New Mexico Environment Department have reviewed the Triassic Park Hazardous Waste Management Disposal Facility (the Facility) Permit application submitted in December 1997 (Vols. I and III revised in November 1998). In a letter dated March 11, 1999, the RPMP/HRMB provided a request for supplemental information in a series of questions prepared by RPMP/HRMBN and their subcontractor Techlaw.

This document provides a response to each comment. The format includes a presentation of the original comment as submitted by RPMP/HRMB. Text presented "in bold" is taken directly from the text of the Facility Permit Application. The response follows each question and is presented in *italics*.

GENERAL COMMENTS

Comment 1.

The stabilized waste portion of the Roll-Off Container Storage Area must be addressed in the Permit application as a regulated unit under the proposed RCRA Permit.

Response: The stabilized waste portion of the Roll-Off Container Storage area will be added to the permit as a permitted unit. The necessary changes will be made to incorporate the area into the permit application.

Comment 2.

The Truck Wash Area must be addressed in the Permit application as a regulated unit under the proposed RCRA Permit.

Response: The Truck Wash Area will generate derived waste and therefore, is not subject to the RCRA permitting requirements. All potential waste generated in this area will be tested and subject to the 90 day storage limitation. The area is shown in the Waste Analysis Plan as a potential generator site for site generated waste (NMED concurrence 5/4/99).

Comment 3.

The Permit application, Vol. I, Section 3.7, *Groundwater Protection Requirements*, p. 3-25, regarding groundwater protection requirements is currently incomplete. The application suggests a separate submittal would follow requesting the substitution of vadose zone monitoring for groundwater monitoring. A draft letter from Gandy Marley's contractor dated November 9, 1998 proposes a groundwater monitoring equivalency demonstration (GMED) to justify vadose zone monitoring.

The November 9, 1998 letter correctly states that the Secretary of the New Mexico Environment Department (NMED) can waive groundwater monitoring requirements if there is concurrence that there is no potential for migration of liquid from the regulated unit to the uppermost aquifer. NMED must withhold making this concurrence decision until a complete application, with all questions answered (see Comments No. 23 through No. 33 and Comments No. 75 and No. 76), is provided. Furthermore, NMED reserves the authority to

Response: The bullet is correct, the facility will not accept liquid wastes containing > 50ppm PCBs. The reviewer is referred to 40 CFR 268.42(a)(1) which states, "Liquid hazardous wastes containing polychlorinated biphenyls (PCBs) at concentrations greater than or equal to 50 ppm but less than 500 ppm must be incinerated in accordance with the technical requirements of 40 CFR 761.70 or burned in high efficiency boilers in accordance with the technical requirements of 40 CFR 761.60." Other PCB media contaminated at concentrations above 50 ppm will be accepted at the facility. These media include non-liquid waste (i.e., rags, debris, etc) and sludges which meet the facility requirements for free liquids and defined in 40 CFR 761.60(a)(5) and PCB contaminated articles as defined in 40 CFR 761.60(b) as being acceptable for a permitted landfill.

- c. 2nd paragraph. The wastes which will be accepted for placement in the landfill include all wastes listed in Part A of this application...

This section does not really address the nature and quantity of waste to be received from off-site generators. Part A does not provide a lot of information, since it seems to have been prepared to cover all eventualities regarding the possible quantity for each hazardous waste constituent. RPMP realizes that the nature and quantity of waste accepted from off-site generators cannot be precisely specified, but would appreciate available estimates and information Gandy Marley may have on the probable kinds and quantities of hazardous waste to be received.

Response: The initial estimates of waste inflow to size the first phase was based on approximately 15,000 cy per month. This turns out to be 180,000 cy per year. Phase 1A of the landfill has a waste capacity of 553,232 (Table 3, Page 3-20, Volume III). Therefore, the first phase would have capacity for approximately 3-yrs of waste placement.

Recommended Changes: None.

- d. The landfill will have...a capacity of approximately 10 million cubic yards of waste.

Response: See Comment 4a.

Comment 17.

Section 2.5.1.7, *Wind Dispersal Control Procedures*, p. 2-17. Wind dispersal control will consist of a daily soil cover obtained from excavation. Typically, the daily cover will consist of soil spread on top of the waste placement area to a depth of 0.2-foot to 0.5-foot.

The daily cover should be 6 inches at a minimum. The daily cover must cover all disposed waste.

Response: There is no regulatory requirement for minimum daily cover thickness. However, GMI will modify the minimum cover thickness to 0.5 feet.

Recommended Changes: Minimum cover thickness will be 0.5 feet.

Comment 18.

Section 2.5.1.8, *Gas Generation Management*, p. 2-18.

- a. 2nd paragraph. ...periodic checks will be made within the landfill to detect the presence of hazardous gases and volatile organics. Surveys of the active

Re: Comments: Draft Responses to Request for Supplemental Information

Dear Mr. Gandy:

Enclosed please find comments prepared by Hazardous and Radioactive Materials Bureau (HRMB) staff on the Gandy Marley, Inc. (GMI) Draft Responses to our Request for Supplemental Information. These Draft Responses were submitted on May 25, 1999.

I believe that we have now reached agreement on several items, although some important issues remain to be discussed prior to finalizing the permit application. At this point, I suggest that a working meeting in Santa Fe to clarify and/or resolve remaining issues would be beneficial for both HRMB and GMI.

Please call Stephanie Kruse of my staff at 505/827-1558 ext. 1024 if you have any questions or comments.

Sincerely,

James P. Bearzi, Chief
Hazardous and Radioactive Materials Bureau

HAZARDOUS AND RADIOACTIVE MATERIALS BUREAU COMMENTS
on
DRAFT RESPONSES: REQUEST FOR SUPPLEMENTAL INFORMATION
submitted May 1999

The Hazardous and Radioactive Materials Bureau (HRMB) has reviewed the Gandy Marley, Inc. (GMI) draft responses to the Request for Supplemental Information issued March 11, 1999. HRMB comments are presented below.

In many cases, the GMI draft responses indicate general agreement with the HRMB RSI comment, and add that appropriate information will be added to the permit application. Without seeing the specifics of the information to be added to the permit application, HRMB's concurrence with the GMI draft responses must remain preliminary.

HRMB staff will be glad to discuss their comments on the GMI draft responses with GMI personnel. HRMB recommends a meeting, to be held in Santa Fe, between HRMB and GMI personnel to clarify and/or resolve other issues prior to finalizing the permit application.

Furthermore, based on the GMI draft response, HRMB will require, under separate cover, additional site characterization to enable processing the groundwater monitoring equivalency demonstration and the facility siting proposal.

GENERAL COMMENTS

- | | |
|------------|--|
| Comment 1. | Response is acceptable, pending review of language added to the permit application. |
| Comment 2. | Response is acceptable. |
| Comment 3. | Mr. Steve Pullen (HRMB staff) is currently discussing the correct format for GMI's groundwater monitoring waiver proposal and other requirements for this proposal with GMI staff. |

SPECIFIC COMMENTS

VOLUME 1 - PART A

- | | | |
|------------|----|--|
| Comment 4. | a. | Response is acceptable, pending review of correction made in Part A of the permit application. |
|------------|----|--|

NMED/HRMB
Comments
June 10, 1999

Gandy Marley
Draft RSI responses
May 25, 1999

- b. Response is acceptable, pending review of corrections made in Vol. I, Part A, and in Vol. III of the permit application. (See GMI response to Comment 4.a.)
- c. Response is acceptable, pending review of corrections made in Part A of the permit application.

PART B

Section 1.0, General Facility Standards

Comment 5. No response necessary.

Comment 6. The response is acceptable. The New Mexico Environment Department (NMED) will write this into the permit as a Permit Condition.

Section 2.0, Treatment, Storage and Disposal

Comment 7. Response is acceptable.

Comment 8. a. The Response and Recommended Change are acceptable.

b. Response and Recommended Change are acceptable. Vol. III should also be corrected.

Comment 9. a. Response and Recommended Change are acceptable.

b. Response is acceptable, pending review of language added to the permit application.

c. Response and Recommended Change are acceptable.

Comment 10. a.-c. Response and Recommended Change are acceptable.

Comment 11. Response is acceptable pending review of corrections to drawings and text as per responses to Comment 11 and Comment D-2a(3). Note: According to response to Comment D-2a(3), piping will not be used to transfer waste from the liquid waste storage tanks to the stabilization bins; all transfer will be by tanker trucks.

Comment 12. a. Response is acceptable. (See response to Comment 11 - no piping

from tanks to stabilization bins.)

b.-c. HRMB staff would like to discuss piping further with GMI.

d. What is the "incompatible waste" referred to and how did it get in the Liquid Waste Storage Tanks? Where is the "incompatible waste" being transferred to? The response to Comment D-2a(3) indicates that no waste will be transferred through pipes. However, this response indicates that piping will be used for this purpose. HRMB staff would like to discuss piping further with GMI.

"...If the rinsate shows to be contaminated above acceptable levels...."
What are acceptable levels?

Is this sampling of the pipes discussed in the WAP? HRMB staff would like to discuss this further with GMI.

Comment 13. a.-b. HRMB would like to discuss this further with GMI.

Comment 14. However, the assessment of the compatibilities of the bin materials and waste, along with the influence of the process (materials, time, temperature, etc.) is not contained in Vol. III. Perhaps the sentence needs to be reworded.

More disturbing, GMI's RSI response indicates that, contrary to the statement, "Waste which is incompatible with the steel used in construction will not be stabilized in the bins", some of the wastes that will be stabilized may be reactive with the steel bins. HRMB recommends that GMI replace Section 2.4.1, p. 2-12, 1st paragraph, with the information presented in the response.

HRMB would like to discuss this paragraph further with GMI.

Comment 15. Response is acceptable, pending review of corrected text.

Comment 16. a. **CK PART A FOR LISTED EXPLOSIVE WASTE.**

b. The response is acceptable. NMED will include a requirement for

GMI to obtain a permit for disposal of this waste from the US Environmental Protection Agency as a Permit Condition in the permit.

- c. Response is acceptable.
- d. Response is acceptable. See Comment 4.a.

Comment 17. Response is acceptable.

- Comment 18.
- a. HRMB would like to discuss this paragraph further with GMI.
 - b. Response and Recommended Change are acceptable, pending review of language added to Section 8.0.

- Comment 19.
- a. HRMB would like to discuss this paragraph further with GMI.
 - b. Recommended change is acceptable.

Comment 20. Response and Recommended Change are acceptable, pending review of corrections to Vol. III to indicate that only one pond is being permitted.

Comment 21. HRMB would like to discuss this further with GMI.

Section 3.0, Groundwater Protection

Comment 22. Response is acceptable.

- Comment 23
- a. Response is acceptable.
 - b. Response is acceptable pending review of language added to the permit application. HRMB understands that all the italicized paragraphs within the May 1999, draft response on pages 12, 13 and 14 will be added to the application.
 - c. Response is acceptable pending review of language added to the permit application. Please add pertinent text to the application that would assist in interpreting geophysical log groundwater information.

RE: PROPOSED HAZARDOUS WASTE LANDFILL

Dear Mr. Davis:

As we discussed by phone recently, I am enclosing some information regarding the proposed Triassic Park Hazardous Waste Landfill for your consideration:

Enclosure 1 consists of a site location map showing the location of the proposed Facility and information on land ownership in the area;

Enclosure 2 contains a list of the hazardous wastes which the Facility will be able to accept. It also contains information on wastes which will be prohibited;

Enclosure 3 shows the Facility layout. Planned operations consist of hazardous waste storage in containers (drums in the Drum Handling Building and roll-off containers on the Roll-Off Pad), treatment by evaporation in the Surface Impoundment and stabilization in four stabilization bins in the Stabilization Building, and final disposal in the Landfill. At present, on one two-celled surface impoundment and Phase IA of the Landfill will be permitted.

Other units include the truck wash unit, the maintenance shop, a chemical laboratory, the stormwater retention pond, the untarping, sampling, and weigh scales area, and the truck staging area;

Dimensions of the units which will be permitted under the Resource Conservation and Recovery Act (RCRA) are provided in Enclosure 4; and

Finally, available information on water supply and the Facility's proposal for emergency response in case of a fire are contained in Enclosure 5.

Mr. Ralph Davis
May 5, 2000
Page 2

The Hazardous and Radioactive Materials Bureau would appreciate your review of this information and information on any requirements your Office may have for the proposed Facility.

Thank you for your cooperation in this matter.

Sincerely,

A handwritten signature in cursive script that reads "Stephanie Kruse".

Stephanie Kruse, Project Manager
Triassic Park Permit

| F006 | Wastewater treatment sludges from electroplating operations except from the following processes: (1) Sulfuric acid anodizing of aluminum; (2) tin plating on carbon steel; (3) zinc plating (segregated basis) on carbon steel; (4) aluminum or zinc-aluminum plating on carbon steel; (5) cleaning/stripping associated with tin, zinc and aluminum plating on carbon steel; and (6) chemical etching and milling of aluminum | 42,120 | T | D80, T01, S01, S02, T02 | |
| F007 | Spent cyanide plating bath solutions from electroplating operations | 42,120 | T | D80, T01, S01, S02, T02 | |
| F008 | Plating bath residues from the bottom of plating baths from electroplating operations where cyanides are used in the process | 42,120 | T | D80, T01, S01, S02, T02 | |
| F009 | Spent stripping and cleaning bath solutions from electroplating operations where cyanides are used in the process | 42,120 | T | D80, T01, S01, S02, T02 | |
| F010 | Quenching bath residues from oil baths from metal heat treating operations where cyanides are used in the process | 42,120 | T | D80, T01, S01, S02, T02 | |
| F011 | Spent cyanide solutions from salt bath pot cleaning from metal heat treating operations | 42,120 | T | D80, T01, S01, S02, T02 | |
| F012 | Quenching waste water treatment sludges from metal heat treating operations where cyanides are used in the process | 42,120 | T | D80, T01, S01, S02, T02 | |
| F019 | Wastewater treatment sludges from the chemical conversion coating of aluminum except from zirconium phosphating in aluminum can washing when such phosphating is an exclusive conversion coating process | 42,120 | T | D80, T01, S01, S02, T02 | |
| F024 | Process wastes, including but not limited to, distillation residues, heavy ends, tars, and reactor clean-out wastes from the production of certain chlorinated aliphatic hydrocarbons by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chain lengths ranging from one to and including five, with varying amounts and positions of chlorine substitution. (This listing does not include wastewaters, wastewater treatment sludges, spent catalysts, and wastes listed in §261.31 or §261.32.) | 42,120 | T | D80, T01, S01, S02, T02 | |
| F025 | Condensed light ends, spent filters and filter aids, and spent desiccant wastes from the production of certain chlorinated aliphatic hydrocarbons, by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chain lengths ranging from one to and including five, with varying amounts and positions of chlorine substitution | 42,120 | T | D80, T01, S01, S02, T02 | |
| F028 | Residues resulting from the incineration or thermal treatment of soil contaminated with EPA Hazardous Waste Nos. F020, F021, F022, F023, F026, F027. | 42,120 | T | D80, T01, S01, S02, T02 | |
| F032 | Wastewaters (except those that have not come into contact with process contaminants), process residuals, preservative drippage, and spent formulations from wood preserving processes generated at plants that currently use or have previously used chlorophenolic formulations (except potentially cross-contaminated wastes that have had the F032 waste code deleted in accordance with 40 CFR 261.35 of this chapter and where the generator does not resume or initiate use of chlorophenolic formulations). This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol. | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| F034 | Wastewaters (except those that have not come into contact with process contaminants), process residuals, preservative drippage, and spent formulations from wood preserving process generated at plants that use creosote formulations. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol. | 42,120 | T | D80, T01, S01, S02, T02 | |
| F035 | Wastewaters (except those that have not come into contact with process contaminants), process residuals, preservative drippage, and spent formulations from wood preserving process generated at plants that use inorganic preservatives containing arsenic or chromium. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol. | 42,120 | T | D80, T01, S01, S02, T02 | |
| F037 | Petroleum refinery primary oil/water/solids separation sludge-Any sludge generated from the gravitational separation of oil/water/solids during the storage or treatment of process wastewaters and oily cooling wastewaters from petroleum refineries. Such sludges include, but are not limited to, those generated in: oil/water/solids separators; tanks and impoundments; ditches and other conveyances; sumps; and stormwater units receiving dry weather flow. Sludge generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges generated in aggressive biological treatment units as defined in 40 CFR 261.31(b)(2) (including sludges generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and K051 wastes are not included in this listing. | 42,120 | T | D80, T01, S01, S02, T02 | |
| F038 | Petroleum refinery secondary (emulsified) oil/water/solids separation sludge-Any sludge and/or float generated from the physical and/or chemical separation of oil/water/solids in process wastewaters and oily cooling wastewaters from petroleum refineries. Such wastes include, but are not limited to, all sludges and floats generated in: induced air flotation (IAF) units, tanks and impoundments, and all sludges generated in DAF units. Sludges generated in stormwater units that do not receive dry weather flow, sludges generated from non-contact once-through cooling waters segregated for treatment from other process or oily cooling waters, sludges and floats generated in aggressive biological treatment units as defined in 40 CFR 261.31(b)(2) (including sludges and floats generated in one or more additional units after wastewaters have been treated in aggressive biological treatment units) and F037, K048, and K051 wastes are not included in this listing. | 42,120 | T | D80, T01, S01, S02, T02 | |
| F039 | Leachate (liquids that have percolated through land disposed wastes) resulting from the disposal of more than one restricted waste classified as hazardous under subpart D of this part. (Leachate resulting from the disposal of one or more of the following EPA Hazardous Wastes and no other Hazardous Wastes retains its EPA Hazardous Waste Number(s): F020, F021, F022, F026, F027, and/or F028.) | 42,120 | T | D80, T01, S01, S02, T02 | |

| K002 | Wastewater treatment sludge from the production of chrome yellow and orange pigments | 42,120 | T | D80, T01, S01, S02, T02 | |
| K003 | Wastewater treatment sludge from the production of molybdate orange pigments | 42,120 | T | D80, T01, S01, S02, T02 | |
| K004 | Wastewater treatment sludge from the production of zinc yellow pigments | 42,120 | T | D80, T01, S01, S02, T02 | |
| K005 | Wastewater treatment sludge from the production of chrome green pigments | 42,120 | T | D80, T01, S01, S02, T02 | |
| K006 | Wastewater treatment sludge from the production of chrome oxide green pigments (anhydrous and hydrated) | 42,120 | T | D80, T01, S01, S02, T02 | |
| K007 | Wastewater treatment sludge from the production of iron blue pigments | 42,120 | T | D80, T01, S01, S02, T02 | |
| K008 | Oven residue from the production of chrome oxide green pigments | 42,120 | T | D80, T01, S01, S02, T02 | |
| K009 | Distillation bottoms from the production of acetaldehyde from ethylene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K010 | Distillation side cuts from the production of acetaldehyde from ethylene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K011 | Bottom stream from the wastewater stripper in the production of acrylonitrile | 42,120 | T | D80, T01, S01, S02, T02 | |
| K013 | Bottom stream from the acetonitrile column in the production of acrylonitrile | 42,120 | T | D80, T01, S01, S02, T02 | |
| K014 | Bottoms from the acetonitrile purification column in the production of acrylonitrile | 42,120 | T | D80, T01, S01, S02, T02 | |
| K015 | Still bottoms from the distillation of benzyl chloride | 42,120 | T | D80, T01, S01, S02, T02 | |
| K016 | Heavy ends or distillation residues from the production of carbon tetrachloride | 42,120 | T | D80, T01, S01, S02, T02 | |
| K017 | Heavy ends (still bottoms) from the purification column in the production of epichlorohydrin | 42,120 | T | D80, T01, S01, S02, T02 | |
| K018 | Heavy ends from the fractionation column in ethyl chloride production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K019 | Heavy ends from the distillation of ethylene dichloride in ethylene dichloride production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K020 | Heavy ends from the distillation of vinyl chloride in vinyl chloride monomer production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K021 | Aqueous spent antimony catalyst waste from fluoromethanes production | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| K022 | Distillation bottom tars from the production of phenol/acetone from cumene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K023 | Distillation light ends from the production of phthalic anhydride from naphthalene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K024 | Distillation bottoms from the production of phthalic anhydride from naphthalene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K025 | Distillation bottoms from the production of nitrobenzene by the nitration of benzene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K026 | Stripping still tails from the production of methy ethyl pyridines | 42,120 | T | D80, T01, S01, S02, T02 | |
| K027 | Centrifuge and distillation residues from toluene diisocyanate production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K028 | Spent catalyst from the hydrochlorinator reactor in the production of 1,1,1-trichloroethane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K029 | Waste from the product steam stripper in the production of 1,1,1-trichloroethane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K030 | Column bottoms or heavy ends from the combined production of trichloroethylene and perchloroethylene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K031 | By-product salts generated in the production of MSMA and cacodylic acid | 42,120 | T | D80, T01, S01, S02, T02 | |
| K032 | Wastewater treatment sludge from the production of chlordane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K033 | Wastewater and scrub water from the chlorination of cyclopentadiene in the production of chlordane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K034 | Filter solids from the filtration of hexachlorocyclopentadiene in the production of chlordane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K035 | Wastewater treatment sludges generated in the production of creosote | 42,120 | T | D80, T01, S01, S02, T02 | |
| K036 | Still bottoms from toluene reclamation distillation in the production of disulfoton | 42,120 | T | D80, T01, S01, S02, T02 | |
| K037 | Wastewater treatment sludges from the production of disulfoton | 42,120 | T | D80, T01, S01, S02, T02 | |
| K038 | Wastewater from the washing and stripping of phorate production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K039 | Filter cake from the filtration of diethylphosphorodithioic acid in the production of phorate | 42,120 | T | D80, T01, S01, S02, T02 | |
| K040 | Wastewater treatment sludge from the production of phorate | 42,120 | T | D80, T01, S01, S02, T02 | |
| K041 | Wastewater treatment sludge from the production toxaphene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K042 | Heavy ends or distillation residues from the distillation of tetrachlorobenzene in the production of 2,4,5-T | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTI |
|---------------------|--|---|----------------------------|-------------------------|------------------------------|
| K043 | 2,6-Dichlorophenol waste from the production of 2,4-D | 42,120 | T | D80, T01, S01, S02, T02 | |
| K044 | Wastewater treatment sludges from the manufacturing and processing of explosives | 42,120 | T | D80, T01, S01, S02, T02 | |
| K045 | Spent carbon from the treatment of wastewater containing explosives | 42,120 | T | D80, T01, S01, S02, T02 | |
| K046 | Wastewater treatment sludges from the manufacturing, formulation and loading of lead-based initiating compounds | 42,120 | T | D80, T01, S01, S02, T02 | |
| K047 | Pink/red water from TNT operations | 42,120 | T | D80, T01, S01, S02, T02 | |
| K048 | Dissolved air flotation (DAF) float from the petroleum refining industry | 42,120 | T | D80, T01, S01, S02, T02 | |
| K049 | Slop oil emulsion solids from the petroleum refining industry | 42,120 | T | D80, T01, S01, S02, T02 | |
| K050 | Heat exchanger bundle cleaning sludge from the petroleum refining industry | 42,120 | T | D80, T01, S01, S02, T02 | |
| K051 | API separator sludge from the petroleum refining industry | 42,120 | T | D80, T01, S01, S02, T02 | |
| K052 | Tank bottoms (lead) from the petroleum refining industry | 42,120 | T | D80, T01, S01, S02, T02 | |
| K060 | Ammonia still lime sludge from coking operations | 42,120 | T | D80, T01, S01, S02, T02 | |
| K061 | Emission control dust/sludge from the primary production of steel in electric furnaces | 42,120 | T | D80, T01, S01, S02, T02 | |
| K062 | Spent pickle liquor generated by steel finishing operations of facilities within the iron and steel industry (SIC Codes 331 and 332) | 42,120 | T | D80, T01, S01, S02, T02 | |
| K064 | Acid plant blowdown slurry/sludge resulting from the thickening of blowdown slurry from primary copper production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K065 | Surface impoundment solids contained in and dredged from surface impoundments at primary lead smelting facilities | 42,120 | T | D80, T01, S01, S02, T02 | |
| K066 | Sludge from treatment of process wastewater and/or acid plant blowdown from primary zinc production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K069 | Emission control dust/sludge from secondary lead smelting. (Note: This listing is stayed administratively for sludge generated from secondary acid scrubber systems. The stay will remain in effect until further administrative action is taken. If EPA takes further action effecting this stay, EPA will publish a notice of the action in the Federal Register.) | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|--|------------------------------------|-----------------|-------------------------|---------------------|
| K071 | Brine purification muds from the mercury cell process in chlorine production, where separately prepurified brine is not used | 42,120 | T | D80, T01, S01, S02, T02 | |
| K073 | Chlorinated hydrocarbon waste from the purification step of the diaphragm cell process using graphite anodes in chlorine production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K083 | Distillation bottoms from aniline production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K084 | Wastewater treatment sludges generated during the production of veterinary pharmaceuticals from arsenic or organo-arsenic compounds | 42,120 | T | D80, T01, S01, S02, T02 | |
| K085 | Distillation or fractionation column bottoms from the production of chlorobenzenes | 42,120 | T | D80, T01, S01, S02, T02 | |
| K086 | Solvent washes and sludges, caustic washes and sludges, or water washes and sludges from cleaning tubs and equipment used in the formulation of ink from pigments, driers, soaps, and stabilizers containing chromium and lead | 42,120 | T | D80, T01, S01, S02, T02 | |
| K087 | Decanter tank tar sludge from coking operations | 42,120 | T | D80, T01, S01, S02, T02 | |
| K088 | Spent potliners from primary aluminum reduction | 42,120 | T | D80, T01, S01, S02, T02 | |
| K090 | Emission control dust or sludge from ferrochromium/silicon production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K091 | Emission control dust or sludge from ferrochromium production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K093 | Distillation light ends from the production of phthalic anhydride from ortho-xylene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K094 | Distillation bottoms from the production of phthalic anhydride from ortho-xylene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K095 | Distillation bottoms from the production of 1,1,1-trichloroethane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K096 | Heavy ends from the heavy ends column from the production of 1,1,1-trichloroethane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K097 | Vacuum stripper discharge from the chlordane chlorinator in the production of chlordane | 42,120 | T | D80, T01, S01, S02, T02 | |
| K098 | Untreated process wastewater from the production of toxaphene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K099 | Untreated wastewater from the production of 2,4-D | 42,120 | T | D80, T01, S01, S02, T02 | |
| K100 | Waste leaching solution from acid leaching of emission control dust/sludge from secondary lead smelting | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| K101 | Distillation tar residues from the distillation of aniline-based compounds in the production of veterinary pharmaceuticals from arsenic or organo-arsenic compounds | 42,120 | T | D80, T01, S01, S02, T02 | |
| K102 | Residue from the use of activated carbon for decolorization in the production of veterinary pharmaceuticals from arsenic or organo-arsenic compounds | 42,120 | T | D80, T01, S01, S02, T02 | |
| K103 | Process residues from aniline extraction from the production of aniline | 42,120 | T | D80, T01, S01, S02, T02 | |
| K104 | Combined wastewater streams generated from nitrobenzene/aniline production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K105 | Separated aqueous stream from the reactor product washing step in the production of chlorobenzenes | 42,120 | T | D80, T01, S01, S02, T02 | |
| K106 | Wastewater treatment sludge from the mercury cell process in chlorine production | 42,120 | T | D80, T01, S01, S02, T02 | |
| K107 | Column bottoms from product separation from the production of 1,1-dimethyl-hydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D80, T01, S01, S02, T02 | |
| K108 | Condensed column overheads from product separation and condensed reactor vent gases from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D80, T01, S01, S02, T02 | |
| K109 | Spent filter cartridges from product purification from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D80, T01, S01, S02, T02 | |
| K110 | Condensed column overheads from intermediate separation from the production of 1,1-dimethylhydrazine (UDMH) from carboxylic acid hydrazides | 42,120 | T | D80, T01, S01, S02, T02 | |
| K111 | Product washwaters from the production of dinitrotoluene via nitration of toluene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K112 | Reaction by-product water from the drying column in the production of toluenediamine via hydrogenation of dinitrotoluene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K113 | Condensed liquid light ends from the purification of toluenediamine in the production of toluenediamine via hydrogenation of dinitrotoluene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K114 | Vicinals from the purification of toluenediamine in the production of toluenediamine via hydrogenation of dinitrotoluene | 42,120 | T | D80, T01, S04, S02, T02 | |
| K115 | Heavy ends from the purification of toluenediamine in the production of toluenediamine via hydrogenation of dinitrotoluene | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|---------------------|--|---|----------------------------|-------------------------|--------------------------------|
| K116 | Organic condensate from the solvent recovery column in the production of toluene diisocyanate via phosgenation of toluenediamine | 42,120 | T | D80, T01, S01, S02, T02 | |
| K117 | Wastewater from the reactor vent gas scrubber in the production of ethylene dibromide via bromination of ethene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K118 | Spent adsorbent solids from purification of ethylene dibromide in the production of ethylene dibromide via bromination of ethene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K123 | Process wastewater (including supernates, filtrates, and washwaters) from the production of ethylenebisdithiocarbamic acid and its salt | 42,120 | T | D80, T01, S01, S02, T02 | |
| K124 | Reactor vent scrubber water from the production of ethylenebisdithiocarbamic acid and its salts | 42,120 | T | D80, T01, S01, S02, T02 | |
| K125 | Filtration, evaporation, and centrifugation solids from the production of ethylenebisdithiocarbamic acid and its salts | 42,120 | T | D80, T01, S01, S02, T02 | |
| K126 | Baghouse dust and floor sweepings in milling and packaging operations from the production or formulation of ethylenebisdithiocarbamic acid and its salts | 42,120 | T | D80, T01, S01, S02, T02 | |
| K131 | Wastewater from the reactor and spent sulfuric acid from the acid dryer from the production of methyl bromide | 42,120 | T | D80, T01, S01, S02, T02 | |
| K132 | Spent absorbent and wastewater separator solids from the production of methyl bromide | 42,120 | T | D80, T01, S01, S02, T02 | |
| K136 | Still bottoms from the purification of ethylene dibromide in the production of ethylene dibromide via bromination of ethene | 42,120 | T | D80, T01, S01, S02, T02 | |
| K141 | Process residues from the recovery of coal tar, including, but not limited to, collecting sump residues from the production of coke from coal or the recovery of coke by-products produced from coal. This listing does not include K087 (decanter tank tar sludges from coking operations). | 42,120 | T | D80, T01, S01, S02, T02 | |
| K142 | Tar storage tank residues from the production of coke from coal or from the recovery of coke by-products from coal. | 42,120 | T | D80, T01, S01, S02, T02 | |
| K143 | Process residues from the recovery of light oil, including, but not limited to, those generated in stills, decanters, and wash oil recovery units from the recovery of coke by-products produced from coal. | 42,120 | T | D80, T01, S01, S02, T02 | |
| K144 | Wastewater sump residues from light oil refining, including, but not limited to, intercepting or contamination sump sludges from the recovery of coke by-products produced from coal. | 42,120 | T | D80, T01, S01, S02, T02 | |
| K145 | Residues from naphthalene collection and recovery operations from the recovery of coke by-products produced from coal | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|---------------------|--|---|----------------------------|-------------------------|--------------------------------|
| K147 | Tar storage tank residues from coal tar refining | 42,120 | T | D80, T01, S01, S02, T02 | |
| K148 | Residues from coal tar distillation, including but not limited to, still bottoms | 42,120 | T | D80, T01, S01, S02, T02 | |
| K149 | Distillation bottoms from the production of alpha-(or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups (this waste does not include still bottoms from the distillation of benzyl chloride). | 42,120 | T | D80, T01, S01, S02, T02 | |
| K150 | Organic residuals, excluding spent carbon adsorbent, from the spent chlorine gas and hydrochloric acid recovery processes associated with the production of alpha-(or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups. | 42,120 | T | D80, T01, S01, S02, T02 | |
| K151 | Wastewater treatment sludges, excluding neutralization and biological sludges, generated during the treatment of wastewaters from the production of alpha-(or methyl-) chlorinated toluenes, ring-chlorinated toluenes, benzoyl chlorides, and compounds with mixtures of these functional groups. | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| P001 | Warfarin, & salts, when present at concentrations greater than 0.3%, 2H-1-Benzopyran-2-one, 4-hydroxy-3-(3-oxo-1 phenylbutyl)-, & salts, when present at concentrations greater than 0.3% | 42,120 | T | D80, T01, S01, S02, T02 | |
| P002 | Acetamide, N-(aminothioxomethyl)-, 1-Acetyl-2-thiourea | 42,120 | T | D80, T01, S01, S02, T02 | |
| P003 | Acrolein, 2-Propenal | 42,120 | T | D80, T01, S01, S02, T02 | |
| P004 | Aldrin, 1,4,5,8-Dimethanonaphthalene, 1,2,3,4,10,10-hexa-chloro- 1,4,4a,5,8,8a,-hexahydro-, (1a-pha,4alpha,4abeta,5alpha,8alpha,8abeta)- | 42,120 | T | D80, T01, S01, S02, T02 | |
| P005 | 2-Propen-1-ol, Allyl alcohol | 42,120 | T | D80, T01, S01, S02, T02 | |
| P006 | Aluminum phosphide | 42,120 | T | D80, T01, S01, S02, T02 | |
| P007 | 5-(Aminomethyl)-3-isoxazolol, 3(2H)-Isoxazolone, 5-(aminomethyl)- | 42,120 | T | D80, T01, S01, S02, T02 | |
| P008 | 4-Pyridinamine, 4-Aminopyridine | 42,120 | T | D80, T01, S01, S02, T02 | |
| P009 | Phenol, 2,4,6-trinitro-, ammonium salt, Ammonium picrate | 42,120 | T | D80, T01, S01, S02, T02 | |
| P010 | Arsenic acid H_3AsO_4 | 42,120 | T | D80, T01, S01, S02, T02 | |
| P011 | Arsenic pentoxide, Arsenic oxide As_2O_5 | 42,120 | T | D80, T01, S01, S02, T02 | |
| P012 | Arsenic oxide As_2O_3 , Arsenic trioxide | 42,120 | T | D80, T01, S01, S02, T02 | |
| P013 | Barium cyanide | 42,120 | T | D80, T01, S01, S02, T02 | |
| P014 | Benzenethiol, Thiophenol | 42,120 | T | D80, T01, S01, S02, T02 | |
| P015 | Beryllium powder | 42,120 | T | D80, T01, S01, S02, T02 | |
| P016 | Dichloromethyl ether, Methane, oxybis(chloro- | 42,120 | T | D80, T01, S01, S02, T02 | |
| P017 | 2-Propanone, 1-bromo-, Bromoacetone | 42,120 | T | D80, T01, S01, S02, T02 | |
| P018 | Strychnidin-10-one, 2,3-dimethoxy-, Brucine | 42,120 | T | D80, T01, S01, S02, T02 | |

XIV DESCRIPTION OF HAZARDOUS WASTES

| EPA CODE | CHARACTERISTIC OR CONTAMINANT | ESTIMATED ANNUAL QUANTITY OF WASTE | UNIT OF MEASURE | PROCESS CODES | PROCESS DESCRIPTION |
|----------|---|------------------------------------|-----------------|-------------------------|---------------------|
| P020 | Phenol, 2-(1-methylpropyl)-4,6-dinitro-, Dinoseb | 42,120 | T | D80, T01, S01, S02, T02 | |
| P021 | Calcium cyanide, Calcium cyanide Ca(CN) ₂ | 42,120 | T | D80, T01, S01, S02, T02 | |
| P022 | Carbon disulfide | 42,120 | T | D80, T01, S01, S02, T02 | |

II.A.3. Zoning

The Permittee shall submit to the Secretary a copy of the appropriate zoning change for the Facility site approved by the appropriate Chaves County authorities as specified at Permit Attachment A, Section 1.3, *Location Information*, before initiation of operations at the Facility, in accordance with Permit Condition I.J.

II.B. PERMITTED AND PROHIBITED WASTE

II.B.1. Permitted Waste

The Permittee shall accept only the hazardous wastes identified at Permit Attachment B, *Permit Application, Part A*, as listed at Table II-1.

II.B.2. Prohibited Waste

II.B.2.a. Prohibited waste streams

As specified at Permit Attachment A, Section 2.5.1.1, *Nature and Quantity of Waste*, and Permit Attachment D, *Waste Analysis Plan*, Section 4.2.2, *Prohibited Waste*, the Permittee is prohibited from accepting, storing, treating, or disposing of the following wastes:

- radioactive/nuclear wastes;
- dioxin-contaminated wastes (F020, F021, F023, F026, and F027 wastes);
- medical wastes;
- municipal solid wastes, except small quantity generator waste;
- construction and demolition debris;
- explosive wastes;
- compressed gases;
- ignitable liquids;

liquid wastes containing polychlorinated biphenyls (PCBs) that are ignitable and/or with a concentration greater than or equal to 50 parts per million (ppm);

soils containing PCBs with a concentration greater than 500 ppm;

special wastes, except sludges; and

unknown or unidentified wastes.

II.B.2.b. Other prohibited waste streams

II.B.2.b.i. PCB-contaminated soils

The Permittee is prohibited from managing soils containing PCBs at a concentration equal to or greater than 500 ppm until a Permit from EPA for management of these Toxic Substances Control Act (TSCA) wastes is obtained, as specified at Permit Attachment D, Section 4.2.1, *Eligible Waste*. A copy of such Permit shall be transmitted to the Secretary.

II.B.2.b.ii. Radioactive hazardous waste streams

The Permittee is prohibited from managing naturally occurring radioactive material (NORM) or equipment from oil, gas, and water production containing hazardous constituents unless it is exempt from the requirements of the New Mexico Radioactive Materials and Radiation Machines Regulations, 20 NMAC 3.1, Subpart 14, i.e., the maximum radiation exposure reading at any accessible point does not exceed 50 microroentgens per hour ($\mu\text{R/hr}$), and the maximum radiation reading for sludges and scales contained in oil, gas, and water production equipment does not exceed 50 $\mu\text{R/hr}$, or, if the radiation readings for removable sludges and scales exceed 50 $\mu\text{R/hr}$, the concentration of Radium 226, in a representative sample, does not exceed 30 picocuries per gram (pCi/g).

II.B.2.c. Wastes prohibited from specific units

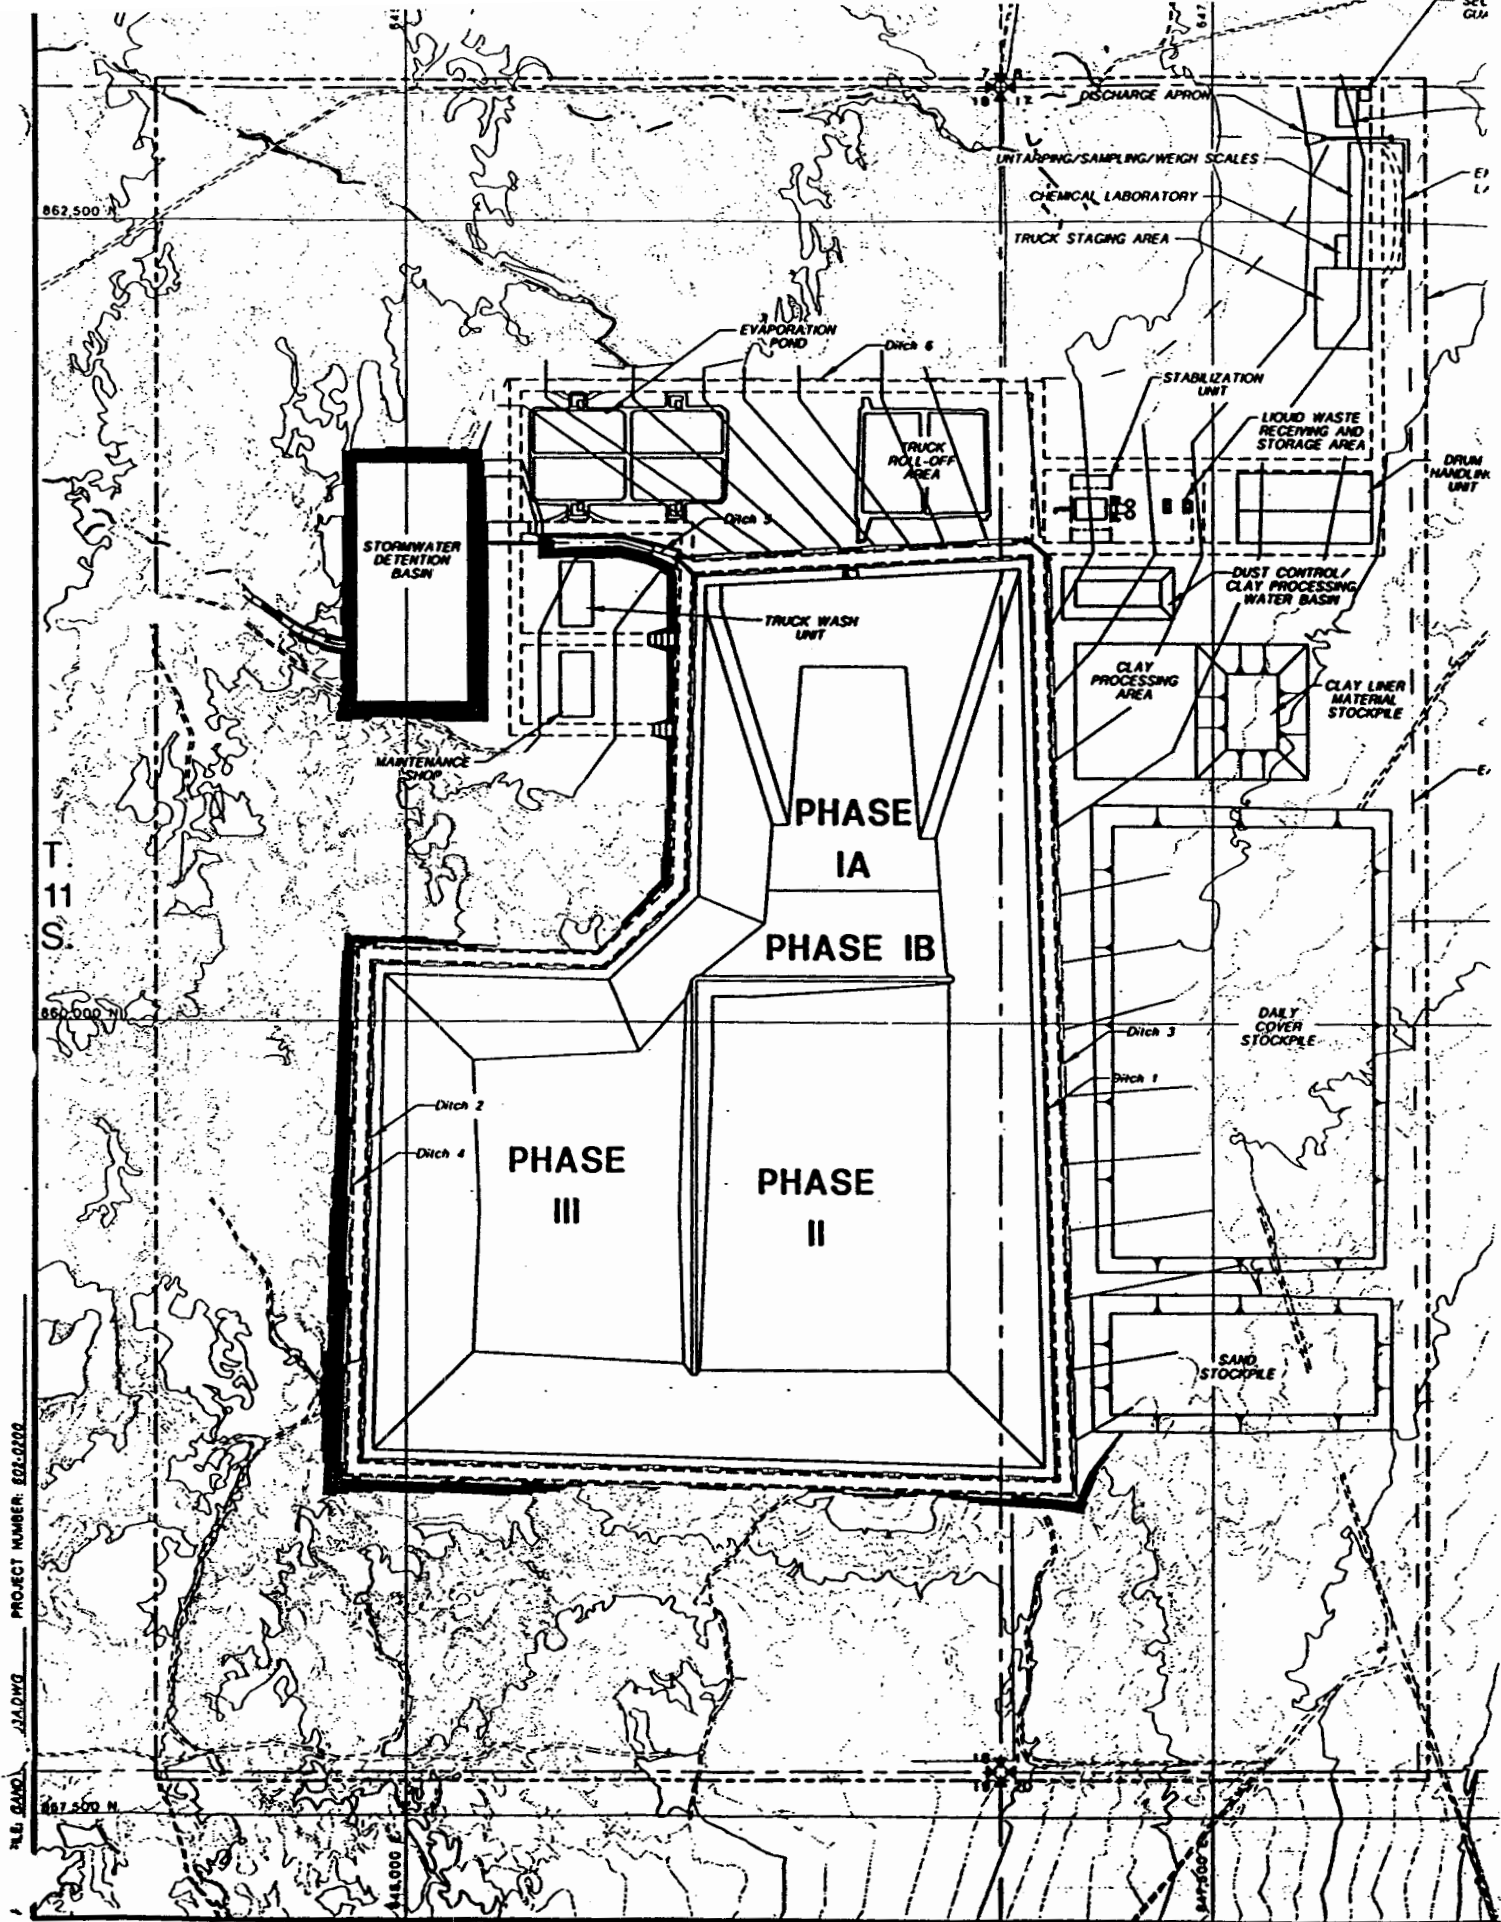

The Permittee is prohibited from managing specific wastes in specific units as required under Permit Conditions III.A.4., IV.A.4., V.ee., and VI.ff.
[Permit Conditions to be inserted when identified.]

**DIMENSION OF PROPOSED PERMITTED UNITS
TRIASSIC PARK HAZARDOUS WASTE DISPOSAL FACILITY**

| <u>Units</u> | <u>Dimensions</u> | <u>Maximum Allowable Capacity</u> |
|-----------------------------------|---|--|
| Drum Handling Unit | | |
| 7 cells | 52 ft by 63 ft/ cell | 160 55-gal drums or equivalent/cell Total: 1,120 55-gal drums or equivalent (61,000 gal) |
| Roll-Off Container Unit | | |
| 2 cells | 220 ft by 160 ft/cell | 44 20-yd ³ roll-off containers or roll-off container equivalent (880 yd ³)/cell Total: 88 20-yd ³ roll-off containers or roll-off container equivalent (1,760 yd ³) |
| Liquid Waste Storage Tanks | | |
| 4 tanks | 10 ft by 16 ft (diameter)/tank | 9,000 gal/tank Total: 36,000 gal |
| Treatment Tanks | | |
| 4 bins | 25 ft by 10 ft by 10 ft/ stabilization bin | 2,500 ft ³ /bin Total: 10,000 ft ³ |
| Surface Impoundment | | |
| 2 cells | 78,600 feet (combined area) | Total: 5.2 million gal |
| Landfill | | |
| Phase 1A | 47 acres | 553,200 yd ³ |

ENCLOSURE 5

New Mexico Environment Department
Hazardous and Radioactive Materials Bureau

Letter: New Mexico State Fire Marshal's Office
May 5, 2000

5.3.3 Emergency Equipment

Emergency response equipment at the Facility includes fire extinguishers and other fire control equipment, spill cleanup kits, and decontamination kits. Each processing area regulated storage unit will be equipped with fire control and spill response equipment. Equipment in the stabilization unit will be used for the tank storage area and roll-off storage area because of their close proximity. A detailed description of this equipment, including the content and type, is included in Appendix M in Volume II and is discussed in the Contingency Plan contained in Section 6.0.

A complete list of the contents and location of the various types of kits will be maintained in the EC's office at the Facility.

5.3.4 Water for Fire Control

Permanent buildings at the Facility will be equipped with automatic sprinkler systems and fire extinguishers, as required by the National Fire Protection Association (NFPA) code. The sprinkler systems will be designed according to NFPA guidelines. Water to fight fires outside of buildings and the landfill will be available in water truck(s). It is expected that landfill fires, in the unlikely event that they occur, will be extinguished with a dirt cover. A ready supply of dirt will be available at the excavation stockpile and landfill and general facility equipment (dozers, loaders and scrapers) will be available to load, haul and place dirt.

5.3.5 Required Aisle Space

The aisle between double rows of containers in the drum handling unit will be 30 inches wide, and roll-off containers will be placed 4 feet apart and 4 feet from the edge of the berm. Such spacing will allow for the unobstructed movement of personnel, fire protection equipment, spill control equipment, and decontamination equipment in the event of an emergency. Drums will only be staked one high.

5.3.6 Arrangements with Local Authorities

The Facility will make arrangements with local authorities as described in the Contingency Plan (see Section 6.0).

5.4 PREVENTIVE PROCEDURES, STRUCTURES, AND EQUIPMENT

To prevent accidents at the Facility, all individuals responsible for material and waste handling will receive classroom and on-the-job instruction in safety awareness, recognition of potential hazards in the work place, environmental procedures and policies, and fire prevention and control procedures. Individuals who may come in contact with hazardous waste will receive Occupational Safety and Health Administration (OSHA) 40-hour training. These individuals also will be trained in the operation of the equipment and vehicles they will be using to perform their duties.

Safety meetings will be conducted as necessary to discuss safety issues, fire prevention and control, good housekeeping and any problems relating to specific areas of the site.

5.4.1 Loading, Unloading, and Waste Transfer Operations

To prevent accidents during loading, unloading, and waste transfer, hazardous waste will be handled only by those individuals who have been properly trained in correct handling procedures and proper

This submittal supersedes all previous information.

The run-off management system will be capable of collecting the water volume resulting from at least a 24-hour, 25-year storm. Run-off in the active portion of the landfill will be collected in the LCRS. The run-on and run-off control system for the landfill is described in greater detail in Section 2.5.1.6.

The area surrounding the evaporation pond will be graded to carry stormwater run-off towards the drainage ditch to the south of the evaporation pond area. This ditch will ultimately empty into the site stormwater detention pond. The perimeter of the evaporation pond is elevated to prevent stormwater run-on into the pond from surrounding areas.

Inspection of the run-off and run-on ditches for the landfill and evaporation pond will be made during daily and weekly site inspections.

5.4.3 Wind Dispersal Control System

The active portion of the landfill will either be covered or managed to control the wind dispersal. In general, dust control will be accomplished by spraying water on the active portion of the landfill and any road or area subject to wind dispersal. Adding water to prevent wind erosion will be limited so that ponding in the landfill does not occur. Additional detail about wind dispersal procedures can be found in Section 2.5.1.7.

5.4.4 Water Supply Protection

The Facility will coordinate intended water use with the State Engineer's Office, Water Rights Division, and other appropriate agencies. The domestic water supply (via underground water line from a spring in the Ogallala formation located approximately one mile east of the Facility) will be protected by the following: (1) natural means because of its location; (2) the design of the landfill; (3) the type of waste that will be accepted at the Facility; and (4) the method of response to releases to soil. Each is discussed in more detail below.

Natural geologic and hydrologic conditions in the area include the following characteristics.

- the Upper Dockum unit is unsaturated beneath the selected site;
- the Lower Dockum consists of a 600-foot thickness of homogeneous, lacustrine mudstone. This sequence of unsaturated, low permeability mudstones represents a geologic barrier to potential downward migration of contaminants from the landfill (see Section 3.0); and,
- the nearest surface water is the Pecos River, approximately 30 miles to the west of the Facility.

The landfill design includes removal of the 10-foot deep layer of alluvial material on the surface of the disposal site prior to construction of the cells, thus eliminating the possibility of hazardous constituents entering the alluvium and migrating away from the Facility.

Free liquid hazardous waste will be placed in the landfill only in accordance with 40 CFR 264.314(d). In addition, no non-hazardous liquid waste will be placed in the landfill. These limitations on the introduction of liquids into the landfill will minimize the generation of leachates and the potential for the migration of any hazardous constituents from the Facility.

This submittal supersedes all previous information.

6.3.3 Assessment of Hazard

Concurrent with the waste identification and characterization phase of the emergency response, the EC will assess possible hazards to human health or the environment that may result from the emergency situation. Indirect and direct effects of the release, fire, or explosion will be considered during this assessment. Examples of direct and indirect effects include the impacts of any toxic, irritating, or asphyxiating gases that are generated or the effects of any hazardous surface water runoff from water or chemical agents used to control a fire.

During this phase of the emergency response, the EC will consider the following information to determine potential risk to human health or the environment:

- the location from which the material or waste is emanating;
- the weather patterns and wind direction at the time of the release; and,
- the characteristics of the released material, including physical, reactive, and human or animal toxicity.

The EC may choose to obtain emergency response guidance by contacting one or more of the emergency response organizations listed in Appendix J (Volume II) or by utilizing various spill control reference textbooks and MSDSs located in the EC's office.

6.3.4 Off Site Notification and Evacuation Criteria

If the EC determines that a release, fire, or explosion has occurred at the Facility that poses an immediate threat to onsite or off site human health and/or the environment, the findings will be reported to appropriate response personnel as follows:

- local authorities will be immediately notified if an emergency incident at the Facility could affect local areas and if evacuation of these areas is necessary. The EC will be available to assist appropriate officials in deciding whether local areas should be evacuated (evacuation plans are provided in Appendix L, Volume II); and,
- the local authorities will be notified with the following information:
 - ◊ the name and telephone number of the reporter;
 - ◊ the name and address of the Facility;
 - ◊ the time and type of incident that occurred;
 - ◊ the name and quantity of material(s) involved, to the extent that this is known;
 - ◊ the extent of injuries, if any; and,
 - ◊ the possible hazards to human health or the environment outside the Facility.

Coordinating agreements will be signed with federal, state, and local emergency response organizations. The agencies with which the Facility will enter these agreements are listed in

This submittal supersedes all previous information

Appendix J presented in Volume II. The agreements outline the conditions under which the agencies will be contacted and the roles they will assume during various emergency scenarios at the Facility. The agreements establish the EC as the lead coordinator of all emergency response activities at the Facility. The details of these agreements will be located in the EC's office and with each of the participating organizations. The agreements will be considered controlled documents and will be kept current by updating all copies each time a change is made. This ensures a coordinated response to all emergency situations.

The EC may contact one or more of the agencies, such as police, fire departments, or hospitals, as listed in Appendix J (Volume II), if additional assistance is needed at the site to protect community populations.

6.3.5 Response and Control Procedures

Following proper notification of agencies and/or evacuation of the Facility, the EC will initiate response and control procedures. This effort will involve the use of emergency equipment, which is listed in Appendix M in Volume II. This list also includes equipment descriptions and locations.

Potential incidents for which response and control procedures are necessary will be grouped into three broad categories: (1) fires and/or explosions; (2) spills, leaks, or other releases; and (3) power failures. A brief discussion of emergency training requirements and the general procedures for handling each of these situations are described in the following sections.

Facility personnel and supervisors will receive safety training to enable them to respond to and handle various emergency situations that are not of a serious nature. In addition to this training, employees will participate in emergency response drills on a periodic basis. These drills will involve both internal responses and those response actions taken in conjunction with external emergency response personnel. Key personnel will be familiar with the use of emergency equipment and fire control structures available to prevent the spread of fires in their areas. To prevent recurrence of an incident, any faulty or defective monitoring equipment, valves, pumps, alarms, or other equipment will be repaired. If repair is not possible, the equipment will be replaced. The unit will not receive hazardous waste until the minimum required equipment for safe operation is fully functional.

Procedures for ensuring that incompatible wastes are not treated, stored, or located in areas where a spill has occurred are addressed in Section 6.3.7.

6.3.5.1 Fire and/or Explosion Control Procedure

If a fire or explosion occurs at the Facility that may impact an active hazardous waste management unit or hazardous material storage area, the Contingency Plan will be immediately implemented, as outlined in Section 6.3. The EC will assess the situation and direct the emergency response effort. The EC will also be responsible for advising emergency response personnel of the hazards associated with released materials and other areas that should be protected from the effects of the incident.

In the event that a fire cannot be brought immediately under control and hazardous waste or material are located in the path of the fire or in an otherwise dangerous place, the waste or materials will be relocated to a safer area, if possible. If this is not possible, the material may be sprayed with an appropriate fire suppressant, at the direction of the EC or under the advisement of fire department personnel.

This submittal supersedes all previous information

If an explosion is likely to occur, for example because a fire threatens to envelop ignitable waste, the EC may choose to evacuate the area, as described in Appendix L presented in Volume II.

Facility employees will be trained and advised to stay in their work areas during emergency situations, unless they are in immediate danger, until they receive further direction via the PA system or other method of communication. If evacuation is necessary, the EC will communicate this via the PA system and by other means, as necessary, and all employees will assemble at the administration building. If anyone is unaccounted for, emergency response personnel will conduct searches.

After the effected areas have been evacuated, re-entry will be authorized by the EC only after the fire has been extinguished and when the emergency has been resolved.

Any equipment used during the incident will be checked for contamination and cleaned and/or replaced prior to resumption of plant operations in the affected area. Any solutions or materials used to decontaminate the equipment will be managed as RCRA-regulated waste.

6.3.5.2 Spills, Leaks, or Other Releases Control Procedure

All areas in which liquids are stored, managed, or potentially encountered (including tanks, containers, or secondary containment areas) will be inspected regularly for leaks, spills, deterioration, or damage in order to reduce the likelihood of an incident. However, on occasion, such incidents may still occur. This section describes the procedures for responding to spills, leaks, or other releases to containment areas or to the environment.

If Facility employees observe a spill, leak, or other release, whether during a formal inspection or during routine work, they will be instructed to contact the EC immediately and describe the situation in as much detail as possible, giving the following information, at a minimum:

- the location;
- material composition;
- approximate quantity; and,
- estimated extent of the release.

Based on this information (and additional investigation by the EC as necessary), the EC will determine whether to evacuate the area and/or implement the Contingency Plan.

As previously stated, if the EC is not available and if the situation is serious or life-threatening, employees will be instructed to dial 911 for emergency assistance. In a life threatening situation personnel may call 911 without first notifying the EC. The EC will then be notified of the employee's actions. Upon notification, the EC will conduct a visual inspection of the release and will then implement immediate containment measures.

Releases Within Containment

The EC will implement the following procedures for responding to leaks or spills from tank systems or containers into secondary containment areas that are not likely to reach the environment:

This submittal supersedes all previous information

Solid Waste

Hazardous Waste Storage and Disposal in Geologic Repositories

Permit Guidance Under the Resource Conservation and Recovery Act

SECTION 7.0 WASTE CHARACTERIZATION

Facility owners and operators must, at a minimum, obtain a detailed chemical and physical analysis of each waste managed that contains all the information that must be known to treat, store, or dispose of the wastes in accordance with applicable 40 CFR 264 regulations and the facility's permit conditions (40 CFR 264.13). This section identifies general waste analysis requirements applicable to all disposal facilities and suggests several parameters appropriate for wastes to be placed in geologic repositories.

Extensive guidance is available describing the development and implementation of waste analysis plans. Three EPA publications that should be consulted in the development of waste analysis plans are:

- o *Waste Analysis Plans - A Guidance Manual*
- o *A Method for Determining the Compatibility of Hazardous Wastes*
- o *Test Methods for Evaluating Solid Wastes-Physical/Chemical Methods (SW-846)*

The latter document provides detailed sampling and analysis procedures that should be used in characterizing hazardous wastes.

The Part B application for a geologic repository must contain a listing of the pertinent physical and chemical properties of every waste type to be received for treatment and/or disposal, as well as a plan for verifying the content of wastes as they are received for treatment/disposal or are generated. The actual wastes placed in the repository may not necessarily correspond to the initial wastes

characterized in the Part B permit application, but the owners or operators should, however, identify the physical and chemical properties of the wastes to be placed in the repository and any limits on waste types appropriate to assuring safe operation of the repository. Of particular concern are those waste properties that could impact waste mobility or repository stability, such as volatility, reactivity, corrosivity, solubility in water and susceptibility to phase or species transformation.

7.1 SUGGESTED CHARACTERIZATIONS AND WASTE LIMITATIONS

Certain waste characteristics may produce undesirable results in the repository environment, either during the facility's active life or after closure. The limitations relevant to the repository must be identified and the wastes analyzed to assure that tolerance levels are not exceeded.

7.1.1 Reactivity

No wastes should be placed in repositories that are explosive or shock sensitive. Wastes that could react to produce toxic gases (such as cyanide- or sulfide-bearing wastes) should also be excluded. Other waste reactivity characteristics should be assessed on a case-by-case basis to determine if the reaction products (e.g., heat or innocuous gases) could present a worker safety threat or compromise the repository's structural integrity or isolation characteristics. Gas generation is a significant concern after closure of the repository if the potential exists to produce back-pressures that could rupture seals or induce rock-mass fractures.

13
14 VOLUME 2

15
16
17 BE IT REMEMBERED that on the 17th day
of
October,

18 2001, this matter came on for hearing before
FELICIA

19 ORTH, Hearing Officer, at the Roswell

1 laboratory to perform chemical sampling analysis?

2 A. As part of the evaluation of information coming
3 from a site, any site, there is chemical data with that,
4 and there are criteria in the permit that they're going
5 to be evaluating this information against. So from that
6 perspective, they would have to be able to satisfy the
7 evaluation criteria.

8 MS. MC MICHAEL: Thank you.

9 MS. ORTH: Thank you.

10 MR. DOMENICI: Can I follow up?

11 MS. ORTH: Yes. Mr. Domenici.

12 RECROSS EXAMINATION

13 BY MR. DOMENICI:

14 Q. Just on this foreign waste issue, are you aware
15 or familiar with circumstances where an importer accepts
16 foreign waste and characterizes it as a generator?

17 A. Am I aware of that?

18 I am not an expert by any means on foreign
19 importation of waste, so I can't say that I am aware of
20 that.

21 Q. Are you aware that importing waste from Mexico
22 would require a US generator number to be provided by
23 someone?

24 A. I'm not familiar with those requirements. I am
25 not familiar with those requirements.

KATHY TOWNSEND COURT REPORTERS (505) 243-5018
110 Twelfth Street, NW, Albuquerque, NM 87102

1 Q. I think your testimony was that the waste
2 analysis plan would -- I don't want to mischaracterize
3 it, but somehow would protect the RCRA requirements at
4 this facility regardless of the location of where the
5 waste came from?

6 A. Speaking internally within the United States,
7 certainly.

8 I have no knowledge, and I am not an expert in
9 waste being imported from outside the United States to
10 facilities, so I would hesitate to make a judgment
11 concerning the specific requirements, other than the fact
12 that I can say that because the permit requires a
13 generator, whoever that might be, to follow the waste
14 analysis plan.

15 The specifics on this I cannot testify to in
16 terms of the detail and legality of shipping across the
17 border. I can't testify.

18 Q. But if the generator, wherever they are,
19 satisfies the waste analysis plan -- the requirements of
20 the waste analysis plan, then you would be satisfied?

21 A. From my limited perspective.

22 MR. DOMENICI: Thank you.

23 MS. ORTH: Nothing else?

24 Okay.

25 Ms. Green? Nothing?

PERMIT FOR THE TRIASSIC PARK
WASTE DISPOSAL FACILITY
U.S. EPA NO. NM0001002484**

No. HRM 01-02 (P)

HEARING OFFICER'S REPORT

I. INTRODUCTION

Applicant Gandy Marley, Inc., ("GMP" or "Applicant") seeks a hazardous waste disposal facility permit for a facility located near Roswell in Chaves County, New Mexico. The New Mexico Environment Department (NMED) Hazardous Waste Bureau (Bureau) supports the issuance of the permit with conditions necessary to protect public health and welfare and the environment.

This matter was heard between October 15 and 19, 2001, in Roswell, New Mexico. The Bureau was represented by Susan McMichael, Claybourne Clark and Julia Mullen of NMED's Office of General Counsel, along with Charlotte Robinson, a contract attorney; and the Bureau's position was presented by staff members Stephen Pullen and David Cobrain, and RCRA consultants Constance Walker, Stephen Druschel and June Dreith.

Those present on behalf of the Applicant included attorneys Pete Domenici, Jr. and, briefly, Dan Dolan; engineer Patrick Corser; geologist Jim Bonner; zoologist/ecologist Joe Merino; meteorologist R.C. Cudney and toxicologist Albert Westerman; governmental relations consultant Ken Schultz; and GMI officers and directors Dale Gandy, Larry Gandy, and Mark Marley.

Article XI, titled "Hazardous Waste Generated From Raw Materials Admitted In-Bond" is the article relevant here: "Hazardous waste generated in the processes of economic production, manufacturing, processing or repair, for which raw materials were utilized and temporarily admitted, shall continue to be readmitted by the country of origin of the raw materials in accordance with applicable national policies, laws and regulations."

This article appears to have been based on Article 55 of the Mexican Environmental General Law requiring that hazardous waste generated by the U.S. manufacturing plants in Mexico ("maquiladoras") using duty-free "in bond" raw materials must be returned to the country of origin for disposal, minus, of course, the amount of "in-bond" material returned as finished product and with some allowance for shrinkage, depending upon the material.

I believe it's appropriate to take notice that this is the same article that forms the legal basis for the acceptance of the waste this agency defines as "solid waste" from Mexico at state-permitted facilities such as the Camino Real Landfill in Sunland Park.

I have also reviewed the RCRA regulations on the export/import of hazardous waste, and agree with GMI's description of the applicable requirements (GMI pp. 22-23): foreign waste must be imported by a U.S. "generator." (40 CFR 262.60(a)) The waste is dually manifested by the foreign generator (40 CFR 262.60(b)(1)) and the U.S. generator (40 CFR 262.60(b)(2)). Absent both manifests and other required approval and notifications, the facility cannot accept the foreign waste. Properly manifested and delivered, however, the facility would be accepting waste from a legally authorized U.S. "generator." The Bureau's consultant on the waste analysis plan, Ms. Walker, agreed

that the permit requires a "generator" to follow the waste analysis plan, whether that generator is in the U.S. or has accepted waste from outside the U.S. (TR. 857-859)

I do not see the legal basis for excluding waste delivered to the facility by a U.S. "generator" in circumstances where that generator has received foreign waste, has met the requirements of the waste analysis plan, and the manifests are in order.

This is the one topic on which I received something like closing argument from the Bureau (see tab ii), and I have considered the arguments made there but still do not see the legal basis for excluding maquiladoras waste. The fact that the Bureau did not originally understand the permit application to seek the ability to accept foreign waste under the La Paz Agreement does not preclude its clarification at this point, particularly when the Applicant raised the issue before hearing and many who made comments in the hearing assumed it was part of the proposal. Mr. Corser did, as the Bureau notes, testify that he has no knowledge about whether facilities in Mexico have the capability to conduct sampling and analysis; this does not mean that they do not. The fact that the GMI permit does not now contain a procedure or process for the return of hazardous waste to Mexico where GMI is unable to accept it for failure to meet waste characterization requirements is not a basis for excluding the waste from acceptance; such a provision can be drafted now, if the Secretary agrees that the waste may be accepted, and if such a provision is necessary, beyond assuring that the waste would be separated and returned to the generator, as any unacceptable waste would be, foreign or not, with notification to NMED.

CARD included some discussion of this issue as well (CARD, pp. 51-52), focusing on the August 2001 final authorization of New Mexico's hazardous waste

XI. Nature of Business (Provide a brief description)

The Waste Isolation Pilot Plant (WIPP) is a U.S. Department of Energy facility intended to demonstrate the technical and operational principles involved in the permanent isolation and disposal of defense-generated transuranic waste. WIPP operations entail receiving, unloading, and transferring radioactive-mixed waste from the surface of the site to the underground hazardous waste management units. Waste will be emplaced in an underground geologic repository horizon located in a deep-bedded salt formation approximately 2,150 feet beneath the surface.

XII. Process Codes and Design Capacities

A. PROCESS CODE - Enter the code from the list of process codes below that best describes each process to be used at the facility. Thirteen lines are provided for entering codes. If more lines are needed, attach a separate sheet of paper with the additional information. For "other" processes (i.e., D99, S99, T04 and X99), describe the process (including its design capacity) in the space provided in Item XIII.

B. PROCESS DESIGN CAPACITY - For each code entered in column A, enter the capacity of the process.

1. AMOUNT - Enter the amount. In a case where design capacity is not applicable (such as in a closure/post-closure or enforcement action) enter the total amount of waste for that process.
2. UNIT OF MEASURE - For each amount entered in column B(1), enter the code from the list of unit measure codes below that describes the unit of measure used. Only the units of measure that are listed below should be used.

C. PROCESS TOTAL NUMBER OF UNITS - Enter the total number of units used with the corresponding process code.

| PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY | PROCESS CODE | PROCESS | APPROPRIATE UNITS OF MEASURE FOR PROCESS DESIGN CAPACITY |
|--------------|---|---|------------------------------------|--|---|
| D79 | <u>Disposal:</u> Underground Injection | Gallons; Liters; Gallons Per Day; or Liters Per Day | T87 | Smelting, Melting, Or Refining Furnace | Gallons Per Day; Liters Per Day; Pounds Per Hour; Short Tons Per Hour; Kilograms Per Hour; Metric Tons Per Day; Metric Tons Per Hour; Short Tons Per Day; or Btu's Per Hour |
| D80 | Landfill | Acres-foot or Hectare-meter | T88 | Titanium Dioxide Chloride Process | |

XII. PROCESS—CODES AND DESIGN CAPACITIES (continued)

2

The Waste Isolation Pilot Plant (WIPP) geologic repository is defined as a "miscellaneous unit" under 40 CFR §260.10. "Miscellaneous unit" means a hazardous waste management unit where hazardous waste is treated, stored, or disposed of and that is not a container, tank, surface impoundment, waste pile, land treatment unit, landfill, incinerator, containment building, boiler, industrial furnace, or underground injection well with appropriate technical standards under 40 CFR Part 146, corrective action management unit, or unit eligible for research, development, and demonstration permit under 40 CFR §270.65. The WIPP is a geologic repository designed for the disposal of defense-generated transuranic (TRU) waste. Some of the TRU wastes disposed of at the WIPP contain hazardous wastes as co-contaminants. More than half the waste to be disposed of at the WIPP also meets the definition of debris waste. The debris categories include manufactured goods, biological materials, and naturally occurring geological materials. Approximately 120,000 cubic meters (m^3) of the 175,600 m^3 of WIPP wastes is categorized as debris waste. The geologic repository has been divided into ten discrete hazardous waste management units (HWMU) which are being permitted under 40 CFR Part 264, Subpart X.

17

During the Disposal Phase of the facility, which is expected to last 25 years, the total amount of waste received from off-site generators and any derived waste will be limited to 175,600 m^3 of TRU waste of which up to 7,080 m^3 may be remote-handled (RH) TRU mixed waste. For purposes of this application, all TRU waste is managed as though it were mixed.

21

On March 25, 1996, the DOE reached the conclusion that in order to comply with 40 CFR 191 §13 which regulates the long-term release of radionuclides from a geologic disposal facility, it is necessary to add magnesium oxide to each disposal room. This additive is to be placed as a backfill over, beside, and within the waste stacks. The function of the backfill is to chemically alter the composition of brine that may accumulate in the disposal region. The result of the chemical alteration is to significantly reduce the solubility of the prevalent TRU radionuclides.

27

The process design capacity for the miscellaneous unit (composed of ten underground HWMUs in the geologic repository) shown in Section XII B, is for the maximum amount of waste that may be received from off-site generators plus the maximum expected amount of derived wastes that may be generated at the WIPP facility. In addition, two HWMUs have been designated as container storage units (S01) in Section XII. One is inside the Waste Handling Building (WHB) and consists of the contact-handled (CH) bay, conveyance loading room, waste hoist entry room, RH bay, cask unloading room, hot cell, transfer cell, and facility cask loading room. This HWMU will be used for waste receipt, handling, and storage (including storage of derived waste) prior to emplacement in the underground geologic repository. No treatment or disposal will occur in this S01 HWMU. The capacity of this S01 unit for storage is 87.7 m^3 , based on 40 standard waste boxes or seven-packs of drums on pallets and in the TRUDOCKs, one standard waste box of derived waste, seven RH canisters in the transfer cell, and five RH canisters in the hot cell. The second S01 HWMU is the parking area outside the WHB where the Transuranic Package Transporter (TRUPACT-II) trailers and the road cask trailers will be parked awaiting waste handling operations. The capacity of this unit is 12 TRUPACT-IIs and three road casks or four rail casks with a combined volume of 47.1 m^3 . The railroad side tracks are included in this area

43

1 to accommodate rail shipments of RH TRU mixed waste. The HWMUs are shown in Appendix
2 A3 as Figures A3-2, A3-3, and A3-4.

3
4 During the ten year period of the permit, up to 52,110 m³ of CH waste and 1,954 m³ of RH waste
5 could be emplaced in Panels 1 to 3. A fourth HWMU (Panel 4), plus disposal area access drifts
6 (designated as Panels 9 and 10), will be constructed under this permit. These latter areas will
7 not receive waste for disposal under this permit.

EPA ID Number (Enter from page 1)

Secondary ID Number (Enter from page 1)

NM4890139088

XIV. Description of Hazardous Wastes

- A. EPA HAZARDOUS WASTE NUMBER** - Enter the four-digit number from 40 CFR, Part 261 Subpart D of each listed hazardous waste you will handle. For hazardous wastes which are not listed in 40 CFR, Part 261 Subpart D, enter the four-digit number(s) from 40 CFR, Part 261 Subpart C that describes the characteristics and/or the toxic contaminants of those hazardous wastes.
- B. ESTIMATED ANNUAL QUANTITY** - For each listed waste entered in column A estimate the quantity of that waste that will be handled on an annual basis. For each characteristic or toxic contaminant entered in column A estimate the total annual quantity of all the non-listed waste(s) that will be handled which possess that characteristic or contaminant.
- C. UNIT OF MEASURE** - For each quantity entered in column B enter the unit of measure code. Units of measure which must be used and the appropriate codes are:

| ENGLISH UNIT OF MEASURE | CODE | METRIC UNIT OF MEASURE | CODE |
|-------------------------|------|------------------------|------|
| POUNDS | P | KILOGRAMS | K |
| TONS | T | METRIC TONS | M |

If facility records use any other unit of measure for quantity, the units of measure must be converted into one of the required units of measure taking into account the appropriate density or specific gravity of the waste.

D. PROCESSES**1. PROCESS CODES:**

For listed hazardous waste: For each listed hazardous waste entered in column A select the code(s) from the list of process codes contained in Item XII A. on page 3 to indicate how the waste will be stored, treated, and/or disposed of at the facility.

For non-listed hazardous waste: For each characteristic or toxic contaminant entered in column A, select the code(s) from the list of process codes contained in Item XII A. on page 3 to indicate all the processes that will be used to store, treat, and/or dispose of all the non-listed hazardous wastes that possess that characteristic or toxic contaminant.

NOTE: THREE SPACES ARE PROVIDED FOR ENTERING PROCESS CODES. IF MORE ARE NEEDED:

- Enter the first two as described above.
- Enter "000" in the extreme right box of Item XIV-D(1).
- Enter in the space provided on page 7, Item XIV-E, the line number and the additional code(s).

- 2. PROCESS DESCRIPTION:** If a code is not listed for a process that will be used, describe the process in the space provided on the form (D.(2)).

NOTE: HAZARDOUS WASTES DESCRIBED BY MORE THAN ONE EPA HAZARDOUS WASTE NUMBER - Hazardous wastes that can be described by more than one EPA Hazardous Waste Number shall be described on the form as follows:

- Select one of the EPA Hazardous Waste Numbers and enter it in column A. On the same line complete columns B, C and D by estimating the total annual quantity of the waste and describing all the processes to be used to treat, store, and/or dispose of the waste.
- In column A of the next line enter the other EPA Hazardous Waste Number that can be used to describe the waste. In column D(2) on that line enter "Included with above" and make no other entries on that line.
- Repeat step 2 for each EPA Hazardous Waste Number that can be used to describe the hazardous waste.

EXAMPLE FOR COMPLETING ITEM XIV (shown in line numbers X-1, X-2, X-3, and X-4 below) - A facility will treat and dispose of an estimated 900 pounds per year of chrome shavings from leather tanning and finishing operation. In addition, the facility will treat and dispose of three non-listed wastes. Two wastes are corrosive only and there will be an estimated 200 pounds per year of each waste. The other waste is corrosive and ignitable and there will be an estimated 100 pounds per year of that waste. Treatment will be in an incinerator and disposal will be in a landfill.

| Line Number | A. EPA HAZARD WASTE NO. (Enter code) | | | | | B. ESTIMATED ANNUAL QUANTITY OF WASTE | C. UNIT OF MEASURE (Enter code) | D. PROCESS | | | | | | | | | |
|-------------|---|---|---|---|---|---------------------------------------|------------------------------------|---|---|---|---|---|---|--|--|--|---------------------|
| | (1) PROCESS CODES (Enter code) | | | | | | | (2) PROCESS DESCRIPTION (If a code is not entered in D(1)) | | | | | | | | | |
| X | 1 | K | 0 | 5 | 4 | 900 | P | T | 0 | 3 | D | 8 | 0 | | | | |
| X | 2 | D | 0 | 0 | 2 | 400 | P | T | 0 | 3 | D | 8 | 0 | | | | |
| X | 3 | D | 0 | 0 | 1 | 100 | P | T | 0 | 3 | D | 8 | 0 | | | | |
| X | 4 | D | 0 | 0 | 2 | | | | | | | | | | | | Included With Above |

XV. Map

Attach to this application a topographic map, or other equivalent map, of the area extending to at least one mile beyond property boundaries. The map must show the outline of the facility, the location of each of its existing and proposed intake and discharge structures, each of its hazardous waste treatment, storage, or disposal facilities, and each well where it injects fluids underground. Include all springs, rivers and other surface water bodies in this map area. See instructions for precise requirements.

XVI. Facility Drawing

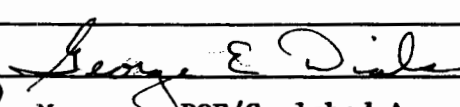

All existing facilities must include a scale drawing of the facility (see instructions for more detail).

XVII. Photographs

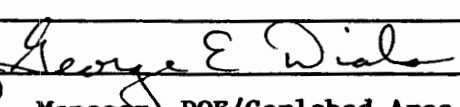

All existing facilities must include photographs (aerial or ground-level) that clearly delineate all existing structures; existing storage, treatment and disposal areas; and sites of future storage, treatment or disposal areas (see instructions for more detail).

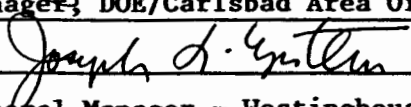

XVIII. Certification(s)

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

XIX. Comments

Section XVIII Operator Signature - *See Attached "RCRA Part A Application Certification"

** Date of submittal of clarifying information as requested by NMED.

Additional data were submitted on July 9, 1991; November 12, 1992; January 29, 1993; March 2, 1995; May 26, 1995; and April 12, 1996. Part A originally signed on January 18, 1991, and submitted on January 22, 1991.

Note: Mail completed form to the appropriate EPA Regional or State Office. (Refer to instructions for more information)

NM4890139088

RCRA PART A APPLICATION CERTIFICATION

The U.S. Department of Energy (DOE), through its Carlsbad Area Office, has signed as "owner and operator," and Westinghouse Electric Corporation, acting through its Waste Isolation Division (WID), has signed this application for the permitted facility as "co-operator."

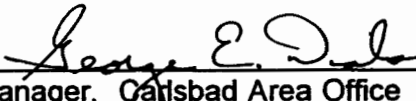

The DOE has determined that dual signatures best reflect the actual apportionment of Resource Conservation and Recovery Act (RCRA) responsibilities as follows:

The DOE's RCRA responsibilities are for policy, programmatic directives, funding and scheduling decisions, Waste Isolation Pilot Plant (WIPP) requirements of DOE generator sites, auditing, and oversight of all other parties engaged in work at the WIPP, as well as general oversight.

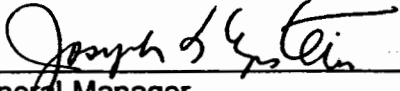

The WID's RCRA responsibilities are for certain day-to-day operations (in accordance with general directions given by the DOE and in the Management and Operating Contract as part of its general oversight responsibility), including, but not limited to, the following: certain waste handling, monitoring, record keeping, certain data collection, reporting, technical advice, and contingency planning.

For purposes of the certification required by Title 20 of the New Mexico Administrative Code, Chapter 4, Part 1 (20 NMAC 4.1), Subpart IX, §270.11(d), the DOE's and the WID's representatives certify, under penalty of law that this document and all attachments were prepared under their direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on their inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of their knowledge and belief, true, accurate, and complete for their respective areas of responsibility. We are aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Owner and Operator Signature:

Title: Manager, Carlsbad Area Office
for: U.S. Department of Energy
Date: 5/27/96

Co-Operator Signature:

Title: General Manager
for: Westinghouse Electric Corporation
Date: 5/28/96

CHAPTER B FACILITY DESCRIPTION

Introduction

This permit application describes the activities at the Waste Isolation Pilot Plant (WIPP) facility that are subject to permitting under the Resource Conservation and Recovery Act (RCRA) and the New Mexico Hazardous Waste Act (HWA). An aerial photograph of the facility is provided as Figure B-1. Specifically, this application addresses the management, storage, and disposal of mixtures of radioactive transuranic (TRU) and hazardous wastes (referred to as TRU mixed waste) in hazardous waste management units (HWMU). The subject of this permit application is TRU mixed waste disposal at the WIPP. For this permit application, discrete underground HWMUs are defined as eight panels, each containing seven rooms and two access drifts (Figure B-2), and the disposal area access drifts (designated as Panels 9 and 10, Figure B-2a). These units will be appropriately permitted under Title 20 of the New Mexico Administrative Code Chapter 4, Part 1 (20 NMAC 4.1), Subpart IX, §270.15. The U.S. Department of Energy (DOE) is also seeking to permit a portion of the Waste Handling Building (WHB) and the parking area south of the WHB as container storage units for waste handling activities under 20 NMAC 4.1, Subpart IX, §270.23. The WHB container storage HWMU is shown on Figure B-3, and the parking area container storage HWMU is shown on Figure B-3a.

The ten major generator/storage sites planning to ship waste to WIPP for disposal are:

- Argonne National Laboratories (East)
- Idaho National Engineering Laboratory
- Los Alamos National Laboratory
- Lawrence Livermore National Laboratory
- Mound Facility
- Nevada Test Site
- Oak Ridge National Laboratory
- Richland (Hanford) Site
- Rocky Flats Environmental Technology Site
- Savannah River Site

Figure C-3 shows the geographic location of these sites. These sites will be subjected to the certification program described in Chapter C and will not ship waste to the WIPP facility until their certifications are granted. There are several other small generator/storage sites that will either ship their waste to the WIPP facility or to one of the major generator/storage sites (Figure C-3) for waste characterization and certification to WIPP requirements. Those sites will be identified to the New Mexico Environment Department (NMED) as they are certified and prior to initiating any shipments to the WIPP facility.

The Disposal Phase, projected to last 25 years, includes receiving, handling, and emplacing TRU and TRU mixed wastes in the WIPP geologic repository. Disposal operations may commence once compliance with applicable federal and state laws and regulations has been demonstrated and the certification and approval requirements of the WIPP Land Withdrawal Act (LWA) of 1992 (Public Law 102-579) (U.S. Congress, 1992)¹ are met. The DOE originally proposed a Test Phase using TRU and TRU mixed waste testing at the WIPP facility. The Test Phase has since been abandoned as a result of reevaluation. The DOE has decided that radioactive waste tests can be conducted more efficiently at locations other than the WIPP facility.

Background

The WIPP Project was authorized by the National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (Public Law 96-164). Its legislative mandate is to provide a research and development facility to demonstrate the safe disposal of radioactive waste resulting from United States defense activities and programs. The DOE is developing the WIPP facility to demonstrate the efficacy of an underground geologic repository for the safe disposal of TRU mixed waste currently stored at or generated by DOE defense installations. The LWA transferred jurisdiction of the land used for the WIPP Project from the Bureau of Land Management to the DOE and provided additional authorization to continue the activities, including the phased implementation of the WIPP Project, initiated by Public Law 96-164. The LWA requirements focus on the criteria for certification of compliance with the long-term disposal regulations developed by the U.S. Environmental Protection Agency (EPA).

Once the WIPP facility has obtained a hazardous waste permit, the facility will be used for the permanent disposal of TRU waste, including TRU mixed waste containing hazardous constituents regulated under the HWA. Prior to initiating the disposal of waste at the WIPP facility, however, the DOE must also demonstrate compliance with the requirements for Performance Assessment in Title 40 of the Code of Federal Regulations (CFR), Part 191 (EPA, 1993)² and the requirements of the land disposal restrictions in 40 CFR Part 268.

¹U.S. Congress, 1992, Public Law 102-579, Waste Isolation Pilot Plant Land Withdrawal Act, 102nd Congress, Washington, DC, October, 1992. The purpose of Public Law 102-579 is to withdraw certain public lands from the jurisdiction of the Bureau of Land Management (BLM) for the operation of the WIPP Project. The law provides for the transfer of the WIPP site lands from the Secretary of the Interior to the Secretary of Energy and withdraws the lands from entry, sale, or disposition; appropriation under mining laws; and operation of the mineral and geothermal leasing laws. The Secretary of Energy is directed to produce a management plan to provide for grazing, hunting and trapping; wildlife habitat; the disposal of salt tailings; and mining. The law provides prerequisites for the DOE and the Environmental Protection Agency (EPA) prior to initiating the Disposal Phase, including EPA review and approval of key WIPP programmatic documents. Roles and responsibilities for the U.S. Department of Interior, the U.S. Department of Labor, the Environmental Evaluation Group (EEG), the National Academy of Science (NAS), and the State of New Mexico are defined.

²EPA, 1993. This regulation, which implements portions of the Nuclear Waste Policy Act, provides for generally applicable environmental standards for the protection of human health and the environment from radioactivity. The regulation includes standards for the management and storage of radioactive waste and spent nuclear fuel (Subpart A) and for the long-term disposal of these wastes (Subparts B and C). In 1987 a federal court vacated the standard and remanded it back to the EPA for reconsideration. The EPA published a final standard in the Federal Register.

The rationale for preferring salt as the disposal medium for nuclear waste, in general, and for the WIPP facility, in particular, resulted from two decades of repository program activities. In 1955, the National Academy of Sciences (NAS) National Research Council was asked by the Atomic Energy Commission (AEC) to examine the issue of permanent disposal of radioactive waste. In a report published in 1957, the committee stated that it was convinced that radioactive waste could be disposed of safely and concluded that the most promising method of disposal of radioactive waste was placement in salt deposits.

Salt was determined to be the most promising disposal medium because of its unique thermal and physical properties. It has a relatively high thermal conductivity, which serves to rapidly conduct heat away from the waste, and has favorable plastic, or creep, properties that permit sizeable strains to be absorbed without fractures. The existence of large salt deposits demonstrates isolation from circulating groundwaters for long periods of geologic time; the depositional nature and preservation of large salt deposits demonstrate regional stability for long periods of geologic time.

Conclusions made from studies that took place from 1963 to 1970 were favorable, and in 1970, a site near Lyons, Kansas, was selected by the AEC as a potential location for a radioactive waste repository. The NAS endorsed this recommendation. Studies at Lyons further confirmed that salt is a good disposal medium.

The site-selection process for the WIPP was initiated in 1973, with a review of available information on potential disposal sites. This work was directed toward salt beds and salt domes. The tentative selection criteria used in the initial stage of the process were geological and logistical in nature and stressed radiation and mine safety, hydrologic isolation, and ease of construction. The criteria specified the following conditions: a 1,000- to 2,500-foot (ft) (305- to 762-meter [m]) depth to salt; a 200-ft (61-m) minimum salt thickness; a lateral extent of salt sufficient to protect against dissolution; favorable tectonics (low historical seismicity and no salt-flow structures nearby); minimal groundwater; low resource potential; a minimum number of boreholes; low population density; and maximum involvement of federal lands. From the bedded-salt regions surveyed in this stage, the U.S. Geological Survey and the Oak Ridge National Laboratory (ORNL) selected eastern New Mexico as the area that best satisfied the tentative selection criteria.

During the second stage of the selection process, two of three New Mexico locations were determined to be inadequate: the Clovis-Portales site, because the shallow salt was very clayey and the purer salt was too deep, and the Mescalero Plains area, because of extensive oil-field development. After ORNL selected a site in the Delaware Basin for extensive characterization, the site was shifted twice in order to avoid drillhole penetrations through the salt within 2 miles (mi) (3.2 kilometers [km]) of the repository border.

In the final stage of the selection process, eight areas in the Delaware Basin in Eddy and Lea Counties were evaluated. Eight additional selection criteria were used in this analysis:

1. The site should be at least 6 mi (10 km) from the Capitan Reef, a major aquifer, to avoid any possible dissolution hazard related to the nearness of the reef.
2. To minimize potential conflicts with mineral resources, the central 4 square mi (10 square km) designated for the repository itself should not be in the known Potash District, and as little as possible of the surrounding buffer zone should be in the district.
3. No part of the central area should be less than 1 mi (1.6 km) away from holes drilled through the Castile Formation into underlying rocks to avoid potential dissolution by water flowing upward through an inadequately plugged borehole.
4. Known oil and gas stratigraphic trends should be avoided.
5. The nearest dissolution front should be at least 1 mi (1.6 km) from the site.
6. Bedding should be nearly flat, so far as can be determined by surface geophysical investigations, to ensure mine safety and ease of construction and to avoid the need for numerous exploratory holes with a subsequent risk to the integrity of the repository.
7. Salt of high purity should be available at depths between 1,000 and 3,000 ft (305 and 914 m) to ensure mine safety and ease of construction. In addition, a salt thickness of 200 ft (61 m) or more is preferred to confine thermal and mechanical effects to the salt.
8. The use of state and private land should be minimized, especially in the central area, to simplify land acquisition and to make residential relocation unnecessary.

The WIPP site was selected as the best of the available areas considered, because the salt possessed the favorable characteristics of size, homogeneity, and depth, and because seismic data indicated that the site was in a syncline, making the accumulation of oil, gas, and geopressurized brines less favorable. Subsequent site-validation and facility-construction activities have confirmed that site features are favorable for the long-term isolation of radioactive and hazardous waste constituents.

Since Public Law 96-164 was enacted establishing the mission of the WIPP Project, program activities have focused on completion of major segments or phases of the project, thereby allowing significant progress to be made toward demonstrating the safety of the WIPP facility. Each major phase has provided an opportunity to study and evaluate the most recent information, individually and collectively, prior to proceeding with the next phase. The major phases of the WIPP Project began with the Preliminary Design (Title I) in October 1979, followed by Detail Design (Title II), which started in September 1981. Following the successful completion

of the Site and Preliminary Design Validation (SPDV) program in July 1983, the Construction Phase was initiated during which surface structures for receiving waste were built and underground excavations were completed for one panel of rooms designed for permanent waste emplacement. The end of the construction phase was marked by a decision by the DOE Energy Systems Acquisition Advisory Board that all prerequisites for ending construction were met and documented to the satisfaction of the DOE's executives.

Because the TRU mixed waste is subject to the RCRA Land Disposal Restrictions, the WIPP Project submitted a petition for a variance from the treatment standards based on a demonstration that the waste would not migrate beyond the unit boundary during a proposed Test Phase. On April 6, 1990, the EPA published a public notice of the agency's intent to grant a "conditional" No Migration Determination (NMD). The EPA's decision to grant the conditional determination was published on November 14, 1990. The EPA's approval of the conditional NMD for the WIPP facility would have allowed the facility to accept for placement in the underground a limited quantity of untreated TRU mixed waste for test purposes that would otherwise have been prohibited from land disposal during the proposed Test Phase. The DOE has since determined not to conduct the Test Phase activities with TRU mixed waste at the WIPP facility. The DOE is seeking an NMD for the Disposal Phase. Chapter L of this RCRA permit application describes the current DOE activities relative to no migration.

The LWA established a framework by which the DOE can proceed with the phased implementation of the WIPP Project, including the initiation of the Disposal Phase. The LWA mandates certain prerequisites, however, that must be completed prior to the initiation of the Disposal Phase and that require the ongoing participation of several federal and state agencies in the review, inspection, and approval of the WIPP facility. Some prerequisites were applied to the Test Phase and no longer apply. Specifically, the prerequisites that are still applicable are:

- The EPA must publish final repository disposal standards (40 CFR 191). (Completed in December, 1993)
- The EPA must issue criteria for determining whether the WIPP complies with environmental protection standards for the disposal of TRU wastes. (40 CFR 194) (Completed in February 1996)
- The federal Occupational Safety and Health Administration (OSHA) must certify that it has reviewed the DOE emergency response training programs and has concurred that such programs are in compliance with 29 CFR 1910.120. (Completed July 1993)
- The EPA Administrator must certify that the WIPP facility is in compliance with final repository disposal standards. (40 CFR 191)

- The DOE must submit decommissioning and post-decommissioning management plans to the U.S. Congress.
- The DOE must notify the U.S. Congress that the WIPP facility is in compliance with all applicable federal laws pertaining to public health and safety of the environment, the attendant regulations, and permit requirements.
- The DOE issued a Land Management Plan (October 1993) for the use of the land until the end of the decommissioning phase.
- Existing rights under Federal Oil and Gas Leases No. NMNM02953 and No. NMNM02953C shall not be affected unless the Administrator determines, after consultation with the Secretary and the Secretary of the Interior, that the acquisition of such leases by the Secretary is required to comply with the final disposal regulations or with the Solid Waste Disposal Act.
- The DOE must submit comprehensive recommendations to the U.S. Congress for the disposal of all TRU waste under DOE control, including a timetable for the disposal of such waste.
- The DOE must complete, with notice and an opportunity for public comment, a survey identifying all TRU waste types at all sites from which wastes are to be shipped to the WIPP facility.

In addition, the LWA places requirements on the DOE, the EPA, the Mine Safety and Health Administration (MSHA), the Bureau of Mines, and the State of New Mexico (NM) during Disposal Phase operations. Specifically, these are:

- The DOE must comply with all applicable federal laws pertaining to public health or safety of the environment, the attendant regulations, and permit requirements.
- The DOE submitted in October 1994 to the EPA and the NM, and will submit every two years hereafter, documentation of compliance with these laws and regulations (to the extent appropriate). Determination and consequences of noncompliance are established in the statute.
- The WIPP facility will not accept for emplacement high-level radioactive waste or spent nuclear fuel.
- No TRU waste received at the WIPP facility may have a surface dose rate in excess of 1,000 rems per hr (rems/hr), and no more than five percent by volume of the remote-handled (RH) TRU waste received at the WIPP facility may have a surface dose rate in excess of 100 rems/hr.

- RH TRU waste received at the WIPP facility shall not exceed an activity level of 23 curies per liter (averaged over the volume of the canister), and the total curies of the RH TRU waste received by the WIPP facility shall not exceed 5,100,000 curies. 1 2 3 4
- The total capacity by volume of the WIPP facility is 6.2 million cubic ft (175,600 cubic m) of TRU waste. 5 6
- No TRU waste may be transported to or from the WIPP facility except in packages the design of which was certified by the Nuclear Regulatory Commission (NRC) and which satisfied the NRC's quality assurance requirements. 7 8 9
- Prior to the transport of TRU waste to or from the WIPP facility, the DOE must provide advance notification to states and to Indian tribes through whose jurisdiction the DOE plans to transport the TRU waste. 10 11 12
- The DOE shall provide technical assistance and funds to train public safety officials and other emergency responders in any state or to any Indian tribe through whose jurisdiction the DOE plans to transport waste to or from the WIPP facility. 13 14 15
- The DOE shall periodically review the training provided in consultation with affected states and Indian tribes, the OSHA, and the National Institute for Occupational Safety and Health. 16 17 18
- The DOE shall submit a study reviewing the technologies that are available and that are being developed for the processing and reduction of volumes of radioactive wastes. 19 20 21
- The MSHA is required to inspect the WIPP facility four times per year. 22
- The U.S. Bureau of Mines is required to prepare an annual evaluation of the safety of the WIPP facility. 23 24
- The DOE is required to provide the NM, the NAS, and the Environmental Evaluation Group (EEG) free and timely access to data relating to health, safety, and environmental issues at the WIPP facility. 25 26 27
- The DOE is required to consult and cooperate with the EEG in the performance of its responsibility to conduct an independent technical review and evaluation of the WIPP Project. 28 29 30

- The DOE is required to use both engineered and natural barriers and waste modifications at the WIPP facility to isolate TRU waste after disposal to the extent necessary to comply with the final disposal regulations.
- The statute does not affect either the Consultation and Cooperation Agreement or the Supplemental Stipulated Agreement between the DOE and the NM except as explicitly stated in the statute.

In addition, the statute contains requirements related to the transportation of radioactive waste to the WIPP facility and instructions for the EPA with regard to establishing economic assistance, waste limitations, and decommissioning.

On March 25, 1996, the DOE reached the conclusion that in order to comply with 40 CFR 191 §13, which regulates the long-term release of radionuclides from a geologic disposal facility, it is necessary to add magnesium oxide (MgO) to each disposal room. This additive is to be placed as a backfill over, beside, and within the waste stacks. The function of the backfill is to chemically alter the composition of brine that may accumulate in the disposal region. The result of the chemical alteration is to significantly reduce the solubility of the prevalent TRU radionuclides.

The circumstances under which the MgO would be necessary are those associated with the inadvertent human intrusion scenario which must be modeled under 40 CFR Part 191. The inadvertent human intrusion scenario cannot happen during the Disposal Phase or Post Closure Care Period because the DOE will be actively controlling the WIPP site as described in Section I-2a(1). Even though the MgO backfill is not needed to enhance performance during the term of this and subsequent permits, it has been added to this application for two reasons:

- 20 NMAC 4.1, Subpart IX, §270.72(a)(3)(ii) requires the approval of changes to processes for the treatment, storage, or disposal of hazardous waste if such changes are required to comply with another federal, state, or local requirement.
- It is necessary to describe the backfilling process and evaluate its effect (both chemical and physical) on the facility and its operations.

The purpose and function of backfill is provided in Appendix D22 along with technical specifications for its placement. The design of backfilling systems is described in Section D-10a(3)(b). The impact of backfill on compliance with the Environmental Performance Standards is discussed in Section, D-9b, D-9b(1)(a), and D-9b(1)(b). Chemical compatibility is demonstrated in Appendix C1. The impact on closure is assessed in Section I-1e(1). Backfill is expected to require no changes in the Contingency Plan as discussed in Section G-1. Further, backfill is emplaced using the same equipment used for emplacing waste, so that no new inspection or prevention measures are needed in Chapter F.

B-1 General Description

In this application the DOE is seeking a permit for the disposal of TRU mixed waste at the WIPP facility. Waste disposal will occur in the underground portion of the WIPP facility in areas designated as Panels 1 through 8. Each panel consists of seven rooms and two access drifts mined in a salt bed 2,150 ft (655 m) below the surface. The precise locations and descriptions of the TRU mixed waste units are given in Section B-1b. The underground disposal design capacity is for 6.2 million cubic ft (ft³) (175,600 cubic m (m³)) of waste. If waste volumes disposed of in the eight panels fail to reach the stated design capacity, the DOE may choose to use the four disposal area access drifts for disposal; however, the DOE is only seeking to permit the construction of these areas at this time. A permit modification or future permit would be submitted describing the condition of those drifts and the controls exercised for personnel safety and environmental protection while disposing of waste in these areas.

For the ten year term of this permit, the DOE plans to dispose of up to 1,840,000 cubic ft (52,110 cubic m) of contact-handled (CH) waste and 69,000 ft³ (1,954 m³) of RH waste, in Panels 1 to 3 (see Figure B-2). Figure B-2a shows the disposal HWMUs that may be covered by three successive permits. Construction of Panels 2, 3, 4, and the disposal area access drifts will begin during the term of the permit.

Detailed descriptions of the container design to be used and associated operations during the Disposal Phase are presented in Sections D-1a(1) and D-10a(3), respectively, to support this permit application. The TRU mixed waste that will be disposed at the WIPP facility results primarily from activities related to the reprocessing of plutonium-bearing reactor fuel and fabrication of plutonium-bearing weapons, as well as from research and development. This TRU mixed waste consists largely of such items as paper, cloth, and other organic material; laboratory glassware and utensils; tools; scrap metal; shielding; and solidified sludges from the treatment of wastewater. Much of this TRU mixed waste is also contaminated with substances that are defined as hazardous under 20 NMAC 4.1, Subpart II, Subparts C and D, and subject to the land disposal restrictions of 20 NMAC 4.1, Subpart VIII.

B-1a Waste Description

Waste destined for WIPP are, or were, produced as a byproduct of weapons production and have been identified in terms of waste streams based on the processes that produced them. Each waste stream identified by generators is assigned to a Waste Summary Category to facilitate RCRA waste characterization, and reflect the final waste forms acceptable for WIPP disposal.

These Waste Summary Categories are:

S3000—Homogeneous Solids

Solid process residues defined as solid materials, excluding soil, that do not meet the applicable regulatory criteria for classification as debris [20 NMAC 4.1, Subpart VIII, § 268.2(g) and (h)]. Included in solid process residues are inorganic process residues, inorganic sludges, salt waste, and pyrochemical salt waste. Other waste streams are included in this Waste Summary Category based on the specific waste stream types and final waste form. Each waste stream designated as a 3000 Homogeneous Solid is identified in Table C-2. This category includes wastes that are at least 50 percent by volume solid process residues.

S4000—Soils/Gravel

This waste summary category includes waste streams that are at least 50 percent by volume soil as identified in Table C-2. Soils are further categorized by the amount of debris included in the matrix.

S5000—Debris Wastes

This waste summary category includes waste that is at least 50 percent by volume materials that meet the NMAC criteria for classification as debris (20 NMAC 4.1, Subpart VIII, §268.2) as follows:

Debris means solid material exceeding a 2.36 inch (60 millimeter) particle size that is intended for disposal and that is: 1) a manufactured object, 2) plant or animal matter, or 3) natural geologic material.

Included in the S5000 Waste Summary Category are metal debris, lead containing metal debris, inorganic nonmetal debris, asbestos debris, combustible debris, graphite debris, heterogeneous debris, and composite filters, as well as other minor waste streams, as identified in Table C-2.

Examples of waste that might be included in the S5000 Waste Summary Category are asbestos-containing gloves, fire hoses, aprons, flooring tiles, pipe insulation, boiler jackets, and laboratory tabletops. Also included are combustible debris constructed of plastic, rubber, wood, paper, cloth, graphite, and biological materials. Examples of graphite waste that would be included are crucibles, graphite components, and pure graphite.

Detailed descriptions of the wastes can be found in section C-1b. Table C-3 lists the hazardous constituents of interest.

Wastes may be generated at the WIPP facility as a direct result of managing the TRU and TRU mixed wastes received from the off-site generators. Such generated waste may occur in either

the WHB or the underground. For example, when TRU mixed wastes are received at the WHB, the shipping containers (the Transuranic Package Transporter II [TRUPACT-II] and the RH cask) and the TRU mixed waste containers are checked for surface contamination. Under some circumstances,³ if contamination is detected, the shipping container and/or the TRU mixed waste containers will be decontaminated. In the underground, waste may be generated as a result of radiation control procedures used during monitoring activities. The waste generated from radiation control procedures will be assumed to be TRU and/or TRU mixed waste. Throughout the remainder of this permit application, this waste is referred to as "derived waste." All such derived waste will be placed in the rooms in HWMUs along with the TRU mixed waste for disposal.

Hazardous wastes generated at the WIPP, through activities where contact with TRU mixed waste does not occur, are characterized, placed in containers, and stored (for periods not exceeding the limits specified in 20 NMAC 4.1, Subpart III, §262.34) until it is transported off site for treatment and/or disposal at a permitted facility. This waste generation and accumulation activity, which is performed in compliance with 20 NMAC 4.1, Subpart III, is not subject to RCRA permitting requirements and, as such, is not addressed in this permit application.

B-1b The Disposal Phase

The Disposal Phase operations, projected to last 25 years, will consist of receiving, handling, and emplacing TRU and TRU mixed waste in the WIPP repository. Facility closure follows the Disposal Phase operations.

This permit application describes WIPP facility operations for the entire 25-year operating period and final facility closure at the end of operations. Waste emplacement will occur in one panel (HWMU) at a time, and when a panel is filled, it will be closed. A subsequent disposal panel will be mined while waste emplacement activities are conducted in an open panel. During the term of the first (ten year) permit period, the DOE anticipates that three panels could be filled and a fourth panel and the disposal area access drifts constructed.

During the Disposal Phase, other areas of the repository may be used for activities that support salt repository technology development programs. These activities are generally conducted in the vicinity of the Air Intake Shaft. Table B-1 contains examples of recently completed nonwaste tests, their location, purpose, methods, and their durations. Tests do not involve or impact the TRU mixed waste disposal operations, the integrity of the WIPP facility, or the permitting of the HWMUs.

³Typically, contamination that is less than six square feet in area and less than 2000 disintegrations per minute (dpm) alpha or 20,000 dpm beta/gamma, may be decontaminated. Containers that exceed these thresholds will be returned to the point of origin for decontamination.

1 **B-1b(1) Surface Hazardous Waste Management Units**

2
3 The WHB is the surface facility where waste handling activities will take place (Figure B-3). The
4 WHB has a total area of approximately 84,000 square ft (ft²) (7,803 square m (m²)) of which
5 33,175 ft² (3,083 m²) are designated for the waste handling and storage of CH TRU mixed waste
6 and 21,318 ft² (1,981 m²) are designated for the waste handling and storage of RH TRU mixed
7 waste, as shown in Figure B-3. These areas are being permitted as a container storage unit.
8 The concrete floors are sealed with an impermeable coating that has excellent resistance to the
9 chemicals in TRU mixed waste and, consequently, provide secondary containment for TRU
10 mixed waste. In addition, a parking area (Figure B-3a) south of the WHB, having a surface area
11 of 272,500 ft² (25,315 m²), will be used for storage of waste in sealed shipping containers
12 awaiting unloading. This area is also being permitted as a container storage unit. The sealed
13 shipping containers provide secondary containment in this HWMU. System descriptions for the
14 WHB HWMU and TRU mixed waste handling systems and a description of the impermeable
15 coating are provided in Sections D-10a(2)(b), D-10a(2)(c), D-10a(2)(d), and D-10a(3).

16
17 **B-1b(1)(a) CH TRU Mixed Waste Handling**

18
19 The CH TRU mixed waste handling process is diagrammed in Figure D-36. CH TRU mixed
20 waste will arrive by tractor-trailer at the WIPP facility in sealed shipping containers (e.g.,
21 TRUPACT-IIs) (see Figure D-27). Upon receipt, security checks, radiological surveys, and
22 shipping documentation reviews will be performed. A forklift will remove the TRUPACT-IIs and
23 transport them a short distance through an air lock that is designed to maintain differential
24 pressure in the WHB. The forklift will place the shipping containers at one of the two
25 TRUPACT-II unloading docks (TRUDOCK) inside the WHB, where an external survey of the
26 TRUPACT-II inner vessel (see Figure D-27) will be performed as the outer containment vessel
27 lid is lifted. The inner vessel lid will be lifted under the TRUDOCK vent-hood system (VHS), and
28 the contents will be surveyed during and after this lift. The TRUDOCK VHS provides
29 atmospheric control and confinement of headspace gases at their source. It also prevents
30 potential personnel exposure and facility contamination due to the spread of radiologically
31 contaminated airborne dust particles and minimizes personnel exposure to volatile organic
32 compounds (VOC).

33
34 All contamination surveys at the WIPP facility are based on the concept of co-detection.
35 Co-detection is used to describe the detection of releases from containers by virtue of detection
36 of radioactive contamination (see Appendix I3). Co-detection applies to all releases except the
37 release of gaseous VOCs from TRU mixed waste containers. Co-detection provides the WIPP
38 facility with a very sensitive method of detecting the release of nongaseous hazardous
39 constituents through the use of surface sampling (swipes) and radioactivity counting.

40
41 If contamination is detected, the TRUPACT-II may be sealed until a determination is made as
42 to how to proceed. Due to the double containment design of the TRUPACT-II, it always provides
43 secondary containment when waste is inside. Depending on the amount and nature of the

radioactivity and the area that is contaminated, the options include: 1) decontaminating in situ, 2) sealing the TRUPACT-II and shipping it back to the generating storage site, 3) shipping the TRUPACT-II to another DOE site, or 4) shipping the TRUPACT-II to a third party contractor. The determination of disposition will be made by Waste Handling Operations in consultation with Operational Health Physics.

Written procedures (available at the WIPP facility for inspection) specify materials, protocols, and steps needed to put an object into a safe configuration for decontamination of surfaces. A Radiological Work Permit will always be prepared prior to decontamination activities. TRU mixed waste products from decontamination will be managed as derived waste.

The TRUPACT-II may hold up to two seven-packs, two standard waste boxes (SWB), or one ten-drum overpack (TDOP). A five-ton overhead bridge crane will be used to remove the contents of the TRUPACT-II. Waste containers will be surveyed for radioactive contamination and decontaminated or returned to the TRUPACT-II as necessary.

For inventory control purposes, TRU mixed waste container identification numbers will be verified against the Uniform Hazardous Waste Manifest and other shipping documentation. The manifest identification codes will be checked against the identification codes of the containers received. Inconsistencies will be resolved with the generator before TRU mixed waste is emplaced. If inconsistencies cannot be resolved, the TRUPACT-II and waste containers will be shipped back to the generator/storage site. Waste awaiting the resolution of manifest discrepancies will be stored in the storage area in the southeast corner of the CH Bay (Figure B-4a).

Each facility pallet will accommodate four seven-packs, four SWBs, four four-packs of 85-gallon drums, or two TDOPs. Waste containers will be secured to the facility pallet (see Figures D-29 and D-30) prior to transfer. A forklift will transport the loaded facility pallet to the conveyance loading car inside the air lock at the Waste Shaft (see Figure B-4). The conveyance loading car will be driven onto the waste hoist deck, where the loaded facility pallet will be transferred to the waste hoist, and the loading car will be backed out.

Figure D-36 provides the CH TRU mixed waste flow diagram with time estimates given for each step.

B-1b(1)(b) RH TRU Mixed Waste Handling

The RH TRU mixed waste handling process, using equipment installed at several different floor levels (Figures D-7 and D-8), is illustrated in Figure D-37. RH TRU mixed waste will arrive at the WIPP facility in a shielded road cask loaded on a tractor-trailer or in a railroad cask loaded on a railcar. Figure D-38 is a flow diagram of the RH TRU mixed waste handling process.

Upon arrival, radiological surveys, security checks, and shipping documentation reviews will be performed. Upon completion of these checks, the hazardous waste manifest will be signed to

1 release the driver. Should radiological surveys (i.e., surface dose rate, contamination) exceed
2 acceptable levels, the road cask and transport trailer will be placed outside the WHB in the
3 controlled area or in the WHB itself. Factors such as weather conditions, time of receipt, and
4 space availability will determine the actual location for placement of the road cask and transport
5 trailer. In the event that fixed and/or removable contamination is detected on the external
6 surface of the road cask in excess of WIPP free release limits, Waste Handling Operations, in
7 conjunction with Operational Health Physics, would assess the situation and formulate a plan of
8 recovery to decontaminate the road cask.

9
10 In the RH Bay, the shielded cask will be unloaded from the tractor-trailer or railcar via a 140-ton
11 bridge crane and will be placed on the cask transfer car. The outer cask lid will be removed, and
12 the inner cask lid will be prepared for removal. The shielded cask will be moved into the
13 unloading room of the hot-cell complex and will be positioned under the hot-cell unloading port
14 (Figure D-7), where the cask-seal collar will be mated with the unloading port. At this point, all
15 personnel will leave the area, and the shield door will be closed. This area will remain an
16 exclusion area until the shielded road cask is unloaded, the waste is moved into the hot cell, and
17 the Hot-Cell shield plug is reinstalled.

18
19 Once the shielded road cask is empty, it will be moved on the road-cask transfer car back to the
20 RH Bay. Surveys will be performed on the cask to detect exterior contamination, if any, and
21 decontamination will be performed, if necessary.

22
23 In the hot-cell operating gallery, the RH TRU mixed waste canister will be checked against the
24 identity on the hazardous waste manifest and the WIPP Waste Information System to verify that
25 the canister is suitable for emplacement. The generator's copy of the manifest is then returned
26 to the generator. If there are any discrepancies, the generator will be contacted for resolution.
27 Discrepancies that are not resolved within 15 days will be reported to the NMED as required by
28 20 NMAC 4.1, Subpart V, §264.72. If a resolution is not reached within 30 days, a decision will
29 be made whether to continue seeking resolution or to ship the canister back to the site that
30 shipped the canister.

31
32 Trained operators will take sample swipes from the canisters using remotely controlled
33 equipment. These samples will be removed to the gallery via the shielded transfer drawer and
34 will be checked for contamination. If a canister is contaminated or physically damaged, it will
35 be decontaminated or overpacked. Since contamination on a canister can only be detected after
36 it is in the Hot Cell, decontamination or overpacking is the least impactful to WIPP operations.
37 Reloading a canister into the road cask is more likely to spread the contamination than
38 overpacking. Upon the completion of the overpack, a sample swipe will be taken to verify that
39 no external contamination exists. When a canister or an overpack is verified to be within
40 acceptable limits, it will either be stored in the Hot Cell or lowered into the Transfer Cell (Figure
41 D-8).

Operations in the Transfer Cell will be monitored by a closed-circuit television. In the Transfer Cell, canisters will be moved to the (facility) cask-loading room port via a shuttle car. In the cask-loading room, the canister will be hoisted into a facility cask (Figure D-37). This will be accomplished by lifting the canister from the shuttle car through a shield valve and into the facility cask oriented vertically on the facility-cask transfer car in the cask loading room. The shuttle car will position the canister directly under the cask-loading room shield valve. The telescoping port shield mates with the underside of the facility cask to ensure shielding continuity, as does the shield bell, located above the facility cask. The operating console for these operations is located behind a shadow shield (Figure D-7). Once the canister is loaded and the facility cask shield valves are closed, the facility cask will be rotated to the horizontal position. A shield door will then be opened, accessing the waste hoist. The facility-cask transfer car will be loaded onto the waste hoist and will be lowered to the waste shaft station underground.

Figure D-38 provides the RH TRU mixed waste flow diagram with normal operational waste management time requirements for each step. Sections D-10a(2)(b)(ii), D-10a(2)(d), and D-10a(3)(c) contain more detailed descriptions of the RH mixed waste handling equipment and process.

Figure B-3 shows the portions of the WHB that comprise the container storage unit. The waste transport routes in the WHB for both CH and RH waste are shown on Figure B-4.

B-1b(1)(c) Container Storage Volumes

The maximum processing rate for CH waste is 14 TRUPACT-IIs per day, or seven pallet loads. Two shifts per day are planned, four days per week. The fifth day is for equipment maintenance with weekends available for more extensive maintenance, when necessary. The maximum volume planned for storage in the WHB is eight pallets, with waste containers stacked two high, corresponding to a maximum of 2,122 ft³ (60.1 m³). One of these positions, shown in Figure B-4a on the south wall of the CH Bay is reserved for waste that is the subject of a manifest discrepancy. This area is along the East wall adjacent to the waste hoist and the RH bay (Figure B-4a). Secondary containment consists of the WHB floor (Section D-1a(4)(b)). Since the facility pallets elevate the waste approximately six inches from the floor, none of the containers would stand in any liquid. Volumes of derived waste up to 66.3 ft³ (1.88 m³), in a SWB or 55-gallon drums, will be located as shown in Figure B-4a, astride the firewater collection trench, which provides secondary containment. In addition, four TRUPACT-IIs containing up to 8 seven-packs or 8 SWBs (530 ft³ [15 m³]) may occupy the staging positions at the TRUDOCKs. Since these waste containers would be in the TRUPACT-II container, no additional secondary containment is necessary.

Contingent TRU mixed waste storage space is available within those areas of the WHB should off-normal events occur that interrupt the timely movement of TRU mixed waste into the underground. The most likely off-normal events are expected to be caused by equipment malfunctions, or contaminated shipments that are not immediately resolved. Overnight or

weekend staging of pallet loads of waste is part of the normal waste management process, and occurs within designated storage areas.

The amount of RH TRU mixed waste disposal planned is two canisters per day or eight per week on the same shifts as CH waste operations. The shuttle car in the transfer cell has seven positions for holding canisters. Shipments of CH, RH, or both will be discontinued temporarily if something occurs that prevents emplacement for more than three days. The storage capacity is seven canisters (limit of positions in the Transfer Cell), corresponding to 220 ft³ (6.23 m³) and five positions in the Hot Cell (Figure D-7) corresponding to 157 ft³ (4.45 m³). The floor and wall coatings provide an impermeable surface that serves as secondary containment in the Hot Cell and the Transfer Cell. The transfer car (Figure D-8) that holds the canisters is supported above the floor and has openings which keep the canisters from standing in liquid.

Generally, only one trailer or railcar would be parked in the RH Bay at any time. Since there is only one cask transfer car, only one cask at a time will be unloaded.

The area extending South from the WHB across the rail sidings is defined as the parking area container storage unit (HWMU) (Figure B-3a). This area provides space for 12 loaded TRUPACT-IIs and three loaded road casks or four rail casks, corresponding to 1,536 ft³ (43.5 m³) of CH waste and 125.6 ft³ (3.56 m³) of RH waste. Secondary containment and protection of the waste containers from standing liquid are provided by the transportation containers.

Storage of CH waste in the WHB container storage unit with volumes greater than 2,719 ft³ (77.0 m³) would be stored only under emergency conditions, in accordance with 20 NMAC 4.1, Subpart IX, §270.61. Storage of RH waste in excess of the 377 ft³ (10.7 m³) is considered an inconceivable condition. RH would remain in the shipping containers in the parking area, if stored at all.

B-1b(2) Underground Hazardous Waste Management Units

B-1b(2)(a) CH Waste Disposal

The waste hoist will lower the loaded facility pallet to the underground. At the waste shaft station, the CH TRU underground transporter will back up to the waste hoist cage, and the facility pallet will be transferred from the waste hoist onto the transporter (see Figure D-31). The transporter will then move the facility pallet to the appropriate HWMU for emplacement (see Figure B-8).

Forklifts with special lift fixtures will be used to remove the waste containers from the facility pallets and to stack them three high in the HWMU. The waste will be emplaced room by room. Each panel is an HWMU with a capacity to dispose an average of 621,600 ft³ (17,600 m³) of waste, assuming that 60 percent are drums and 40 percent are SWBs. The panels will be successively filled and closed, beginning with Panel 1 and continuing through Panel 8. Panels

9 and 10 may be used if needed. Their sequence will be determined at the time they are needed and permitted.

Panel construction will occur during the other shift so there is no overlap between the mining operations and waste handling on the same shift underground. Figure B-8 shows the underground construction traffic pattern.

B-1b(2)(b) RH Waste Disposal

The waste hoist will lower the loaded facility cask to the underground. At the waste shaft station underground, the facility cask will be moved from the waste hoist cage by the facility-cask transfer car. A forklift will be used to remove the cask from the transfer car and to transport the loaded facility cask to the HWMU. There the facility cask will be placed on the horizontal emplacement equipment (Figure D-33), which will have been previously aligned with a horizontal hole bored into the room wall. The horizontal emplacement equipment assembly, along with the facility cask, has multiple shield valves which can be sequentially opened or closed to protect the waste handling operators. The emplacement equipment will insert the canister into the horizontal hole. A shield plug will then be inserted into the hole to provide radiation shielding which is not intended to seal off the borehole. RH waste transport underground follows the same path as CH waste.

Each panel has the capacity to contain 22,900 ft³ (649 m³) of RH TRU waste. The ten-year period for the first permit will encompass a maximum of 1,840,000 ft³ (52,110 m³) of CH and 69,000 ft³ (1,954 m³) of RH in three HWMUs (Figure B-2a).

Using the above HWMU disposal capacity, more than eight panels would be needed to meet the WIPP facility limit of 6.2 million ft³ (175,600 m³) of waste. The four disposal area access drifts are considered for expansion of the disposal volume to that maximum. However, the ground conditions will have to be assessed prior to a final decision on use of that area of the underground for disposal. Since this will occur near the end of the projected facility life, a future permit or a permit modification would be submitted for these two additional HWMUs. These drifts are not wide enough for RH canisters to be emplaced.

B-1b(2)(c) Backfill

As specified in Appendix D22, MgO will be used as a backfill in order to provide chemical control over the solubility of radionuclides in order to comply with the requirements of 40 CFR 191.13. The MgO backfill will be purchased prepackaged in the proper containers for emplacement in the underground, eliminating handling and placement problems associated with bulk materials, such as dust creation. It also reduces potential worker exposure to radiation. Should a backfill container be breached, MgO is benign and cleanup is simple. No hazardous waste would result from a spill of backfill.

1 The MgO backfill will be purchased and received in two different containers: 1) a super sack
2 holding 4,000 pounds (lbs) (1,814 kilograms [kg]); and 2) a mini sack holding 25 lbs (11.3 kg).
3 The filled containers will be shipped by road or rail and will be delivered underground using
4 current shaft and material handling procedures and processes.

5
6 The mini sack will be 34 inches (in) (86.4 centimeters [cm]) long, 6 in. (15 cm) in diameter, and
7 will be fabricated of a single layer of polyethylene or other suitable material with an integral
8 handle/hook attached into the sack closure. Six mini sacks will be manually placed in the
9 external voids of each 7-pack unit just before the 7-pack is positioned on the waste stack. The
10 mini sack will be lifted up behind the shrink wrap around the top of the 7-pack, slid into place,
11 and held there by the 4 in. hole in the lower slip sheet. See Figure D-30A. Once the sacks are
12 in place, the 7-pack will be positioned on the waste stack in the normal manner. A similar
13 process will be used for SWBs except that the mini sacks will be hung from the lift clips on these
14 units.

15
16 Super sacks will be handled and placed using the technique used for normal waste handling
17 operations. Once each row of waste units is in place, a layer of six super sacks will be placed
18 on top of them. See Figure D-30B. The super sack will be 5 ft (1.5 m) wide by 6 ft (1.8 m) deep
19 by 1.5 ft (0.5 m) high and will be of multi-wall construction with a vapor/moisture barrier. The
20 super sack will have an integral slip sheet or base attachment so that it can be handled and
21 placed in a manner that is identical to how waste units are emplaced.

22
23 Finally, mini sacks will be manually stacked on the floor in the space between the waste stack
24 and ribside, placed horizontally or vertically as may be convenient. Backfill placed in this manner
25 is protected until exposed, when sacks are broken during creep closure of the room and
26 compaction of the backfill and waste. There are no mine operational considerations (e.g.
27 ventilation flow and control) when backfill is placed in this manner.

28 29 B-1b(3) Description of Containers

30 31 B-1b(3)(a) CH Waste Containers

32
33 CH TRU mixed waste containers will be either 55-gallon (gal) (208-liter [L]) drums singly or
34 arranged into seven-packs, 85-gal (321-L) drums singly or arranged into four-packs, TDOPs, or
35 SWBs. RH mixed waste containers will be canisters. A summary description of each container
36 type is provided below.

37
38 Standard 55-gal (208-L) drums meet the requirements for Department of Transportation (DOT)
39 specification 7A regulations. Standard 55-gal (208-L) drums will generally be used as TRU

mixed waste containers for collecting derived waste. A standard 55-gal (208-L) drum has a gross internal volume of 7.4 ft³ (0.208 m³). Figure D-3 shows a standard TRU mixed waste drum. A carbon-composite filtered vent will be installed in the drum lid by the generator, to prevent the escape of any radioactive particulates and to eliminate any potential of pressurization.

Standard 55-gal (208-L) drums are constructed of mild steel and may also contain rigid, molded polyethylene (or other compatible material) liners. These liners are procured to a specification describing the functional requirements of fitting inside the drum, material thickness and tolerances, and quality controls and required testing. A quality assurance surveillance program is applied to all procurements to verify that the liners meet the specification. The drum material and liner will not react with, and will be otherwise compatible with, the TRU mixed waste, so that the ability of the container to contain the TRU mixed waste will be not impaired. Appendix C1 provides a discussion of compatibility.

The SWBs meet all the requirements of DOT specification 7A regulations. The SWBs are fitted at the generator sites with a standard carbon-composite filter as required for shipment in a TRUPACT-II and for safety during TRU mixed waste storage. They have an internal volume of 66.3 ft³ (1.88 m³). Appendix D3 provides detailed design drawings for the SWBs (165-F-001-W).

The 85-gal (321-L) drums meet the requirements for DOT specification 7A regulations. The drums are required to have a nominal life of 20 years from the date of TRU mixed waste certification. These drums are also equipped with filter vents.

The 85-gal (321-L) drum overpack, which is shown in Figure D-5, will be used primarily for overpacking contaminated 55-gal (208-L) drums at the WPP facility, but can also be used for derived waste, should there be a need for a container of that size.

The TDOP is a metal container, similar to a SWB, that meets DOT specification 7A and is certified to be noncombustible and to meet all applicable requirements for Type A packaging. The TDOP is a welded-steel, right circular cylinder, approximately 74 inches (in.) (1.9 meters (m) high and 71 in. (1.8 m) in diameter (Figure D-4). The maximum loaded weight of a TDOP is 7,265 pounds (lbs) (3,294.7 kilograms (kg)). A bolted lid on one end is removable; sealing is accomplished by clamping a neoprene gasket between the lid and the body. filter ports are located near the top of the TDOP. Each TDOP contains carbon-composite filters. A TDOP may contain up to ten standard 55-gal (208-L) drums or one SWB. TDOPs may be used to overpack drums or SWBs containing CH TRU mixed waste.

CH TRU waste containers are continuously vented. The filter vents allow aspiration, preventing internal pressurization of the container and minimizing the buildup of flammable gas concentrations.

1 **B-1b(3)(b) RH Waste Containers**

2
3 The RH canister meets all the requirements of DOT specifications 7A regulations. It is a carbon-
4 steel single-shell container measuring 26 in. (0.7 m) in diameter, with an overall length of 121 in.
5 (3.1 m), with a gross weight of 8,000 lbs (3,636 kg). The canister is vented using a carbon-
6 composite high-efficiency particulate air-grade filter and is capable of overpacking three 30-gal
7 (114-L) or 55-gal (208-L) waste drums or packaging uncontainerized waste. The top of the
8 canister has a round plate pintle for remote handling purposes.

9
10 The overpack RH TRU waste canister is the same as the RH canister, except it is 28 in. (0.7 m)
11 in diameter and 133 in. (3.4 m) in maximum length and weighs a maximum of 10,000 lbs
12 (4,535.0 kg) when loaded.

13
14 **B-1c The WPP Site**

15
16 There are three basic groups of structures associated with the WPP facility that will be used for
17 the Disposal Phase: surface structures, shafts, and underground structures (Figures B-5 and
18 B-6). Surface structures accommodate the personnel, equipment, and support services required
19 for the receipt, preparation, and transfer of TRU mixed waste from the surface to the
20 underground. The surface structures are located within a perimeter security fence, and access
21 is controlled 24 hours a day by security officers. Among surface structures (Figure B-6) other
22 than the WHB, the ones that support TRU mixed waste management are:

23
24 Exhaust Filter Building - houses the filter banks to which the underground ventilation
25 can be diverted in the unlikely event of a release of radionuclides. A description of
26 the underground ventilation system is provided in Section D-10a(2)(f).

27
28 Guard and Security Building - houses the facility security personnel and
29 communications equipment necessary for them to perform their duties. Section G-4a
30 specifies the duties of the security officers relative to contingency actions.

31
32 Safety and Emergency Services Building - houses the surface emergency response
33 vehicles (fire truck, rescue truck, ambulance), Health Services (first aid), Emergency
34 Operations Center, and the Dosimetry Laboratory. Inspection of the emergency
35 response equipment is identified in Table F-1. Table G-6 describes emergency
36 equipment and associated locations.

37
38 Support Building - houses the Central Monitoring Room (see section G-4a).

39
40 TRUPACT-II Maintenance Facility - located west of the CH bay, houses equipment
41 required for conducting preventive maintenance and other activities required by the
42 NRC to maintain the Certificate of Compliance. No TRU waste management activities
43 will occur in this facility.

The WIPP facility has been divided into functional areas as shown in Figure B-7. The Property Protection Area (PPA), formerly referred to as Zone I, surrounded by a chain-link security fence, encompasses 34.16 acres (ac) (0.14 square km) and provides security and protection for all major surface structures. The DOE Off Limits Area encloses approximately 1,454 ac (589 hectares) and serves the function of defining the DOE exclusion zone within which certain items and materials (e.g., firearms) are prohibited. The final zone is marked by the WIPP Site Boundary (WIPP land withdrawal area), a 16-section (16-square-mi [41-square-km]) federal land area under the jurisdiction of the DOE. The land sections were withdrawn by the LWA, which authorized the use of the land for TRU waste emplacement. Volumetrically, the WIPP withdrawal area can be visualized as both surface and the underlying areas extending vertically to the center of the earth, with the exception of Section 31, where the depth of the withdrawal is to 6,000 ft (1,828 m).

In terms of the *facility*, the RCRA facility is referred to as the WIPP facility and is the area contained within the WIPP Site Boundary. The active portion of the WIPP facility includes the WHB container storage HWMU, the parking area container storage HWMU, and ten underground HWMUs for which a permit is sought.

There are other areas within the WHB and the underground that have been constructed and equipped to ensure compliance with the general facility standards in 20 NMAC 4.1, Subpart V, and the environmental compliance standards to ensure safe waste handling disposal, public and worker safety, and environmental protection. These include the contingency response waste management areas (such as portions of the WHB), the waste shaft, the waste haulage ways, the underground ventilation system, the underground fire protection and emergency response areas and equipment, the underground communication system within the TRU mixed waste handling areas, and the emergency evacuation equipment. Chapter G provides a full description of contingency plans in Sections G-3 and G-4, and response equipment in Section G-5. Also shown on Figure B-6 is Facility No. 474 (Hazardous Waste Storage Facility), which is an area designated for management of non-mixed hazardous wastes and materials. No permit is required for that facility.

Four vertical shafts connect the surface facility to the underground. These are the Waste Shaft, the Salt Handling Shaft, the Exhaust Shaft, and the Air Intake Shaft. The Waste Shaft will be used to transport TRU mixed waste to the underground. It is also used to transport materials, large equipment, and personnel. The Salt Handling Shaft is the primary route for personnel and mined materials; it carries power, control, monitoring, and communication cables and serves as the secondary air-supply duct for the underground ventilation. The Exhaust Shaft serves as the exhaust air duct for the underground. The Air Intake Shaft is the primary duct to supply fresh air into the underground and also serves as a backup for personnel egress from the underground during unusual or emergency events, when the previously mentioned shaft hoists are not operable.

The WIPP facility underground structures are located on the repository horizon 2,150 ft (655 m) under the surface. The underground structures include the active HWMUs, an area for future HWMUs (other panels), the shaft pillar area, interconnecting tunnels, and other areas unrelated to the Disposal Phase activities in this permit application. The underground HWMUs are defined as waste panels consisting of seven rooms and two access drifts each. The HWMUs included in this application are Panels 1 through 8 (Figure B-2), and the disposal area access drifts, designated as Panels 9 and 10. Each room has the nominal dimensions of 300 ft (91.4 m) long, 33 ft (10 m) wide, and 13 ft (4 m) high. Access drifts connect the rooms and have the same cross section. Figure B-8 is a map showing the movement of the TRU mixed waste through the facility into Panel 1 and the return route for the transporter. Detailed descriptions of the panel and room system are provided in Section D-10a(2)(f). The configuration (stacking) of the TRU mixed waste in the room will be seven-packs of drums and SWBs, three high, either separated or intermixed. Occasionally TDOPs and 85-gal drum overpacks may be emplaced in the stack. The ventilation system is described in Section D-10a(2)(f). The DOE intends to operate the WIPP facility in a manner that minimizes the number of HWMUs that are open at any one time. Generally, panels will fall into one of six categories:

- Unmined (future) panels
- The panel undergoing mining
- The panel being filled with waste
- The filled panel being closed
- Closed panels
- Disposal area access drifts

B-2 Topographic Map

Topographic maps of the WIPP site and facility, as required by 20 NMAC 4.1, Subpart IX, §270.14(b)(19), are presented in Figures B-9 and B-10. In accordance with the note located at the end of 20 NMAC 4.1, Subpart IX, §270.14(b)(19), and due to the large size of the facility, the scale on Figure B-9 is 1 inch = 1,000 ft. Contour lines on Figures B-9 and B-10 are at intervals of 10 ft (3 m) (except those within the PPA fence on Figure B-10, which equal 1 ft. [0.3 m]), reflecting the flat desert-plain topography at the WIPP site. In addition, a contour map at the approximate midheight of the underground facility is presented in Figure B-11 and depicts the elevation of the underground unit relative to sea level. Appendix D3 contains drawings showing the details of site drainage.

B-2a General Requirements

A map scale, date, and north arrow are shown on Figures B-9 and B-10. The WIPP facility is not in a 100-year floodplain, and there are no major surface-water bodies within 10 mi (16.1 km) of the site. Therefore, these requirements are not included on Figure B-9 or Figure B-10.

There are no hydrocarbon production wells within the volumetric boundary defined by the land withdrawal. One active well, referred to as James Ranch 13, was drilled in 1982 to tap gas resources beneath Section 31. This well was initiated in Section 6, outside the WIPP site boundary, and slanted to enter Section 31, north of Section 6 and within the WIPP site boundary. The well enters beneath Section 31 below a depth of 6,000 ft (1,828 m) beneath ground level.

Grazing leases have been issued for all land sections immediately surrounding the WIPP facility. Information regarding other land uses on and near the WIPP facility is illustrated in Figures B-12 through B-17. Access control features, such as fences and gates, buildings, and other surface structures, are illustrated in Figure B-10. Site security is addressed in Section D-10a(2)(a). Environmental performance standards are discussed in Section D-9b, and the following subsections address protection of groundwater, surface water, and the atmosphere. Chapter D also contains the following information: WHB (D-10a(2)(b)), facility design and construction (D-10a(2)), CH TRU mixed waste handling equipment (D-10a(2)(c)), RH TRU mixed waste handling equipment (D-10a(2)(d)), shafts and underground facilities (D-10a(2)(e)), and storm water drainage (D-9b(3)). Section G-4d and Table G-7 provide fire control measures information.

B-2b Additional Requirements for Land Disposal Facilities

The point of compliance for environmental performance standards is the WIPP facility boundary (Section D9b(4)(b)), instead of the nearest resident, which is an additional half mile outside of the boundary (Figure B-7). Section D9-b(1)(c) provides additional discussion on this subject. This conservative assumption is made to be consistent with DOE radiation protection practices. Air emissions from underground and WHB HWMU exhausts are the only pathway of concern. (Because the waste is not in liquid form and waste containers are required to be closed at all times, waste mobility during operations is very limited.) An environmental pathway analysis and assessment of the environmental performance of the miscellaneous unit are included in Section D9b.

Environmental performance groundwater monitoring is not considered necessary for the Disposal Phase because the waste is not in liquid form per 20 NMAC 4.1, Subpart V, §264.90(b)(2), and because there is no pathway that will allow waste constituents or brines containing mixed waste constituents to contact other nearby groundwaters during operation or the 30-year post-closure care period. Sections E-1c and E-2 address groundwater monitoring, and Appendix E1 (Sections E1-2 and E1-6) presents RCRA groundwater protection information. Appendices D1 and D6 contain detailed descriptions of WIPP site characteristics, including geology and hydrology, and maps of known water-bearing zones. No contamination has, and it is highly improbable that any contamination will, enter the groundwater from the regulated unit.

Although the DOE has requested a waiver from the groundwater monitoring requirements, the NMED has indicated that their policy is not to grant such variances. Consequently, a groundwater monitoring plan is provided in Section D-10d(1)(a).

1 Emissions of hazardous VOCs are demonstrated to be far below levels of concern for protection
2 of workers, members of the public, and the environment (Section D-9b(4)). VOC emission
3 standards for containers in 40 CFR §264, Subpart CC, will not apply to the TRU mixed waste
4 containers because VOC emissions standards are currently deferred for mixed waste containers
5 generated after June 6, 1996. Mixed wastes generated prior to this date are exempted from
6 Subpart CC requirements.

7 8 B-3 Location Information

9
10 The WIPP facility is located in the Pecos River Valley section of the Great Plains physiographic
11 province in the north-central part of the Delaware Basin. The facility is north of the Jal Highway
12 (State Highway 128) in Eddy County, New Mexico (Figure B-18), and consists of 16 sections of
13 federal land in Township 22 South, Range 31 East. The latitude and longitude at the center of
14 the land withdrawal area is 32 degrees, 22 minutes, 30 seconds North, and 103 degrees,
15 47 minutes, 30 seconds West respectively.

16
17 Selection of the WIPP site followed an extensive study of potential sites and was based on
18 stringent site-selection criteria. Investigation of the geographic area proposed for the WIPP
19 facility, the Los Medaños region of southeastern New Mexico, began in 1973 with a careful
20 review of the extensive geologic database developed by potash and hydrocarbon industry
21 exploration in the area. The results of this review were favorable, and detailed characterization
22 of the present site was initiated in 1976 with drilling of a stratigraphic borehole, ERDA-9, at the
23 center of the proposed site. For details regarding WIPP site characterization, geology, and
24 hydrology, see Appendix D6.

25
26 Between 1975 and 1988, over 95 boreholes were drilled, and over 35,000 ft (10,668 m) of core
27 were retrieved specifically for geologic evaluation of the site. More than 40 of these boreholes
28 have been used to acquire hydrologic data needed to establish models of local and regional
29 hydrology. A detailed and exhaustive study of the geology of the WIPP vicinity was completed
30 in 1978. In addition, a variety of geophysical exploration techniques, including electrical
31 resistivity, seismic reflection, gravity, and magnetic surveys, have contributed to and updated
32 understanding of the many aspects of site geology.

33
34 A comprehensive WIPP Project research and development program began in 1975 with
35 investigations of salt-creep properties and constitutive laws, gas generation from the degradation
36 of TRU waste, corrosion behavior of TRU waste containers, and backfill behavior. From 1981
37 through 1983, field tests were conducted on waste package materials, large-scale salt
38 deformation, and brine transport in a potash mine near the WIPP site. Investigations in the
39 WIPP facility underground began in 1982 with the instrumentation of the Salt Handling Shaft and
40 selected underground drifts. An extensive underground (in situ) test program for
41 thermal/structural interactions, plugging and sealing, brine inflow, and waste package
42 performance began in 1983 and has recently been completed. The area used for these tests
43 are being deactivated (Figure B-2).

The SPDV program (1981-1983) was developed and implemented to permit direct observation of geologic conditions at the proposed repository horizon and to allow determination of the geomechanical response of the salt beds after excavation of underground workings. Two shafts were drilled, and a four-room test panel was excavated at the selected disposal depth. Extensive data from geologic investigations showed the geology of the disposal horizon to be consistent with predictions based on previous site investigations.

B-3a Seismic Standard

Located in Eddy County, New Mexico, the WIPP site is not listed in 20 NMAC 4.1, Subpart V, Appendix VI, "Political Jurisdictions in Which Compliance With §264.18(a) Must Be Demonstrated." Therefore, the WIPP site is assumed to be in compliance with the requirements of 20 NMAC 4.1, Subpart V, §264.18(a).

B-3b Floodplain Standard

The WIPP site does not lie within a 100-year floodplain. There are no major surface-water bodies within 10 mi (16 km) of the site. The site is 12 mi (19 km) from the nearest river, the Pecos River (Figure B-18). The general ground elevation in the vicinity of the surface facilities (approximately 3,400 ft [1,036 m] above mean sea level) is about 450 ft (137 m) above the river bed and 400 ft (122 m) above the 100-year floodplain. Although there are no flood-protection requirements for the WIPP site, the WIPP facility drainage and diversion structures, which include berms and dikes, have been constructed so that ponding, resulting from a probable maximum precipitation (PMP) event, will not affect surface or subsurface structures. The floor levels of all surface facilities are above the levels calculated for local flooding due to PMP events. Even though the elevation of the underground unit is over 2,000 ft (610 m) below the level of the surface unit, the underground unit is protected from flooding by berms and dikes that divert water away from the open shafts (the Salt Handling Shaft and Air Intake Shaft) as shown in Figure B-10.

B-3b(1) Demonstration of Compliance

The WIPP facility is not in a 100-year floodplain as defined in 20 NMAC 4.1, Subpart V, §264.18(b)(2)(i), and as regulated under 20 NMAC 4.1, Subpart V, §264.18(b)(1). Floodplain regulations are not applicable to the WIPP facility.

B-3b(1)(a) Flood-Proofing and Flood-Protection Measures

The WIPP facility is not in a 100-year floodplain as defined in 20 NMAC 4.1, Subpart V, §264.18(b)(2)(i), and as regulated under 20 NMAC 4.1, Subpart V, §264.18(b)(1). Flood-proofing and flood-protection measures are not applicable to the WIPP facility.

1 B-3b(1)(b) Floodplain

2
3 The WIPP facility is not in a 100-year floodplain as defined in 20 NMAC 4.1, Subpart V,
4 §264.18(b)(2)(i), and as regulated under 20 NMAC 4.1, Subpart V, §264.18(b)(1). Floodplain
5 regulations are not applicable to the WIPP facility.
6

7 B-3b(2) Plan for Future Compliance with Floodplain Standard

8
9 The WIPP facility is not in a 100-year floodplain as defined in 20 NMAC 4.1, Subpart V,
10 §264.18(b)(2)(i), and as regulated under 20 NMAC 4.1, Subpart V, §264.18(b)(1). The plan for
11 future compliance with the floodplain standard regulation is not applicable to the WIPP facility.
12

13 B-3b(3) Waiver for Land Storage and Disposal Facilities

14
15 The WIPP facility is not in a 100-year floodplain as defined in 20 NMAC 4.1, Subpart V,
16 §264.18(b)(2)(i), and as regulated under 20 NMAC 4.1, Subpart V, §264.18(b)(1). The waiver
17 for land-storage and disposal facilities regulation is not applicable to the WIPP facility.
18

19 B-4 Traffic Information

20
21 Access to the WIPP facility is provided by two access roads that connect with
22 U.S. Highway 62/180, 13 mi (21 km) to the north, and NM Highway 128 (Jal Highway), 4 mi
23 (6.4 km) to the south (Figure B-18). The northern access road, which connects the site to
24 U.S. Highway 62/180, is an access road built specifically for the DOE that will be used to
25 transport TRU mixed waste from the highway to the site. The southern access road is a county
26 highway maintained by Eddy County. Road-pavement materials and construction, as well as
27 other road features, were designed in accordance with specifications given by Bechtel (1981a⁴,
28 1981b⁵). Signs and pavement markings are located in accordance with the Uniform Traffic
29 Control Devices Manual (Bechtel, 1981a). Access-road design designation parameters, such as
30 traffic volume, are presented in Table B-2. Rail access is available and may be used for TRU
31 mixed waste transport during the Disposal Phase (RH casks) as an option. Railroad materials
32 and construction were designed to be in accordance with specifications given by Bechtel (1983),
33 including the four-axle railcar gross vehicle weight limit of 263,000 lbs. A six-axle railcar has
34 even greater gross vehicle weight limit, but is not required for the pay loads shipped to WIPP.
35

36 Rail access is from the west across the southern access road (marked by railroad crossing
37 signs), but does not cross the northern access road used by the tractor-trailers (Figure B-19).

38 ⁴Bechtel, 1981a. This document establishes the design requirements for the northern access road and contains information
39 applicable to the southern access road. Design standards applied include Standard Specifications for Road and Bridge Construction,
40 New Mexico State Highway Department (NMSHD) 1976, and Standard Details, NMSHD (latest edition).

41 ⁵Bechtel, 1981b. This specification covers the furnishings and constructing of aggregate and bituminous pavement for roads and
42 parking. Codes, specifications, and standards applied include AASHTO T 11-82, AASHTO T 27-82, AASHTO T 30-78 (R 1982),
43 AASHTO T 89-81, AASHTO T 90-81, AASHTO T 96-77 (R-1982), AASHTO T 104-77 (R 1982), AASHTO T 164-80, AASHTO T 165-
44 82, AASHTO T 166-78 (R 1982), AASHTO 167-82, AASHTO 245-82, ASTM D 1557-78, ASTM D 2216-80, and NMSHD-1976.

The roadway is raised above the surrounding terrain, ensuring clear visibility of all on-site rail movements. Security opens a locked gate at the West end of the PPA when rail shipments arrive and closes it while the locomotive is on site. The reverse takes place as the locomotive departs with the empty cask(s) on railcars. The road crossing will not be blocked for extended periods of time. A railcar mover is used to move railcars into and out of the WHB for waste handling operations when the locomotive is not on site. The alternate truck route to the parking area HWMU at the east end of the WHB will be staffed by waste operations personnel to protect the crossing during any railcar movements into or out of the WHB.

Access to the facility for personnel, visitors, and trucks carrying supplies and TRU mixed waste is provided through a security checkpoint (vehicle trap). After passing through the security checkpoint (see Figure F-1), TRUPACT-II TRU mixed waste transport trucks will normally turn right (south) before reaching the Support Building and then left (east) to park in the parking area HWMU just east of the air locks (Figure B-19). Outgoing trucks depart the same way they arrived, normally out of the west end of the parking area, north through the fence gate and out through the vehicle trap. An alternate inbound route is to continue straight ahead from the security checkpoint to the second road and to turn south to enter the truck parking area. The alternate outbound route is also the reverse of this route. Salt transport trucks, which remove mined salt from the Salt Handling Shaft area, will not cross paths with TRU mixed waste transporters; instead, they will proceed from the Salt Handling Shaft northward to the salt pile. Figure B-19 shows surface traffic flow at the WIPP facility.

The site speed limit for motor vehicles is 10 mph (16 kph) and 5 mph (8 kph) for rail movements. Speed limits are clearly posted at the entrance to the site and enforced by security officers. There are no traffic signals. Stop signs are located at the major intersections of roadways with the main east-west road. Safety requirements are communicated to all site personnel via General Employee Training within 30 days of their employment. Employee access to on-site facilities requires an annual refresher course to reinforce the safety requirements. Security officers monitor vehicular traffic for compliance with site restrictions, and provide instructions to off-site delivery shipments. Vehicular traffic other than the waste transporters use the same roads, but there will be no interference because there are two lanes available on the primary and alternate routes for waste shipments. Pedestrian traffic is limited to the sidewalks and prominently marked crosswalks. Site traffic is composed mostly of pickup trucks and electric carts with a frequency of perhaps 10 per hour at peak periods. Emergency vehicles are exercised periodically for maintenance and personnel training, with an average frequency of one each per day. They are used for their intended purpose on an as-required basis.

The traffic circulation system is designed in accordance with American Association of State Highway and Transportation Officials (AASHTO) Site Planning Guides for lane widths, lateral clearance to fixed objects, minimum pavement edge radii, and other geometric features. Objects

1 in or near the roadway are prominently marked in accordance with the standards in Bechtel,
2 1981c.⁶

3
4 On-site roads, sidewalks, and paved areas are used for the distribution and storage of vehicles
5 and personnel and are designed to handle all traffic generated by employees, visitors, TRU
6 mixed waste shipments, and movements of operational and maintenance vehicles (Bechtel,
7 1981c). The facility entrance and TRU mixed waste haul roads are designed for AASHTO
8 H20-S16 wheel loading (Bechtel, 1981c). Service roads are designed for AASHTO H10 wheel
9 loading (Bechtel, 1981c). Access and on-site paved roads are designed to bear the anticipated
10 maximum load of 80,000 lbs (36,287.2 kg), the maximum allowable weight of a truck/trailer
11 carrying loaded TRUPACT-IIs.

12
13 The facility is designed to handle an average of five truck trailers per day, each carrying three
14 TRUPACT-IIs and two truck trailers per day carrying one shielded road cask. Outbound
15 transporters with empty shipping containers will match that number daily. This is equivalent to
16 1,335 TRU mixed waste-carrying vehicles per year. Railcar shipments of road casks would offset
17 road shipments of RH TRU waste on a one-for-one basis. Railroad shipments of RH road casks
18 could be up to four per delivery, twice a week. The empties would be picked up and hauled
19 away by the departing locomotive. A loaded railcar could remain on the siding for a maximum
20 of five days, considering weekends, the maintenance day, and two days to process all four
21 shipments. A railroad cask could be developed to carry four RH canisters, which would reduce
22 the highway shipments even further.

23
24 Underground traffic, with and without TRU mixed waste, will travel on separated paths. The
25 ventilation and traffic flow path in the TRU mixed waste handling areas underground are
26 restricted and separate from those used for mining and haulage (construction) equipment (Figure
27 B-8). Non-waste and non-construction traffic use the same routes as waste and construction
28 traffic. In general, waste traffic will use the intake ventilation drift in that area. The exhaust drift
29 in the construction area will generally be used for mining/construction equipment for maximum
30 isolation of this activity from personnel. The exhaust drift in the waste disposal area will normally
31 not be used for personnel access. Non-waste and non-construction traffic is generally comprised
32 of escorted visitors only and is minimized during each of the respective operations.

33
34 Adequate clearances that exceed the mining regulations of 30 CFR 57 exist underground for
35 safe passage of vehicles and pedestrians. Pedestrians/personnel are given precedence over
36 vehicles in the WIPP underground facility. This condition is reinforced through the WIPP

37 ⁶Bechtel, 1981c. This document identifies the design requirements for on-site roads and sidewalks of the WIPP that are used for
38 distribution and storage of vehicles and personnel. Design standards applied include The Standard Specifications for Road and
39 Bridge Construction, New Mexico State Highway Department (1976); Standard Details, New Mexico State Highway Department
40 (Latest Edition); Geometric Design Guide for Local Roads and Streets, American Association of State Highway Officials (1971);
41 Thickness Design, Asphalt Pavement Structures for Streets and Highways (MS-1) 1970, The Asphalt Institute; Construction
42 Specifications for Asphalt Concrete (SS-1), The Asphalt Institute, current edition; Standard Specifications for Highway Bridges, The
43 American Association of State Highway and Transportation Officials (AASHTO), current edition; and Standard Specifications for
44 Transportation Materials and Methods of Sampling and Testing (AASHTO), current edition.

equipment operating procedures, the WIPP Safety Manual, the WIPP safety briefing required for all underground visitors, the General Employee Training annual refresher course, and the Underground annual refresher course that are mandated by 30 CFR 57, the New Mexico Mine Code, and DOE Order 5480.20A. 1
2
3
4

In addition, other physical means are utilized to safeguard pedestrians/personnel when underground such as: 5
6

All equipment operators are required to sound the vehicle horn when approaching personnel and intersections. 7
8

All airlock and bulkhead doors are equipped with warning bells to alert personnel when door opening is imminent. 9
10

Hemispherical mirrors are used at blind intersections so that persons can see around corners. 11
12

All heavy equipment is required to have operational back-up alarms. 13

Heavily used intersections are well lighted. 14

Typically, the traffic routes during waste disposal in all Panels (1 through 10) will use the same main access drifts. 15
16

All traffic safety is regulated and enforced by the federal and state mine codes of regulations (30 CFR 57 and New Mexico State Mine Code). The agencies that administer these codes make regular inspection tours of the WIPP underground facilities for the purpose of enforcement. 17
18
19

All underground equipment is designed for off-road use since all driving surfaces are excavated in salt. No loads on the underground roadways will exceed the bearing strength of in situ halite. In addition, mining construction will usually take place on a different work shift. 20
21
22

Since waste emplacement activities require a radiological work permit, personnel and materials entering the active emplacement room are strictly controlled. 23

TABLES

TABLE B-1
SUMMARY OF NONWASTE TESTS CONDUCTED
IN THE WIPP FACILITY

| Test Title | Location | Description | Duration |
|---|--|---|-----------------|
| Repository Plugging and Sealing Studies | Experimental Area (Rooms L1, L2, D) | Testing is designed to evaluate the procedures and techniques for installing plugs and seals and to evaluate the long-term physical and chemical behavior of candidate materials. The results are germane to the post-closure performance of the WIPP facility. | Complete (1995) |
| Rock Mechanics Experiments | Experimental Area (Rooms H, G1, A1, A2, A3, C1, C2) | A multiphase test is in progress to evaluate the geomechanical response of the rock formation to a range of stresses, including stresses in excess of those anticipated to be encountered in the underground facility. This information is germane to the prediction of the long-term behavior of salt. | Complete (1995) |
| TRU Waste Container Performance Experiments | Experimental Area (Rooms A1, A2, A3, B, T) | The performance of CH TRU and RH TRU container materials when exposed to anticipated long-term repository conditions is being evaluated. These tests are germane to estimating the corrosion rates on containers under severe repository conditions. | Complete (1995) |
| Thermal-Structural Interactions | Experimental Area (Rooms A1, A2, A3, T) | Testing of materials, including salt and backfill materials and waste package materials, is performed under a series of conditions ranging from dry to brine-saturated. Results are useful for estimating extreme case interactions between backfill materials and various waste components. | Complete (1994) |
| Brine Inflow Studies | Numerous locations (including Room Q near the base of the Air Intake Shaft, Rooms D, L4) | Brine sampling includes the collection of brine in a number of shallow boreholes distributed throughout the underground. Brine quantities are measured and brine samples are analyzed. Room Q is a circular room, configuration of which was selected to maximize the fraction of incoming brine that can be collected in instrumented containers and measured directly without the need to infer brine volumes. Data on brine inflow and chemistry are used to infer brine transport mechanisms. | Complete (1995) |
| Marker Bed Studies | Geotechnical Area (Rooms C1, C2, L3, D) | This study includes evaluations of the transmissivities of Marker Bed 139. Data are directly related to long-term repository transport mechanisms. | Complete (1995) |
| Facility Permeability | Throughout facility | The objective is to test the permeability of the nondisturbed zone at many locations from the north to south ends of the mine. | Complete (1995) |

TABLE B-2
WASTE ISOLATION PILOT PLANT SITE DESIGN DESIGNATION
TRAFFIC PARAMETERS^a

| Traffic Parameter | North Access Road (No. of Vehicles, unless otherwise stated) | South Access Road (No. of Vehicles, unless otherwise stated) | On-Site Waste Haul Roads (TRUPACT-II Traffic) |

| Average Daily Traffic (ADT) ^b | 800 | 400 | 6 |
| Design Hourly Volume (DHV) ^c | 144 | 72 | NA ^g |
| Hourly Volume (Max. at Shift Change) | 250 | 125 | NA |
| Distribution (D) ^d | 67% | 67% | NA |
| Trucks (T) ^e | 2% | 0 | 100% |
| Design Speed ^{h,i} | 70 mph (113 kph) | 60 mph (97 kph) | 25 mph (40 kph) |
| Control of Access ^f | None | None | Full |

^aFor WIPP personnel and TRU mixed waste shipments only.

^bADT—Estimated number of vehicles travelling in both directions per day.

^cDHV—A two-way traffic count with directional distribution.

^dD—The percentage of DHV in the predominant direction of travel.

^eT—The percentage of ADT comprised of trucks (excluding light delivery trucks).

^fControl of Access—The extent of roadside interference or restriction of movement.

^gNA—Not applicable.

^hmph—miles per hour.

ⁱkph—kilometers per hour.
