The other fields used to develop roll ups for the tables in the reports are the waste material parameters. The sites were asked to estimate an average, minimum and maximum concentration of materials in each waste stream. For example, weights of metals such as brass, copper, tantalum and materials simply described as metals were rolled up under the field OM_xxx (where xxx is min, max, or avg) which stands for "Other Metals" (see the data dictionary; Table 7-1). Note that because some materials are described only as metals, aluminum and iron can be in the OM_xxx field as well as in the IB_xxx or AB_xxx fields.

Two categories of sludges and solidified materials are represented by fields. These are solidified inorganic solids (SIM_xxx) and solidified organic solids (SOM_xxx). The particular category into which a sludge or solidified material is placed is determined by the overall matrix of the resulting material after any solidification or stabilization steps. For example, a small amount of organic liquids/sludges solidified in cement would be placed in the solidified inorganics category and a drum of organic based resin beads solidified would be placed in the solidified organics category.

The rest of the fields are reasonably self explanatory, but additional discussion on Cel_xxx, Rub_xxx, and Plas_xxx, may be helpful. Cel_xxx includes all cellulose base materials and will typically include paper, cloth, wood, kimwipes and other materials derived from plant based materials. It is assumed that cloth is plant derived material such as cotton and not plastic based such as rayon or nylon. Rub_xxx consists of rubber based materials. Included in this category are Hypalon®, neoprene, and surgeons gloves. Plas_xxx represents plastics such as Lucite®, polyethylene, Tyvek®, teflon and polyvinyl chloride. Plastic bags are used extensively in packaging the waste and would be included in this category. The plastic drum or container liners were not included in this category and were requested separately.

The parameter information is manipulated so that the waste material parameters can be added up and averaged at WIPP, site and Final Waste Form levels. Waste streams for which no waste parameters are provided or for which average, minimum and maximum parameters are not all provided cannot be rationally averaged and summed. Therefore, in order to calculate averaged parameters from the waste stream data provided, certain manipulations on the data are necessary. These manipulations are summarized below. If the parameters for a particular waste material were incomplete, the following assumptions were used to adjust the data so that rational averages and sums could be accomplished:

- If no minimum was provided, but a maximum was provided, the minimum was assumed to be zero.
- If a maximum was provided, but no average, the average was assumed to be one half the sum of the maximum and minimum.
- If an average was provided but no minimum or maximum, the average was assigned to the minimum and maximum.
- If only a minimum was provided, the minimum was assigned to both the maximum and the average.

For those waste streams that did not have any waste parameter information provided, but which could be assigned to a final waste form, an average set of parameters was calculated and used. This average set of parameters was calculated by volume averaging the parameters provided for other waste streams with the same final waste form.

The data that is printed out on all the tables in the report is based on these calculations and assumptions. The individual stream data printed out in Appendix A is the original unmanipulated data submitted by the generator/storage sites or agreed to by the sites through discussions and questions with the WTWBIR team.

The roll ups of these material parameters for tables in the report by Final_Waste_Form or by site were performed using a volume weighted averaging procedure. The averages for the material parameters for a Final_Waste_Forms (FWF) are calculated as follows:

$$\text{Average Density of FWF parameter}_i = \text{Density of Parameter}_i \times \frac{(\text{Volume in Stream}_i)}{(\text{Total Volume in FWF})} + \dots$$

where i is an index representing individual waste streams of the same FWF.

The minimum density is chosen as the smallest minimum density of a particular material parameter in the WTWBIR streams in a particular Final_Waste_Form. The maximum density is chosen in a similar manner except that the largest maximum density was chosen. Note that the maximum and minimum densities apply to individual containers and cannot be used to directly calculate a maximum and minimum density of particular material parameters for the entire WIPP inventory. Also note, that it is possible, that the maximum density may not be a true maximum but a maximum average density, if a site provided only averages and no maximums and these averages are higher than other sites' maximums.

The amount of and type of materials in the containers and liners was requested separately in the waste stream profiles. Many of the sites did not provide data for final form WIPP approved containers. Some sites provided current containers, some did not provide containers and some provided final form containers. In order to add up packaging materials for the waste as it would arrive at WIPP, standard container configurations were assumed for waste from all sites.

If the site provided final form containers, the final form containers (drums, SWBs, or RH Canisters) were used, but standard liners were assumed. This was done because many sites did not provide liner information and assuming standard liners will generally maximize the amount of liner material.

For CH waste containers, the following assumptions were used:

- If the type of container was unclear, it was assumed to be drums. (This was rare.)
- If drums were reported they are assumed to be WIPP approved drums with rigid liners. Many sites have a mixture of liner types in a stream or are unsure of liners.
- If waste was reported in containers larger than drums, then the waste was divided into (Standard Waste Boxes) SWBs with standard plastic bag liners; using the standard internal volume for SWBs and the reported waste stream volumes to determine the number of SWBs.
- If the waste was reported in a liquid or sludge form (i.e. tanks), it was assumed to be placed in drums with rigid liners. No treatment volume expansion was included unless provided by the site.

For RH waste, the following assumptions were used:

- If the waste was reported in drums, the drums were assumed to be overpacked in RH canisters at 3 drums per canister.
- If the waste was not reported to be in drums, the waste was assumed to be direct loaded into RH canisters; using the standard internal volume for RH canisters and the reported waste stream volumes to determine the number of RH canisters.

Packaging material weights used in the WTWBIR report are shown in the table below:

Table 7-1. Table of Materials for CH and RH Waste Containers
(Weights in kg per container, Volume in m³ per container)

| CH Waste | | | |
|-----------------------------|------------------|---------|-----------------------------------|
| Container Characteristic | Drum | SWB | SWB Overpack ¹ |
| Steel Weight | 27.3 | 290.9 | 400.1 (include. 4 drums |
| Liner Type | Rigid Drum Liner | Bag | Rigid Drum Liners and Bag |
| Liner Material | 90 mil HDPE | Plastic | 90 mil HDPE and Plastic |
| Liner Weight | 7.7 | 2.2 | 33 |
| Volume (Capacity) | 0.208 | 1.89 | 1.89 |
| Payload Volume ² | 0.208 | 1.89 | 0.832 (4 drums) |
| RH Waste | | | |
| Container Characteristics | RH Canister | | RH Canister Overpack ³ |
| Steel Weight | 387.3 | | 469.2 (3 drums) |
| Lead Weight | 413.6 | | 413.6 |
| Steel Plug Weight | 1909.1 | | 1909.1 |
| Liner Type | None | | Rigid Liner in Drums |
| Liner Material | N/A | | 90 mil HDPE |
| Liner Weight | N/A | | 23.1 |
| Volume (Capacity) | 0.89 | | 0.89 |
| Payload Volume ² | 0.89 | | 0.624 (3 drums) |

¹ Four drums overpacked in an SWB

² Payload volume is the actual volume of waste which can be placed in the container.

³ Three drums overpacked in an RH Canister

The tables and reports for the WTWBIR were produced using the facilities provided by the Microsoft Access Vs 2.0 database system. These tables and reports consist primarily of various sorts based on waste streams, final waste forms, sites, etc. and summations of volumes and material parameter weights.

7.2 DATA DICTIONARY

Table 7-2. WTWBID Data Dictionary

| Field/Table Name | Notes | Description |
|---|---|---|
| Table: Container_Data WIPP_ID | Key Field Index Relating from Page_1 data table | The unique waste stream identification number as assigned by the WTWBIR Team |
| MWIR_ID | | The unique waste stream identification number as listed in the Mixed Waste Inventory Report |
| Cont | Key Field to relate to Nuclides data table | Container (SWB, Std Drum, or RH Canister) |
| Counter | | Access 2.0-generated record identifier |
| MWIR_Cont | | The type of container as listed in the MWIR |
| Type/Size | | type and/or size of container |
| Param | | Parameter Information Reported? |
| RAD | | Yes - Isotopes listed; No - None Listed; Quan - Concentrations listed |
| Container Material | | Material of which the waste container is made |
| Ext_Volume | | cubic meters per container |
| Liner_type | | Nomenclature identifying the type and size of liner. |
| Liner_material | | composition of liner |
| Nbr_Stored | | number of this type of container stored. |
| Nbr_Projected | | Total number of this container for this waste stream projected through the life of the WIPP |
| IB_avg | | Iron-based constituents, Average, in kg/m3 |
| IB_min | | Iron-based constituents, Minimum, in kg/m3 |
| IB_max | | Iron-based constituents, Maximum, in kg/m3 |
| AB_avg | | Aluminum-based constituents, Average, in kg/m3 |
| AB_min | | Aluminum-based constituents, Minimum, in kg/m3 |
| AB_max | | Aluminum-based constituents, Maximum, in kg/m3 |
| OM_avg | | Other metals constituents, Average, in kg/m3 |
| OM_min | | Other metals constituents, Minimum, in kg/m3 |
| OM_max | | Other metals constituents, Maximum, in kg/m3 |
| OI_avg | | Other inorganics constituents, Average, in kg/m3 |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|------------------------|-------|---|
| OI_Min | | Other inorganics constituents, Minimum, in kg/m3 |
| OI_max | | Other inorganics constituents, Maximum, in kg/m3 |
| Cel_avg | | Cellulosics constituents, Average, in kg/m3 |
| Cel_min | | Cellulosics constituents, Minimum, in kg/m3 |
| Cel_max | | Cellulosics constituents, Maximum, in kg/m3 |
| Rub_avg | | Rubber constituents, Average, in kg/m3 |
| Rub_min | | Rubber constituents, Minimum, in kg/m3 |
| Rub_max | | Rubber constituents, Maximum, in kg/m3 |
| Plas_avg | | Plastic constituents, Average, in kg/m3 |
| Plas_min | | Plastic constituents, Minimum, in kg/m3 |
| Plas_max | | Plastic constituents, Maximum, in kg/m3 |
| SIM_avg | | Solidified Inorganic Materials constituents, Average, in kg/m3 |
| SIM_min | | Solidified Inorganic Materials constituents, Minimum, in kg/m3 |
| SIM_max | | Solidified Inorganic Materials constituents, Maximum, in kg/m3 |
| SOM_avg | | Solidified Organic Materials constituents, Average, in kg/m3 |
| SOM_min | | Solidified Organic Materials constituents, Minimum, in kg/m3 |
| SOM_max | | Solidified Organic Materials constituents, Maximum, in kg/m3 |
| SL_avg | | Soils, Average, kg/m3 |
| SL_min | | Soils, Minimum, kg/m3 |
| SL_max | | Soils, Maximum, kg/m3 |
| PM_Steel | | Packaging materials, steel, kg/m3 |
| PM_Plastic | | Packaging materials, plastic, kg/m3 |
| End_of_92 | | Volume of this waste stream as of the end of 1992 |
| Projected_end_of_92 | | Projected volume of this waste stream as of the end of 1992 |
| FF_End_of_92 | | The Volume of this waste stream on hand at end of 1992 in it's estimated final waste form to ship to the WIPP |
| FF_Projected_end_of_92 | | Not used. |
| End_of_93 | | The cumulative waste volume at the end of the year. |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|-----------------------------------|--|--|
| FF_End_of_93 | | The cumulative waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP. |
| End_of_94 | | The new waste volume at the end of the year; the increment added during the year |
| FF_End_of_94 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| End_of_95 | | The new waste volume at the end of the year; the increment added during the year |
| FF_End_of_95 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| End_of_96 | | The waste volume at the end of the year; the increment added during the year |
| FF_End_of_96 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| End_of_97 | | The waste volume at the end of the year; the increment added during the year |
| FF_End_of_97 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| 98-2002 | | The waste volume added per year during the period. |
| FF_98-2002 | | The waste volume added per year during the period in its estimated final form for shipment to the WIPP. |
| 03-2022 | | The waste volume added per year during the period. |
| FF_03-2022 | | The waste volume added per year during the period in its estimated final form for shipment to the WIPP. |
| Comments | | Miscellaneous comments applicable to page 2 of the data form |
| Container_- Footnotes | | Footnotes applicable to a specific container type in a waste stream. |
| <i>Table: Page_1</i> Site_Name | | Name of site, text spelled out as specified in a look-up table (ANL-E, Hanford, INEL, AMES, etc.). |
| MWIR_ID | | Unique Waste Stream Number derived from the Mixed Waste Inventory Report. |
| WIPP_ID | Key field to relate to container_data and EPACodes data tables | WIPP specific identification number assigned by WTWBIR Team. |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|-------------------------------|-------|---|
| LOCAL_ID | | Locally assigned ID number for the waste stream |
| Gen_Site | | The name of the site that generated the waste, regardless of the actual storage site. |
| Waste_Type | | MTRU or TRU |
| Handling | | CH or RH |
| Stream_Name | | Abbreviation Description/Name of the Stream |
| Stream_description | | Memo field to describe the type of stream |
| MWIR_matrix_code | | Matrix Code, from MWIR if applicable and relevant |
| Assigned_matrix_code | | Matrix Code assigned by WTWBIR analysts... to be left blank by sites |
| Final_Waste_Form | | This is the code of the final (to WIPP) form of the waste stream |
| Matrix_Description | | Description and comments for the waste matrix in its final form for the WIPP |
| TRUCON | | Assigned TRUCON Code |
| NoMigrationAssign | | Code assigned for purposes of the WIPP No Migration Variance Petition. |
| IDC_from_Site_- Final_Form | | IDC supplied by Site for this stream. |
| IDC_Assigned_Final_ Form | | Equivalent IDC assigned by WTWBIR analysts based on their judgement |
| Waste_Ownership | | Defense, non-defense, commercial, or unknown |
| Waste_mixed_type | | Mixed, non-mixed, suspect mixed, or unknown |
| Waste_source | | R&D, Operational, Residues, ER and D&D, ER, D&D, or Unknown |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|--|--|---|
| TSCA_data | | Asbestos, PCBs, Asbestos & PCBs, Other (describe in comment), No, N/A, or Unknown |
| Storage_data | | Retrievably stored, Buried, Building Storage, or Bermed Storage |
| Page 1_Footnotes | | Footnotes applicable to the whole waste stream. |
| <i>Table: epacodes</i> UNIQUE_WS | Key Field, related to Page_1, WIPP_ID | Unique waste stream identifier number. |
| EPA_CODE | | EPA code associated with a specific waste stream. |
| <i>Table: Nuclides</i> Cont_Counter | Key Field related to Container_Data, Counter | Relation to Container data counter, lock the record to a specific container/stream record in Container_Data. |
| Nuclide | | Nuclide designation in form Element Abbreviation, Atomic Weight, and excitation indicator if applicable (Ba137M). |
| Activity | | Scientific notation of activity in Pu239 equivalents in Curies/m3. |

7.3 DATABASE OPERATING INSTRUCTIONS

The WIPP Transuranic (TRU) Waste Baseline Inventory Report (WTWBIR), Revision 1, database is a Microsoft Access 2.0 database. It requires the user to possess a copy of Access 2.0 and be running under the Windows 3.1 operating system. Access, unlike most other databases, provides a single structure that contains objects such as queries, reports, program segments, macros, indexes, relations, and multiple data tables. This means there is only one file to work with, one with the suffix, .MDB. A second file normally accompanies the database file, one with the suffix .LDB and having the same name. It is not normally used except for certain file maintenance operations.

Two databases are provided as part of the compressed file on the distribution disk. The first database is WTWBIR_1, which contains the original data by waste streams from all generator/storage sites. This is the database used to print out the individual stream data in

Appendix A. The second database is called REPORTS. This is the database used to produce the other tables and figures in Volume 1 and Appendix B of the report. The databases are separate because the roll ups of data require some changes to the data to produce rational numbers in the tables and figures. These changes were described in section 7.2.

INSTALLATION: The two databases are compressed into a file on the distribution disk called WTWBIR.EXE. Approximately 6 megabytes of hard disc space should be available to install the database. To install the WTWBIR Rev. 1 database, copy WTWBIR.EXE to a convenient directory on your hard disk, go to the directory containing WTWBIR.EXE, type WTWBIR and press the enter key. The database should be expanded into the directory. The directory should now contain WTWBIR.EXE, WTWBIR1.MDB, WTWBIR1.LDB, WTWBIR.HLP, REPORTS.MDB, and REPORTS.LDB. WTWBIR.HLP contains the data field descriptions. This procedure can be performed either in DOS, a DOS prompt in Windows or from File Manager in Windows. Enter Windows and start Access, and open the WTWBIR_1 or REPORTS database. See the Access User's Manual in case of difficulty.

WTWBIR_1 INSTRUCTIONS: The WTWBIR Rev. 1 database has a built-in program (a macro called "autoexec") which takes control immediately upon opening the database file. It brings up a screen from which the user can view, edit, and locate various waste streams using the normal Access 2.0 tool bar features. In addition, a large printer icon button appear midway down the left side of the screen. This button affords the user the opportunity of printing the waste stream being viewed, waste streams for a specific site, or waste streams for all sites in the database. Scroll bars are provided to scroll between waste streams at the bottom left of the screen. For a given waste stream, the gray section contains waste container data for the various containers used to store this stream, and a scroll bar is provided in the bottom left to scroll among the types of containers for that waste stream. For a given type of container, the typical nuclides for that type of container are listed in a white area inset into the gray and a scroll bar provided.

Mirroring the contraction of the view screen, the WTWBIR data table set consists of the main table, Page_1, which contains site and stream data applicable to all container types used for the stream. Using the waste stream identification code (WIPP_ID) as a key, container-specific data in the Container_Data data table is related to the Page_1 table. Where radionuclides exist in a waste stream, they are listed in the Nuclides table and related to the Container_Data using record counters. For mixed streams, another data table, EPACodes, is related from Page_1's MWIR_ID field to EPACodes' UNIQUE_WS field. This structure affords a considerable savings in database size and is implemented in Access in such a way that they effectively function as one large, compact table.

Descriptions of the data fields can be viewed by opening the desired data table in Access's Table Mode, Design View. If the WTWBIR_1.HLP file was copied into the directory occupied by the WTWBIR database files, limited descriptions of the data fields in the WTWBIR database are available when you place the cursor in a data box and then press the F1 function key.

Reports Instructions:

Open the database REPORTS.MDB. An "autoexec" macro executes when the database opens. This macro presents a form, titled "Figure and Table Viewer", listing the reports available for viewing.

The reports and tables available for review are listed with a number on the left side. There should be eleven entries. If all entries cannot be seen, the scrolling arrows on the right side of the form can be used to scroll the entries. On the bottom of the form is a series of buttons numbered 1 to 11. Each form can be viewed (in report preview mode) by clicking on the command button with the same number as the number to the left of the list of figures and tables.

When the table appears on screen, the size of the window for viewing the table can be adjusted by clicking on the upper right corner up or down arrow in the report window. The report preview window also permits moving between pages of multi-page sets of figures and tables by using the arrows on the lower left corner.

The table or figure can be printed from the report preview window. The tables and figures were originally printed from and formatted for a Laserjet III. When printing the tables and figures, make sure the margins are set so that the entire table or figure is contained on one page, otherwise blank pages may be printed.

The first 8 tables and figures are the same as the tables and figures printed in volume 1 and Appendix B of this report. The figure and table numbers listed are the same as the figure and table numbers in the report. Figures number 9 and 10 show the average material parameters by site for contact handled and remote handled waste. These figures were not used in the report. The last table shows the estimated WIPP packaging material parameters. These numbers are also presented on Tables 5-1 and 5-2 in this viewer and in Volume 1 of the report.

7.4 WTWBID QUALITY CONTROL

To ensure that proper controls and documentation were in place during development and population of the WTWBID, several quality control activities were implemented by the WTWBIR Team. Project quality control objectives were to:

- Define a method for receiving, tracking, reviewing, updating, and documenting data received from the waste generator/storage sites.
- Identify and document the contents of each project baseline.
- Establish and implement a process for releasing and maintaining the WTWBID.
- Create a master library for WTWBID software and documentation.
- Ensure that WTWBID-generated reports and database copies are produced from released database revisions.

The activities performed to meet these objectives are described in the Waste Isolation Pilot Plant Baseline Inventory Report Database Management Procedure (DOE, 1995). The procedure identifies the responsible individuals and required actions for developing, populating, and maintaining the WTWBID, and for managing the data used to produce the WTWBIR and other summary documents.

8. GLOSSARY

40 CFR Part 191, Protection of Environment. EPA: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and TRU Radioactive Wastes – The EPA's environmental standards for the storage (Subpart A) and disposal (Subpart B) of spent nuclear fuel, and high-level and TRU radioactive wastes. This is the primary post-closure standard that applies to WIPP. It limits annual radiation doses to the public from waste management storage and disposal facilities.

40 CFR Part 268, Protection of Environment. EPA: Land Disposal Restrictions – Restricts the land disposal of all hazardous wastes and specifies strict treatment standards that must be met before these wastes can be land-disposed.

Americium (Am) – A TRU radionuclide having an atomic number of 95, containing 95 electrons and 95 protons. Am-241 (half-life 432.7 y) results from the decay of Pu-241 (half-life 14.4 y). Waste initially rich in Pu-241 will therefore "grow" in Am-241 for several decades as the Pu decays. Am-241 exists in finite amounts in TRU waste at some DOE sites.

Anticipated Inventory – The sum of the stored and projected inventories, as defined in this document.

Buried Waste – TRU waste buried in shallow trenches prior to the 1970 Atomic Energy Commission policy that required TRU waste to be retrievably stored.

Californium (Cf) – A TRU element having an atomic number 98 (the number of protons in the nucleus). An alpha emitter (half-life 2.64 y), Cf-252 also spontaneously fissions, thus making it desirable as a neutron source. Cf-252 is created by neutron bombardment of Cm-244 targets. OR is the only production agency for Cf. As a result, the OR inventory is the only TRU waste inventory showing finite quantities of this element.

Code of Federal Regulations (CFR) – (1) A codification of the general and permanent rules published in the **Federal Register** by the department and agencies of the federal government. The CFR is divided into 50 titles that represent broad areas subject to federal regulation. It is issued quarterly and revised annually. (2) All federal regulations in force are published annually in codified form in the CFR.

Contact-Handled (CH) TRU Waste – Packaged TRU wastes with an external surface dose rate of 200 mrem or less per hour.

Curie – A quantitative measure of radioactivity equal to 3.7×10^{10} disintegrations per second.

Curium (Cm) – A TRU element having an atomic number of 96 (the number of protons in the nucleus). An alpha emitter (half-life 18.1 y), Cm-244 is used for neutron bombardment of targets for the production of Cf-252 at OR. In spite of its half-life being less than 20 years, OR considers and handles Cm-244 as a TRU nuclide. Some TRU waste at both OR and SR contains Cm-244.

Decontamination and Decommissioning (D&D) – The process through which DOE facilities which are no longer operational are cleared of contamination and removed from service. In particular, a reference to D&D waste is a reference to the waste materials that are generated during D&D activities.

Defense Waste – (1) Radioactive waste from any activity performed in whole or in part in support of DOE atomic energy defense activities; excludes waste under purview of the Nuclear Regulatory Commission or generated by the commercial nuclear power industry. (2) Nuclear waste derived mostly from the manufacture of nuclear weapons, weapons-related research programs, the operation of naval reactors, and the decontamination of production facilities.

Department of Energy Site – A DOE-owned or -controlled tract used for DOE operations. Either a tract owned by DOE or a tract leased or otherwise made available to the federal government under terms that afford to DOE rights of access and control substantially equal to those that DOE would possess if it were the holder of the fee (or pertinent interest therein) as agent of and on behalf of the government. One or more DOE operations/program activities are carried out within the boundaries of the described tract.

Design Capacity – The planned waste capacity of the Waste Isolation Pilot Plant.

Disposal – Emplacement of waste in a manner that assures isolation from the biosphere for the foreseeable future with no intent of retrieval and that requires deliberate action to regain access to the waste. For example, disposal of wastes in a mined geologic repository occurs when all of the shafts to the repository area are backfilled and sealed.

Disposal Inventory – The total inventory defined for WIPP emplacement (after scaling) to be used for SPM and PA calculations.

Environmental Restoration (ER) – Those activities associated with the remediation of sites contaminated with hazardous and/or radioactive materials. In particular, a reference to remediation activities conducted under the auspices of the DOE Office of Environmental Restoration and Waste Management, Office of Environmental Restoration, EM-40.

Federal Facility Compliance Act (FFCAct) – Public law 102-386, 1992.

Gas Production – Three gas generation processes are expected to be a factor in the degradation of TRU wastes in the WIPP repository. The generation of gaseous species is expected to occur through chemical (i.e., corrosion), microbial, and radiolytic processes.

Generator/Storage Sites – See Waste Generator/Storage Sites.

Hazardous Waste – Those wastes that are designated hazardous by EPA (or state) regulations through the RCRA.

Integrated Data Base (IDB) – The latest version of the IDB, the *Integrated Data Base for [CY]: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1994b)

Mixed TRU Waste – TRU waste that contains both radioactive and hazardous components as defined by the Atomic Energy Act and the RCRA as codified in 40 CFR Parts 263, 265, 268, and 270 (EPA, 1980a; 1980b; 1986; and 1983).

Mixed Waste Inventory Report (MWIR) – The latest release of information from the MWIR database that supports requirements under the FFCA of 1992 (Public Law 102-386). The latest version of the MWIR documentation/files is *Distribute of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a). This information replaces the Phase I MWIR release (DOE, 1994c).

Newly Generated Wastes – See Projected Inventory.

No-Migration Variance Petition (NMVP) – Section 3004 of RCRA allows EPA to grant a variance from the land disposal restrictions when a determination can be made that, to a reasonable degree of certainty, there will be no migration of hazardous constituents from the disposal unit for as long as the waste remains hazardous. Specific requirements for making this demonstration are found in 40 CFR 268.6, and EPA has published a draft guidance document to assist petitioners in preparing a variance request.

Non-Mixed TRU Waste – Transuranic waste that does not contain hazardous constituents or exhibit hazardous characteristics, as identified in 40 CFR 261, Subparts C and D.

Performance Assessment (PA) – (1) A systematic analysis of the potential risks posed by waste management systems to the public and environment and a comparison of those risks to established performance objectives. (2) An analysis that (a) identifies the processes and events that might affect the disposal system, (b) examines the effects of these processes and events on the performance of the disposal system, and (c) estimates the cumulative releases of radionuclides, considering the associated uncertainties, caused by all significant processes and events. These estimates shall be incorporated into an overall probability distribution of cumulative release to the extent practicable. (3) A term used to denote all activities (qualitative and quantitative) carried out to (a) determine the long-term ability of a site/facility to effectively isolate the waste and ensure the long-term health and safety of the public and (b) provide the basis for demonstrating regulatory compliance.

Plutonium (Pu) – A radionuclide having an atomic number of 94. Pu isotopes exist in some TRU waste at all the major DOE storage facilities. The significant isotopes that may exist in measurable quantities at these facilities are Pu-238 through Pu-242. Each isotope is an alpha emitter; the respective half-lives in years are: 238=87.7, 239=24,000, 240=6,563, 241=14.4, 242=376,000. Because of its high activity, Pu-238 can contribute significantly to the thermal loading on some TRU waste. Pu-241 decays, primarily by beta emission, to Am-241.

Process Knowledge – A qualitative evaluation of the contents of a waste container through the study of existing records of production history of the waste.

Projected Inventory – That part of the inventory that has not been generated but is estimated to be generated at some time in the future by the TRU waste generator/storage sites. The estimated timeframe may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Radioactive – The emission of radiation from unstable atomic nuclei.

Radionuclide – (1) A species of atom having an unstable nucleus, that is subject to spontaneous decay or disintegration and usually accompanied by the emission of ionizing radiation. (2) Any nuclide that emits radiation. A nuclide is a species of atom characterized by the constitution of its nucleus and hence by the number of protons, the number of neutron, and the energy content.

Remote-Handled (RH) TRU Waste – Packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour.

Repository – Designated location for disposal of transuranic wastes; the Waste Isolation Pilot Plant.

Resource Conservation and Recovery Act (RCRA) – (1) Establishes a system for controlling hazardous waste from generation to disposal. (2) A Federal law passed in 1976, and amended under the HSWA of 1984, that established a structure to track and regulate hazardous wastes from the time of generation to disposal. The law requires safe and secure procedures to be used in treating, handling, transporting, storing, and disposing of hazardous substances. RCRA is designed to prevent new uncontrolled hazardous waste sites. The law also regulates the disposal of solid waste that may not be considered hazardous. (3) Specifically, Subtitle D of RCRA governs the management of solid waste. (Note: 40 CFR Parts 260-281 are the regulations for complying with RCRA with respect to hazardous waste and hazardous waste treatment, storage, and disposal facilities.)

Retrievable Storage – Designated storage location for transuranic wastes that is designed, operated, and maintained in such a manner that the wastes remain accessible for subsequent retrievable operations.

Scaling – The process for adjusting the anticipated inventory to the design limit (disposal inventory) of the WIPP repository.

Site-Specific Waste Profile – Represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles, at a particular DOE TRU waste site, that have been placed in the same WMCG are summarized in the site-specific waste profile.

Stakeholders – Those persons and/or groups of people and organizations who are affected or perceive they are affected by the DOE waste management program. Stakeholders include DOE management, employees, and contractors (internal); and executive, legislative, and regulatory groups, public representatives, the general public, intervenor groups, special interest groups, contractors, suppliers, and universities (external).

Stored Inventory – That part of the TRU inventory currently in retrievable storage as of the time of the last data call for inventory information. Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and does not include any waste that was buried prior to 1970.

System Prioritization Methodology (SPM) – The SPM is a process formulated to identify a set of activities (required experiments, modeling, engineering design, and waste acceptance criteria) that will lead to regulatory compliance. The process is formulated such that it also: (1) addresses stakeholder and regulator concerns early and throughout the regulatory process and (2) leads to a fully defensible performance assessment to be used in demonstrating regulatory compliance. Ultimate products and associated customers are:

- (1) A decision matrix containing the most likely sets of activities that will lead to compliance as a function of time and budget to be delivered to the WIPP program manager,
- (2) A performance assessment built on assumptions and data that are defensible in the eyes of the stakeholders and the regulators to be delivered to the regulatory compliance branch of Carlsbad Area Office/WIPP through the Westinghouse Waste Isolation Division and ultimately to the EPA, and
- (3) A set of regulatory issues and their current status that result from the SPM process and are to be included in compliance packages by the Westinghouse Waste Isolation Division.

Thorium (Th) – A radionuclide having an atomic number of 90. Although not TRU, Th-232 is an alpha emitter (half-life 14 billion years) and exists in finite amounts in some TRU waste at HA, IN, and OR. [Note: Thorium is naturally occurring and contributes to background radiation at some sites (e.g., IN)]

Transuranic – Pertaining to elements that have atomic numbers greater than 92, including neptunium, plutonium, americium, and curium; all are radioactive, are products of artificial nuclear changes, and are members of the actinide group.

Transuranic (TRU) Waste – (1) Waste containing alpha-emitting radionuclides with an atomic number greater than 92 and half-lives greater than 20 years, at concentrations of TRU isotopes greater than 100 nanocuries per gram of waste. **This core definition appears in modified form in various relevant documents as follows:** (a) For purposes of management, DOE Order 5820.2A: (i) considers TRU waste, as defined above, "without regard to source or form" (*The proposed revision to the Order [DOE Order 5820.2A Major Issues for Revision, May 6, 1992]* contemplates removing this clause); (ii) allows head of field elements to determine that wastes containing other alpha-emitting radionuclides must be managed as TRU waste; and (iii) adds "at time of assay," implying both that the classification of a waste as TRU waste is to be made based on an assay, and that such classification can be superseded only by another assay. (b) For purposes of setting standards for management and disposal, 40 CFR 191.02(i) adds "except for: (i) high-level wastes; (ii) wastes that the DOE has determined, with the concurrence of the EPA Administrator, do not need the degree of isolation required by this part; or (iii) wastes that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61. (2) Waste materials contaminated with U-233 (and its daughter products), with certain isotopes of plutonium, or with other nuclides with atomic numbers greater than 92. In order to be classified as TRU waste, the long-lived alpha activity from subject isotopes must exceed 100 nanocuries per gram of waste material and from the use of plutonium in the fabrication of nuclear weapons. (3) Wastes that are contaminated with radioactive elements heavier than uranium, thus the name trans-(or beyond) uranic.

TRUCON – See TRUPACT-II Content Code.

TRUPACT-II Content Codes (TRUCON) – The document containing a description of the waste stream, waste form, and package configuration for each waste content code authorized for shipment in TRUPACT-II containers.

Unknown Waste Stream – Those waste streams for which there is insufficient process knowledge to assign a specific WMC.

Uranium (U) – A naturally radioactive element with the atomic number of 92 (number of protons in the nucleus) and an atomic weight of approximately 238. The two principal naturally occurring isotopes are the fissionable U-235 (0.7 percent of natural uranium) and the fertile U-238 (99.3 percent of natural uranium). (Note: An alpha emitter [half-life 159,000 y], U-233 also spontaneously fissions; it is present in finite quantities in some TRU waste inventories at INEL and ORNL.)

Waste Acceptance Criteria (WAC) – The criteria used to determine if waste packages are acceptable.

Waste Form – The physical form of the waste such as sludges, combustibles, metals, etc.

Waste Generator/Storage Sites – The 10 largest DOE facilities and several smaller sites throughout the U.S. that produce and store TRU waste.

Waste Isolation Pilot Plant (WIPP) – (1) The project authorized under Section 213 of the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (Public Law 96-164; 93 Stat. 1259, 1265) to demonstrate the safe, and environmentally sound, disposal of radioactive waste materials generated by atomic energy defense activities. (2) A research and development facility, located near Carlsbad, New Mexico, to be used for demonstrating a practical, long-term solution to a complex problem: the safe disposal in deep geologic repositories of TRU waste resulting from DOE activities. (3) The WIPP has two primary objectives. First, the WIPP is investigating the behavior of salt rock and interactions between the salt rock and radioactive wastes in a variety of forms. Second, the WIPP seeks to demonstrate the safe and efficient handling, transportation, and disposal of TRU waste in an actual facility.

Waste Material Parameter – A waste material that occurs in TRU waste that is an input parameter into one or more current SPM or PA models, an SPM or PA model under development, a potential future model, or is required to adequately describe the waste form.

Waste Matrix Code (WMC) – A DOE-developed coding system for organizing waste streams by their physical and chemical properties. A WMC is assigned to each waste stream by the DOE TRU waste generator/storage site. The WMC for each waste stream can be found in the Mixed Waste Inventory Report (DOE, 1994a). This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. Appendix C contains the DOE guidance document to help categorize individual waste streams. An example of a WMC for "heterogeneous waste" would be 5400.

Waste Matrix Code Group (WMCg) – Consists of a series of WMCs that for SPM or PA purposes has similar physical and chemical properties.

Waste Stream – Individually, those stored or projected wastes that are defined by a unique identifier in the MWIR.

Waste Stream Name – A site-specific, unique descriptive identifier for a TRU waste stream.

Waste Stream Profile – A description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of the important information about a particular waste stream.

Waste Stream Site ID – A site-specific alphanumeric identification code which provides a unique identifier for an individual TRU waste stream.

WIPP Waste Profile – Represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG.

APPENDIX A

ARGONNE NATIONAL LABORATORY-EAST (AE) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the AE waste stream profiles:

- AE Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by AE.
- The volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).
- A data entry error was made on the original form for the number of containers stored at AE. This error was corrected.

Comments

Hanford, WA site data includes ANL-E waste forecast data for years 1995 through 2022. ANL-E has included the requested data in its forecast to Hanford and reporting this data separately would result in double counting of waste volumes. ANL-E plans to ship this waste to Hanford provided projects are funded, Storage/Disposal Approval Requests are approved, estimated waste volumes are actually generated, regulations allow shipment, etc., during that time period.

ANL-E plans to ship this waste to Hanford provided projects are funded, Storage/Disposal Approval Requests are approved, estimated waste volumes are actually generated, regulations allow shipment, etc., during that time period.

APPENDIX A WASTE STREAM PROFILES

AMES LABORATORY (AL) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the AL waste stream profiles:

- AL Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by AL.
- A data entry error was made on the original form for the number of containers stored at AL. This error was corrected.
- The projected volumes reported by AL were not distributed to individual years. Based on the footnotes provided by AL, these volumes were distributed by the WTWBIR team for both current and final form volumes for the years 2003-2022.
- The volume of the final waste form assumes a 2.5 volume expansion factor for solidification.

| | Local ID | Glovebox | DESCRIPTION | Mixed Transuranic/Uranium in Glovebox |
| MATRIX CODE | | 1000 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group Site Matrix Description Solidified Inorganics This waste stream will be generated during the remediation of a glovebox that has been used for plutonium and other transuranic research. The glovebox continues to be used for transuranic research. Some of the contents of the glovebox will become MTRU waste. It has not yet been determined what volume will be MTRU and what will be TRU. Isotopes that are known to be in the glovebox are: Pu-239, Pu-240, Pu-242, Np-237, Pa-233, U-235, U-236, and U-238. Concentrations of the TRU components range from 1 pph to 2300 ppm in various concentrations of nitric acid. Uranium concentrations range from 0.1 pph to 407,770 ppm. | | | | |

Comments

- Assumptions:
- Transuranic waste will be generated through research and development. The isotopes are currently housed in a glovebox with the appropriate HEPA filters.
 - TRU waste will only be generated when the research project is complete or when the filters are replaced. Therefore, there will be no TRU waste generation until CY2004 at the earliest.
 - Ames Laboratory plans to utilize the storage services of Hanford for TRU waste pending the opening of WIPP.

ARGONNE NATIONAL LABORATORY-WEST (AW) WASTE STREAM PROFILES

The following assumptions were made by the WTWBIR team in developing the AW waste stream profiles.

- An AW RH Canister (without any shielding) has been assumed for the 0.112 m³ RH container.

Comments

CH-ANL-180T will be treated to remove sodium contamination from waste to meet the WMPP WAC (no reactives). The final waste form to be sent to WMPP will be metal TRU waste material (no sodium contamination).

| Local ID CH-ANL-182T | | DESCRIPTION | Sodium Potassium - NaK - TRU |
| MATRIX CODE | 6200 | | |
| SITE FINAL FORM IDC | | | |
| Waste Matrix Code Group Site Matrix Description Uncategorized Metal Sodium potassium alloy (NaK) is used as a coolant for some components of the EBR-II reactor. Waste NaK metal is a hazardous constituent of some transuranic wastes stored at the ANL-W Radioactive Scrap and Waste Facility (RSWF). The remote-handled NaK waste at RSWF is contained in stainless steel capsules or tubing and placed inside carbon steel waste cans which are then placed in stainless steel outer cans. The entire package is then stored in RSWF storage liners (carbon steel soil storage vaults). The NaK is generated during maintenance and operational activities. NaK waste is in canisters with TRU waste metal pieces and rods from reactor experiments. | | | |

BATTELLE COLUMBUS LABORATORY (BC) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the BC waste stream profiles:

- BC Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by BC.
- The WTWBIR ID "RHTRU" submitted by BC was changed to BC-T001 to be consistent with the ID's used in the WTWBIR database.
- The containers for RH-TRU waste streams were reported as drums by the site. The drums were changed to RH canisters, with three drums overpacked in each canister.
- The volumes for the years 1998-2002 were reported by the site as total volumes for each five-year period. The WTWBIR team converted the values to volume/year.

Comments

BC has no mixed TRU waste.

Footnotes

Includes 465 kg/m³ in lead shielding.

BC-T001 - 2

ENERGY TECHNOLOGY ENGINEERING CENTER (ET) WASTE STREAM PROFILES

The following assumptions/modifications were made by the WTWBIR team in developing the ET waste stream profiles:

- Final Waste Form Groups were not provided by ET. In order to permit roll-ups of the data, the WTWBIR team assigned Final Waste Form Groups based on the descriptions and parameters provided by ET.
- The WTWBIR team had to assign identification numbers (IDs) to those ET waste streams not given an identifier by the site.
- Since only current volumes were provided by ET, the final form volumes were assumed to be the same as the current volumes.
- The volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).

Comments

Iron-based metal - 8" dia. pipe which forms the concrete annulus.
Other inorganic materials - concrete liners (shielding).
Solidified, inorganic matrix - Debris from drain line.
Typical isotopic composition is unknown for this container.
Packaging Materials, Steel - Based on 35 kg/drum
Drums are for internal transfer and storage only. Although there is no plastic liner, R/A material is placed in one-gallon cans or plastic bags before placing in the concrete-lined drums
Would be "RH" without concrete liner.

IDAHO NATIONAL ENGINEERING LABORATORY (IN) WASTE STREAM PROFILE METHODOLOGY

The approach used and the assumptions made in preparing the IN waste stream profiles are as follows:

- WTWBIR, Revision 0 waste stream profile data was reviewed and updated by IN to generate Revision 1 WTWBIR data. The primary sources used for the IN review were data from the Idaho Mixed Waste Information (IMWI) system and the IN Draft Site Treatment Plan (DSTP), (Ref. 5). Other sources of information included the Radiological, Physical, and Chemical Characterization of Transuranic Wastes Stored at the IN Report (Ref. 4), the TRU Waste Sampling Program (TWSP) Report (Ref. 1), the Content Code Assessments (Ref. 2), and the Exploratory Research and Development Program (ERDP) 2802 Report (Ref. 3).
- The IMWI contains container level data on all waste stored at the IN. Although the IMWI was initially designed to inventory mixed waste, non-mixed waste is also inventoried in this system. The DSTP database is derived from the data stored in the IMWI and provides determinations and assumptions of the treatment plans and options for proper waste management. The Characterization Report (Ref. 4) contains detailed composition information on each waste stream; most of this information was also derived from the IMWI.
- To determine volume and radionuclide inventory information for Revision 1 WTWBIR, IN corrected and updated the Revision 0 WTWBIR data, as needed, through manipulation and calculation of data existing in the IMWI. This consisted of calculating the volume of waste that will be available for direct shipping to WIPP, the volume of waste that will require repackaging prior to shipment, the volume resulting from treatment of waste prior to shipment to WIPP, and the average curie concentration of all contained radionuclides for each waste stream. Presently, the WTWBIR waste stream profiles sum the volumes for direct ship waste and repackaged waste to report as one volume. All calculations were made on a waste volume basis, as the method used in the IMWI and the DSTP, then converted into container counts where appropriate.
- All treated waste is grouped into a new vitrified final form waste stream number IN-M07. Volumes for wastes after vitrification are reported in this waste stream. Curie concentrations for this waste stream are weighted average of all wastes that are treated and included in the final waste form volume.
- Material parameter data entries in the "Typical Material Weights for Final Waste Form" of the waste stream profiles were determined using information from past waste examination programs and knowledge gained in the WIPP Experimental Test Program. This consisted of reviewing past and current visual waste characterization activities and determining average, maximum, and minimum concentrations of waste constituent parameters, where possible. The majority of the data can be traced back to the TRU Waste Sampling Program (TWSP) Report (Ref. 1), the Content Code Assessments (Ref. 2), or the Characterization Report (Ref. 4). Waste volumes used to correct Revision 0 WTWBIR parameter densities were based on the Exploratory Research and Development Program (ERDP) 2802 report (Ref. 3), which includes data obtained from the TRU Waste Management Information System (TWMIS) in 1990. The Characterization Report and IN Draft Site Treatment Plan were also used to determine the typical material weights reported on the waste stream profile sheets, when information from the above sources were inadequate.

DESCRIPTION Concrete-Brick (TRU); Firebrick

Waste Matrix Code Group
Site Matrix Description

Inorganic Non-metal

This waste contains whole and broken pieces of construction bricks, cinderblocks, and firebrick. Waste generated in the 1971 to 1973 period includes firebrick from the Pu recovery incinerator and related refractory development and from four boilers; cinderblocks and other brick from routine maintenance and from following the Rocky Flats Plant fire. Waste generated since 1973 is mostly firebrick from Pu recovery operations. The firebrick generated since 1973 is a high-alumina, high-strength, class 1 brick manufactured by Pilbrico (Plicast 40). Typical composition is A1203 = 95.67%, SiO2 = 0.03%, Fe2O3 = 0.10%, TiO2 = 0.01%, CaO = 3.6%, MgO = 0.8%, and Alkalies = 0.28%. Some of the incinerator firebrick is scarfed to remove surface contamination and then leached with nitric acid to recover Pu.

Comments

10% of this waste stream volume is classified as RH-TRU without current shielding. It is anticipated that the RH-TRU portion will be shipped as CH-TRU with internal shielding.

| Site Matrix Description | | This waste, generated at Rocky Flats Plant, contains mainly Benelex which is a dense, laminated, ignocellulose hardboard made from wood chips and particles (masonite corp. type 402). The benelex is generally 2 inches thick. Some of the Benelex has lead shielding attached to it. Metal hinges, and angle iron strongbacks are also present. Plexiglass is the other major constituent in the waste. The plexiglass thickness ranges from 2 to 4 inches. Both the Benelex and the Plexiglass are combustible. | |

Waste Matrix Code Group

Site Matrix Description

Heterogeneous
The waste stream is from the Rocky Flats Plant and primarily consists of damp or wet line- and nonline-generated dry combustible materials such as paper, rags, plastics, surgical gloves, canvas, cardboard, wood, PE bottles, and rubber. Some combustibles may be damp or moist. Moisture content may range from damp to wet, and may include water, soaps, nitric acid, or caustic solutions. Limited amounts of noncombustibles such as glass, concrete, cement, leaded glovebox gloves, and metal scrap may also be present. These wastes are mostly from decontamination and cleanup work, and may be from any plutonium area.

| Heterogeneous | | This waste stream, generated at Mound Laboratory, includes two different types of waste depending on when the waste was generated. Prior to 1980, this content code was used for glove box floor sweepings and rust. The actual amount of floor sweeping is small. After 1981, this content code is used for large combustible waste items such as plastic tanks, plexiglass shielding and windows, wood, and fiberglass conveyor glove box sections. These types of large combustible wastes were included in content code 824 prior to 1980. Limited amounts of small combustibles such as shoe covers and surgical gloves are also included. | |

Waste Matrix Code Group Solidified Inorganics

Site Matrix Description

This waste stream, generated at Rocky Flats Plant, consists of sludge from the incinerator off-gas system, recovery building filter plenums, pumps, etc. Portland cement is added to absorb free liquids. The sludge may contain a limited number of surgical gloves. Content code 292 replaced code 290 in 1973.

| MATRIX CODE | 5440 | | |
| SITE FINAL FORM IDC | | | |
| Waste Matrix Code Group | | Heterogeneous | |
| Site Matrix Description | | <p>The waste, generated at Rocky Flats Plant, contains mainly Benelex which is a dense, laminated, lignocellulose hardboard made from wood chips and particles (masonite corp. type 402). The benelex is generally 2 inches thick. Some of the benelex has lead shielding attached to it. Metal hinges, and angle iron strongbacks are also present. Plexiglass is the other major constituent in the waste. The plexiglass thickness ranges from 2 to 4 inches. Both the benelex and the plexiglass are combustible. Content Code 302 was replaced by 464 in 1973.</p> | |

Waste Matrix Code Group

Site Matrix Description

Solidified Inorganics
This waste stream, generated at the Rocky Flats Plant, consists of wet sludge from treatment of all other plant radioactive and/or chemical contaminated wastes, and further treatment of the first stage effluent. Some pre-1973 wastes may include non-sludge wastes such as electric motors, mercury and lithium batteries, bottles of liquid chemicals, and small amounts of mercury in pint bottles. Portland cement was added to absorb the free liquids.

Waste Matrix Code Group Inorganic Non-metal

Site Matrix Description

This waste stream, generated at the Rocky Flats Plant, consists of glass sample vials, bottles, lead-taped sample vials, ion exchange columns, dissolver pyrex laboratory glassware such as pyrex flasks and beakers, glovebox windows (glass, plexiglass, leaded glass), and crushed and ground glass. The waste includes limited amounts of other noncombustibles such as metals, and limited amounts of combustible wastes. No sludges should be present although some glass vials may contain limited amounts of free liquids.

| <p>Waste Matrix Code Group Inorganic Non-metal</p> <p>Site Matrix Description This waste stream, generated at the Rocky Flats Plant, consists of boronated glass rings used to minimize neutron multiplication in liquid storage tanks. Content code 441, Unleached Rashig Rings was used from 1971-79 as a separate stream, and then combined with content code 442, Leached Rashig Rings. The rings are about 1.75 inches high and 1.5 inch in diameter, with a 0.25 inch wall thickness. The rings are heat and chemical resistant borosilicate glass with 11.8 - 13.8 weight % B2O3, with an isotopic content of 10B/11B of not less than 0.24. Some of the rings, which had above-discard amounts of plutonium, were leached with nitric acid to recover the plutonium and then rinsed with water, and dried. Some of the rings may be contaminated with small amounts of oil.</p> | | | | |

| MATRIX CODE | 5400 | | |
| SITE FINAL FORM IDC | | | |
| Waste Matrix Code Group | | Heterogeneous | |
| Site Matrix Description | | This waste stream, generated at Argonne National Laboratory-East, contains alpha hot cell waste. Noncombustible and combustible waste are segregated. Combustible wastes include: paper, plastic and PVC containers, rubber O-rings and gloves, rags, and Q-tips. Noncombustible wastes include: lab equipment, tools, fixtures, glassware, pipe, tubing, fitting, fasteners, firebrick, ferrous and nonferrous metal scraps and parts, and small electric motors. Sodium in the waste is reacted with ethyl alcohol, mixed with pelletized clay, and dried. Nitrates and oxidizing agents are neutralized or reduced, mixed with pelletized clay, and ?? to ferrous or ferric salts. | |

Site Matrix Description

Soils

This waste, generated at Mound Laboratories, consists of soils, including small rocks and pebbles, generated from cleanup of a leak. All soil waste was dry when packaged. A few waste boxes also include picks, shovels, metal cans, rubber gloves, booties, respirators, plastic, and possibly an air hammer and chisel.

| <p>Waste Matrix Code Group</p> <p>Site Matrix Description</p> <p>Graphite</p> <p>This waste stream, generated at the Rocky Flats Plant, is similar to graphite molds, content code 300. A graphite core is part of the shaped graphite mold to cast plutonium metal. Some graphite molds are also included in this content code. This content code has not been used since 1977. The graphite has broken into pieces, and some of the graphite has been scarfed or wire brushed to remove any above-discard deposits of plutonium</p> | | | | |

Waste Matrix Code Group Graphite

Site Matrix Description

This waste stream, generated at the Rocky Flats Plant, consists of graphite molds used in casting plutonium metal. The waste may also include small amounts of surgical gloves. The graphite is in the form of broken mold pieces. Some of the graphite has been scarfed or wire-brushed to remove above-discard deposits of plutonium.

DESCRIPTION

Metals (TRU): Metal, Equipment, Pipes, Valves, Etc.

Waste Matrix Code Group

Site Matrix Description

Uncategorized Metal

This waste comes from Mound Laboratory. It consists of stainless steel, carbon steel, and small amounts of aluminum-metal wastes in the form of valves, piping, wrenches, nuts, bolts, stainless steel tubing, spatulas, pans, hotplates, ringstands, etc. Limited amounts of combustible and noncombustible waste also present from content codes 810, 811, 812, 813, 814, 826, and 832. Content code 812 is spent ion-exchange resin and content code 832 is containers of liquid mercury. Most of the waste is metal waste that is primarily from D&D operations. Some of the metals were leached with nitric acid, ultrasonically cleaned and dried to remove above-discard amounts of plutonium.

Uncategorized Metal

The waste comes from Rocky Flats Plant. It consists of nonline- and line-generated wastes. The waste may be in the form of gloveboxes, glovebox windows, furnaces, lathes, drill presses, ducting, piping, angle iron, tanks, downdraft tables, part carriers, respirator filters, ultrasonic cleaners, control panels, electronic instrumentation, vacuum sweepers, pumps, motors, railing stairs, metal racks and trays, hotplates, empty metal produce and paint cans, carts, power tools (saws, drills, etc.), hand tools (wrenches, hammers, saws, chisels, gauges, etc.), chairs, desks, tables, typewriters, filing cabinets, crushed 55-gallon drums, etc. The waste may also include limited amounts of combustible waste.

| <p>Waste Matrix Code Group</p> <p>Site Matrix Description</p> <p>Heterogeneous</p> <p>This waste stream, generated at Bettis Atomic Power Laboratory, contains noncompressible and noncombustible items such as absolute filters, solidified chemical waste, contaminated metal equipment, furnace brick, and highly contaminated glovebox equipment. Metal scrap could include bars, sheet, fixtures, small equipment tools, etc. made of carbon steel, stainless steel, inconel, aluminum, copper, brass and zirconium. Chemical wastes include spent chemical solutions and associated solids from the isotope and isotopic dilution analysis of nuclear fuel specimens. The residues were neutralized before being either mixed with absorbent material or solidified.</p> | | | | |

Site Matrix Description

Waste primarily consists of noncombustible wastes such as small tanks, dissolvers, motors, pumps, piping, small valves, tools, hotplates, presses, grinders, metallurgical polishers, ringstands, concrete, floor tile, sheet metal, vacuum sweeper filters, sweeper hose, and glass. Limited amounts of combustible wastes, such as plastic tanks, will be present.

Comments

5.7% of the waste stored is currently characterized as RH-TRU if internal shielding is not used. It is anticipated that all waste in this waste stream will be categorized as CH-TRU at the time of shipment to WIPP utilizing minimal internal shielding as necessary. For WTWBIR purposes, all of the waste in this waste stream is assumed to be CH-TRU.

Salts (TRU): Pyrochemical Salt Waste

SITE FINAL FORM IDC

Waste Matrix Code Group
Site Matrix Description

Salt Waste

Pyrochemical salt consists of used chloride salts from pyrochemical processes such as electrorefining, molten salt extraction or direct oxide reduction. Very little additional information is available about this content code.

| Site Matrix Description | This waste stream was generated at the Argonne National Laboratory-West and NRF at the INEL. Most of the waste is organic and combustible materials including paper, wood, PVC and plastic containers and items, rubber gaskets and gloves, leather, rags, towels, Q-tips, tubing, filter media, abrasive media and metal pieces. Small residuals of moderators and fuel are trapped on the filters. Drums of contact-handled waste are stored at the Transuranic Storage Area (TSA). Drums of remote-handled waste are stored at the intermediate level transuranic facility (ILTSF). | | |

Site Matrix Description

Combustible
This waste stream is from Mound Laboratory and consists of nonline generated combustible wastes such as plastic sheeting, paper, reagents, gloves (rubber and cloth), plastic bottles, wood, paper suits, and shoe covers. About 75% of the waste is compacted. The waste may be either dry or damp.

| Site Matrix Description | | | | |

This waste stream, generated at Mound Laboratory, consists of various types of plastics (PVC, PE tygon, etc.) in the form of tubing, piping, sample vials, gaskets, manipulator boots, etc. Limited amounts of other combustible wastes from content codes 801 and 802 may also be included. One drum contains content code 832, liquid mercury. The wastes are primarily from D&D activities at the plutonium processing and research buildings. Waste was shipped on 7 1977. Limited amounts of waste may be damp.

Combustible
This waste stream, generated at Battelle Columbus Laboratories, contains such combustible items as wood, plastic suits, nylon reinforced plastic tent structures, shoe covers, rubber gloves, and air hose. The waste is from decontamination and deactivation of the plutonium laboratory.

Comments

The weights per container in the MID for boxes are identical to the weights per container for drums. I'd rather use the same kg/m3. (Chuck Edinborough)

| Heterogeneous | | | | |
| This waste stream, generated at the Idaho National Engineering Laboratory, consists of a plastic glove box, a hydraulic pump containing oil, vacuum pump, centrifuges, tools, and experimental fuel capsules. The presence of hazardous materials is not known, but some absorbed oil is likely. | | | | |

| This Transuranic mixed waste has not yet been generated. Waste will be segregated to the extent possible (considering ALARA) into inorganic, organic and heterogeneous waste streams and packaged separately. Homogeneity of the waste packages is currently unknown. Details of waste characteristics will be developed upon generation. This waste stream will not be a moratorium waste. | | | |

LOS ALAMOS NATIONAL LABORATORY (LA) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the LA waste stream profiles:

- Final Waste Form Groups were not assigned by LA but by the WTWBIR team in order to permit roll-ups of the data. However, the Final Waste Form Groups are based on the descriptions and parameters provided by LA.
- For the years 1994 to 2022, LA reported cumulative volumes instead of volumes generated per year. The WTWBIR team has modified the site reported data so that volumes can be consistently rolled-up across all the sites.
- Packaging material parameters were incorrectly reported by LA. These were discussed with LA and corrected by the WTWBIR team.

LOS ALAMOS NATIONAL LABORATORY (LA) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the LA waste stream profiles:

- Final Waste Form Groups were not assigned by LA but by the WTWBIR team in order to permit roll-ups of the data. However, the Final Waste Form Groups are based on the descriptions and parameters provided by LA.
- For the years 1994 to 2022, LA reported cumulative volumes instead of volumes generated per year. The WTWBIR team has modified the site reported data so that volumes can be consistently rolled-up across all the sites.
- Packaging material parameters were incorrectly reported by LA. These were discussed with LA and corrected by the WTWBIR team.

LAWRENCE BERKELEY LABORATORY (LB) WASTE STREAM PROFILES

The following assumptions/modifications were made by the WTWBIR team in developing the LB waste stream profiles:

- LB Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by LB.
- The reported volume for the single LB waste stream was divided equally among the four different isotopic mixtures.

LAWRENCE LIVERMORE NATIONAL LABORATORY (LL) WASTE STREAM PROFILES

The following assumptions/modifications were made by the WTWBIR team in developing the LL waste stream profiles:

- Since only current volumes were provided by LL, the final form volumes were assumed to be the same as the current volumes.
- The WTWBIR team had to assign Identification numbers (IDs) to those LL waste streams not given an identifier by the site. The assigned identification numbers are consistent with the site reported numbers.
- LL Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by LL.
- The volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).

| | WIPP ID | DESCRIPTION | |
| | Local ID | | |
| MATRIX CODE | | | |
| SITE FINAL FORM IDC | | | |
| Waste Matrix Code Group | | Combustible | |
| Site Matrix Description | | <p>The waste consists mostly of untreated dry solids such as tissues, paper, assorted plastics, glassware, ceramics, and metals. Portland cement or Aquaset is used to solidify small amounts of water-based liquids; Envirostone or Petroset is used to solidify small amounts of solvents and oil-based liquids. The composition varies considerably, but it is predominantly organics (> 90% by weight). The waste does contain small amounts of RCRA listed hazardous materials. Typical hazardous materials are leaded gloves or materials contaminated with solvents.</p> | |

The waste consists of glovebox bagout waste, laboratory trash and some contaminated equipment. The waste contains small amounts of RCRA materials such as solvents or lead shielding. The waste may occasionally include small quantities of solidified liquids, but these are usually segregated as waste form 2.

| | WIPP ID | DESCRIPTION | |
| | Local ID | | |
| MATRIX CODE | | | |
| SITE FINAL FORM IDC | | | |
| Waste Matrix Code Group | Combustible | | |
| Site Matrix Description | The waste consists mostly of untreated dry solids such as tissues, paper, assorted plastics, glassware, ceramics, and metals. Portland cement or Aquaset is used to solidify small amounts of water-based liquids; Envirostone or Petroset is used to solidify small amounts of solvents and oil-based liquids. The composition varies considerably, but it is predominantly organics (> 90% by weight). The waste does not contain any RCRA listed hazardous materials. | | |

The waste consists of glovebox bagout waste, laboratory trash and some contaminated equipment. The waste may occasionally include small quantities of solidified liquids, but these are usually segregated as waste form 2.

| MATRIX CODE | Local ID Form 3 mixed | DESCRIPTION | This waste consists of contaminated equipment and laboratory trash too big to fit in 55 gallon drums. This waste does contain RCRA hazardous materials. |
| SITE FINAL FORM IDC | | | |
| Waste Matrix Code Group | Uncategorized Metal | | |
| Site Matrix Description | The waste consists mostly of metal scrap such as decommissioned gloveboxes, hoods and other large equipment as well as laboratory trash. Typically it will contain metal components, glassware, ceramics, plastics, paper, and wood. It will be mostly inorganic material, but can vary widely. This waste does contain RCRA listed hazardous materials such as solvents and lead shielding. | | |

MOUND PLANT (MD) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the MD waste stream profiles:

- MD Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by MD.
- The WTWBIR team had to assign identification numbers (IDs) to those MD waste streams not given an identifier by the site.

UNIVERSITY OF MISSOURI (MU) WASTE STREAM PROFILES

The following assumptions/modifications were made by the WTWBIR team in developing the MU waste stream profiles:

- MU Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by MU.
- Since only current volumes were provided by MU, the final form volumes were assumed to be the same as the current volumes.

Site Matrix Description

MTRU Heterogeneous Debris. The radioactive wastes generated on the project will come first from normal operations and second from the D&D of the facility at the end of the project. Radioactive wastes from normal operation will consist of the following: 1) HEPA filters from the glovebox, 2) HEPA filters from offgas and room filtration systems, 3) paper wipes from periodic cleaning of the gloveboxes, and 4) used sample bottles.

NEVADA TEST SITE (NT) WASTE STREAM PROFILES

The following assumptions/modifications were made by the WTWBIR team in developing the NT waste stream profiles:

- NT Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by NT.
- The material parameters for NT waste streams were added by the WTWBIR team based on volume weighted averages of appropriate waste streams from LL. All of the NT TRU waste is assumed to be waste from LL.
- Final form volumes were not provided by NT for individual years. Based on agreements with the site, the same value for the total projected volume was reported as the final form volume for the years 2003 to 2022.

DESCRIPTION

NTS STORED, TRU WASTE FROM LLNL

Waste Matrix Code Group

Site Matrix Description

Heterogeneous

This waste stream consists of glovebox parts, laboratory trash, contaminated equipment, and solidified sludges. Real time radiography has been performed on the waste to verify there are no free liquids present, with the exception of liquid in aerosol cans. Most of the waste is contact handled TRU waste; one and 3 drums are remote handled. The waste stream was generated at Lawrence Livermore National Laboratory, Livermore, CA (LLNL) and shipped to the NTS from 1974 until 1990. The waste was declared as potentially mixed TRU waste by the generator in April, 1991.

Comments

- This waste stream/container combination contains material regulated under California Hazardous Waste codes CA352 and CA181.
- Most of this waste was packaged before RCRA characterization requirements were imposed; the generator is not confident about waste content
- Isotope content, activity, quantity, and EPA codes were established based on info provided by LLNL.
- Assumptions:
 - Contents of 1636 55-gal. drums and one 85 - gal drum will fit inside 1,637 0.208 m3 drums.
 - Two boxes contain 12 drums, whose contents will be transferred to 12 0.208 m3 drums.
 - Empty 55-gal. overpacks are decontaminated and/or disposed as LLW, generating 3 drums (0.208 m3/drum) of decon residue, i.e., rags, kimwipes, clothing, carbon filter vents, and gaskets.
 - Empty 55-gal. drums are decontaminated and/or disposed as LLW, generating 2 drums (0.208 m3 drum) and 1 SWB of decon residue.
- 58 steel, oversized boxes: 1) Contents are size-reduced to fit inside 143 SWBs;

OAK RIDGE NATIONAL LABORATORY (OR) WASTE STREAM PROFILES

The following assumptions/modifications were made by the WTWBIR team in developing the OR waste stream profiles:

- OR Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by OR.
- Since only current volumes were provided by OR, the final form volumes were assumed to be the same as the current volumes.
- Based on agreements with OR, the volumes per year for 1998-2002 and 2003-2022 were corrected to reflect the appropriate number of years.
- OR reported all containers for each waste stream on one form. In order to maintain consistency with the other sites, forms for each type of container were developed by the WTWBIR team. All of the information on the container form remained the same as reported by OR, except that the volume information for each container was recalculated. These calculations were based on the total number of each container, the volume of each container, and the total volumes reported by OR. The volumes for three casks were listed as unknown. The volumes were assumed to be an average of the other casks submitted by OR.

Stream Name Inactive Storage Tank Contents - MTRU Sludge

DESCRIPTION

3129 Uncategorized Inorganic Sludges

Solidified Inorganics

The waste stream is comprised of MTRU sludge which has settled and separated from wastewater that has been stored in large underground storage tanks. The waste is a product of past operations at ORNL involving various nuclear research and radiolotope fabrication processes and is currently undergoing RI/FS as part of a CERCLA program involving these tanks and contents. This waste is under the responsibility of DOE EM-40 and as such are not technically a RCRA mixed waste. However, since the waste has been reported in the ORR LDR FFCA, it is included in the MMR.

Waste Matrix Code Group
Site Matrix Description

This waste stream is comprised of LLLW waste that has been concentrated by evaporation and subsequently stored in large underground storage tanks. The waste is generated as relative dilute low level waste in various nuclear research and radioisotope fabrication processes. These streams are collected centrally and the volumes reduced in an evaporation facility. After the waste has been stored, it separates into phases. The resulting solids (sludge phase) is fairly homogeneous chemically and radiochemically. Since the sludge is a product of solids concentration, it has been classified as a TRU waste.

Comments

5400 Heterogeneous Debris information and data available has not been compiled and reduced to provide a detailed breakdown for the material parameters for each waste stream and waste matrix code. ORNL is implementing a QAPIP for TRU waste characterization in which utilization of process knowledge data will be used to produce more detailed information on material parameters per waste stream. Data submitted was taken from the BIR database.

PADUCAH GASEOUS DIFFUSION PLANT (PA) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the PA waste stream profiles:

- PA submitted a new waste stream with the WTWBIR ID PA-015A. In order to be consistent with the way ID's are assigned this was changed to PA-W016.
- The volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).

Comments

Activities for Th230 and U are not available.
Ranges of activities reported by Paducah for isotopes in this waste stream:
Tc99 4500-5400 m Ci/kg
Np237 28-90 m Ci/kg
Pu239 108-325 m Ci/kg

PANTEX (PX) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the PX waste stream profiles:

- Final Waste Form Groups were not provided by PX. In order to permit roll-ups of the data, the WTWBIR team assigned Final Waste Form Groups based on the descriptions and parameters provided by PX.
- The drum volume listed on page 1 of the waste stream form was corrected to 0.208 m³.
- The number of containers was changed to three to match the volume for the one PX waste stream.

ROCKY FLATS PLANT (RF) WASTE STREAM PROFILE METHODOLOGY

The approach used and the assumptions made in preparing the RF waste stream profiles are as follows:

- End of 1992 and end of 1993 inventory volumes for TRU-mixed and mixed residues were taken from the Interim Mixed Waste Inventory Report (IMWIR) and the Mixed Waste Inventory Report (MWIR), respectively.
- Projection volumes were taken from the Comprehensive Waste Management Plan (CWMP) with the exception of Solid Stabilization (formerly Residue Elimination). The program projection available for Solid Stabilization at the time the CWMP was being drafted was a "not to exceed" volume. The volume and breakdown of final form waste streams used in preparing the WTWBIR was an updated, projected volume taken from the Conceptual Design Report for Residue Elimination at Rocky Flats, RES-005-001, May 1994.
- The planned treatment for waste streams requiring treatment to meet WIPP WAC and TRAMPAC requirements are taken from the Draft Site Treatment Plan (DSTP) and the Treatment System Definition Report (TSDR) published by the Waste Compliance Programs.
- In the case where the waste stream or some portion of the waste stream requires treatment to change to the final waste form, the volume of waste resulting from the treatment of the original waste stream is included in the final waste form volume of the resulting waste stream. For example, the volume of waste resulting from treatment of Incinerator Ash is included in the final waste form volumes of the resulting waste stream, Solidified Process Solids.
- The following expansion factors were used to determine final waste form volumes resulting from treatment: immobilization of ash, 2.11; immobilization of sludges, 2.21; and all other immobilization treatment, 2.16. These factors were derived from the Technology Evaluation Framework (TEF) published by Waste Compliance Programs. The specific immobilization technology assumed for this purpose was cementation.
- Volume increases due to repackaging waste that exceed the current decay heat limit when no other treatment is required were not included. Waste Characterization Reassessment activities in 1994 resulted in the recharacterization of some waste. Significant changes are noted in the comments field of the affected waste streams.
- To remain consistent with the volumes reported in the IMWIR and the MWIR, 0.21 m³ was used as the container volume of a standard DOT-17C 55-gallon drum. The volume used for other containers was as specified on the data forms.
- Waste in boxes other than standard waste boxes (SWB) are assumed to be repackaged into SWBs, such that the waste from one 4'x4'x7' box is repacked into two SWBs. Therefore, the final waste form volumes for SWBs include the projected volume increase resulting from such repackaging activities.
- The values for the Typical Waste Material Weights for Final Waste Form data for the TRU waste streams are the same as the corresponding TRU mixed waste streams.

Comments

Upper limit assumes a drum can contain all cellulosics, all rubber, or all plastics - actual max is 681.8.
Lower limit assumes that a single drum can contain no cellulosics, rubber or plastics - actual min is 0.
Steel packaging materials assumes 1 overpack drum (55-gal) & 2 pucks (35-gal).
Plastic packaging material assumes 1 PVC liner, 1 P.E. liner and 1 rigid liner.

Footnotes

1. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Comments

2 as number stored includes waste in metal box requiring repacking to SWBs.
Final waste form volumes include waste repacked from metal boxes into SWBs with 1:2 ratio.

End of 1992 1 metal box repacked into 2 SWBs
End of 1993 1 metal box repacked into 2 SWBs

Typical isotopic composition data is not available for this container type.

Footnotes

1. The number of containers stored (2) includes waste that is presently stored in 4x4x7 metal boxes that will be repackaged into SWB's.
2. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Footnotes

1. The inventory for this waste stream contains mixed residues (24.15 m3 in 1992 and 39.38 m3 in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
2. The 1994 drum inventory reflects an increase of 19.32 m3 which is due to the Waste Characterization Re-assessment effort (5.66 m3 generated + 19.32 m3 transferred to non-mixed = 24.98 m3 represented for annual generation). This volume of waste was re-characterized as non-mixed TRU waste. This inventory of waste was transferred from Waste Stream RF-W012.
3. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Comments

This waste was recharacterized as Ground Glass/TRM (RF-W032) as part of waste characterization reassessment effort.
Typical isotopic composition data is not available for this container.

Footnotes

1. The 1994 box inventory reflects a decrease of 3.17 m3 (one 4x4x7 metal box) which is due to the Waste Characterization Re-assessment effort. This volume of waste was re-characterized as TRU Mixed waste (previously considered non-mixed TRU). This inventory of waste was transferred to Waste Stream RF-W032.
2. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

| Site Matrix Description | | |

This waste stream represents the solidified final form of all particulate and sludge type materials. Particulates and sludge type materials are immobilized with Portland cement. The cemented wastes are cast into 1-gallon molds and allowed to cure prior to packaging. This is the final waste form for Firebrick, Pulverized or Fines/TRM (RF-W036), Incinerator Ash/TRM (RF-W040), Particulate Sludge/TRM (RF-W068), and Sand, Slag, and Crucible/TRM (RF-W059). IDC 806 - All inorganic particulate and inorganic sludge waste must be immobilized by processing into a solid and identified as IDC 806.

Comments

Upper limit assumes a drum can contain all cellulosics, all rubber, or all plastics - actual max is 681.8.
Lower limit assumes that a single drum can contain no cellulosics, rubber or plastics - actual min is near zero.
Steel packaging materials assumes 1 overpack drum (55-gal) & 2 pucks (35-gal).
Plastic packaging materials assumes 1 PVC liner, 1 P.E. liner and 1 rigid liner.
Activity on these radionuclides is unknown.

Footnotes

1. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Waste Matrix Code Group Solidified Inorganics

Site Matrix Description This waste stream consists of aqueous sludge from wastewater treatment mixed with 30% Portland cement. IDC No. 800, 803, 807. The waste is generated as a result of process waste water treatment in Building 374 and 774. Aqueous sludge is produced by vacuum filtration of precipitated solids from pretreated aqueous waste slurry. Entrapped solids are skimmed off the surface of the filter medium of the rotating drum as wet sludge. The recaptured solids are chiefly hydroxides with pH of 10-12. The final waste form is obtained by mixing the wet sludge with approximately 30% Portland cement. RFP has several drums of aqueous sludge that were returned by INEL. These old drums were packaged by alternating the layers of cement and wet sludge or by adding cement to the top and bottom of a drum containing wet sludge. This older waste is described by IDC's 001, 002, and 007.

| IDCs 480 and 481. This waste includes items such as gloveboxes and machinery, and empty containers. Items that are difficult to reduce to a size that would fit in a 55-gal. drum are placed in DOT 7A, Type A metal boxes. These drums are lined with a rigid polyethylene liner, fiberboard liner and several bag liners. The boxes are lined with a fiberboard and PVC liner. This waste also includes final form waste of classified metal (IDC Nos. 484, 485, 486, 489) after processing to declassified form. Inventory data include residues in IDCs 480 and 481. | | | |

Comments

Assume waste in metal boxes is repackaged into SWBs with 1:2 ratio.
End of 1992 - 13 metal boxes repackaged into 26 SWBs
End of 1993 - 13 metal boxes repackaged into 26 SWBs
Final form waste volumes included in final form waste volumes for SWBs.

Footnotes

1. The 1994 4x4x7 metal waste box inventory reflects a decrease of 19.02 m3 which is due to the Waste Characterization Re-assessment effort. This volume of waste was re-characterized as TRU Mixed waste (previously considered non-mixed TRU). This inventory of waste was transferred to Waste Stream RF-W011.
2. The typical waste densities for this container were derived for the SWB.

Footnotes

1. The inventory for this waste stream contains mixed residues (14.28 m3 in 1992 and 6.11 m3 in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
2. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.
3. The typical waste densities for this container were derived for the SWB.

| Site Matrix Description | | <p>This waste stream was previously named "Firebrick - Pulverized or Fines." IDC No. 377 and 378. This waste is generated from replacement of fire brick in the plutonium recovery incinerator in Building 771. The fire brick must be replaced periodically because of the plutonium buildup. The fire brick is pulverized to facilitate plutonium recovery. Material which assays below the economic discard limit is discarded as pulverized fire brick waste. The waste is packaged in 55-gallon drums lined with a rigid polyethylene liner. Inventory data include residues in the same IDCs. IDC 377 - Waste from IDC 371 which is smaller than one inch diameter and larger than 1/4 inch diameter. IDC 378 - Particulate firebrick residue from recovery or particulate firebrick waste for discard. This IDC must be processed into IDC 806 (RF-T06).</p> | |

| <u>Site Matrix Description</u> | | IDC No. 320 Heavy (non-SS) metal waste is generated at various locations throughout the RFP. Heavy scrap metals is defined as metal elements above Cu on the periodic chart. In 1987, IDC 321 was created specifically for lead. Prior to this, lead was not segregated from IDC 320. Typically, these scrap metals consist of crucibles, funnels, rods and fixturing from several processes and production operations. Tantalum, tungsten and platinum are examples of scrap metals at the RFP. Inventory data include residues in IDC 320. IDC 320 - Scrap metals which are heavier than iron and steel. Metal above Cu on the periodic table. Mainly used tantalum crucibles. | |

| <p><u>Site Matrix Description</u></p> <p>IDC No. 802. This waste stream is liquid waste solidified with Portland Cement. This waste consists of waste liquids from the analytical labs, research and development laboratories, and maintenance shops which are packaged and sent to Building 774 for immobilization with Portland cement and absorbent cement. These are wastes which are incompatible with the process collection system and the liquid waste treatment plant. Acidic wastes are neutralized before immobilization. Immobilization is done in 55-gallon drums. Approximately 21 gallons of waste are added to each drum prior to storage. This waste stream is newly identified since the Storage and Inventory Report.</p> | | | |

Inorganic Non-metal

IDCs 370, 368 and 655. This waste stream includes any type or size of ceramic crucibles or liners including LECO crucibles. This waste consists of magnesium oxide ceramic crucible, magnesium oxide crucible fragments with reactive salts of calcium, magnesium, sodium, and/or potassium adhering to the surface and containing plutonium residue. This waste stream was generated during plutonium recovery using pyrochemical and electro-chemical processing. Waste is placed in 4-liter poly bottles and double plastic bagged or placed in 1 gallon or 1 quart paint cans then placed into 55-gallon drums. Inventory data include residues in IDC 368.

| Site Matrix Description IDC 438 - This waste stream is contaminated insulation. The insulation is generated from construction and demolition onsite. This waste was characterized using process knowledge for manifesting purposes is 1987 and 1989 to determine if any reportable quantities per 49 CFR 172 were present. No laboratory analyses of these waste for RCRA hazardous constituents have been conducted. | | |

Footnotes

- The inventory for this waste stream contains mixed residues (0.42 m3 in 1992 and 0.63 m3 in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
- The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

IDC No. 070, 400, 401, 500, 503, 508, 527, and 541. As result of the shutdown of plutonium operations at RFP in November, 1989, several hundred plastic bottles and several tanks of process liquids remained in storage in Buildings 371, 559, 771, and 779. These liquids are included in the list of residues. Basis for the five-year projected generation is an estimate of the past three years generation history.

Site Matrix Description

This waste stream was previously named "Filter Waste/TRU." IDC No. 328, 331, 335, 342, 376, 490, 491, 492. Filter waste is generated from process operations throughout the plant site. This waste consists of Full-flow filters from the Building 771 Incinerator (IDC 328), full-flow filters from non-incineration operations (IDC 331), absolute glovebox filters from non-acid contaminated operations (IDC 335), acid contaminated absolute glovebox filters (IDC 342), acid contaminated HEPA filters (IDC 492), non-acid contaminated HEPA filters (IDC 492), plenum prefilters (IDC 491), filter media (IDC 338), and processed filter media (IDC 376). Processed filter media is material which has been treated using Portland cement to absorb moisture and neutralize acid contamination. Filter waste is packaged in 55-gallon drums and metal standard waste boxes. Inventory data include residues within the same IDCs.

Comments

Site final form IDC also includes 490 and 491.
IDC 331 must be immobilized to convert to IDC 376.
The following volumes were included in the final waste form volumes for Cemented Filters/TRU to reflect the immobilization of IDC 331:
End of 1992 .21m3 x 2.16 = .45m3
End of 1993 .21m3 x 2.16 = .45m3

Footnotes

1. The inventory for this waste stream contains mixed residues (32.97 m3 in 1992 and 38.01 m3 in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
2. The final waste form drum volumes for 1992 and 1993 show a decrease of 0.21 m3 as a result of processing IDC 331 waste and transferring to Waste Stream RF-T067.
3. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Site Matrix Description

This waste stream was previously named "Filter Wastes/TRU." IDC No. 338 and 376. Filter waste is generated from process operations throughout the plant site. Processed filter media, DC 376, is material which has been treated using Portland cement to absorb moisture and neutralize acid contamination. Filter waste is packaged in 55-gallon drums and metal standard waste boxes. Inventory data include residues within the same IDCs because they are regulated as waste.

Site Matrix Description: This waste stream is construction rubble generated during decontamination and decommissioning activities. The waste consists of blacktop/concrete/dirt/sand. The waste is generated from construction/demolition within the plutonium process buildings. The waste is usually packed in 55-gal. drums with multiple bag liners, a fiberboard liner, and a rigid polyethylene liner. Also, the waste can be packaged in DOT 7A, Type A metal boxes which are lined with a fiberboard and PVC liner. This waste is identified by IDC 374. Inventory data include mixed residues in this IDC. IDC 374 - Construction rubble generated during decontamination and decommissioning operations. Metals are considered to be potentially present in the rubble from demolition and cleanup activities. Solvents are potentially present from the materials used during decontamination.

| Waste Matrix Code Group | | Solidified Inorganics | | |
| Site Matrix Description | | <p>This waste stream consists of aqueous sludge from wastewater treatment mixed with 30% Portland cement. IDC No. 800, 803, 807. The waste is generated as a result of process waste water treatment in Building 374 and 774. Aqueous sludge is produced by vacuum filtration of precipitated solids from pretreated aqueous waste slurry. Entrapped solids are skimmed off the surface of the filter medium of the rotating drum as wet sludge. The precipitated solids are chiefly hydroxides with pH of 10-12. The final waste form is obtained by mixing the wet sludge with approximately 30% Portland cement. RFP has several drums of aqueous sludge that were returned by INEL. These old drums were packaged by alternating the layers of cement and wet sludge or by adding cement to the top and bottom of a drum containing wet sludge. This older waste is described by IDC's 001, 002, and 007.</p> | | |

Comments

Assume waste in metal boxes will be repackaged into SWBs with 1:2 ratio
Final waste form volumes are included in final waste form volumes for SWBs

Footnotes

1. The 1994 inventory reflects an increase of 19.02 m3 which is due to the Waste Characterization Re-assessment effort. This volume of waste was re-characterized as TRU Mixed waste (previously considered non-mixed TRU). This inventory of waste was transferred from Waste Stream RF-T011.
2. The number of containers stored and number of containers projected is reported as 0 because these are not final packages. The waste reported on this sheet will be repackaged into SWB's.
3. The typical waste densities for this container were derived for the SWB.

Comments

Final waste form volume reflects inclusion of final form waste from treatment of PCB solid/TRM (RF-W001) of following amounts:
End of 1992 - 21m³
End of 1993 - 42m³

Footnotes

- The inventory for this waste stream contains mixed residues (16.42 m³ in 1992 and 6.14 m³ in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
- The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Comments

On site final form IDC, 822 is also submitted for inclusion in TRUCON.
New densities assume no supercompaction.

Footnotes

- The inventory for this waste stream contains mixed residues (104.1 m3 in 1992 and 33.18 m3 in 1993; the decrease in inventory is due to repackaging efforts) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
- The 1994 inventory reflects a decrease of 19.32 m3 which is due to the Waste Characterization Re-assessment effort (8.9 m3 generated - 19.32 m3 transferred to non-mixed - -10.42 m3 represented for annual generation). This volume of waste was re-characterized as non-mixed TRU waste. This inventory of waste was transferred to Waste Stream RF-T002.
- The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Site Matrix Description

IDC No. 801. This waste stream includes waste TRU organic fluids which are transferred to Building 774 for cementation from Buildings 707, 776, and 777. The liquids are mixed with gypsum cement within 55-gallon drums. The drum is lined with one or two bag liners with a rigid polyethylene liner. This waste stream includes cemented solids, and organic sludges/particulates. IDC 801 - Organic waste from liquid waste processing in Building 774. Mixed waste.

| Waste Matrix Code Group | | Inorganic Non-metal | |
| Site Matrix Description | | <p>This waste stream was previously named "Spent Absorbent/TRU (Oil Dry)". This waste stream was not specifically identified in the Storage and Inventory Report prepared by RFP in fulfillment of FFCA requirements. This waste is the TRU fraction of the waste titled "Oil Dry/LLW Mixed" in the Inventory Report. Normally it is LLW, but occasionally some assays as TRU. This waste stream is IDC N.. 375 Absorbents, usually vermiculite materials, which are used in the absorption, or absorption of any liquids as needed. One of the most commonly used absorbents is Oil Dry(R). Spent absorbents are assumed to be radiologically contaminated. The waste is packaged in 55-gallon drums lined with two polyethylene bags.</p> | |

Site Matrix Description
 IDC No. 339. This waste stream consists of leaded rubber gloves which are used on gloveboxes to reduce radiation exposure to personnel. Gloves which are damaged, or do not meet safety inspection requirements are replaced with new gloves and discarded as waste. The gloves are packaged in 55-gallon drums lined with a rigid polyethylene liner and one bag liner. Inventory data include mixed residues in IDC 339. 339 - Leaded drybox gloves, not acid contaminated - See IDC 341 if the gloves are acid contaminated.

Comments

Assume waste in metal boxes will be repackaged into SWBs with 1:2 ratio. Final waste form volumes are included in final waste form volumes for SWBs.

Footnotes

- 1. The 1994 inventory of 4x4x7 metal boxes reflects an increase of 3.17 m3 which is due to the Waste Characterization Re-assessment effort. This volume of waste was re-characterized as TRU Mixed waste (previously considered non-mixed TRU). This inventory of waste was transferred from Waste Stream RF-T003.
- 2. The typical waste densities for this container were derived for the SWB.

Comments

Final waste form volumes reflect repackaging of metal boxes into SWBs with 1:2 ratio
1994 - 1 metal box repackaged into 2 SWBs.

Footnotes

1. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.
2. The number of containers projected (2) includes waste that is presently stored in 4x4x7 metal boxes that will be repackaged into SWB's.

| <p>Waste Matrix Code Group Heterogeneous</p> <p>Site Matrix Description This waste stream was previously named "Firebrick - Pulverized or Fines." IDC No. 377 and 378. This waste is generated from replacement of fire brick in the plutonium recovery incinerator in Building 771. The fire brick must be replaced periodically because of the plutonium buildup. The fire brick is pulverized to facilitate plutonium recovery. Material which assays below the economic discard limit is discarded as pulverized fire brick waste. The waste is packaged in 55-gallon drums lined with a rigid polyethylene liner. Inventory data include mixed residues in the same IDCs. IDC 377 - Waste from IDC 371 which is smaller than one inch diameter and larger than 1/4 inch diameter. IDC 378 - Particulate firebrick residue from recovery or particulate firebrick waste for discard. This IDC must be processed into IDC 806 (RF-M01).</p> | | | |

| Uncategorized Metal | | | |
| IDC No. 320 Heavy (non-SS) metal waste is generated at various locations throughout the RFP. Heavy scrap metal is defined at RFP as metal elements above Cu on the periodic chart. In 1987, IDC 321 was created specifically for lead. Prior to this, lead was not segregated from IDC 320. Typically, these scrap metals consist of crucibles, funnels, rods and fixturing from several processes and production operations. Tantalum, tungsten and platinum are examples of scrap metals at the RFP. Inventory data include mixed residues in IDC 320. IDC 320 - scrap metals which are heavier than iron and steel. Metal above Cu on the periodic table. Mainly used tantalum crucibles. | | | |

Site Matrix Description IDC No. 802. This waste stream is liquid waste solidified with Portland Cement. This waste consists of waste liquids from the analytical labs, research and development laboratories, and maintenance shops which are packaged and sent to Building 774 for immobilization with Portland cement and absorbent cement. These are wastes which are incompatible with the process collection system and the liquid waste treatment plant. Acidic wastes are neutralized before immobilization. Immobilization is done in 55-gallon drums. Approximately 21 gallons of waste are added to each drum prior to storage. This waste stream is newly identified since the Storage and Inventory Report.

Site Matrix Description

Solidified Inorganics

IDCs 419, 420, 421, 425 and 428. This waste stream was previously named "fluidized bed incinerator ash (TRU)-mixed." Ash is generated from operation of a fluidized bed incinerator in Building 776 or an incinerator in Building 771. The incinerator was used to burn office trash, combustible waste generated in process areas, combustible oils from refrigeration units, diesel fuel, and crank case oils. The oil had been accumulated as a low level mixed waste. FBI ash was packaged in 55-gallon drums lined with a rigid polyethylene liner and one bag liner. It is a portion of the waste stream entitled "fluidized bed incinerator ash/LLW mixed" in the inventory report. The ash normally assays as LLW but this portion was found to be TRU. Inventory data include mixed residues of the same IDC.

Comments

1. This waste stream must be immobilized to convert to final waste form. A volume expansion of 2.11 occurs for processing of this TRUM waste to final form.

Footnotes

1. The inventory for this waste stream contains mixed residues (232.61 m3 in 1992 and 233.77 m3 in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
2. Final waste form reflects TRU waste inventories of incinerator ash being processed (with a volume expansion of 2.11). The final waste form volumes for this waste stream are in Waste Stream RF-M01.
3. The number of containers stored is for the year 1993. The number of

| MATRIX CODE | 5311 | | |
| SITE FINAL FORM IDC | 339 | | |
| Waste Matrix Code Group Site Matrix Description Lead/Cadmium Metal Waste IDC No. 341. This waste stream consists of leaded rubber gloves used in the glovebox system for plutonium recovery operations in Buildings 771 and 371. These gloves are contaminated with nitric acid and other acids when replaced and discarded as waste. The gloves are packaged in 55-gallon drums lined with a rigid polyethylene liner and a bag liner. Inventory data include mixed residues in IDC 341. Leaded gloves as waste are currently characterized by process knowledge and sample analysis using the EP Toxicity Test. EP toxicity results of two new 30 mil glovebox type gloves (Lab # M85-2833) were below established levels for lead (D008) per 40 CFR 261.24, Table I. Leaded gloves discarded as waste have not been sampled due to the lack of capabilities to perform sample analysis on TRMs at RFP. | | | |

This waste is generated during plutonium recovery operations such as direct oxide reduction molten salt extraction, electrorefining, and salt scrub. Its composition includes mixed salts, a probable presence of magnesium, sodium and potassium metals (reactivity characteristic D003) and chromium (D007). Inventory data include mixed residues in the IDCs. This waste stream includes inorganic sludges/particulates, and reactive metals. This waste consists of reactive molten and electrorefining (ER) salt residues from plutonium purification and direct oxide reduction.

Footnotes

1. The inventory for this waste stream contains mixed residues (146.55 m³ in 1992 and 138.76 m³ in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
2. The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Site Matrix Description

Solidified Inorganics

This waste includes unpulverized slag (IDC 387, 390, 395, 396), unpulverized sand and crucible (IDC 391), unpulverized sand, slag and crucible (IDC 392), sand slag and crucible heel (IDC 393), sand from button breakout (IDC 394), pulverized sand slag and crucible (IDC 398), and pulverized slag and crucible (IDC 399). This waste is generated during the reduction of plutonium tetrafluoride to plutonium metal. Its composition includes magnesium oxide sand, crucible, calcium metal and stainless steel (contains chromium). The calcium metal gives the reactivity characteristic of D003; the chromium gives the D007. Inventory data include mixed residues in these IDCs.

Site Matrix Description

Solidified Inorganics
IDC No. 070, 400, 401, 500, 503, 508, 527, and 541. As result of the shutdown of plutonium operations at RFP in November, 1989, several hundred plastic bottles and several tanks of process liquids remained in storage in Buildings 371, 559, 771, and 779. These liquids are included in the list of mixed residues. Basis for the five-year projected generation is an estimate of the past three years generation history.

Footnotes

- The inventory for this waste stream contains mixed residues (78.72 m³ in 1992 and 54.40 m³ in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP WAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
- The drum final waste form reflects TRU waste inventories of IDCs 328 and 331 being processed (with a volume expansion of 2.16). Final waste form volumes for these IDCs are in Waste Stream RF-W067.
- The number of containers stored is for the year 1993. The number of containers projected is for the years 1994 - 2022.

Filter

Site Matrix Description

This waste stream was previously named "Filter Waste/TRU." IDC NO. 338 and 376. Filter waste is generated from process operations throughout the plant site. Processed filter media, DC 376, is material which has been treated using Portland cement to absorb moisture and neutralize acid contamination. Filter waste is packaged in 55 gallon drums and metal standard waste boxes. Inventory data include mixed residues within the same IDCs because they are regulated as mixed waste. Hazardous constituents originate in liquid and gaseous effluents from processing operations.

Comments

Final waste form volume included in other waste forms as REP output.
No isotopic data available.

Footnotes

1. The inventory for this waste stream contains mixed residues (17.39 m³ in 1992 and 15.91 m³ in 1993) in addition to the mixed waste inventory described above. This residue stream will be processed through the Rocky Flats Residue Elimination Program which will generate several WIPP VAC certifiable waste streams as defined in the "Conceptual Design Report for Residue Elimination at Rocky Flats" (EG&G Rocky Flats, 1994). Volume changes, waste stream changes, and processing schedules for residues are defined in this document.
2. No isotopic information is available.

HANFORD SITE (RL) WASTE STREAM PROFILE METHODOLOGY

APPROACH

The approach used in preparing the RL waste stream profiles is as follows:

- Waste is divided between "past practice waste" (1970 through 1986) and currently-generated waste (1987 through 2028). Currently-generated waste includes projected waste generation.
- Past practice waste is grouped by generators, whereas currently-generated waste is grouped by waste matrix. The reasons for grouping the data in this manner are as follows: 1) the interim storage practice was changed from below ground surface (trenches) to above surface (storage buildings) in the 1986/1987 time period; 2) the By-Product Rule was issued by DOE on May 1, 1987, which compelled the hazardous components of TRU waste to be regulated by EPA under RCRA; 3) more detailed matrix information per container has been collected from the generator since 1987, and stored in the site's record waste tracking system; and 4) starting approximately 1986, waste generators began packaging the waste in accordance with the WIPP Waste Acceptance Criteria, thus reducing the need for additional waste processing prior to shipping to WIPP.
- Currently-generated waste streams were identified by reviewing each container record in the site's solid waste tracking system. Groups of containers that have similar physical characteristics and chemical contaminants (mixed only) were placed into a treatability group waste stream. The waste was then separated into drums, boxes, and RH canisters.

ASSUMPTIONS

The following assumptions were made by the site in repackaging the waste into the final waste form:

1. General

- A. A portion of the thermocouple assemblies, transfer pumps, mixing pumps, and other equipment in the single-shell and double-shell tanks will be removed, size-reduced, decontaminated, and assayed. Assay information will be used to designate the waste packages as low-level waste or TRU waste. The projection is that 10% of the equipment will be designated as RH-TRU, mixed waste and 90% will be designated as remote-handled, low level mixed waste. (WHC-EP 0768, Solid Waste 30-Year Volume Summary, p. 4-6, Table 4-1)
- B. TRU waste forecast volume data has been provided from the following off-site waste generators: AL, AE, BCL, LB, LL, and Santa Susana Field Laboratory (Rockwell, Canoga Park). The assumption is that TRU waste from these off-site waste generators will be received at RL for treatment in the Waste Receiving and Processing Facility (WRAP) and shipment to WIPP. (WHC-EP-0768, Solid Waste 30-Year Volume Summary)

HANFORD SITE (RL)
WASTE STREAM PROFILE METHODOLOGY (continued)

C. RH-TRU Waste

- Approximately 149 m³ of the TRU waste in drums and boxes stored in trenches, approximately 24 m³ of the TRU waste in 1-, 2-, and 5-gallon cans stored in alpha caissons, and approximately 140 m³ of irradiated material in drums, boxes and casks stored in trenches received prior to CY 1994 will be classified as RH-TRU waste when it is processed through the WRAP facility.
- No volume reduction is projected due to size reduction for transport in RH canisters.
- A small amount of CH-TRU (2.0E+2 m³) is expected to be retrieved and packaged as RH-TRU waste.

3. Newly-generated TRU waste

A. This waste will be generated during the fiscal years 1994 through 2013.

B. CH-TRU Waste

- One hundred percent of the waste in drums will be managed as TRU waste with 10% considered noncertifiable and requiring treatment.
- All boxed waste (except waste in SWBs) will require size reduction in the WRAP facility.

C. RH-TRU Waste

- Newly-generated RH-TRU waste will be stored in shielded drums pending repackaging in RH-canisters in the WRAP facility.
- RH-TRU waste retrieved from the 618-11 burial ground will include some soil surrounding breached containers. It is assumed that this soil will increase the waste volume to be retrieved by 25%. No volume reduction is projected for treatment in the WRAP facility.
- A portion of the single-shell and double-shell tank equipment will be size-reduced and decontaminated, assayed, and shipped to WIPP as RH-TRU waste. The assumption is the 90% of the equipment will be classified as remote-handled, low level mixed waste and 10% will be RH-TRU, mixed waste.
- Most of the waste generated between 1987 and 1993 is debris waste. As such, projected RH-TRU waste is assumed to be debris waste.
- The mixed waste contaminants and radionuclide composition of projected RH-TRU waste are unknown.

Comments

Activity for these radionuclides is unknown.

Footnotes

An additional 31,027 m3 of "suspect" mixed RH-TRU waste has been reported by Hanford in the data submittals. Sufficient information is currently unavailable on the processes that are anticipated to generate this waste to ascertain if this waste would be eligible for disposal in WIPP as RH-TRU. Additional information has been requested from Hanford to resolve this issue in Revision 2 of the WTWBIR.

| WASTE STREAM | MWIR ID | | STREAM NAME | 202 A Bldg TRU Waste |
| | WIPP ID | RL-T101 | | |
| | Local ID | RL-TB-101 | DESCRIPTION | This waste stream consists of contact-handled TRU waste from the Fuel Reprocessing Plant using the Plutonium/Uranium Solvent Extraction Process. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | | Heterogeneous | |
| Site Matrix Description | | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | |

| WASTE STREAM | MWIR ID | | STREAM NAME | 234-SZ TRU Waste |
| | WIPP ID | RL-T107 | DESCRIPTION | This waste stream consists of TRU waste from the Plutonium Finishing Plant. |
| | Local ID | RL-TB-107 | | |
| MATRIX CODE | 5400 | | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | Heterogeneous | | |
| Site Matrix Description | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | | |

| WASTE STREAM | MWIR ID | | STREAM NAME | 324 and 325 Bldg Oper TRU Waste |
| | WIPP ID | RL-T110 | | |
| | Local ID | RL-TB-110 | DESCRIPTION | This waste stream consists of contact-handled TRU waste from the Chemical Materials Engineering Laboratory. A volume of 1.74E+1 m3 generated in 1984 is radioactive sources. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | | Heterogeneous | |
| Site Matrix Description | | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. The waste consists of irradiated fuel from R&D activities, both in complete assemblies or pins of irradiated fuel; and irradiated fuel fragments and resultant waste generated from irradiated fuel experiments and/or examinations, such as polishing residue, cutting fluids, absorbents, and metal fines. | |

|--------------------------------|----------|---|--------------------|--|
| WASTE STREAM | MWIR ID | | STREAM NAME | 325B and 327 Bldg Oper TRU Waste |
| | WIPP ID | RL-T111A | DESCRIPTION | This waste stream (RL-T111A and RL-T111B) consists of typically remote-handled TRU waste from the Shielded Laboratory Annex of the Radiochemistry Building and Post Irradiation Test Laboratory. A volume of 21.1 m3 generated in 1971 is contact-handled waste. |
| | Local ID | RL-TB-111A | | |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | Heterogeneous | | |
| Site Matrix Description | | Typically, 70 to 80% of waste presently in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. The waste presently in boxes typically consists of whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | | |

| | | | | |
|--------------------------------|-----------------|--|--------------------|--|
| WASTE STREAM | MWIR ID | | STREAM NAME | 209 E Bldg TRU Waste |
| | WIPP ID | RL-T114 | DESCRIPTION | This waste stream consists of TRU waste from the Critical Mass Laboratory. |
| | Local ID | RL-TB-114 | | |
| MATRIX CODE | 5400 | | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | Heterogeneous | | |
| Site Matrix Description | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | | |

| WASTE STREAM | MWIR ID | | STREAM NAME | 300 Area RD TRU Waste |
| | WIPP ID | RL-T118 | | |
| | Local ID | RL-TB-118 | DESCRIPTION | This waste stream consists of contact-handled TRU waste from the Chemical Engineering Building and Radiochemistry Building Laboratory and Hot Cells, and Radiochemistry Building Cesium Recovery, and Radioanalytic Laboratory. A volume of 3.19 m3 generated in 1984 is radioactive sources, stored in trenches. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | Heterogeneous | | |
| Site Matrix Description | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. The waste consists of irradiated fuel from R&D activities, both in complete assemblies or pins of irradiated fuel; and irradiated fuel fragments and resultant waste generated from irradiated fuel experiments and/or examinations, such as polishing residue, cutting fluids, absorbents, and metal fines. | | |

| WASTE STREAM | MWIR ID | | STREAM NAME | Argonne Nat Lab Type III TRU Waste |
| | WIPP ID | RL-T125 | | |
| | Local ID | RL-TB-125 | DESCRIPTION | This waste stream consists of TRU waste from the Argonne National Laboratory. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | Heterogeneous | | | |
| Site Matrix Description | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | | | |

| MATRIX CODE | | 5400 | DESCRIPTION | This waste stream consists of TRU waste from Battelle Columbus. |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | Heterogeneous | | |
| Site Matrix Description | | <p>Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms.</p> | | |

| WASTE STREAM | MWIR ID | | STREAM NAME | GE San Jose and Vallecitos TRU Waste |
| | WIPP ID | RL-T143 | | |
| | Local ID | RL-TB-143 | DESCRIPTION | This waste consists of typically contact-handled TRU waste from the General Electric Plants at San Jose and Vallecitos. A volume of 1.10E+2 m3 is radioactive sources from General Electric Vallecitos Plant, generated in 1974. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | | Heterogeneous | |
| Site Matrix Description | | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. The waste consists of irradiated fuel from R&D activities, both in complete assemblies or pins of irradiated fuel; and irradiated fuel fragments and resultant waste generated from irradiated fuel experiments and/or examinations, such as polishing residue, cutting fluids, absorbents, and metal fines. | |

| WASTE STREAM | MWIR ID | | STREAM NAME | 234 5Z High Pu238 TRU Waste |
| | WIPP ID | RL-T146 | | |
| | Local ID | RL-TB-146 | DESCRIPTION | This waste stream consists of TRU waste from the High Pu238 routed through the Plutonium Finishing Plant. Waste originated from an off-site R&D activity. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | | Heterogeneous | | |
| Site Matrix Description | | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | | |

| WASTE STREAM | MWIR ID | | STREAM NAME | 234 5Z High Activity TRU CH Waste |
| | WIPP ID | RL-T150 | | |
| | Local ID | RL-TB-150 | DESCRIPTION | This waste stream consists of TRU waste from the Plutonium Finishing Plant that is relatively high in fission product activity. |
| MATRIX CODE | | 5400 | | |
| SITE FINAL FORM IDC | | | | |
| Waste Matrix Code Group | Heterogeneous | | | |
| Site Matrix Description | Typically, 70 to 80% of waste in drums is combustible items such as wood, plastics, paper, absorbents, rubber, rags. Approximately 20 to 30 % of waste in drums is noncombustible waste, such as failed machinery, tools, glass, concrete, plumbing and fixture and soil. Boxes typically contain whole and sectioned glove boxes, hoods, ducting, conduit, lathes, pumps, piping, fans, light fixture, instrumentation, tools, conveyor sections, wire, etc. The combustible materials in boxes may include cotton rags and clothing, plastic sheeting, plastic pipe, tape, ladders, plexiglass, step benches, polyethylene bottles, gloves and rubber. Absorbed combustible liquids such as oils have also been placed in some drums and boxes. Drums and boxes are also used for disposal of high-efficiency particulate air filters. Several boxes contain only high-efficiency particulate air filters, while others contain these filters and other waste forms. | | | |

Comments

Activity for these radionuclides is unknown.

Footnotes

An additional 11,861 m3 of "suspect" nonmixed RH-TRU waste has been reported by Hanford in the data submittals. Sufficient information is currently unavailable on the processes that are anticipated to generate this waste, to ascertain if this waste would be eligible for disposal in WIPP as RH-TRU. Additional information has been requested from Hanford to resolve this issue in Revision 2 of the WTWBIR.

**SANDIA NATIONAL LABORATORIES/NEW MEXICO (SA)
WASTE STREAM PROFILES**

The following modifications were made by the WTWBIR team in developing the SA waste stream profiles:

- Final Waste Form Groups were not provided by SA. In order to permit roll-ups of the data, the WTWBIR team assigned Final Waste Form Groups based on the descriptions and parameters provided by SA.
- ITRI waste stream(s) are included in the SA submittal.

Comments

Weights and volumes of individual lab trash items are based on current information available.

SAVANNAH RIVER SITE (SR) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the SR waste stream profiles:

- SR Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by SR.
- SR provided total projections for the years 1993 to 2022 instead of annual waste generation rates. The WTWBIR team modified the site data by dividing the SR total projections equally across the years 1993 to 2022. This was necessary to maintain consistency with the other sites and to roll-up the volumes correctly. The years to which the volumes are assigned may not be meaningful.
- An RH-TRU waste stream has been compiled from IDB volumes and information from SR to make the RH-TRU in the WTWBIR consistent with that in the IDB.

| Site Matrix Description | Ash from the Rocky Flats incinerator was sent to SRS for plutonium recovery research purposes. It is stored in a satellite area in 235-F. The sample material was sent to SRS to investigate possible flow sheets for the recovery of SNM (plutonium). The ash was classified as waste by the Colorado Court System and the flow sheet experiments were cancelled. | | | |

APPENDIX C

Sandia National Laboratories

Managed and Operated by Sandia Corporation
a subsidiary of Martin Marietta Corporation
Albuquerque, New Mexico 87185-1328

date : June 24, 1994
to : P.E. Drez, [Drez Environmental Associates]
from :  L. C. Sanchez, Org 6342, MS-1328 (505)848-0685

subject : Comments on May 9, 1994 Communications

The following is a synopsis of communications that took place on May 9, 1994 [1]. In those communications you requested responses to the following two questions:

- [1] In the radionuclide table (Table 3-3.1) located in SAND92-0700/3, there are a series of radionuclide inventories listed by isotope. This is the list that we have to replace in the WTWBIR. On the list, I thought that only isotopes with half-lives greater than 20 years were listed, but for instance, Cf-252 is listed which has a half-life of 2.64 years. Is this because it decays to Cm-248, which has a long half life? There are other isotopes which have half-lives greater than 20 years which are not reported in Table 3-3.1. Is this because of their overall low curie content in the inventory? If so what is the "cut-off" used as to whether an isotope appears in the table?
- [2] One of the strong comments by Karen Knudtsen was that we need to put in a strong justification for the different waste parameters that will be documented in the inventory. Can one or both of you work with the PA and model development people (e.g., Larry Brush) and fill in the table attached?

Per your request [1] I had talked with several people to get responses to your two questions. The responses obtained on May 9, 1994 and relayed to you were [2]:

- [1] In talking to Andy Peterson, he said that the table of radionuclides (Table 3.3-1) is a synopsis of all the available data from the sites. Any radionuclides not reported were probably due to the sites: 1) not identifying them in the waste, 2) they had been of undetectable quantities, etc. Also, the decay chains of interest (Figure 3.3-5) were those identified by SNL scientists as being the chains of interest.
- [2] The matrix which identifies the justification of waste parameters was reviewed by (see attachment):

MECHANICAL CHARACTERISTICS

APPENDIX D

Instructions for Completing Table 11,
TRU and TRU Mixed Waste Characterization for
the WIPP TRU Waste Baseline Inventory Report (WTWBIR)

Table 11 forms have been provided to those sites with mixed waste streams listed in the Mixed Waste Inventory Report (MWIR) (DOE, 1994) or TRU waste listed in the Integrated Data Base (IDB) for 1993 (DOE, 1994d). Please review and make corrections to these forms.

NOTE: Remember the waste forms being asked for are "final waste forms" that would be shipped and emplaced in the Waste Isolation Pilot Plant (WIPP).

FIRST PAGE OF FORM

1. **SITE NAME:** Enter the name of your site.

WASTE TYPE: Enter either TRU (non-mixed) or MTRU (mixed TRU).

HANDLING: Enter either CH (contact-handled) or RH (remote-handled).

2. **WASTE STREAM -**

MWIR ID: Enter the MWIR identifier or assign a new MWIR identifier for TRU or new MTRU waste streams.

Local ID: Enter any relevant local stream identification number(s).

3. **STREAM NAME:** Enter the site name for the waste stream.

4. **DESCRIPTION:** Enter a description of the waste stream. If this stream is a new stream created from changing another waste stream into final form for WIPP, please include the identifier of the original waste stream in the MWIR or provide an equivalent number.

5. **MATRIX CODE -**

Fm MWIR: If available, this number should come from the MWIR. Otherwise enter the proper waste matrix (treatment) code for the identified waste stream.

Assigned: Leave blank. This entry is used for evaluation purposes.

Final Waste Form Group: Of the eleven waste groups identified in the WTWBIR (e.g., Heterogeneous), select the most appropriate one for the final waste form of this waste stream and enter in this block.

Site Matrix Description: Enter a reasonably detailed description of the waste matrix and other relevant information.

6. **FINAL WASTE FORM IDC's -**

From Site: Enter the appropriate Item Description Code (IDC) (DOE, 1992) for this waste stream.

Assigned Equivalent IDC: Leave blank. This block will be used for evaluation purposes.

7. CONTAINERS - There should be a line for each container type (i.e., 55-gallon drum and/or standard waste box) in which this waste stream would be shipped to WIPP.

NOTE: For each type of waste container, there should be a continuation page.

The numbers provided for stored and projected containers were accidentally incorporated from the non-radionuclide inventory database (NID) and should be ignored and replaced with the correct inventory volumes.

The standard 55-gallon drum has an internal volume of 0.208 m^3 . The internal value of a standard waste box is 1.9 m^3 .

8. CHECK BOXES - Please check the appropriate boxes for this waste stream, observing the notes which apply to them.

SECOND PAGE OF FORM

9. HEADER DATA on continuation sheet is repeated from page 1.

10. WASTE CONTAINER - Type: Identify the applicable container type (i.e., 55-gallon drum, standard waste box).

11. TYPICAL WASTE MATERIAL WEIGHTS FOR FINAL WASTE FORM - For the listed waste stream, identify the "typical" Average, Lower Limit, and Upper Limit estimates in kg/m^3 for each waste material parameter listed for the particular container type (i.e., 55-gallon drum or standard waste box). If the estimates are zero, enter a zero in the column. Do not leave any blanks. Include any pertinent comments in the Comment box.

12. STORED TRU WASTE AND ESTIMATED RATES OF TRU WASTE GENERATION - These dates should be entered as pairs of numbers:

- The upper number is the actual stored and projected waste volumes, identical to that reported in the MWIR for MTRU waste streams.
- The lower box is the volume of waste changed to account for its conversion into the final WIPP waste form.

NOTE: The volumes to be reported for the years 1998-2002 and 2003-2022 are per year estimates. The years 1998-2002 are for a 5-year period; the years 2003-2022 are for a 20-year period.

13. TYPICAL ISOTOPIC COMPOSITION - Enter the radionuclides and average anticipated activity (curies) for those radionuclides in the waste stream which comprise greater than 1% of the stream's activity.

14. SIGNATURE: Please print and sign your name, and date each form.

Table 11: TRU AND TRU MIXED WASTE CHARACTERIZATION FOR THE WIPP TRU WASTE BASELINE INVENTORY REPORT

APPENDIX F

APPENDIX F WASTE STREAM IDENTIFICATION CROSS-CORRELATION TABLE

The following tables provide a cross-correlation between the waste stream WIPP ID number, waste stream name, local identifier, TRUCON content code, and NMVP code. The WIPP ID number is used to identify the waste stream profiles. The waste stream name and local identifier are also based on information in the waste stream profiles. The local ID is a site assigned identifier. These may be waste Item Description Codes (IDCs) or other codes which were/are used by the sites in their own waste identification system, or it may be a unique identifier assigned by the site for the purposes of the WTWBIR and/or WIPP data call.

The content codes listed in the TRUCON document were originally provided as a consolidation of the site specific IDCs or codes used under previous waste identification systems. The initial consolidation of the site codes into TRUCON codes was performed in 1988. The majority of these content codes and the correlating IDCs were included in the March, 1990 version of the NMVP. The correlation of the WIPP ID numbers to the TRUCON and NMVP content codes provided in the following tables is based on using the local identifier whenever possible. In many cases, the local identifier or IDC could be traced directly to the IDCs listed in the TRUCON and/or NMVP document. When the IDCs were not provided in the waste stream profile, the correlation was based on matching the waste stream description in the waste stream profile to the descriptions for the content codes in the TRUCON document. A one-to-one correlation between the WIPP ID numbers and the TRUCON and NMVP content codes is not always possible. This is primarily due to one or more of the following reasons:

- The WTWBIR waste stream profiles are typically segregated into mixed and non-mixed waste streams. The TRUCON and NMVP did not provide this segregation.
- Since 1988, when the consolidation of waste streams for the TRUCON was performed, many of the sites have inventoried their wastes into databases, thereby allowing greater segregation and manipulation than that provided in the TRUCON document.
- The WTWBIR provides an inventory of all wastes destined for WIPP. The TRUCON and NMVP only list those waste streams that met the criteria of the TRUPACT-II SARP and the WIPP-WAC.

It is important to note that correlation of an WIPP ID number to a TRUCON or NMVP content code does not imply that the waste stream meets the criteria of the TRUPACT-II SARP or WIPP-WAC. The correlation is provided as guidance only, and is not meant to signify compliance with any of the WIPP criteria or governing regulations.

The first number of a TRUCON content code is a "1" or "2", to provide a distinction between newly generated and retrievably stored waste. For the purposes of the TRUCON, newly generated waste was defined as waste generated after the WIPP waste certification program had been implemented at each site. Retrievably stored waste is waste which was generated before the implementation of the certification program. The WTWBIR does not typically make this distinction, and therefore a WTWBIR waste stream that correlates to a content code listed in TRUCON as 1XX and 2XX, is listed in the correlation tables with both of these codes.

The TRUCON document contains content codes followed by an "A", "B", or "C" letter (i.e., RF 111A, ID 225A). These letters were used for varying reasons. In some cases they were used to distinguish different waste streams within a content code, or to differentiate between different packaging configurations. In other cases they were used to identify waste specifically packaged for the WIPP Test Phase. The letters are only included in the correlation tables if they were used to distinguish between different waste streams. If a letter is not used after the content code in the correlation tables, the waste stream correlates to the "A" content codes.

Correlation tables have been provided for all of the sites except Hanford and the Savannah River Site. There was inadequate information in the TRUCON document and the WTWBIR waste stream profiles to determine a correlation. The waste streams listed in the TRUCON document for these two sites were very general and all-encompassing, whereas the WTWBIR waste streams were more segregated.

ANL-E WASTE STREAM IDENTIFICATION CROSS-CORRELATION TABLE

| Waste Stream Name/Description ^a | WIPP ID | RH/ CH | TRUCON ^{b,c} | NMVP ^{b,c} |
|--|---------|--------|-----------------------|---------------------|
| | AE-T001 | CH | | |
| | AE-T003 | CH | | |
| Aqueous Lab Packs | AE-W038 | CH | | |
| Organic Resins | AE-W039 | CH | | |
| Wastewater Treatment Sludges | AE-W040 | CH | AE 111A | AE 111 |
| Non-activated Lead | AE-W041 | CH | | |
| ^a Cadmium containing metal debris | AE-W042 | CH | | |
| | RF | RH | | |

Footnotes:

- a - Blank fields indicate that no waste stream name was reported in the waste stream profiles.
- b - RH waste streams are not listed in the TRUCON and NMVP.
- c - Local identification or Item Description Codes (IDCs) were not reported in the waste stream profiles. Cross-correlation with TRUCON and NMVP content codes were assigned based on matching physical descriptions.

FOOTNOTES

- After 1985 RFP shipped waste to INEL used content code numbers similar to those presented in the TRUCON document instead of the IDCs used before and following this time. For example, content code 118 (ID-EGG-119T-118) consists of IDCs 370, 440, and 442.
- These are TRUCON-equivalent codes. These codes are presently approved transport in the TRUPACT-II package from their respective generators to WIPP (i.e., MD-111 can be shipped from Mound to WIPP). A revision to TRUCON will be prepared to allow transport of these codes from INEL to WIPP.
- The "A" and "B" trailers on some of the content codes are used in TRUCON to identify wastes within a content code that differ in one or more parameter(s), such as waste packaging, or segregation of one or more IDCs. The ID 1XX codes do not include the letter code, as all of these are assumed to be the ID 1XXA codes.
- A blank entry under TRUCON and/or NMVP denotes that the corresponding wastes were not included in these documents and do not have a correlating content code. Revision 6, TRUCON and the 3/9/90 issue of the NMVP were used to determine the correlation.

Footnotes:

- a - The waste stream description name is from the WTWBIR waste stream profiles. The names in italic represent the name of the stream in the TRUCON and/or NMVP if different than the WTWBIR name.
- b - The correlation of the WIPP# to IDCs, TRUCON codes, and NMVP identifiers has been deduced from waste stream names and material parameter information. There is not a one-to-one correlation between these codes, and the waste stream by WIPP# may include one or more waste streams as identified in the TRUCON and/or NMVP. The TRUCON and NMVP correlations codes listed may not be inclusive of all TRUCON and NMVP codes in that WIPP#, however, those listed are the only codes that could be determined from the available information.
- c - There is no TRUCON or NMVP correlation for the RH wastes.

LLNL WASTE STREAM IDENTIFICATION CROSS-CORRELATION TABLE

| Waste Stream Name/Description ^a | LOCAL ID | WIPP ID | RH/CH | TRUCON ^b | NMVP ^b |
|--|------------------|---------|-------|---------------------|---------------------|

Footnotes:

- a - Blank fields indicate that no waste stream name was reported in the waste stream profiles.
- b - Item Description Codes (IDCs) as defined in the TRUCON were not reported in the waste stream profiles. Cross-correlation with TRUCON and NMVP content codes were assigned based on matching physical descriptions provided. The content codes listed do not represent a one-to-one correlation with the WIPP waste streams. Blank fields indicate that no correlating content code could be assigned.
- c - The content code listed is only a subset of the WIPP waste stream. Correlating content codes are not listed in TRUCON or the NMVP for the remainder of the WIPP waste stream.

Footnotes:

- a - *Italic Text* denotes waste stream descriptions obtained from the waste stream profile used to clarify the type of waste being described.
- b - **Bold Text** denotes IDCs that are noted as Final Waste Form #'s by the RFP.
- c - Correlating TRUCON and NMVP content codes are assigned based on the final waste form numbers (bolded IDCs). Blank fields indicate that no correlating content code exists for the waste stream.
- d - These IDCs are listed as INEL TRUCON codes (generated by RFP), but are not included as RFP TRUCON content codes. Therefore, no correlation exists.
- e - Supercompacted combustibles are listed in TRUCON under RF 116C, but under older IDCs 831, 832, 833.

LOS ALAMOS NATIONAL LABORATORY WASTE MATERIAL TYPE CODES

The Los Alamos National laboratory (LANL) uses a set of codes to specify special mixtures of special materials in waste matrices where appropriate. In the listing that follows, the codes appear on the left and the column on the right contains the specifics of the mixture. Subheadings provide additional general information where thought to be helpful to the reader.

Isotopic Mixes for LANL

| Type Code | Type-Description |

3. TRANSURANIC WASTE

3.1 INTRODUCTION

This chapter presents information on the inventories and characteristics of transuranic waste (TRUW) at various sites in the United States. TRUW is a waste category peculiar to DOE; it does not apply to wastes regulated by the NRC. DOE Order 5820.2A defines TRUW as waste that (1) is contaminated with alpha-emitting transuranium (i.e., atomic numbers greater than 92) radionuclides with half-lives greater than 20 years and (2) contains a total concentration of such radionuclides in excess of 100 nCi per gram of waste at the time of assay.¹

Under an earlier definition, DOE wastes containing more than 10 nCi of TRU radionuclides per gram of waste were classified as TRUW. The change to 100 nCi of TRU radionuclides per gram of waste took place in 1984. As a result of this change, some waste that had already been classified as TRUW became potentially reclassifiable as low-level waste (LLW). Some of this waste has been so reclassified, and some is still managed as TRUW with the potential of being reclassified as LLW at some future time.

DOE Order 5820.2A also states that heads of field elements can determine that other alpha-contaminated waste peculiar to a specific site must be managed as TRUW.¹ As a consequence of this provision, wastes containing radionuclides such as ²³⁵U, ²⁴¹Pu, and ²⁴⁴Cm, which do not meet the strict definition of TRU radionuclides because of atomic number or half-life, may be classified as TRUW at some sites.

TRUW is primarily generated by research and development activities, plutonium recovery, weapons manufacturing, environmental restoration, and decontamination and decommissioning (D&D) projects. Most TRUW exists in solid form (e.g., items such as protective clothing, paper trash, rags, glass, miscellaneous tools, and equipment that have become contaminated with TRU radionuclides). Some TRUWs are in liquid form (sludges) resulting from chemical processing for recovery of plutonium or other TRU elements. Prior to 1970, TRUW was disposed of on-site in shallow, landfill-type configurations. TRUW disposed of in this manner is referred to as "buried" TRUW. In 1970, the U.S. Atomic Energy Commission (AEC), which was a predecessor to DOE, concluded that waste containing long-lived alpha-emitting radionuclides should have greater confinement from the environment. Thus, all TRUW generated since the early 1970s has been segregated from other waste types and placed in retrievable storage pending shipment and final disposal in a permanent geologic repository.² This waste is referred to as "retrievably stored" TRUW.

Retrievably stored waste is contained in a variety of packagings (metal drums, wooden and metal boxes) and is stored in earth-mounded berms, concrete culverts, or other types of facilities.

TRUW packages are classified as either "contact handled" (CH) or "remote handled" (RH) depending on the radiation level at the surface of the package at the time of packaging. If this level exceeds 200 mrem/h, the package is classified as RH.

CH TRUW contains relatively small quantities of fission and activation products that produce highly penetrating radiation; typically, its emissions consist mostly of alpha particles and low-energy photons of little penetrating power. Most TRUW (more than 90% by volume) is of the CH type. RH TRUW typically contains a greater proportion of fission and activation products that produce highly penetrating radiation and therefore tends to produce a higher level of radiation at the surface of the package.

It is estimated that as much as 50 to 60% of TRUW is mixed waste, meaning that it contains, in addition to radioactive constituents, hazardous constituents defined and regulated in accordance with the Resource Conservation and Recovery Act (RCRA). Examples of mixed waste are radionuclide-contaminated spent solvents, discarded materials contaminated with both solvents and radioactive materials, scintillation fluids, and discarded contaminated lead shielding. Mixed TRUW must be managed to comply with the applicable hazardous waste regulations (e.g., RCRA) as well as those applying to radioactive TRUW only. Some TRUW may be contaminated with hazardous materials defined by other regulations. DOE is currently developing strategies for identifying and managing TRUW containing hazardous contaminants defined by regulations other than RCRA.

Under existing arrangements, retrievably stored TRUW is the responsibility of the DOE/EM Office of Waste Management (EM-30). It is planned that the retrievably stored TRUW and newly generated TRUW from defense-related activities will be shipped to the Waste Isolation Pilot Plant (WIPP) for disposal. Prior to the start of these shipments, it is planned that tests will be conducted over approximately the next 4 years to ensure that the wastes to be shipped to WIPP, and the criteria for their emplacement at WIPP, will meet all applicable federal and state requirements for TRUW and mixed TRUW. If the test phase is successful, the retrievable TRUW inventory will be disposed of in WIPP over approximately the next 20 years.

Buried TRUW and TRUW generated from site remediation activities and D&D activities are the responsibility of the Office of Environmental Restoration (EM-40). The disposition of TRUW in these categories is uncertain at this time.

3.2 TRUW INVENTORIES

3.2.1 Sources of Data

Quantitative information contained in this chapter is derived from data furnished by the DOE sites through annual data calls, as described later in this section. As programs and plans evolve or change, modifications and/or additions will be made to the data and other information in this chapter. It is expected that the quality and accuracy of the data will improve with each annual revision of this document, thus improving the usefulness of the data for program planning and decision purposes.

Early TRUW inventory practices were not as stringent as those of today in regard to requirements for waste identification, categorization, and segregation. Consequently, the early inventory data are based largely on process knowledge and on various studies and summaries related to site-specific practices.³ As these efforts continue and TRUW is further characterized by radioassay, significant revisions in the estimated overall quantities of TRUW are anticipated.

3.2.2 Site Locations—Summarized Volumes and Radioactivity

TRUW management activities (generation, retrievable storage, etc.) are performed at six major and fourteen minor DOE sites. The major sites, from the standpoint of TRUW quantities, are (1) the Hanford Site (HANF), (2) Idaho National Engineering Laboratory (INEL), (3) Los Alamos National Laboratory (LANL), (4) Oak Ridge National Laboratory (ORNL), (5) Rocky Flats Plant (RFP), and (6) the Savannah River Site (SRS). HANF and RFP no longer generate TRUW as part of weapons production processes but do generate TRUW as part of environmental restoration (cleanup) activities. The fourteen minor sites are (1) Ames Laboratory (AMES), (2) Argonne National Laboratory—East (ANL-E), (3) Bettis Atomic Power Laboratory (BAPL), (4) Knolls Atomic Power Laboratory (KAPL), (5) Lawrence Berkeley Laboratory (LBL), (6) Lawrence Livermore National Laboratory (LLNL), (7) Mound Laboratory (MOUND), (8) Nevada Test Site (NTS), (9) Paducah Gaseous Diffusion Plant (PAD), (10) Pantex Plant (PANT), (11) Sandia National Laboratory (SNL/NM), (12) (6) Santa Susana Field Laboratory (SSFL) [also referred to as the Energy Technology Engineering Center (ETEC)], (13) University of Missouri (MURR), and (14) West Valley Demonstration Project (WVDP). Figure 3.1 shows the locations of the sites that store the largest quantities of TRUW and gives an approximate indication of the relative volumes of TRUW stored at each site. Figure 3.2 shows the volumes of CH and RH retrievably stored TRUW at the major sites and clearly shows that the preponderance of TRUW volume is in the CH category. Figure 3.3 shows the decayed radioactivities of retrievably stored CH and RH TRUW at the major sites as of December 31, 1993.

3.2.3 Development of Detailed Inventory Data

Last year's IDB described recent changes in the manner in which TRUW data were collected, reviewed, and used.⁴ This year, the data collection process for the IDB was adjusted somewhat to allow for the priority collection of data for the WIPP Baseline Inventory Report.

3.2.3.1 Site data submittal process

All of the quantitative TRUW data in the IDB are ultimately derived from the site data submittals. The sites supply volumes, radionuclide compositions, and curies of each radionuclide added in each year of TRUW accumulation. This is done for each TRUW type (CH stored, RH stored, CH buried, and RH buried). The annual radioactivities in the site submittals are on an as-stored basis; that is, they represent the curies of each radionuclide added each year at the end of the year in which the waste was placed in storage. The data are entered by the sites on standardized forms. The complete set of TRUW site data submittals for this year's IDB is listed as ref. 5 (Sect. 3.6). In a few cases, it was found necessary to use last year's submittal to the IDB because no submittal was received this year.

3.2.3.2 Site data review and modification

The site data submittals for TRUW were reviewed to make certain, insofar as possible, that the data supplied met the requirements of completeness and consistency. The data review process included modifying the formats of the data so that they could be easily converted to input data files for use in the decay calculations.

3.2.3.3 As-stored volumes and radioactivities

Tables 3.1 through 3.3 summarize a small portion of the information in the site submittals. These tables show the volumes and cumulative as-stored (undecayed) radioactivities of retrievably stored CH and RH TRUW at each site in 5-year increments from 1970 to 1990 and at the end of 1993. Table 3.2 shows total radioactivities (i.e., all radionuclides included), and Table 3.3 shows TRU radioactivity (i.e., only TRU radionuclides included).

3.2.3.4 Calculation of annual decayed radioactivities

As described in last year's IDB report, a computer code converts the annual as-stored radioactivities to annual decayed radioactivities and accumulates these quantities to produce tables showing decayed grams, curies, and watts on a year-by-year, site-by-site, and radionuclide-by-radionuclide basis. Annual added volumes and cumulative volumes are also shown. Volumes are assumed to be unaffected by decay.

In a number of cases, the site-submitted data were not sufficiently detailed to permit the desired decay calculations. The difficulty most frequently encountered was that radionuclide compositions were not adequately specified on a radionuclide-by-radionuclide basis. In some cases, data conversion codes were used to convert site-supplied input

data to the radionuclide-specific forms required for decay calculations. These codes were used as follows:

1. Where the site-supplied data called for mixtures of fission products but did not give quantitative composition data for such mixtures, the assumption was made that the isotopic composition was the same as that specified by Hanford in their submittal to last year's (Rev. 9) IDB report.
2. Certain parent fission products are always accompanied by short-lived daughters. Short-lived daughter fission products are added in cases where the site submittal shows the parent but does not specifically show the daughter and it is clear that the daughter must be present. For example, if a site shows 100 Ci of ^{90}Sr but does not show any ^{90}Y , it is assumed that the 100 Ci is the total activity of parent and daughter and the input is changed to 50 Ci ^{90}Sr and 50 Ci ^{90}Y . Other fission product parent-daughter combinations are handled in the same manner, using the appropriate curie ratio for each combination.

3.2.4 Results of Inventory Calculations

3.2.4.1 Retrievably stored wastes

Tables 3.4 and 3.5 show the cumulative decayed radioactivities of retrievably stored CH and RH TRUWs for each of the sites by 5-year increments from 1970 through 1990 and at the end of 1993. These tables are analogous to Tables 3.2 and 3.3, except that in Tables 3.4 and 3.5 the radioactivities are on a decayed basis; that is, they take into account the processes of radioactive decay and ingrowth of radioactive daughters. As before, Table 3.4 shows total radioactivities (all radionuclides included), and Table 3.5 shows only the radioactivities of TRU radionuclides. As previously stated, it is assumed throughout the tables that volumes of TRUW are not affected by radioactive decay.

Tables 3.6 and 3.7 summarize the total system inventories (i.e., all sites combined) of retrievably stored CH and RH TRUWs at DOE sites for the end of each year from 1970 to 1993. The cumulative masses, radioactivities, and thermal powers shown in these tables are decayed values. The difference between Tables 3.6 and 3.7 is that the masses, radioactivities, and thermal powers in Table 3.6 are based on all the radionuclides in the waste, whereas the quantities shown in Table 3.7 include only the contributions of the TRU radionuclides; daughters of TRU nuclides are not included in Table 3.7.

3.2.4.2 Buried TRUW

Buried TRUW volumes and radioactivities are shown in Tables 3.8 through 3.12. These are based on data provided in the site submittals. The form of the site-submitted data for buried waste is identical to that of the retrievably stored waste except that no distinction is made between CH and RH buried wastes. The buried waste tables (Tables 3.8 through 3.12) are analogous in form and information content to the retrievably stored waste tables (Tables 3.1 through 3.7)

and follow the same general sequence. Table 3.8 shows as-stored volumes by sites and time periods. Tables 3.9 and 3.10 show cumulative as-stored total and TRU-only radioactivities by sites and time periods. Tables 3.11 and 3.12 show cumulative decayed total and TRU-only radioactivities. In these tables, "total" radioactivity means that all radionuclides are included, and "TRU-only" radioactivity means that only TRU nuclides are included.

3.2.4.3 Contaminated soil

Over the years, many of the older buried waste containers have developed leaks and contaminated the adjacent soil. Also, at some sites, soil has become contaminated by liquid spills or has been used as an ion-exchange medium for dilute liquid waste streams. It is difficult to make accurate estimates of the actual quantity of contaminated soil. The data reported by the sites are shown in Table 3.13. Additional characterization efforts will be required to reduce the uncertainties in these data.

3.3 ESTIMATED MIXED WASTE CONTENT OF TRUW

The sites were requested to submit estimates of the volumes of retrievably stored CH and RH TRUWs that might fall into the category of mixed TRUWs. These estimates were requested for three time periods: 1970-1986, 1987-1993, and 1994. Table 3.14 summarizes the site-submitted estimates of these volumes.

3.4 PROJECTED FUTURE QUANTITIES OF TRUW

Table 3.15 shows the data submitted by the sites for estimated future volumes of TRUW generation. The sites were not requested to estimate the radioactivities or isotopic compositions of these wastes, since it was felt that there would be little basis for such estimates. The estimated volumes are given in terms of average annual rates ($m^3/year$) for seven time periods from 1994 to 2020. An effort was made to obtain estimated rates in three categories: (1) general operations, (2) D&D, and (3) remedial action. The estimated effect of volume-reduction processes was also requested; however, little information on this was available.

3.5 TRUW DISPOSAL

The goals of the DOE TRUW Program are to terminate interim storage and achieve permanent disposal of all DOE TRUW.⁶ One of the major efforts in this direction is the WIPP project. As stated in Public Law 96-164,⁷ the WIPP project was to be constructed "... as a defense activity of the DOE for the purpose of providing a research and development facility to demonstrate the safe disposal of radioactive

waste resulting from defense activities and programs of the United States." Construction of the facility is now essentially complete, and WIPP is now the only facility specifically designed for isolation of TRUW. It is designed to emplace about 175,000 m³ of TRUW 650 m below ground in a mined salt formation.

Waste received at WIPP must meet the WIPP-WAC and associated quality assurance requirements specified in WIPP/DOE-069.⁸ A number of other approvals remain to be completed before DOE can begin disposal operations at the facility. As previously stated, a test program of approximately 4 years will be conducted to ensure that the wastes to be shipped to WIPP, and their emplacement at WIPP, will comply with all applicable federal and state regulations. If the test phase is successful and all necessary approvals are obtained, it is planned that shipment and emplacement of wastes will begin and will continue through approximately the year 2018.

In 1993, the WIPP Legislative Land Withdrawal Act was passed, confirming congressional intent to have DOE continue with development and permitting of the facility. Since then, the DOE has stated its intent to accelerate processes leading to the start of waste disposal operations at the WIPP.

^aMass means mass of radionuclides, not of total waste.

^bSRS CH waste data not available for individual years prior to 1991 but is included in totals for years 1991 and 1992.

^aRadioactive daughters of TRU radionuclides are not included.

^bTRU mass means mass of TRU radionuclides, not of total waste.

^cSRS CH waste data not available for individual years prior to 1991 but is included in totals for years 1991 and 1992.

^aReference 4 states that upon retrieval of this waste, a significant amount of the soil will become contaminated and will increase the volume of waste. The estimated waste and associated contaminated soil volume is 109,000 m³. Quantities shown for Hanford are based on their submittal of Aug. 30, 1993.

^bNo year-by-year breakdown available for these years. SRS shows 4,874 m³ as the total volume buried from 1952 through 1974.

^cUnknown amounts were buried prior to 1970 and are not included in totals.

^dTotals do not include approximately 9,500 m³ of TRUW injected by hydrofracture at ORNL. This was included in last year's totals.

^aData for HANF are based on their submittal of Aug. 30, 1993 (Rev. 9 IDB data).

^bUnknown.

^cSRS data submittal showed 33,670 Ci of TRU radionuclides buried from 1952 through 1974. The curies of fission products and other non-TRU radionuclides associated with this waste were listed as unknown.

^dDoes not include about 680,000 Ci deposited by hydrofracture at ORNL. Last year's table included this material.

^aINEL did not give isotopic compositions, so radioactivity for TRU radionuclides cannot be determined. See Table 3.9 for data on a total radioactivity basis.

^bQuantities shown for ORNL include ²⁴⁴Cm, which is considered a TRU radionuclide at ORNL. If ²⁴⁴Cm is omitted, the totals are reduced by 0.08 10³ Ci/year.

^cSRS did not give data on a year-by-year basis. Cumulative curies from 1952 through 1974 were given for TRU radionuclides only.

Table 3.11. Summary of buried TRUW by sites: decayed radioactivity (all radionuclides)

^aINEL data did not include any isotopic compositions, so no decay calculations could be made.

^bSRS gave cumulative radioactivity as of 1974 on an as-stored basis for TRU radionuclides only. The reduction in activity shown from 1975 through 1993 is essentially all due to the decay of ²³⁸Pu.

Table 3.12. Summary of buried TRUW by sites: decayed radioactivity (TRU radionuclides only)

^aCompiled from Table 4 of site submittals. The quantities shown in each column represent the total volume of a given waste type generated during the period indicated at the top of the column.

^bUnknown.

^cNo data submitted for this table.

^dKAPL estimated their TRUW contains about 10% LLW and 5% mixed waste.

^eData are from previous submittal for Rev. 9 IDB report.

^fLBL reports that they do not generate or store TRU mixed waste.

^gNot applicable.

^hThere is no remote-handled TRUW at RFP.

ⁱSNL/NM appended the following notes to their Table 4 submittal:

1. Includes only TRU waste included in SNL/NM's Disposal Request process.
2. With regard to instruction footnote c of Table 4: TRU material, which may be mixed and may be remote-handled material, is in storage in Technical Area V (TA-V) and the Manzano Site Structures. The years the material was generated or placed in storage is unknown. The material in TA-V is approximately 1 m³ and is listed in the 180-day report, although it may not be categorized as waste under SNL/NM policy current at the time of this report. A recent inventory found two 55-gal containers of TRU material in the Manzanos, one contact-handled and one remote-handled. The material may be mixed and also may not yet be officially categorized as waste. None of this Manzano material was included in TRU estimates for the 180-day report. There is no activity information for the material at TA-V or the Manzanos. The TRU material at TA-V and the Manzanos has not been entered into the Disposal Request process. To be consistent with SNL/NM's approach for input into this report, no material that has not been entered into the Disposal Request process is included in the values listed in Table 4, "Mixed TRU waste and non-mixed TRU waste volumes (m³)."
3. The estimated waste generation for 1993 for environmental restoration waste containing TRU contaminated with RCRA constituents was estimated in Table 2-4, "Projection of mixed waste to be generated by DOE environmental restoration activities (in cubic meters)," Volume 1: *U.S. Department of Energy Interim Mixed Waste Inventory Report: Waste Streams, Treatment Capacities, and Technologies*, DOE/NBM-1100, April 1993, as being 1 m³. A more recent estimate puts 1993 CH TRU mixed (RCRA) environmental restoration waste generation at zero. (See Table 5, "Future generated TRU solid waste volumes—average annual.") The amount of TRU mixed operational or D&D waste in 1993 is unknown. Therefore, the volume of CH TRU waste contaminated with RCRA constituents in 1993 is unknown.
4. The amount of contact-handled non-mixed TRU waste to be generated by Dec. 31, 1993, is unknown.
5. An unknown amount of remote-handled non-mixed TRU waste has been generated in 1993 to date and it is not known what additional amounts will be generated by Dec. 31, 1993.

^aCompiled from Table 5 of site submittals.

^bUnknown.

^cQuantities are based on Hanford submittal to WIPP Baseline Inventory Report.

^dNo estimates given.

^eNo RH waste at this site.

^fD&D and remedial action waste unknown in all periods.

APPENDIX J

WEST VALLEY DEMONSTRATION PROJECT (WV) WASTE STREAM PROFILES

The following modifications were made by the WTWBIR team in developing the WV waste stream profiles:

- WV Final Waste Form Groups were modified to be consistent with the nomenclature used in the WTWBID. These changes included word and spelling changes. The assigned Final Waste Form Groups are consistent with the information provided by WV.
- The number of containers were corrected based on the volumes reported by WV.
- The volumes for the year 1993 were changed from an annual rate of generation (m^3/year) to a cumulative value (m^3).
- Total volumes were reported for the years 1998-2002 and 2003-2022. These were changed to volume per year.
- WV reported the projected volumes of some waste streams as "unknown" (UNK). Since numeric values are required in these fields, these entries were replaced with zeros.
- For the waste stream WV-T016, the SWB containers reported by the site were replaced by RH canisters.

Comments

*This waste stream represents 2-90ft³ and 7-70ft³ boxes currently stored in the Lag Storage Building.

As a result of the development of the Historical Waste Report (HWR) in support of the Federal and State Facility Compliance Agreement (FSFCA), these wastes were identified as radiologically contaminated but require further evaluation to perform a complete hazardous characterization.

The typical waste material weights (kg/m³) are not available for this waste stream.

Typical activity (curies/m³) is unknown for these radionuclides.

Comments

*This waste stream represents 1 370.3R3 box currently stored in the Chemical Process Cell - Waste Stream Area.

As a result of the development of the Historical Waste Report (HWR) in support of the Federal and State Facility Compliance Agreement (FSFCA), these wastes were identified as radiologically contaminated but require further evaluation to perform a complete hazardous characterization.

The typical waste material weights (kg/m3) are not available for this waste stream.

Typical activity (curies/m3) is unknown for these radionuclides.

Comments

*This waste stream represents 3 55-gallon drums currently stored in the Lag Storage Building.

The typical waste material weights (kg/m3) are not available for this waste stream.

Typical activity (curies/m3) is unknown for these radionuclides.
