**STATE OF NEW MEXICO
BEFORE THE SECRETARY OF THE ENVIRONMENT**

**IN THE MATTER OF THE FINAL PERMIT
ISSUED TO THE UNITED STATES
DEPARTMENT OF ENERGY AND
WESTINGHOUSE ELECTRIC COMPANY
WASTE ISOLATION DIVISION FOR
A HAZARDOUS WASTE ACT PERMIT
FOR THE WASTE ISOLATION PILOT
PLANT; USEPA No. NM4890139088**

HRM 98-04(P)

REPORT OF THE HEARING OFFICER

**STATEMENT OF THE CASE
ISSUE
FINDINGS OF FACT
DISCUSSION
CONCLUSIONS OF LAW
RECOMMENDED DECISION AND PROPOSED FINAL ORDER**

STATEMENT OF THE CASE

The United States Department of Energy ("DOE") is the owner and operator, and the Westinghouse Waste Isolation Division ("WID"), a private corporation, is the co-operator (collectively "Applicants") of the Waste Isolation Pilot Plant ("WIPP"). The WIPP facility is located in southeastern New Mexico, approximately 26 miles east of the City of Carlsbad. WIPP was designed and constructed to store and dispose transuranic ("TRU") nuclear waste and TRU waste that is mixed with hazardous waste ("TRU mixed waste") in an underground geologic repository, mined within a bedded salt formation. Owners and operators of facilities located in New Mexico that store or dispose TRU mixed waste must apply for a permit from the New Mexico Environment Department. Accordingly, Applicants seek a permit under the New

(Miscertification) *supra*; NMED's Response to Public Comment (June 25, 1999); Proposed Final Permit of June 25, 1999.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact and Discussion, the Hearing Officer renders the following legal conclusions:

1. The Secretary of NMED ("the Secretary") has jurisdiction to require all persons that manage, store or dispose TRU mixed waste to submit an application and obtain a final permit that includes corrective action requirements under the HWA and 20 NMAC 4.1. *et seq.*
2. The WIPP repository is a "miscellaneous unit" under 20 NMAC 4.1.101 (incorporating 40 C.F.R. §260.10); 20 NMAC 4.1.300 (incorporating 40 C.F.R. § 262.10) and subject to the standards under 20 NMAC 4.1.500 (incorporating 40 C.F.R. § 264.600 (Subpart X)).
3. DOE is a "person" under Section 74-4-3.K of the HWA and the owner and operator of WIPP under 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.2). WID is also a "person" under Section 74-4-3.K of the HWA and a co-operator of WIPP under 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.2).
4. The Secretary has authority to require and issue a final permit to Applicants for the management, storage or disposal of TRU mixed waste at WIPP under the HWA and 20 NMAC 4.1. *et seq.* Under NMED regulations, the burden of proof for issuance of a HWA permit, shall be on the Applicants. 20 NMAC 4.1.901.E.6.
5. NMED has complied with all administrative and procedural laws and regulations

respecting the application and permitting process including the pertinent provisions of 40 C.F.R. §124.32(b)(1), 270.10(c) and 20 NMAC 4.1.900, 901.

6. Pursuant to 20 NMAC 1.4.401.A. and 20 NMAC 4.1.901.E.6, Applicants are charged with the burden of proving that the permit application should be granted and a HWA permit issued. NMED has the burden of proving that the conditions it proposes in the Proposed Final Permit are justified. After establishment of a *prima facie* case, any person opposed to the Permit, or to any imposed condition therein, has the burden of going forward with any adverse evidence proving that the Permit should not be granted.

7. Pursuant to 20 NMAC 4.1.901.A.7, the Secretary must give due consideration and weight to all comments received during the public comment period and to all relevant facts presented at the public hearing.

8. Based upon the full record, Applicants have met their burden of proving that a HWA permit should be granted. Notwithstanding certain findings and recommendations of the Hearing Officer set forth herein [*see Discussion* (TRU Non-Mixed Waste and RH TRU Waste) *supra*], NMED has met its burden of proving that the conditions it proposes to impose in the Proposed Final Permit of June 25, 1999, along with all attachments thereto, are justified. Those opposed to issuance of the Proposed Final Permit, or to any conditions set forth therein, have failed to meet their burdens of proof.

9. Each permit for an interim status or new hazardous waste management facility shall contain terms and conditions as necessary to protect human health and the environment. 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.32(b)(2)).

10. Each permit must include permit conditions necessary to achieve compliance with

the HWA and regulations, including each of the applicable requirements specified in 20 NMAC 4.1.500 (incorporating 40 C.F.R. Part 264), 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.32(b)(1))

11. The audit requirement as proposed by NMED in Permit Condition³³ II.C.2 of the Proposed Final Permit of June 25, 1999, is a condition necessary for approval of the WAP in order to protect human health and the environment. 20 NMAC 4.1.901.A.8 and NMSA 1978 §74-4-4.2(C) (Repl. Pamp. 1993).

12. Permit Condition II.C.2 is a condition necessary to achieve compliance with 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.14 (b)(2) and §270.32(b)(1)) in order to address permit application deficiencies; to demonstrate compliance with the WAP; and to obtain all the information which must be known to manage, store and dispose TRU mixed waste at WIPP in accordance with 40 C.F.R. Part 264. 20 NMAC 4.1.901.A.8 and NMSA 1978 §74-4-4.2(C) (Repl. Pamp. 1993).

13. No Party or commentator has met their burden in challenging NMED's determination to impose Permit Condition II.C.2 by presenting substantial evidence that this condition is unreasonable or inconsistent with the HWA. *See* 20 NMAC 4.1.901.E.6 and 20 NMAC 1.4.401.A.

14. Permit Condition II.C.3.h is necessary to protect human health and the environment consistent with NMAC 4.1.500, .900 (incorporating 40 C.F.R. §§264.13, 270.14(b)(2)).

15. No Party or commentator has met their burden in challenging NMED's

³³ Hereinafter, unless otherwise specified, "Permit Conditions" refers to those conditions proposed by NMED in the proposed Final Permit of June 25, 1999.

EXECUTIVE SUMMARY

The *Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR)* establishes a methodology for grouping wastes of similar physical and chemical properties, from across the U.S. Department of Energy (DOE) transuranic (TRU) waste system, into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies.

The WIPP baseline inventory is estimated using waste streams identified in the recent information released in the *Mixed Waste Inventory Report (MWIR)*, supplemented by information from the Nonradionuclide Inventory Database (NID) and the 1993 Integrated Data Base (IDB). Each waste stream is defined in a waste stream profile and has been assigned a waste matrix code (WMC) by a DOE TRU waste generator/storage site. Waste stream profiles with WMCs that have similar physical and chemical properties can be combined into a waste matrix code group (WMCG), which is then documented in a site-specific waste profile for each TRU waste generator/storage site that contains waste streams in that particular WMCG.

Based on methodology presented here in the WTWBIR, a maximum of 11 site-specific waste profiles have been identified for contact-handled (CH) TRU waste and a maximum of 11 have been identified for remote-handled (RH) TRU waste. Based on analyses of existing inventories, no site has more than 10 site-specific CH-TRU waste profiles, nor more than 5 site-specific RH-TRU waste profiles. Each of these site-specific waste profiles have unique WMCG criteria and they are developed, if appropriate, for each of the TRU waste generator/storage sites. A particular site-specific waste profile, with a specific WMCG, can be combined with other site-specific waste profiles having identical WMCGs from the TRU waste generator/storage sites to derive a WIPP waste profile. Therefore, a maximum of 11 WIPP waste profiles for CH-TRU waste and a maximum of 6 WIPP waste profiles for RH-TRU waste have been identified that describe the different TRU wastes across the DOE system.

The anticipated inventory of TRU waste is defined as the sum of retrievably stored waste plus currently projected TRU waste volumes. The anticipated inventory is not sufficient to fill the allowed capacity of WIPP (calculated: $6.2 \times 10^6 \text{ ft}^3$ [$\sim 1.76 \times 10^5 \text{ m}^3$]), and scaling has been developed as a means of examining the impacts of the full repository. Additionally, there is a high uncertainty in and a current lack of data on wastes produced from decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the anticipated inventory has been "scaled" to the WIPP capacity. The scaling of the inventory in future revisions of the WTWBIR will be derived from the best available data and assumptions.

An example of five waste streams at two sites (Idaho National Engineering Laboratory and Rocky Flats Plant) has been used to illustrate the waste profile methodology. Preliminary total WIPP inventory volumes for the 11 CH-TRU and 6 RH-TRU WIPP waste profiles are provided; final volumes will be provided in Revision 1 of this document after the DOE TRU waste generator/storage sites have reviewed the data and after quality checks of the data have been completed.

Using the same waste profile methodology, the WTWBIR also estimates the WIPP disposal inventory (anticipated inventory that has been scaled to WIPP design capacity) in terms of 10 waste material parameters and packaging materials that have been identified as inputs needed

for the system prioritization (SP) and performance assessment (PA) calculations. The 10 waste material parameters and packaging materials are waste constituents that occur in TRU waste and are input parameters for one or more SP and PA models or are required to adequately describe the waste form. These parameters may change as a result of SP and PA efforts.

The 10 waste material parameters and packaging materials that are defined and included in the WTWBIR are:

- Inorganics
 - Iron-based metals/alloys
 - Aluminum-based metals/alloys
 - Other metals
 - Other inorganic materials
- Organics
 - Cellulosics
 - Rubber
 - Plastics
- Solidified Materials
 - Inorganic matrix
 - Organic matrix
- Soils
- Packaging Materials
 - Steel
 - Plastic or lead

The waste material parameter information is reported in kilograms per cubic meters (kg/m^3) and estimates of the uncertainty in the waste material parameters have been calculated, based on data derived from the NID (i.e., average, minimum, and maximum estimates of waste material parameters on a per-waste-stream basis). The maximum values for waste material parameters in the waste stream, site-specific, and WIPP waste profiles are expressed on a weight/volume basis. However, the occurrence of more than one waste material parameter at the maximum value within a waste stream is highly unlikely. During SP and PA calculations, the sampling statistics must be controlled so that several waste material parameters do not get sampled all at their maximum value (weight/volume), lest the maximum weight/volume is exceeded. A five-waste-stream/two-site example is used to illustrate the methodology for estimating quantities of waste material parameters. **The preliminary total WIPP inventory for the waste material parameters is provided and should be used in any SP and PA calculations until Rev. 1 of the WTWBIR is published, pending completion of quality checks of the data used. The nonradionuclide and radionuclide inventory presented in this report replaces any previously used information in SP and PA calculations.**

Although the initial purpose of this report is to provide data to be included in the Sandia National Laboratories/New Mexico SP and PA processes, all data are presented and explained in such a way that they can be adapted as needed for other applications. The WTWBIR, Revision 0, is presented in two parts: Book 1 contains this Executive Summary through Chapter 7, References; Book 2 contains Appendix A, Glossary, through Appendix M, MWIR Code Designations and Descriptions.

CHAPTER 1

1. INTRODUCTION

1.1 BACKGROUND

The Waste Isolation Pilot Plant (WIPP) is a transuranic (TRU) waste management facility operated by the U.S. Department of Energy (DOE). The WIPP is currently identified as the permanent disposal site for DOE TRU waste.

TRU waste is defined as waste that is contaminated with alpha-emitting radionuclides with an atomic number greater than 92, with half-lives greater than 20 years, and concentrations of TRU isotopes greater than 100 nanocuries per gram of waste (DOE, 1988). TRU wastes are classified as either contact-handled (CH) waste or remote-handled (RH) waste, depending on the dose rate at the surface of the waste container. CH-TRU wastes are packaged TRU wastes with an external surface dose rate of 200 millirems (mrem) or less per hour, while RH-TRU wastes are packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour. Unless otherwise indicated, for purposes of this document, all references to TRU waste include TRU waste and mixed TRU waste (waste that contains both radioactive and hazardous components, as defined by the Atomic Energy Act and the Resource Conservation and Recovery Act [RCRA] as codified in Title 40 Code of Federal Regulations [CFR] Parts 264, 265, 268, and 270 [EPA, 1980a; 1980b; 1986; and 1983]).

The DOE is committed to demonstrating compliance with all applicable regulations prior to permanent disposal of TRU wastes in the WIPP repository. These regulations are the environmental standards for management and disposal of TRU wastes as mandated in 40 CFR Part 191 (EPA, 1993b) and Part 194 (EPA, 1993a), and the RCRA regulations. The WIPP is scheduled to receive and dispose of TRU wastes from 10 major and several minor DOE TRU waste generator/storage sites (see Figure 1-1). Compliance will be demonstrated through performance assessment (PA) calculations based on the inventory of existing and currently projected waste streams developed in this report, and as reported by the DOE TRU waste generator/storage sites.

1.2 PURPOSE

The purpose of this document, the *Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report* (WTWBIR), is to document the disposal inventory of TRU waste to be emplaced in WIPP from the DOE TRU waste generator/storage sites. This inventory of CH-TRU and RH-TRU waste will be used in systems prioritization (SP) and PA calculations and sensitivity analyses that will support the development of compliance applications to the appropriate regulatory agencies regarding the operations and post-closure timeframes of the WIPP repository.

To accomplish this purpose, the WTWBIR has been developed from the best available information and process knowledge provided by the DOE TRU waste generator/storage sites. The WTWBIR describes a process for grouping individual waste streams with similar physical and chemical properties into waste profiles, based on their waste matrix code (WMC) assigned by the DOE TRU waste generator/storage sites. Waste profiles with similar WMCs, are then combined across the DOE TRU waste system to provide estimated total volumes and total waste material parameters. The methodology for this grouping and combining is discussed in detail in Section 2.3, Methodology for Development of Disposal Inventory, of this document.

The individual waste streams also are evaluated to estimate the occurrence and quantities of waste material parameters (e.g., cellulose, plastics, iron-based metals/alloys, etc.) that have been identified by Sandia National Laboratories/New Mexico (SNL/NM) as being potentially important to the performance of the WIPP repository as defined in Appendix G (see Table 1-1). The methodology, assumptions, and totals of these waste material parameters are described in Chapter 6, Waste Material Parameters.

**TABLE 1-1. TECHNICAL DATA NEEDS FOR PERFORMANCE ASSESSMENT
WASTE MATERIAL PARAMETERS**

| Waste Material Parameter | Input Variable in <u>Current</u> SP/PA Models | | Input Variable in SP/PA Models <u>Under Development</u> | Input Variable in Possible <u>Future</u> PA Models |
|------------------------------|---|----------------------------|---|--|
| | Gas Generation | Mechanical Characteristics | | |
| Iron-Based Metals/Alloys | YES | YES | YES | YES |
| Aluminum-Based Metals/Alloys | | YES | YES | YES |
| Other Metals | | YES | | YES |
| Other Inorganic Material | | YES | YES | YES |
| Cellulose | YES | YES | YES | YES |
| Plastics | | YES | YES | YES |
| Rubber | YES ⁽¹⁾ | YES | YES | YES |
| Solidified Inorganic Matrix | | YES | YES | YES |
| Solidified Organic Matrix | | YES | YES | YES |
| Soils | | YES | | |

⁽¹⁾ Only 50 weight percent included

Although the initial purpose of this report is to provide data to be included in the SNL/NM SP and PA processes, all data are presented and explained in such a way that they can be adapted for other applications.

1.3 WASTE INVENTORY TERMINOLOGY

The derivation of a disposal inventory from individual waste streams is a formidable and complex process. To document each step of this process, a system of waste inventory terminology needs to be defined so the reader may more easily follow the process. The following sections provide definitions of terminology used throughout the WTWBIR. These

definitions also are summarized in Appendix A, Glossary, of the WTWBIR. Appendix B provides a list of acronyms and abbreviations used in this document.

1.3.1 Inventory Terminology

Stored Inventory – That part of the TRU inventory currently in retrievable storage as of the time of the last data call for inventory information is known as "stored inventory." Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and does not include any waste that was buried prior to 1970 (DOE, 1994b).

Projected Inventory – That part of the inventory that has not been generated but is currently estimated to be generated at some time in the future by the TRU waste generator/storage sites is considered "projected inventory." The estimated timeframe for the projections may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Anticipated Inventory – For the WTWBIR, this is the sum of the stored and projected inventories, calculated:

$$\begin{array}{ccccccc} \text{Stored} & & & & \text{Projected} & & \text{Anticipated} \\ \text{Inventory} & + & & & \text{Inventory} & = & \text{Inventory} \end{array}$$

Scaling – The process for adjusting the anticipated inventory to the design limit (disposal inventory) of the WIPP repository is called "scaling." Section 2.3.2 describes the scaling process.

$$\text{Anticipated Inventory} \xrightarrow{\text{Scaling}} \text{Disposal Inventory}$$

Disposal Inventory – The total inventory defined for WIPP emplacement (after scaling) to be used for SP and PA calculations is the "disposal inventory."

1.3.2 Waste Matrix Code Terminology

Waste Matrix Code (WMC) – The WMC is a DOE-developed coding system for organizing waste streams by their physical and chemical properties. A WMC is assigned to each waste stream by the DOE TRU waste generator/storage site. The WMC for each waste stream can be found in the Mixed Waste Inventory Report (MWIR) (DOE, 1994a). This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. Appendix C contains the DOE guidance document used to help categorize individual waste streams. An example of a WMC for "heterogeneous waste" would be 5400.

Waste Matrix Code Group (WMCG) – A WMCG consists of a series of WMCs that for SP or PA purposes have similar physical and chemical properties. An example of combining WMCs

is the following three WMCs, which either contain particulates or are cemented particulate waste:

- WMC 3100 (inorganic process residues)
- WMC 3110 (inorganic particulates)
- WMC 3150 (solidified process residues)

Because of the restriction on particulate wastes in the *TRU Waste Acceptance Criteria, (WAC) for the Waste Isolation Pilot Plant*, Revision 4.0 (DOE, 1991), all particulate waste will usually be solidified prior to shipment to WIPP. Therefore, all three of these WMCs would be the same basic waste form when emplaced in WIPP and have similar physical and chemical properties. Table 1-2 presents all anticipated WMCs for TRU waste and indicates in which WMCG each WMC occurs for the WTWBIR. There are 11 WMCGs used in this WTWBIR. The last two rows in Table 1-2 group WMCs that will not be acceptable to WIPP unless characterized and/or processed using a yet-to-be-developed treatment technology. The combined WMCG for this example is:

Solidified Inorganic Waste

1.3.3 Waste Profile Terminology

Waste Stream Profile – This is a description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of important information about a particular waste stream. Examples of information included in a waste stream profile are:

- Currently and previously used identification codes, including the DOE TRU waste site identification;
- Assigned WMC;
- Volumes of waste currently in retrievable storage and waste projected to be generated: estimated minimum, average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.);
- Whether the waste is CH-TRU or RH-TRU; and
- Hazardous waste codes (EPA codes) as assigned by the DOE TRU waste generator/storage sites for the RCRA-regulated portion of the waste stream.

Figure 1-2 provides an example of a blank waste stream profile form. The methodology and assumptions for developing waste stream profiles are provided in Chapter 3 and printouts of waste stream profiles are provided in Appendix E.

Site-Specific Waste Profile – This represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles, at a particular DOE TRU waste site, that have been placed in the same WMCG are summarized in the site-specific waste profile. Examples of information included in a site-specific waste profile are:

- DOE TRU waste generator/storage site identification;

TABLE 1-2. WASTE MATRIX CODE GROUP NAMES (CONTINUED)

¹ Liquid waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidification.

² WMCs 3000, 3900, 9100, and 9200 are placed in "solidified inorganic waste," "salt waste," or "solidified organic waste," depending on the information provided in the MWIR.

³ Particulate waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidifying particulate waste.

⁴ WMCs 6100 and 6190 are placed in "solidified organic waste," or "solidified inorganic waste," depending on the information provided in MWIR. Volume conversion is described in footnotes 5 and 6.

⁵ Liquid lab pack waste is assumed to be solidified prior to sending to WIPP. It is assumed that the packing material in lab packs will be low-level waste when the liquid containers are removed. A volume conversion of 2.5:1 is assumed for solidification.

⁶ Solid lab packs are assumed to be solidified prior to sending to WIPP. It is assumed that the packing material in lab packs will be low-level waste when solidifying. Because lab packs have a 3:1 ratio of waste to absorbent material, it is assumed that when the chemicals are removed from the drum and solidified, there will not be a volume increase.

⁷ WMCs 6200 and 6290 are placed in "solidified inorganic waste," "solidified inorganic waste," or "heterogeneous waste" if the waste stream must be solidified. They are placed in "unspecified metal waste," or "lead/cadmium metal waste" if they are primarily nonreactive metal contaminated with reactive metal. Reactive waste streams must be treated prior to shipment to WIPP.

⁸ Waste stream is assumed to be treated prior to shipment to WIPP. Volume change is dependent of the waste stream and treatment.

⁹ WMC 5000 is placed in "unspecified metal waste," "lead/cadmium metal waste," "inorganic nonmetal waste," "combustible waste," "graphite waste," "heterogeneous waste," or "filter waste," depending on the information in MWIR.

¹⁰ WMC 7000 and 9300 are placed in "unspecified metal waste" or "lead/cadmium metal waste," depending on the information in MWIR.

¹¹ WMCs 7400, 7410, 7420, and 7490 are assumed to be drained of liquid and contain only metal waste.

¹² These waste streams are excluded from disposal in WIPP at this time.

¹³ If adequate information is provided in MWIR, these WMCs are changed. If there is not enough information in MWIR, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

- The WMCG that the profile represents;
- Listing of the waste streams (represented by waste stream profiles at the site) that are included in the site-specific waste profile, including the waste stream identification and volumes of stored and currently projected waste; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

Figure 1-3 provides an example of a blank site-specific waste profile form. The methodology and assumptions for developing site-specific waste profiles are provided in Chapter 4 and printouts of site-specific waste profiles are provided in Appendix F.

WIPP Waste Profile – The WIPP waste profile represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG. Examples of information included in a WIPP waste profile are:

- Profile name;
- The WMCG that the profile represents;
- Listing of the DOE TRU waste sites (represented by the same WMCG) that are included in the WIPP waste profile, including the name of the DOE TRU waste site and volumes of stored and currently projected waste for each site for the particular WMCG represented; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

Figure 1-4 provides an example of a blank WIPP waste profile form. The methodology and assumptions for developing WIPP waste profiles are provided in Chapter 5.

1.3.4 Database Terminology

Mixed Waste Inventory Report (MWIR) – The MWIR refers to the latest release of information from the MWIR database that supports requirements under the Federal Facilities Compliance Act (FFCA) of 1992 (Public Law 102-386). The latest version of the MWIR documentation/files is *Distribute [Distribution] of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a). This information replaces the MWIR Phase I release (DOE, 1994c).

Integrated Data Base (IDB) – The IDB refers to the latest version of the *Integrated Data Base for 1993: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1994b).

Nonradionuclide Inventory Database (NID) – The NID is the database of nonradionuclide constituents in the TRU inventory that was originally developed by International Technology Corporation (IT) during 1988/1989 in support of the SNL/NM PA effort. A summary of the database was transmitted to SNL/NM in a letter report dated May 1989 (WIPP PA, 1991). A

copy of the NID waste stream information used in the WTWBIR is included in Appendix D.

In cases where additional information/process knowledge was used that is not contained in the three databases just mentioned, the source of the information will be included in the text.

1.3.5 Other Terminology

Waste Material Parameter – This is a waste material that occurs in TRU waste that is an input parameter into one or more current SP or PA models, an SP or PA model under development, a potential future model, or is required to adequately describe the waste form (see Section 3.3.1). The 10 waste material parameters and packaging materials that are defined and included in the WTWBIR are:

- Inorganics
 - Iron-based metals/alloys
 - Aluminum-based metals/alloys
 - Other metals
 - Other inorganic materials
- Organics
 - Cellulosics
 - Rubber
 - Plastics
- Solidified Materials
 - Inorganic matrix
 - Organic matrix
- Soils
- Packaging Materials
 - Steel
 - Plastic or lead

Definitions for these waste material parameters can be found in Chapter 6.

1.4 OBJECTIVES

The objectives of the WTWBIR are threefold:

1. **Establish a methodology for grouping wastes of similar physical and chemical composition.** A methodology for grouping wastes of similar physical and chemical properties into "waste profiles" will provide a common frame of reference for discussion of TRU waste issues with regulatory organizations.
2. **Define the anticipated disposal inventory of TRU wastes destined for WIPP.** The anticipated inventory of CH-TRU and RH-TRU wastes is defined as the sum of the existing volumes of stored and currently projected waste streams at each of the TRU waste generator/storage sites. Because the existing stored and currently projected waste streams do not contain sufficient volume (CH-TRU waste only) to fill the allowed capacity of WIPP, calculated: $6.2 \times 10^6 \text{ ft}^3$ ($\sim 1.76 \times 10^5 \text{ m}^3$) (Public Law 102-579, 1992), scaling of the CH-TRU waste anticipated inventory is necessary to attain the WIPP design limit. Additionally,

there is a high uncertainty in and a current lack of data on waste produced by decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the anticipated inventory has been scaled to the WIPP capacity (disposal inventory). The scaling of the inventory in future revisions of the WTWBIR will be derived from the best available data and assumptions.

3. **Calculate the disposal inventory in terms of waste material parameters.** Several waste material parameters (e.g., iron-based metals/alloys, rubber, plastics, etc.) have been identified as being potentially significant in relation to the performance of the WIPP repository (see Table 1-1). Calculating the WIPP disposal inventory in terms of these parameters provides input for the SP and PA calculations and sensitivity analyses needed to determine compliance with federal standards.

1.5 BASELINE INVENTORY UPDATES

The WTWBIR represents the best available TRU waste inventory information in support of the WIPP Project. It is anticipated that the WTWBIR will be updated periodically. This update cycle will be modified based on the availability of additional waste information or the data needs of the WIPP Project.

1.6 DOCUMENT ORGANIZATION

The WTWBIR is organized into chapters of text, figures, tables and supporting appendices. It flows from specific, detailed TRU waste information (provided by the TRU waste generator/storage sites) to the development and description of waste profiles and waste material parameters. The contents of remaining chapters in this document are summarized in the following:

- Chapter 2 discusses the three main databases and the methodology used to define the TRU waste disposal inventory.
- Chapter 3 describes the correlation of individual waste streams among the three databases and outlines the methodology and assumptions used to derive waste stream profiles.
- Chapter 4 describes the WMCGs used to combine waste stream profiles with similar physical and chemical properties to provide site-specific waste profiles, and provides estimations of non-mixed TRU waste volumes derived from the waste stream profiles identified in Chapter 3.
- Chapter 5 discusses the methodology for "rolling up" the site-specific waste profiles into WIPP waste profiles. Total weights per volume of waste material parameters are provided for each of the WIPP waste profiles. Radionuclide totals in curies are provided from site-specific data.
- Chapter 6 rolls up the waste material parameter information assigned at the waste stream profile level in Chapter 3 to obtain parameter totals. These totals are presented as parameter weights per volume.

- Chapter 7 lists references cited in the WTWBIR.
- Several appendices also are provided to either present more detailed waste inventory information or to describe the methodology in more detail. The appendices are provided in Book 2 of this WTWBIR.

CHAPTER 2

2. TRU WASTE DISPOSAL INVENTORY

2.1 INTRODUCTION

The TRU waste disposal inventory is derived from existing information on waste, which has been provided by the DOE TRU waste generator/storage sites and is predominately based on process knowledge. This chapter is designed to assist the reader by describing the existing waste information used to derive the inventory and developing the methodology used to correlate and combine the existing data into a WIPP disposal inventory.

2.2 SOURCES OF TRU WASTE INFORMATION

Several sources of information have been used to compile the WTWBIR. The three primary databases used are: (1) the MWIR (DOE, 1994a) (see Appendix H), (2) the IDB (DOE, 1994b), and (3) the NID (summarized in Appendix D). Although the bulk of the information used to compile the inventory was extracted from these three databases, several other resources also were used. These are the *Transuranic Package Transporter-II (TRUPACT-II) Content Codes* (TRUCON) (DOE, 1992), the *No-Migration Variance Petition* (NMVP) (DOE, 1990), and the draft *RCRA Part B Permit Application* (DOE, 1993a). These sources are discussed further in the following sections.

2.2.1 Mixed Waste Inventory Report

The FFCA of 1992 (Public Law 102-386, 1992; Section 105) required that the DOE, within 180 days of enactment of the FFCA, submit to the EPA Administrator and the governor of each state in which the DOE stores or generates mixed wastes a report that contains:

- National inventory report of all mixed wastes, regardless of the time they were generated, on a state-by-state basis and
- National inventory of mixed waste treatment capacities and technologies.

The FFCA also stipulated specific reporting requirements for each of these inventories. The DOE submitted the six-volume set entitled: *U.S. Department of Energy Interim Mixed Waste Inventory Report: Waste Streams, Treatment Capacities and Technologies*, DOE/NBM-1100, dated April 1993 (DOE, 1993b), to fulfill these requirements. Since issuance of the "interim" report, DOE has requested additional information from the DOE TRU waste generator/storage sites and published two updated reports entitled:

- *Release of Phase I Mixed Waste Inventory Report Data*, dated April 1, 1994 (DOE, 1994c), which includes a data diskette (Version .97B) and the draft *Mixed Waste Inventory Report Data Base System User's Guide*.
- *Distribute [Distribution] of the Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a), which includes a data diskette (Version 1.00) and the draft *User's Guide for National Data Base System for the Final Mixed Waste Inventory Report* (May 1994).

The waste-stream specific information contained in the Phase II MWIR report is the basis for defining waste streams and building a CH-TRU and RH-TRU waste disposal inventory for

WIPP. The Phase II MWIR report has the following information about each mixed TRU waste stream by generator/storage site:

- Physical and chemical description,
- Retrievably stored and projected inventory volumes (in cubic meters),
- Source of the waste stream (including process descriptions),
- Toxic Substances Control Act (TSCA) constituents,
- Hazardous (EPA) waste codes,
- Radionuclide characterization data (generally qualitative), and
- WMCs for treatability, developed by the DOE to group waste streams with similar physical and chemical properties (see Appendix C).

Although the Phase II MWIR contains fields for all the information listed here, some fields are left blank or limited information is provided by the sites. Volumes, RCRA constituents, and WMCs are provided for each waste stream reported. Generally, the TRU waste generator/storage sites provide some information in the other fields, but its completeness ranges from very detailed to extremely sparse. Source information, TSCA constituents, and radionuclide characterization fields often contain incomplete information or are left blank.

The Phase II MWIR (DOE, 1994a) database is used for this revision of the WTWBIR for mixed TRU waste streams. Idaho National Engineering Laboratory (INEL) non-mixed TRU waste stream information from the Phase I MWIR (DOE, 1994c) is used to define non-mixed waste streams for TRU waste at INEL.

2.2.2 Nonradionuclide Inventory Database

The NID was developed in 1988/1989 by IT for SNL/NM in support of initial PA calculations. This database defines each waste stream that was planned for WIPP disposal in 1989, on which sufficient information existed about the waste materials. Most waste streams in the NID also are described in detail in the TRUCON document (DOE, 1992). The NID contains estimated numerical information (minimum, maximum, and average weights), based on process knowledge and limited visual examination (a qualitative technique that involves human judgment) on many different types of waste materials for each waste stream included in the database.

The waste material parameters listed in Section 1.3.5 occur in the NID and are the emphasis of the waste stream profile. Although these waste material parameters are deemed important for SP and PA model evaluations, their effect on repository performance may prove to be insignificant as determined by sensitivity analyses.

The NID information was summarized in 1989 for inclusion in the PA calculations (WIPP PA, 1991). Most of the information (except that for the waste material parameters) has been superseded by the MWIR database. The waste material parameter information used to define the WTWBIR is presented in Appendix D.

2.2.3 Integrated Data Base

In the IDB, radionuclide inventory is reported at the top level only (at the TRU waste site level). The IDB is published by Oak Ridge National Laboratory (ORNL) for the DOE. The ORNL assembles radioactive waste inventories provided by DOE TRU waste generator/storage sites. The IDB contains site inventory estimates for retrievably stored and currently projected waste (i.e., waste projections are made for 1993 until the year 2020). This database does not report by waste stream, but rather, by the total inventory at each DOE site. The IDB also contains the radionuclide isotopic distribution for the waste generated/stored at each site. Because consistent reporting is not available at the waste stream level in the MWIR, the radionuclide information in the IDB is the basis for the WTWBIR inventory for radionuclides.

2.2.4 Other Sources of TRU Waste Information

The three main databases described here in Section 2.2.1, MWIR (DOE, 1994a); Section 2.2.2, IDB (DOE, 1994b); and Section 2.2.3, NID (WIPP PA, 1991), represent the bulk of the data used to build the WIPP disposal inventory. Table 2-1 lists the information that was used from each database to compose the waste stream profiles for each TRU waste stream in the MWIR. In addition to the database records, several other resources have been used. These include:

- TRUCON (DOE, 1992) – Waste streams that are included in TRUCON have been indicated by recording the designation in the waste stream profile for each MWIR waste stream (see Appendix E).
- NMVP (DOE, 1990) – Waste streams that are covered by the NMVP have been indicated by recording the designation in the waste stream profile for each MWIR waste stream (see Appendix E).
- RCRA Part B Permit Application (DOE, 1993a) – Waste streams across the DOE TRU system have been summarized in the WIPP RCRA Part B Permit Application by general categories. The name of these general categories has been included on the waste stream profile for each MWIR waste stream (see Appendix E).

2.3 METHODOLOGY FOR DEVELOPMENT OF DISPOSAL INVENTORY

Development of the WIPP TRU waste disposal inventory is accomplished by a series of steps starting with the individual waste streams identified in the MWIR (DOE, 1994a). These waste streams are grouped together, based on similar physical and chemical properties, into common "waste profiles," which should facilitate discussions concerning the disposal waste inventory with regulatory agencies and stakeholders. The waste profiles also contain information on waste material parameters that could affect the performance of the WIPP repository and that, therefore, may be direct inputs to SP and PA models. A more detailed explanation of these processes is found in the following sections.

TABLE 2-1. SOURCES OF INFORMATION FOR WASTE STREAM PROFILES

| Mixed Waste Inventory Report ¹ | Nonradionuclide Inventory Database ² | Integrated Data Base ³ |

¹ Phase II MWIR (DOE, 1994a).

² A summary of the database output is provided as Appendix D.

³ Current version is Revision 9, published March 1994.

⁴ For INEL, the Phase I MWIR also contains non-mixed TRU waste volumes.

2.3.1 Estimation of Anticipated Inventory

The anticipated inventory is the sum of the stored and currently projected wastes including the non-mixed waste that is **not** included in the MWIR (DOE, 1994a). The methodology for deriving the anticipated inventory is as follows:

- Approximately 260 individual TRU waste streams are defined in the Phase II MWIR (DOE, 1994a). Each of these waste streams is identified in the WTWBIR as a waste stream profile (see Appendix E). These waste stream profiles were developed using information from the sources listed in Section 2.2; these profiles are the lowest tier of information in the WTWBIR. Five TRU waste streams are used throughout this report to illustrate the methodology for this process.
- Each waste stream in the MWIR has been assigned a WMC by the TRU waste generator/storage site that defines the general physical and chemical properties of the waste. The WMC is located in the upper portion of each waste stream profile. The assignment of the WMC is based on DOE guidance, which can be found in Appendix C.
- Waste streams at each TRU waste generator/storage site with similar WMCs can be grouped together into a site-specific waste profile. The methodology for grouping waste streams is shown in Figure 2-1. The grouping of individual waste stream profiles into a site-specific waste profile is based on the similar physical and chemical properties of the waste streams and how that information is used in the SP and PA models. In the

Figure 2-1. Schematic of Waste Stream Profile Methodology

example in Figure 2-1, due to their similar mechanical properties, concrete waste, glass waste, firebrick waste, and ceramic waste mainly influence the estimation of porosity and permeability in the SP and PA calculations. Therefore, the three waste streams at DOE TRU Waste Site #1 and the two at DOE TRU Waste Site #2 can be grouped together at each site based on similar physical and chemical properties and placed into the site-specific waste profile "inorganic nonmetal waste," with the WMCG defined in Table 1-2.

A more detailed description of the methodology for grouping waste stream profiles into site-specific waste profiles is presented in Section 4.3 and is illustrated with examples of five actual TRU waste streams. There are a maximum of 11 possible CH-TRU and RH-TRU site-specific waste profiles at any generator/storage site; however, most sites have fewer profiles due to differences in waste segregation practices. All the site-specific waste profiles for TRU waste are provided in Appendix F.

- Site-specific waste profiles from different waste generator/storage sites that contain the same WMCG (e.g., inorganic nonmetal waste for the example in Figure 2-1) can be combined together into a WIPP waste profile similar to that presented in Figure 2-1. As with site-specific waste profiles, there can only be a maximum of 11 possible WIPP waste profiles for CH-TRU or RH-TRU waste.
- Definition of the anticipated WIPP inventory is based on summing volumes of waste from each DOE TRU waste generator/storage site by site-specific waste profiles to synthesize the overall WIPP waste profiles. In the example in Figure 2-1, the inventories of inorganic nonmetal waste for Site #1 and Site #2 are added together to define a WIPP waste profile. To define the anticipated total WIPP inventory for inorganic nonmetal waste, all site-specific waste profiles for this waste category are combined to determine the WIPP waste profile for inorganic nonmetal waste.
- The anticipated inventory of TRU wastes for disposal at WIPP is determined from stored and currently projected waste streams as identified in the MWIR (DOE, 1994a) and/or the IDB (DOE, 1994b). The MWIR reports only volumes of mixed TRU waste. To estimate the volume of non-mixed TRU waste, the MWIR volumes by TRU waste site were subtracted from the 1993 IDB total volumes. The resultant total, which was always positive, was assumed to be non-mixed TRU waste.

In the Phase I MWIR (DOE, 1994c), INEL reported non-mixed TRU waste streams. These waste streams and their associated volumes have been used instead of the extrapolation of non-mixed TRU waste from the difference in volume of the MWIR and IDB.

Because the non-mixed TRU waste volumes are derived by the difference between the IDB and the MWIR, there are no WMCs associated with these volumes. Generally, mixed TRU and non-mixed TRU waste streams have similar physical and chemical properties. Based on this assumption, the non-mixed TRU waste was proportionally distributed among the predominant WMCs for each site using the combined stored and projected volumes. Therefore, the volumes reported in the site-specific waste profiles include both mixed and non-mixed TRU wastes. Appendix F provides a percentage breakout of mixed TRU and non-mixed TRU waste by site and WMCGs.

2.3.2 Estimation of Scaling Factor

Because the existing stored and currently projected waste streams, including non-mixed TRU waste, do not contain sufficient volume to fill the allowed capacity of WIPP, $6.2 \times 10^6 \text{ ft}^3$ ($\sim 1.76 \times 10^5 \text{ m}^3$) (Public Law 102-579, 1992), scaling of the CH-TRU inventory is necessary to attain the WIPP capacity. The scaling is accomplished by:

- The anticipated inventory (as defined in Section 1.3.1) consists of 11 overall CH-TRU and RH-TRU WIPP waste profiles based on the physical and chemical properties of the waste streams. The sum of the anticipated inventory is subtracted from the allowable WIPP inventory ($1.76 \times 10^5 \text{ m}^3$) and divided by the anticipated inventory, then added with 1:

$$\frac{1.8\text{E} + 05 \text{ m}^3 - \text{anticipated inventory}}{\text{anticipated inventory}} + 1 = \text{scaling factor}$$

The scaling of the inventory, in future revisions of the WTWBIR, will include volumes of waste anticipated from D&D and ER activities as these estimates are made available.

2.3.3 Estimation of Disposal Inventory

The disposal inventory is the total inventory to be used in SP and PA calculations. To calculate the disposal inventory by WMCG, the anticipated inventory is multiplied by the scaling factor for each WMCG and summed together. See Section 5.3 for further details.

2.3.4 Estimation of Waste Material Parameters

Some waste materials that exist in TRU waste may degrade, to some extent, over the 10,000-year period for performance modeling (WIPP PA, 1993). Some waste may produce gas by either chemical, microbial, or radiolytic degradation processes. The WIPP SP and PA models will evaluate the impacts of these processes on repository performance. The waste material parameters that are direct inputs into the SP process and PA models or potential models being considered or developed have been included in the WTWBIR and are documented in Section 6.2. These parameters will be evaluated in the SP process and PA modeling to determine the sensitivity of each parameter to repository performance.

Each TRU waste stream identified in the MWIR (DOE, 1994a) was reviewed. An example of a Phase II MWIR printout can be found in Appendix H. The item description codes (IDCs) and general waste information in the MWIR were compared with the NID (see Appendix D). The comparison of the MWIR and NID information on a waste stream basis resulted in one of two scenarios:

1. The MWIR waste stream correlates directly with NID waste stream.
2. The MWIR waste stream does not correlate directly with NID waste stream.

If a direct match was made between a waste stream in the MWIR and a waste stream in the NID (i.e., both had the same IDC), the waste parameter information from the NID was used in the waste stream profile for the MWIR waste stream. This information included the minimum, average, and maximum quantities of waste material parameters reported within the waste stream. If there was not a direct match, a comparison of the general waste information

between the MWIR and the NID was used to assign a waste material parameter distribution from another waste stream in the NID to the one under consideration in the MWIR to produce the waste stream profile. A more detailed explanation of the methodology used for assignment of waste material parameter information is provided in Section 3.3 and Appendix J.

CHAPTER 3

3. WASTE STREAM PROFILE METHODOLOGY

3.1 INTRODUCTION

The lowest tier of information in the WTWBIR is the waste stream profile, which documents specific information for each separate waste stream identified in the MWIR at each DOE TRU waste generator/storage site. In order to develop a waste characterization package for each waste stream at each site, it was necessary to correlate the information between the MWIR, NID, and IDB. Because these databases were generated at different times to meet different requirements, the nomenclature, waste description codes, waste groupings, and waste streams can be different in each database.

3.2 WASTE STREAM PROFILE DESCRIPTION

Each DOE waste stream was reviewed and, using the MWIR (DOE, 1994a) waste streams as the basis, those which were identified as acceptable for disposal under the WIPP WAC (DOE, 1991) were developed into waste stream profiles. Figure 3-1 provides an example TRU waste stream profile for a waste stream at INEL. In addition to presenting the quantity of waste material parameters in each DOE waste stream, the waste stream profile also provides a cross-reference table (top of the waste stream profile form) to list the different nomenclature used in previously generated DOE documents to identify the waste stream. Appendix K provides a cross correlation table for an MWIR waste stream with the NMVP, the draft *RCRA Part B Permit Application*, and the TRUCON. Table 3-1 lists the fields utilized on the waste stream profile, the sources of the information, and a short explanation of the data located in a particular field. A complete set of the waste stream profiles is provided in Appendix E.

In development of the MWIR, DOE directed the TRU waste generating/storage site to append their hazardous waste codes (EPA codes) to further define the waste in order to develop an appropriate treatment technology. These code designations and descriptions are presented in Appendix M. For example, D003 is defined by EPA as reactive. DOE further defined this code as D003A (reactive cyanide), D003B (reactive sulfides), D003C (explosives), D003D (water reactives), and D003E (other reactives). Other EPA codes are further defined as listed in Appendix M.

There are three waste volumes reported in the waste stream profiles: retrievable, projected, and total. On some waste stream profiles there can be a rounding error. If retrievable plus projected do not equal the total, it is due to a rounding error.

3.3 WASTE STREAM PROFILE METHODOLOGY AND ASSUMPTIONS

3.3.1 Assignment of Waste Material Parameters to MWIR Waste Stream

Each waste stream described in the MWIR (DOE, 1994a) is evaluated to determine the physical and chemical properties of the waste. This information is then compared with the NID (Appendix D). As a result of this comparison, two scenarios are possible (see Appendix J):

1. **MWIR Waste Stream Correlates Directly with NID Waste Stream** – If the MWIR waste stream has a direct correlation with a NID waste stream (i.e., they both have the same

IDC), the waste parameter information from the NID is placed on the waste stream profile for that particular waste stream.

2. **MWIR Waste Stream Does Not Correlate with NID Waste Stream** – If the MWIR waste stream does not have a direct correlation with a NID waste stream (i.e., IDCs do not match), the Waste Stream Description (See Section 2.2 in Appendix H) and the Specific Matrix Constituents (See Section 4.2 in Appendix H) are examined to determine the physical and chemical properties of the waste stream. Based on that information, a NID waste stream is found that closely approximates the MWIR waste stream description. The waste material parameter data from the similar NID waste stream are assigned to the particular waste stream profile.

3.3.2 Assignment of WMC to MWIR Waste Stream

The DOE TRU waste generator/storage sites have assigned an overall WMC to each waste stream based on the current form of the waste (see Section 4.1 in Appendix H). The WIPP Project has developed the WIPP WAC (DOE, 1991) for any waste packages to be shipped to WIPP to ensure the safe handling and emplacement in the WIPP. In general, the waste forms acceptable for emplacement in WIPP are described in Table 1-2. For the purpose of this document, waste streams that are in a physical or chemical form that is unacceptable for WIPP disposal are assumed to be processed to meet WIPP WAC. To accomplish the grouping of WMCs, the waste streams were evaluated as follows:

- Documented physical and chemical properties were revised as described in the MWIR database.
- If the waste stream documentation was sufficient, a treatment was assumed for the waste stream (e.g., solidification of inorganic liquids [1000 series] or organic liquids [2000 series]) and grouped with similar WMCs. Other waste streams in the 6000, 7000, 8000, and 9000 series have also been grouped with the 3000, 4000, or 5000 series using similar methodology to address any waste characteristics that would be unacceptable for emplacement in WIPP. Some sites have reported "unknown" (e.g., WMC 8900) for some waste streams. In a few cases, WMCs have been assigned through expert judgement to the waste stream when sufficient information has been included in the waste stream description. Any waste streams that have been changed from "unknown" to another WMC have been documented on the waste stream profiles. Those waste streams that cannot be placed in a new WMC have been grouped together under the WMC 8900. The "unknown" waste streams are documented as part of the WIPP inventory, but are not used in any of the scaling of TRU waste volumes necessary to fill WIPP to its design capacity. "Unknown" wastes will have to be characterized and may require treatment prior to emplacement in WIPP.
- The TRU waste generator/storage sites have identified several waste streams that are regulated under the TSCA (i.e., containing asbestos or polychlorinated biphenyls [PCBs]). Because the concentration of the asbestos and/or PCBs is unknown, it is assumed that these waste streams cannot be accepted at WIPP under the proposed draft WIPP RCRA Part B Permit Application. These waste streams are summarized in Table 3-2 and are not included in the WTWBIR.

TABLE 3-1. SOURCES OF INFORMATION USED IN WASTE STREAM PROFILES

| INFORMATION FIELD | SOURCE OF INFORMATION | EXPLANATION |
|---|--|--|
| Data Base WS ID | MWIR Database | Unique identification number for waste stream in MWIR database |
| Handling: RH/CH | MWIR Database | Identifies whether waste stream is classified as CH or RH |

Key: WS = waste stream ID = identification

- All "particulate" wastes have been assumed to be solidified prior to shipment to WIPP.
- Rocky Flats Plant (RFP) residue wastes are included in the MWIR, and are reported at the volumes represented in *Removing Plutonium Residues from Rocky Flats Will Be Difficult and Costly*, a U.S. General Accounting Office (GAO) report to Congress (GAO, 1992). Many of these wastes will have to be repackaged or treated to meet the WIPP WAC, which will result in a volume change.

CHAPTER 4

4. SITE-SPECIFIC WASTE PROFILE METHODOLOGY

4.1 INTRODUCTION

Waste streams with similar physical and chemical properties can be grouped together using WMCs. For example, the following four waste streams from INEL are identified in Figure 4-1:

- Dry paper and rags (IN-W169);
- Combustible equipment boxes (IN-W203);
- Benelex and Plexiglas (IN-W225); and
- Miscellaneous paper, metal, etc., (IN-W285).

These waste streams are all "heterogeneous waste" and can be combined into one site-specific waste profile because it is assumed that for long-term compliance purposes (i.e., SP and PA modeling inputs), all four waste streams have essentially the same physical and chemical properties. At INEL, there are additional waste streams grouped under the "heterogeneous waste" profile; but only these four have been included to simplify the example.

For the other site example identified in Figure 4-1, the combustibles waste stream profile RF-W012 is the only one that occurs in the "heterogeneous waste" classification and is, therefore, placed under that site-specific waste profile for the RFP. This methodology of grouping waste streams by WMCs is similar at each DOE TRU waste generator/storage site.

4.2 SITE-SPECIFIC WASTE PROFILE DESCRIPTION

A site-specific waste profile is developed at each of the TRU waste generator/storage sites for each of the WMCGs (listed previously in Table 1-2) that have individual waste streams at each site. These site-specific waste profiles provide a rollup of the waste material parameter and volume information found in the waste stream profiles for each site.

4.3 SITE-SPECIFIC WASTE PROFILE METHODOLOGY

The general methodology for combining waste streams at a site into WMCGs is similar to that shown in Figure 4-1. The WMCGs are then converted directly into site-specific waste profiles to be used to build the WIPP disposal inventory. An example site-specific waste profile is presented in Figure 4-2 using the IN example waste streams from Figure 4-1. Table 4-1 lists the sources of information for site-specific waste profiles. All site-specific waste profiles are provided in Appendix F.

4.3.1 Grouping of WMCs

For the purposes of this document, 11 WMCGs have been identified. The WMCGs were developed by combining waste streams with similar physical and chemical properties by using WMCs as defined in the *DOE Waste Treatability Groups Guidance* (see Appendix C) and after reviewing the individual waste stream descriptions in the MWIR. Table 1-2 (in Chapter 1) displays the WMCGs and associated WMCs.

| WMCG | DOE Waste Treatability Groups Guidance and MWIR Database | Groups waste streams that have similar chemical and physical properties. |
| Waste Stream Volume | 1993 IDB and/or MWIR Database | Provides estimates of retrievably stored, projected, and total volumes of TRU and mixed TRU wastes by waste stream. |
| Waste Material Parameters | NID | Provides total weight estimates of selected waste materials in a particular WMCG for the entire site. |

4.3.2 Assignment of WMCGs to Site-Specific Waste Profiles

Once the waste stream(s) at a particular site have been reviewed and grouped under the appropriate WMCG(s), a site-specific waste profile is developed for each WMCG, using the name of the appropriate WMCG to identify the site-specific waste profile. Although the maximum number of site-specific waste profiles for any given TRU waste generator/storage site is 11 CH and 11 RH, most sites possess fewer.

4.3.3 Estimation of Non-mixed TRU Waste Volumes

The Phase II MWIR (DOE, 1994a) reports only volumes of mixed TRU waste, except for INEL (reported in the Phase I MWIR; DOE, 1994c). To estimate the volume of non-mixed TRU waste (except for INEL), the MWIR volumes by TRU waste site were subtracted from the 1993 IDB total volumes, which report the total TRU and mixed TRU waste volume at each site (DOE, 1994b). The resultant total, which was always positive, was assumed to be non-mixed TRU waste:

$$\text{IDB (TRU and mixed TRU waste)} - \text{MWIR (mixed TRU waste)} = \text{TRU (non-mixed TRU waste)}$$

Because the non-mixed TRU waste volumes are derived from the difference between the IDB total TRU waste volumes and the MWIR total mixed TRU waste volumes per site, there are no WMCs associated with these volumes. Generally, mixed TRU and non-mixed TRU waste streams have similar physical and chemical properties (DOE, 1990).

Based on this assumption, the following example is presented only to illustrate the methodology used at most DOE TRU waste generator/storage sites:

- At a DOE TRU waste generator/storage site, three predominant WMCGs are assumed to occur (i.e., solidified inorganic waste, solidified organic waste, and combustible waste).
- The volume of the three WMCGs is calculated by combining stored and projected volumes of all waste stream profiles under each WMCG.
- For this example, the following partitioning of mixed TRU waste volumes among the WMCGs is assumed: 40 percent solidified inorganic waste, 10 percent solidified organic waste, and 50 percent combustible waste.
- Assuming that the difference between the IDB waste volume and the combined MWIR volume is 200 m³, then the non-mixed portion of the inventory would be distributed among the three WMCGs in the same ratio. That is: 80 m³ (solidified inorganic waste), 20 m³ (solidified organic waste), and 100 m³ (combustible waste). The volumes reported in the site-specific waste profiles include the non-mixed TRU waste.

Because of the disparity in available data on the non-mixed volumes of TRU waste, notations will be made on a waste stream basis, indicating which method was used to arrive at the non-mixed volume of the TRU waste. Appendix F includes tables that define the percentages of the WMCG that is TRU and mixed TRU waste.

CHAPTER 5

5. WIPP WASTE PROFILE METHODOLOGY

5.1 INTRODUCTION

The WIPP waste profiles are the highest tier of information in the WTWBIR. Site-specific waste profiles with the same WMCGs (see Table 1-2) can be combined across the TRU waste generator/storage sites into what is defined as an overall WIPP waste profile.

5.2 WIPP WASTE PROFILE METHODOLOGY

As described in chapters 3 and 4, each waste stream from each TRU waste generator/storage site is defined in a waste stream profile, then grouped by site WMCGs into site-specific waste profiles. These site-specific waste profiles are then rolled-up into WIPP waste profiles by combining identical WMCGs from all the TRU waste generator/storage sites. For example, all site-specific waste profiles for heterogeneous waste (see Table 1-2) can be grouped together to help generate the WIPP waste profile, "heterogeneous waste." The WIPP waste profiles are presented in Figures 5-1 through 5-17 at the end of this chapter.

5.3 WIPP WASTE PROFILE ROLL-UPS

To illustrate the methodology for grouping similar site-specific waste profiles into WIPP waste profiles, the WIPP waste profile for "heterogeneous waste" (based on the five example waste streams shown in Figure 4-1) is provided in Figure 5-4. Table 5-1 lists the sources of information used for the WIPP waste profiles.

TABLE 5-1. SOURCES OF INFORMATION USED IN WIPP WASTE PROFILES

| INFORMATION FIELD | SOURCE OF INFORMATION | EXPLANATION |
|--------------------------------|--|--|
| Waste Matrix Code Group (WMCG) | DOE Waste Treatability Groups Guidance and MWIR Database | Groups waste streams that have similar chemical and physical properties |
| DOE Site Volumes | 1993 IDB and/or MWIR Database | Provides estimates of retrievably stored, projected, and total volumes of TRU and TRU mixed wastes by DOE site |
| Waste Material Parameters | NID Database | Provides weight estimates of selected waste materials in a particular WMCG for the DOE Complex |

Using volumes for all the TRU waste streams (including the mixed and non-mixed TRU waste volumes) in the WIPP TRU Waste Baseline Inventory Database, disposal inventory of TRU waste has been developed using the methodology described in this and the preceding

chapters. This inventory is presented in Table 5-2 (by WMCGs) and depicts both the anticipated and disposal inventory volumes.

The anticipated inventory volumes are the sum of the "stored" and "projected" volumes in Table 5-2. The procedure to obtain the disposal inventory is summarized below:

- The total CH-TRU "stored" and "projected" waste volumes are added together ($8.6 \times 10^4 + 4.1 \times 10^4 = 1.3 \times 10^5 \text{ m}^3$)
- The "unknown" volume of waste in Table 5-2 ($4.2 \times 10^3 \text{ m}^3$) is subtracted from the anticipated inventory because DOE does not intend to produce any "unknown" waste in the future.
- The "unknown" waste will have to be added back into the total scaled inventory because it is assumed that this waste will be characterized and then shipped to WIPP. The target design volume of CH-TRU waste beyond that identified in the MWIR is decreased by $4.2 \times 10^3 \text{ m}^3$ ($1.8 \times 10^5 - 4.2 \times 10^3 = 1.8 \times 10^5 \text{ m}^3$ [there is no significant difference due to rounding]).
- Applying a modified version of the formula given in Section 2.3:

$$\frac{\begin{array}{c} 1.8 \times 10^5 \\ \text{(modified design} \\ \text{inventory)} \end{array} - \begin{array}{c} 1.3 \times 10^5 \\ \text{(modified anticipated} \\ \text{inventory)} \end{array}}{1.3 \times 10^5 \text{ (modified anticipated inventory)}} + 1 \approx 1.4 \text{ (scaling factor)}$$

- Multiply the CH-TRU waste modified anticipated inventory volumes by the scaling factor 1.4 for all the WMCGs, except for the "unknown" waste (which results in the numbers in the fourth column [Scaled Volumes] of Table 5-2).
- Add the CH-TRU waste volumes in the fourth column (Scaled Volumes), including the "unknown" waste, to attain the disposal inventory.

The waste stream volume on a system-wide WMCG basis is increased by 40 percent to account for the difference between the anticipated inventory and the repository design limit. The RH-TRU waste volumes have not been scaled because the volume of anticipated RH-TRU waste inventory already exceeds the design capacity by 21 percent (DOE, 1990).

5.4 RADIONUCLIDE ROLL-UPS

Quantitative radionuclide information is not available on a per-waste-stream basis, as is the nonradionuclide information that is summarized in the waste stream profiles. However, quantitative radionuclide information is available as part of the annual IDB submittal (DOE, 1994b). Table 5-3 contains a summary of the total radionuclide activity (curies) for CH-TRU and RH-TRU waste from information submitted by the DOE TRU waste generator/storage sites (Column 2 of Table 5-2) in support of the data call for the 1993 IDB (DOE, 1994b).

TABLE 5-2. TRANSURANIC WASTE DISPOSAL INVENTORY FOR WIPP

| Waste Matrix Groups | Stored Volumes m ³ | Projected Volumes m ³ | Scaled Volumes m ³ |
|------------------------------|----------------------------------|-------------------------------------|----------------------------------|

| Lead/Cadmium Metal Waste | 0.0E+00 | 8.8E-01 | |
| Solidified Inorganics | 6.2E+02 | 1.4E+03 | |
| Uncategorized Metal | 1.5E-01 | 4.8E+01 | |
| Unknown | 5.6E+02 | 4.2E+02 | |
| Total | 2.0E+03 | 7.0E+03 | |
| Grand Total | 8.8E+04 | 4.8E+04 | |

¹ The projected "unknown" waste streams are calculated non-mixed TRU waste streams as defined in section 4.3.3. There was not enough information provided in the MWIR from the TRU waste generator/storage sites to assign these streams to a WMCG.

The curie totals for CH-TRU waste have been scaled (1.4) by the same percentage as the volume numbers in Section 5.3 for CH-TRU waste. The scaling will allow SP and PA modeling of the performance of the repository, with the inventory increased to the permitted volume limits. The curie totals presented in Column 4 (for RH-TRU) and Column 3 (for CH-TRU) in Table 5-3 are intended to replace the curie totals used by SNL/NM in the latest published data on waste parameters used in PA (Table 3.3-1 in Sandia WIPP Project, 1992). A more comprehensive listing of radionuclide inventories can be found in Appendix I.

TABLE 5-3. IDB TOTALS FOR SELECTED RADIONUCLIDES, DECAYED, AND ACCUMULATED TO DECEMBER 1992

| RADIONUCLIDE | CH (REPORTED) CURIES | CH (SCALED) CURIES | RH CURIES |
|--------------|----------------------------|--------------------------|--------------|

| U 238 | 6.08E+00 | 8.51E+00 | 2.30E+00 |

N/A = RH-TRU curie content was not scaled to fill the WIPP repository. (See Section 5.4 for details.)

* = Scaling factor is 1.4 from the volumes in Table 5-2.

ASSUMPTIONS:

1. Activities reported in 1993 are complete and accurate.
2. Equivalent Pu 239 activities.
3. Calculations to "decay" values reported by DOE sites were performed correctly and assumptions stated in 1993 IDB are valid.
4. Site reporting was done in accordance with the instructions in the 1993 IDB data call.
5. Reported values are scaled to design repository volume for CH-TRU waste only.

METHODOLOGY:

The figures presented were arrived at by summing the calculated decayed values in the 1993 IDB from data reported by DOE sites managing TRU waste in response to a formal, nationwide data call.

CHAPTER 6

6. WASTE MATERIAL PARAMETERS

6.1 INTRODUCTION

Some waste materials that occur in TRU waste may degrade over the 10,000-year period for performance modeling (EPA, 1993a). Some of these waste materials may produce gas by either chemical, microbial, or radiolytic processes (WIPP PA, 1993). These types of processes need to be evaluated as part of the WIPP SP and PA modeling effort to analyze their impact on repository behavior.

6.2 PARAMETER DESCRIPTION

This chapter identifies and defines the waste material parameters to be evaluated in performance assessment calculations. The same methodology used for identifying waste stream profiles and combining them into site-specific and WIPP waste profiles is used to develop a disposal inventory for WIPP by waste material parameters (see Figures 2-1 and 4-1). Waste material parameter information is provided for each waste stream profile (Figure 1-2). This waste material parameter information is used to estimate the anticipated WIPP inventory, which is then scaled to obtain the repository design limit (disposal inventory). This inventory is presented as a weighted average with a maximum and minimum expected weight/volume for each waste material parameter.

A discussion of the methodology for assignment of waste parameter information from the NID to WTWBIR waste streams is presented in Section 2.3.4 and Appendix J. The 10 waste material parameters and packaging materials that are direct inputs into the SP and PA models are:

Inorganics

- Iron-based metals/alloys – This designation is meant to include iron and steel alloys in the waste and does not include the waste container materials.
- Aluminum-based metals/alloys – Aluminum or aluminum-based alloys in the waste materials.
- Other Metals – All other metals found in the waste materials (e.g., copper, lead, zirconium, tantalum, etc.). The lead portion of lead rubber gloves/aprons are also included in this category.
- Other Inorganic Materials – Include inorganic nonmetal waste materials such as concrete, glass, firebrick, ceramics, sand, and inorganic sorbents.

Organics

- Cellulosics – Includes those materials, generally derived from high polymer plant carbohydrates. Examples are paper, cardboard, kimwipes, wood, cellophane, cloth, etc.
- Rubber – Includes natural or manmade elastic latex materials. Examples are Hypalon, Neoprene, surgeons' gloves, leaded-rubber gloves (rubber part only), etc.
- Plastics – Includes generally manmade materials, often derived from petroleum feedstock. Examples are polyethylene, polyvinylchloride, Lucite, Teflon, etc.

Solidified Materials

- Inorganic Matrix – This includes any homogenous materials consisting of sludge or aqueous-based liquids that are solidified with cement, Envirostone, or other solidification agents. Examples are wastewater treatment sludge, cemented aqueous liquids, and inorganic particulates, etc.
- Organic Matrix – This includes cemented organic resins, solidified organic liquids, and sludges.

Soils

- Generally consists of naturally occurring soils that have been contaminated with inorganic waste materials.

Packaging Materials

- Steel – For this revision of the WTWBIR all CH-TRU waste is **assumed** to be packaged in 55-gallon drums and RH-TRU waste is **assumed** to be packaged in the RH-TRU shipping container for disposal in WIPP. As additional data on other packaging configurations is specified by the TRU waste generator/storage sites, this information will be added to the WTWBIR.
- Plastics – For this revision of the WTWBIR, all CH-TRU waste is assumed to be packaged in ~80 mil high-density polyethylene liner with several layers of plastic bags inside.
- Lead – The RH-TRU canister contains lead as well as steel.

6.3 METHODOLOGY

If an MWIR waste stream is a direct match with a waste stream in the NID (i.e., has the same IDC), then that waste material parameter information is used in the WTWBIR. In cases where a direct match does not occur, the waste stream description and WMCs are used in conjunction with expert judgement and general process knowledge to assign waste parameter information from a particular NID waste stream to the particular MWIR waste stream (see Appendix J for additional information). In some cases, two or more NID waste streams could be combined on a weighted basis to provide the correct mix of waste materials for the MWIR waste stream.

The NID information provides weights for materials in an average drum and sometimes provides minimum and maximum weights for the materials. These data were used to calculate densities of particular materials for each IDC. These weights for each material parameter represent the waste profile for each IDC and, hence, for each MWIR waste stream.

Waste material parameters from the NID were rolled up into more general categories. The best way to describe this is with a **hypothetical example** as shown in Table 6-1.

TABLE 6-1. NID INFORMATION

| Waste Material Parameter | Minimum (wt%) | Average (wt%) | Maximum (wt%) |
|---------------------------------|----------------------|----------------------|----------------------|
| Paper | 10 | 30 | 80 |
| Kimwipes | 5 | 15 | 40 |
| Cloth | 0 | 5 | 10 |
| Cellulosics (summed) | 15 | 50 | |
| Drum Weights (kg) (waste only) | 50 | 95 | 150 |

The average weight percent does not add to 100 percent because other parameters such as metals make up the rest of an average drum. As shown in the fourth line, the data would roll up into the WTWBIR database as cellulosic materials. The result in the WTWBIR would be as follows:

| Weight per drum (Kg) | | | |
|----------------------|-----|------|-----|
| Parameter | Min | Avg | Max |
| Cellulose | 7.5 | 47.5 | 150 |

The minimum is the sum of the minimum weight percents in the NID multiplied by the minimum weight of waste (i.e., 15 percent x 50 kg = 7.5 kg) in the drum. The average is the sum of the average weight percents multiplied by the average weight of waste (i.e., 50 percent x 95 kg = 47.5 kg) in the drum. The maximum is the sum of the maximum weight percents multiplied by the maximum weight of waste (i.e., 100 percent x 150 kg = 150 kg) in the drum. In this case the maximum weight percents add to more than 100 percent which is physically impossible; therefore, 100 percent is used for the maximum weight percent. When tables and reports are computed for the WTWBIR, the weights per drum are converted to weight per cubic meter based on 0.208 cubic meters per 55-gallon drum.

The rollups of these material parameters by WMCGs or by site use the volumes from the MWIR data in the WTWBIR database. The roll ups by WMCGs or by site require combining data for several MWIR waste streams. The averages for the material parameters are calculated from the NID-derived average densities modified by the MWIR volume fractions and summed as follows:

$$\text{Average Density of rollup group} = \text{Average Density, of rollup group} \times \frac{(\text{Volume MWIR Stream})}{(\text{Total Volume of Group})} + \dots$$

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the MWIR waste streams in a particular site-specific rollup. The maximum density is chosen in a similar manner, except that the largest maximum density was chosen.

In many cases, the NID does not have data for minimum and maximum percentages, even though average percentages are provided. In these cases, for rollup purposes only, the minimum is assumed to be zero and the maximum is assumed to be equal to the average. This ensures that the calculated and rolled up maximum densities are greater than the average densities. However, the maximum density may not be a true maximum but the maximum average density (see Appendix L for further WTWBIR Database information).

6.4 QUALITY ASSURANCE

WTWBIR Team – The data entry, manipulations, and reporting was conducted in conformance to a Quality Assurance Plan (CTS-WTAC-0001). The basic concept of the plan was to:

- Maintain record copies of the database at different points in the development.
- Maintain an auditable record of additions and changes to the database.
- Document and verify the correct use of the database to produce the reports and tables used in the WTWBIR.

This was accomplished by documenting and verifying the changes, additions, corrections, and report and table generation through the use of formal change forms signed and dated by the implementor and checker. The implementor is the individual who initially makes the changes or develops the report or table and the checker is another individual who checks and verifies that the initial work was correct. If the initial implementation was not correct, the checker confers with the implementor, changes are agreed upon, and the checker and implementor both check that the changes are properly implemented.

The change form is also used by anyone on the WTWBIR team to request a change or addition to the database. In this case the form also includes the requestor's name and the date requested. The requestor can also be the checker or implementor – but not both.

The database manager is responsible for maintaining the record copies of the database, tracking and ensuring proper use of change forms, and ensuring that the technical lead for the WTWBIR team is cognizant of changes being made to the data.

6.5 WIPP WASTE MATERIAL PARAMETER ROLLUPS

The waste material parameters that are inputs into the SP process and PA models are presented in Table 6-2 for CH-TRU waste and Table 6-3 for RH-TRU waste. These tables represent the WIP disposal inventory of waste material parameters. These waste material parameters are the final rollups of the WIPP waste profiles in Tables 5-1 through 5-17.

Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report

June 1994

Book 2 of 2

APPENDIX A

APPENDIX A GLOSSARY

40 CFR Part 191, Protection of Environment. EPA: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and TRU Radioactive Wastes – The EPA's environmental standards for the storage (Subpart A) and disposal (Subpart B) of spent nuclear fuel, and high-level and TRU radioactive wastes. This is the primary post-closure standard that applies to WIPP. It limits annual radiation doses to the public from waste management storage and disposal facilities.

40 CFR Part 268, Protection of Environment. EPA: Land Disposal Restrictions – Restricts the land disposal of all hazardous wastes and specifies strict treatment standards that must be met before these wastes can be land-disposed.

Americium (Am) – A TRU radionuclide having an atomic number of 95, containing 95 electrons and 95 protons. Am-241 (half-life 432.7 y) results from the decay of Pu-241 (half-life 14.4 y). Waste initially rich in Pu-241 will therefore "grow" in Am-241 for several decades as the Pu decays. Am-241 exists in finite amounts in TRU waste at INEL, LANL, LLNL, NTS, ORNL, RFP, and SRS.

Anticipated Inventory – The sum of the stored and projected inventories, as defined in this document.

Buried Waste – TRU waste buried in shallow trenches prior to the 1970 Atomic Energy Commission policy that required TRU waste to be retrievably stored.

Californium (Cf) – A TRU element having an atomic number 98 (the number of protons in the nucleus). An alpha emitter (half-life 2.64 y), Cf-252 also spontaneously fissions, thus making it desirable as a neutron source. Cf-252 is created by neutron bombardment of Cm-244 targets. OR is the only production agency for Cf. As a result, the OR inventory is the only TRU waste inventory showing finite quantities of this element.

Code of Federal Regulations (CFR) – (1) A codification of the general and permanent rules published in the **Federal Register** by the department and agencies of the federal government. The CFR is divided into 50 titles that represent broad areas subject to federal regulation. It is issued quarterly and revised annually. (2) All federal regulations in force are published annually in codified form in the CFR.

Contact-Handled (CH) TRU Waste – Packaged TRU wastes with an external surface dose rate of 200 mrem or less per hour.

Curie – A quantitative measure of radioactivity equal to 3.7×10^{10} disintegrations per second.

Curium (Cm) – A TRU element having an atomic number of 96 (the number of protons in the nucleus). An alpha emitter (half-life 18.1 y), Cm-244 is used for neutron bombardment of targets for the production of Cf-252 at ORNL. In spite of its half-life being less than 20 years, OR considers and handles Cm-244 as a TRU nuclide. Some TRU waste at both OR and SR contains Cm-244.

Decontamination and Decommissioning (D&D) – The process through which DOE facilities which are no longer operational are cleared of contamination and removed from service. In

particular, a reference to D&D waste is a reference to the waste materials that are generated during D&D activities.

Defense Waste – (1) Radioactive waste from any activity performed in whole or in part in support of DOE atomic energy defense activities; excludes waste under purview of the Nuclear Regulatory Commission or generated by the commercial nuclear power industry. (2) Nuclear waste derived mostly from the manufacture of nuclear weapons, weapons-related research programs, the operation of naval reactors, and the decontamination of production facilities.

Department of Energy Site – A DOE-owned or -controlled tract used for DOE operations. Either a tract owned by DOE or a tract leased or otherwise made available to the federal government under terms that afford to DOE rights of access and control substantially equal to those that DOE would possess if it were the holder of the fee (or pertinent interest therein) as agent of and on behalf of the government. One or more DOE operations/program activities are carried out within the boundaries of the described tract.

Design Capacity – The planned waste capacity of the Waste Isolation Pilot Plant.

Disposal – Emplacement of waste in a manner that assures isolation from the biosphere for the foreseeable future with no intent of retrieval and that requires deliberate action to regain access to the waste. For example, disposal of wastes in a mined geologic repository occurs when all of the shafts to the repository area are backfilled and sealed.

Disposal Inventory – The total inventory defined for WIPP emplacement (after scaling) to be used for SP and PA calculations.

Environmental Restoration (ER) – Those activities associated with the remediation of sites contaminated with hazardous and/or radioactive materials. In particular, a reference to remediation activities conducted under the auspices of the DOE Office of Environmental Restoration and Waste Management, Office of Environmental Restoration, EM-40.

Federal Facility Compliance Act (FFCA) – Public law 102-386, 1992.

Gas Production – Three gas generation processes are expected to be a factor in the degradation of TRU wastes in the WIPP repository. The generation of gaseous species is expected to occur through chemical (i.e., corrosion), microbial, and radiolytic processes.

Generator/Storage Sites – See Waste Generator/Storage Sites.

Hazardous Waste – Those wastes that are designated hazardous by EPA (or state) regulations through the RCRA.

Integrated Data Base (IDB) – The latest version of the IDB, the *Integrated Data Base for 1993: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1994b)

Mixed TRU Waste – TRU waste that contains both radioactive and hazardous components as defined by the Atomic Energy Act and the RCRA as codified in 40 CFR Parts 263, 265, 268, and 270 (EPA, 1980a; 1980b; 1986; and 1983).

Mixed Waste Inventory Report (MWIR) – The latest release of information from the MWIR database that supports requirements under the FFCA of 1992 (Public Law 102-386). The latest

version of the MWIR documentation/files is *Distribute of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a). This information replaces the Phase I MWIR release (DOE, 1994c).

Newly Generated Wastes – See Projected Inventory.

No-Migration Variance Petition (NMVP) – Section 3004 of RCRA allows EPA to grant a variance from the land disposal restrictions when a determination can be made that, to a reasonable degree of certainty, there will be no migration of hazardous constituents from the disposal unit for as long as the waste remains hazardous. Specific requirements for making this demonstration are found in 40 CFR 268.6, and EPA has published a draft guidance document to assist petitioners in preparing a variance request.

Non-Mixed TRU Waste – Transuranic waste that does not contain hazardous constituents or exhibit hazardous characteristics, as identified in 40 CFR 261, Subparts C and D.

Nonradionuclide Inventory Database (NID) – A database of the nonradionuclide constituents in the TRU inventory, originally developed by IT during 1988/1989 in support of SNL/NM PA efforts. A summary of the database was transmitted to SNL/NM in a letter report dated May 1989 (WIPP PA, 1991). A copy of the NID waste stream information used in the WTWBIR is provided in Appendix D.

Performance Assessment (PA) – (1) A systematic analysis of the potential risks posed by waste management systems to the public and environment and a comparison of those risks to established performance objectives. (2) An analysis that (a) identifies the processes and events that might affect the disposal system, (b) examines the effects of these processes and events on the performance of the disposal system, and (c) estimates the cumulative releases of radionuclides, considering the associated uncertainties, caused by all significant processes and events. These estimates shall be incorporated into an overall probability distribution of cumulative release to the extent practicable. (3) A term used to denote all activities (qualitative and quantitative) carried out to (a) determine the long-term ability of a site/facility to effectively isolate the waste and ensure the long-term health and safety of the public and (b) provide the basis for demonstrating regulatory compliance.

Plutonium (Pu) – A radionuclide having an atomic number of 94, the first TRU element. Pu isotopes exist in some TRU waste at all the major DOE storage facilities. The significant isotopes that may exist in measurable quantities at these facilities are Pu-238 through Pu-242. Each isotope is an alpha emitter; the respective half-lives in years are: 238=87.7, 239=24,000, 240=6,563, 241=14.4, 242=376,000. Because of its high activity, Pu-238 can contribute significantly to the thermal loading on some TRU waste. Pu-241 decays, primarily by beta emission, to Am-241.

Process Knowledge – The determination of waste container contents through the study of existing records on the production history of the waste.

Projected Inventory – That part of the inventory that has not been generated but is estimated to be generated at some time in the future by the TRU waste generator/storage sites. The estimated timeframe may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Radioactive – Substances that emit radiation either naturally or as a result of scientific manipulation.

Radionuclide – (1) A species of atom having an unstable nucleus, that is subject to spontaneous decay or disintegration and usually accompanied by the emission of ionizing radiation. (2) Any nuclide that emits radiation. A nuclide is a species of atom characterized by the constitution of its nucleus and hence by the number of protons, the number of neutron, and the energy content.

Remote-Handled (RH) TRU Waste – Packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour.

Repository – Designated location for disposal of transuranic wastes; the Waste Isolation Pilot Plant.

Resource Conservation and Recovery Act (RCRA) – (1) Establishes a system for controlling hazardous waste from generation to disposal. (2) A Federal law passed in 1976, and amended under the HSWA of 1984, that established a structure to track and regulate hazardous wastes from the time of generation to disposal. The law requires safe and secure procedures to be used in treating, handling, transporting, storing, and disposing of hazardous substances. RCRA is designed to prevent new uncontrolled hazardous waste sites. The law also regulates the disposal of solid waste that may not be considered hazardous. (3) Specifically, Subtitle D of RCRA governs the management of solid waste. (Note: 40 CFR Parts 260-281 are the regulations for complying with RCRA with respect to hazardous waste and hazardous waste treatment, storage, and disposal facilities.)

Retrievable Storage – Designated storage location for transuranic wastes that is designed, operated, and maintained in such a manner that the wastes remain accessible for subsequent retrievable operations.

Scaling – The process for adjusting the anticipated inventory to the design limit (disposal inventory) of the WIPP repository.

Site-Specific Waste Profile – Represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles, at a particular DOE TRU waste site, that have been placed in the same WMCG are summarized in the site-specific waste profile.

Stakeholders – Those persons and/or groups of people and organizations who are affected or perceive they are affected by the DOE waste management program. Stakeholders include DOE management, employees, and contractors (internal); and executive, legislative, and regulatory groups, public representatives, the general public, intervenor groups, special interest groups, contractors, suppliers, and universities (external).

Stored Inventory – That part of the TRU inventory currently in retrievable storage as of the time of the last data call for inventory information. Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and **does not include any waste that was buried prior to 1970.**

System Prioritization (SP) – The SP is a process formulated to identify a set of activities (required experiments, modeling, engineering design, and waste acceptance criteria) that will lead to regulatory compliance. The process is formulated such that it also: (1) addresses stakeholder and regulator concerns early and throughout the regulatory process and (2) leads to a fully defensible performance assessment to be used in demonstrating regulatory compliance. Ultimate products and associated customers are:

- (1) A decision matrix containing the most likely sets of activities that will lead to compliance as a function of time and budget to be delivered to the WIPP program manager,
- (2) A performance assessment built on assumptions and data that are defensible in the eyes of the stakeholders and the regulators to be delivered to the regulatory compliance branch of Carlsbad Area Office/WIPP through the Westinghouse Waste Isolation Division and ultimately to the EPA, and
- (3) A set of regulatory issues and their current status that result from the SP process and are to be included in compliance packages by the Westinghouse Waste Isolation Division.

Thorium (Th) – A radionuclide having an atomic number of 90. Although not TRU, Th-232 is an alpha emitter (half-life 14 billion years) and exists in finite amounts in some TRU waste at HA, IN, and OR. [Note: Thorium is naturally occurring and contributes to background radiation at some sites (e.g., IN)]

Transuranic – Pertaining to elements that have atomic numbers greater than 92, including neptunium, plutonium, americium, and curium; all are radioactive, are products of artificial nuclear changes, and are members of the actinide group.

Transuranic (TRU) Waste – (1) Waste containing alpha-emitting radionuclides with an atomic number greater than 92 and half-lives greater than 20 years, at concentrations of TRU isotopes greater than 100 nanocuries per gram of waste. **This core definition appears in modified form in various relevant documents as follows:** (a) For purposes of management, DOE Order 5820.2A: (i) considers TRU waste, as defined above, "without regard to source or form" (*The proposed revision to the Order [DOE Order 5820.2A Major Issues for Revision, May 6, 1992]* contemplates removing this clause); (ii) allows head of field elements to determine that wastes containing other alpha-emitting radionuclides must be managed as TRU waste; and (iii) adds "at time of assay," implying both that the classification of a waste as TRU waste is to be made based on an assay, and that such classification can be superseded only by another assay. (b) For purposes of setting standards for management and disposal, 40 CFR 191.02(i) adds "except for: (i) high-level wastes; (ii) wastes that the DOE has determined, with the concurrence of the EPA Administrator, do not need the degree of isolation required by this part; or (iii) wastes that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61. (2) Waste materials contaminated with U-233 (and its daughter products), with certain isotopes of plutonium, or with other nuclides with atomic numbers greater than 92. In order to be classified as TRU waste, the long-lived alpha activity from subject isotopes must exceed 100 nanocuries per gram of waste material and from the use of plutonium in the fabrication of nuclear weapons. (3) Wastes that are contaminated with radioactive elements heavier than uranium, thus the name trans-(or beyond) uranic.

TRUCON – See TRUPACT-II Content Code.

TRUPACT-II Content Codes (TRUCON) – The document containing a description of the waste stream, waste form, and package configuration for each waste content code authorized for shipment in TRUPACT-II containers.

Unknown Waste Stream – Those waste streams for which there is insufficient process knowledge to assign a specific WMC.

Uranium (U) – A naturally radioactive element with the atomic number of 92 (number of protons in the nucleus) and an atomic weight of approximately 238. The two principal naturally occurring isotopes are the fissionable U-235 (0.7 percent of natural uranium) and the fertile U-

238 (99.3 percent of natural uranium). (Note: An alpha emitter [half-life 159,000 y], U-233 also spontaneously fissions; it is present in finite quantities in some TRU waste inventories at INEL and ORNL.)

Waste Acceptance Criteria (WAC) – The criteria used to determine if waste packages are acceptable.

Waste Form – The physical form of the waste such as sludges, combustibles, metals, etc.

Waste Generator/Storage Sites – The 10 largest DOE facilities and several smaller sites throughout the U.S. that produce and store TRU waste.

Waste Isolation Pilot Plant (WIPP) – (1) The project authorized under Section 213 of the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (Public Law 96-164; 93 Stat. 1259, 1265) to demonstrate the safe, and environmentally sound, disposal of radioactive waste materials generated by atomic energy defense activities. (2) A research and development facility, located near Carlsbad, New Mexico, to be used for demonstrating a practical, long-term solution to a complex problem: the safe disposal in deep geologic repositories of TRU waste resulting from DOE activities. (3) The WIPP has two primary objectives. First, the WIPP is investigating the behavior of salt rock and interactions between the salt rock and radioactive wastes in a variety of forms. Second, the WIPP seeks to demonstrate the safe and efficient handling, transportation, and disposal of TRU waste in an actual facility.

Waste Material Parameter – A waste material that occurs in TRU waste that is an input parameter into one or more current SP or PA models, an SP or PA model under development, a potential future model, or is required to adequately describe the waste form.

Waste Matrix Code (WMC) – A DOE-developed coding system for organizing waste streams by their physical and chemical properties. A WMC is assigned to each waste stream by the DOE TRU waste generator/storage site. The WMC for each waste stream can be found in the Mixed Waste Inventory Report (DOE, 1994a). This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. Appendix C contains the DOE guidance document to help categorize individual waste streams. An example of a WMC for "heterogeneous waste" would be 5400.

Waste Matrix Code Group (WMCG) – Consists of a series of WMCs that for SP or PA purposes has similar physical and chemical properties.

Waste Stream – Individually, those stored or projected wastes that are defined by a unique identifier in the MWIR.

Waste Stream Name – A site-specific, unique descriptive identifier for a TRU waste stream.

Waste Stream Profile – A description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of the important information about a particular waste stream.

Waste Stream Site ID – A site-specific alphanumeric identification code which provides a unique identifier for an individual TRU waste stream.

WIPP Waste Profile – Represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG.

1. INTRODUCTION

This guidance document provides a standard methodology for categorizing waste information that should be implemented at DOE sites. This methodology will assist in the development of the final mixed waste inventory report, the Site Treatment Plans, preparation of the national Site Treatment Plan summary, and analyzing different national treatment options.

The U.S. Department of Energy (DOE) is required by the Resource Conservation and Recovery Act (RCRA), as amended on October 6, 1992 by the Federal Facility Compliance Act, to prepare an inventory report of its mixed wastes and treatment capacities and technologies. The purpose of the inventory report is to identify all mixed waste in the DOE system that is currently stored or will be generated over the next five years, provide an inventory of the existing and planned treatment capacity, and identify DOE's technology development efforts. To aid in identifying the appropriate treatment needs, the waste streams must be grouped according to their technological requirements in a consistent manner. This grouping or characterization will enable the waste streams to be matched to available treatment capacities either at the site or at another DOE facility as well as to identify treatment and technology development needs.

The Federal Facility Compliance Act also requires DOE to develop site treatment plans for each facility at which DOE generates or stores mixed waste. The plans must describe the development of treatment capacities and technologies for treating the site's mixed waste. These plans must be submitted to the State in which the site is located or to the U.S. Environmental Protection Agency (EPA) for review and approval, approval with modification, or disapproval. As discussed in the schedule for the development of the plans, published in the Federal Register on April 6, 1993, DOE intends to prepare two interim versions of the plan (i.e., conceptual plan and draft plan), in addition to the final plan, to facilitate discussions among states and other interested parties. DOE also intends to prepare a summary document (or national "roll up") for each of the conceptual, draft, and final plans to provide a national picture of DOE's technology needs and possible options for treatment of its mixed waste. To properly integrate the site plans into a cohesive national summary and to be able to use the national summary to help identify and evaluate DOE-wide treatment needs against treatment capacities and capabilities, and to develop treatment options, each site plan must be developed using the same technically-based approach for categorizing waste streams and identifying appropriate treatment.

1.1 BACKGROUND

The need for a consistently applied, technically-based approach for categorizing waste information has been demonstrated by past national strategic planning efforts involving mixed waste. Since the 1987 byproduct rulemaking, several complex-wide reports and studies have been prepared on mixed waste characteristics and inventories, and associated treatment technology and capacity needs. Most notable of these were the:

- National Report on Prohibited Wastes and Treatment Options, submitted to the Environmental Protection Agency (EPA) in January 1990 as required by the Rocky Flats Plant Federal Facility Compliance Agreement;
- DOE complex-wide Land Disposal Restrictions Case-by-Case Extension Application for Thirds Radioactive Mixed Wastes, submitted to the EPA in November 1991; and
- Interim Mixed Waste Inventory Report, submitted to the EPA and the States in April 1993 as required by the Federal Facility Compliance Act.

Throughout these efforts, characteristic and inventory data on mixed waste streams were collected from the sites resulting in the development of a national data set.

Two significant problems that became apparent throughout these efforts were: 1) mixed waste streams were not always defined on a technical basis that supported assessment of treatment technology and capacity needs, and 2) information and data available on mixed waste streams have improved through time, resulting in apparent inconsistencies between reports. A contributing factor to both these problems has been the lack of a technically-based approach to defining waste streams and the lack of a standardized method to define treatability groups.

Section 102(a)(3) of the Federal Facility Compliance Act waives sovereign immunity for Federal facilities for fines and penalties for violations of federal, state, interstate, and local hazardous and solid waste management requirements. This waiver is delayed for three years for any violations of the land disposal restrictions storage prohibition, RCRA section 3004(j), involving mixed waste at DOE facilities. This waiver is contingent upon the management of the waste being in compliance with all other applicable requirements. The Act further delays the waiver of sovereign immunity beyond the three year period at a facility if DOE is in compliance with an approved plan for developing treatment capacity and technologies for mixed waste generated or stored at the facility and an order requiring compliance with the plan.

DOE published in the Federal Register on April 6, 1993 a schedule for the development of the plans for treating mixed waste for each facility at which DOE generates or stores mixed waste. These plans will describe the use of existing capabilities, and the development of treatment capacities and technologies for treating the site's mixed waste. The Act allows the Plans to provide for centralized, regional or on-site treatment of mixed waste, or any combination thereof. DOE has proposed to prepare two interim versions of the plan, the Conceptual Site Treatment Plan (CSTP) and the Draft Site Treatment Plan (DSTP), to facilitate discussion between the site and the regulatory agency and among states, EPA, and other interested parties on technical and equity issues. The interim plans will also facilitate information exchange among the sites and regulatory agencies and help identify common technical problems and needs. The interim plans will provide information about the technology needs, existing and planned treatment facilities, and treatment options, including potential options for treating off-site wastes. Each site, if possible, will discuss its CSTP framework with the appropriate State or EPA, and will submit to the State or EPA, by October 1993, a CSTP that will provide a preliminary identification of options for treating the site's waste. DOE will summarize all CSTPs by preparing a national roll-up for various cross-cut treatment options. Based on the CSTPs, the national summary, and discussions among states, EPA, DOE and others, each site will submit a DSTP not later than August 1994 to identify the preferred option for treating its mixed waste. Each DOE site will submit the final Site Treatment Plan not later than February 1995 to the appropriate State or EPA for review and approval.

In order to properly integrate the site treatment plans into a cohesive national summary, to be able to use the national summary to help identify and evaluate DOE-wide treatment needs against treatment capacity and capabilities, and to develop treatment options, each Site Treatment Plan must be developed using the same technically-based approach for categorizing waste streams and identifying appropriate treatment. By using the same methodology, DOE sites will be able to share information across the complex on potential treatment technologies/treatment capacities for any specific category of waste. Therefore, this should assist the site in the development of various options with the site treatment plan.

The Act also requires the DOE to prepare an inventory report of its mixed wastes and treatment capacities and technologies. The interim report was submitted to EPA and the States in April 1993 as required by the Act. The inventory report as required by the Act contains:

- a national inventory of all mixed waste in the DOE system that are currently stored or will be generated over the next five years, including waste stream name, description, EPA waste codes basis for characterization, quantity stored that is subject to the Land Disposal Restrictions (LDRs) storage prohibition, quantity stored that is not subject to the LDRs, expected generation over the next five years, Best Demonstrated Available Technology (BDAT) used for developing the LDR requirements, waste minimization activities, and a statement of whether and how the radionuclide content alters or affects the use of treatments technologies; and
- a national inventory of mixed waste treatment capacities and technologies, including information such as the description, capacities, and locations of all existing and proposed treatment facilities, explanations for not including certain existing facilities in capacity evaluation, information to support decisions on unavailability of treatment technologies for certain mixed wastes, and the planned technology development activities.

The purpose of the inventory report is to identify all mixed waste in the DOE system and to be able to match these waste streams to the appropriate treatment. To accomplish this, the waste streams and their associated treatability groups must be identified consistently at all DOE sites so that the waste streams can be matched to available treatment capacities and to identify treatment needs and technology development needs complex-wide. DOE intends to revise the interim inventory report and to update it on an annual basis. The inventory report will act as the most up-to-date information source for DOE's mixed waste.

When developing the site treatment plans and updating the interim mixed waste inventory report, this guidance provides a technically-based method for categorizing waste streams based on the regulatory and technological requirements from different waste streams/waste packages. While developed primarily for mixed waste, the method may be applied to other DOE waste types, e.g., radioactive waste and hazardous waste.

1.2 PURPOSE AND SCOPE

The purpose of the guidance is to provide a technically-based methodology for categorizing DOE waste information in a consistent, and technically valid manner to be used for the development of the Site Treatment Plans and to update the Mixed Waste Inventory Report. The methodology provides a formal approach for categorizing waste based on waste characteristics. This guidance includes:

- A methodology with standard definitions for aligning site-specific wastes into treatability groups that share similar treatment needs;
- A standard structure that will allow comparing waste treatability groups among sites, and combining all site-specific data into one data set for the national summary and the mixed waste inventory report;
- A technically-based approach to identify treatment technology needs, treatment capacity needs, technology development needs, and storage and disposal requirements for DOE mixed waste.

The treatability group assignments will allow comparisons of basic treatment needs to available and planned treatment capacity. The assignment of a treatability group to a waste stream is not intended to provide the detailed level of knowledge necessary to certify waste streams to treatment or disposal facility waste acceptance criteria (WAC), or to provide detailed characterization information required to proceed

beyond conceptual design to specific facilities. Additional characterization of waste streams will be required to accomplish facility design and WAC certification.

2. METHODOLOGY OVERVIEW

The methodology for categorizing waste streams into treatability grouping is based on the premise that the key information necessary for identifying treatment methods/or assessing technology needs can be identified from the radiological, physical, and chemical properties of the waste and its contaminants. This methodology uses three characteristic parameters: radiological, bulk physical/chemical matrix, and contaminants.

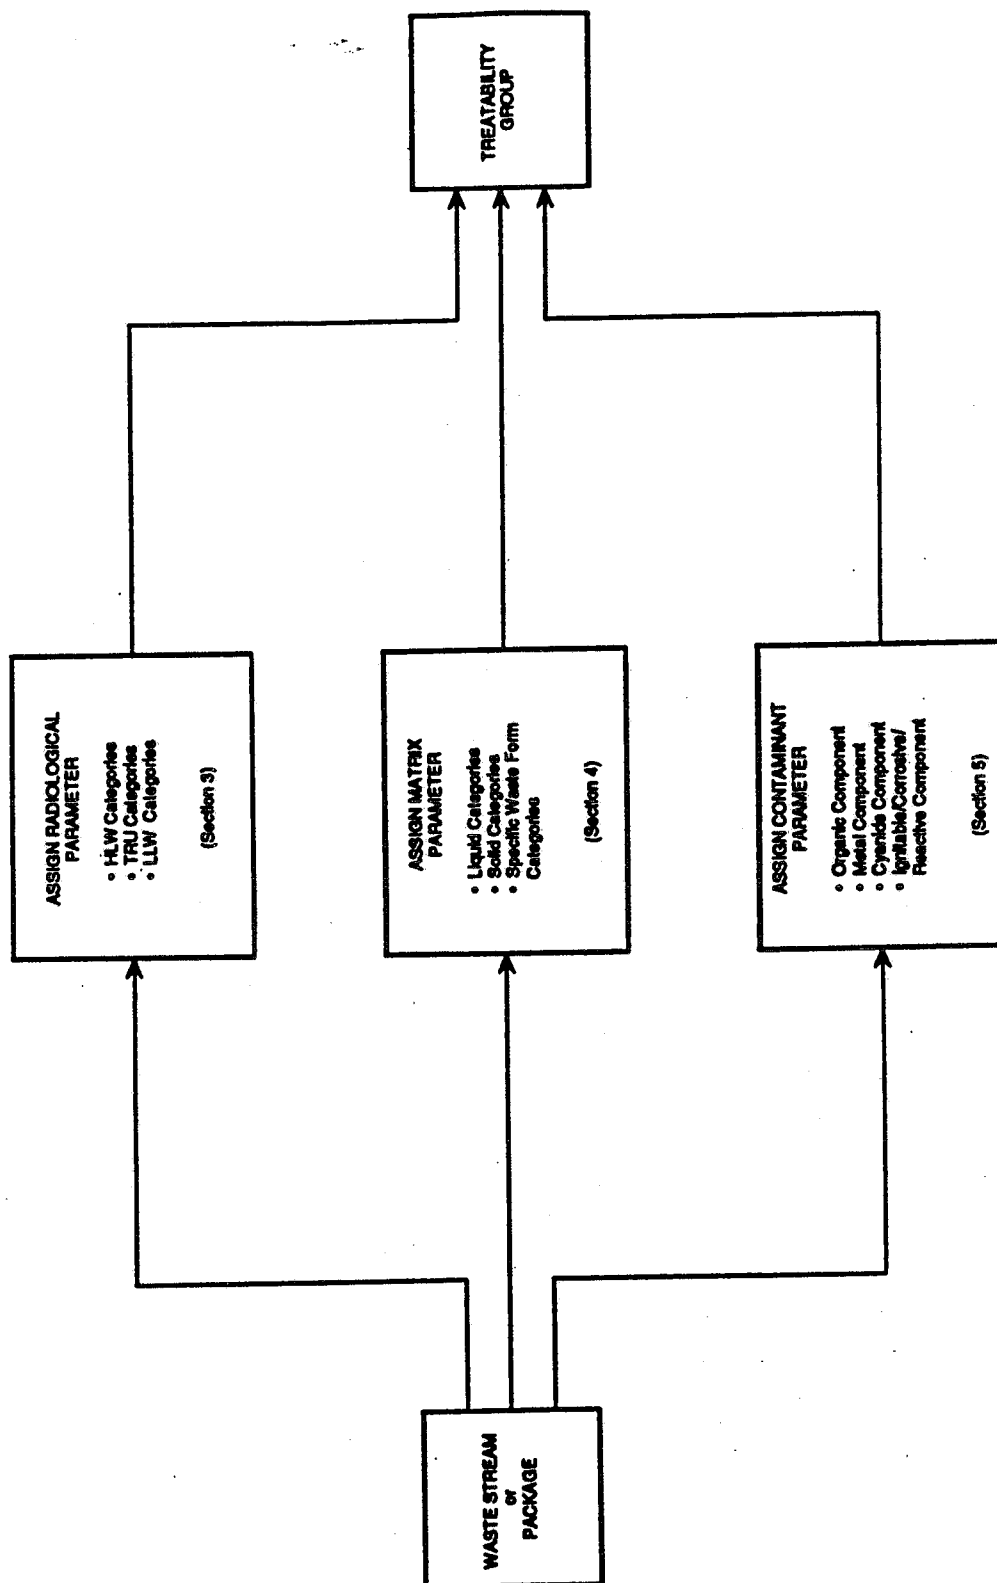

For the purposes of this guidance, waste streams should be consistent with those identified in the most current Mixed Waste Inventory report. For the Mixed Waste Inventory Report a waste stream is defined as "waste material generated from a single process or activity (e.g., a pipe or series of pipes from a single production process, replacement of a certain component of a production or support process (like a battery), or remediation activity like cleaning out a lagoon), covered by only one treatability group. For wastes stored in transportable containers, a waste stream should comprise at least one container (unless the material in the container is likely to be separated prior to sending it anywhere for processing). A single waste stream in storage may include several containers of waste material, but only if the material is from the same type of source and of essentially the same physical and chemical properties."¹ A single waste stream should be assigned to no more than one unique treatability group consisting of a single radiological and bulk physical/chemical matrix parameter. A single waste stream may have more than one contaminant parameter assigned to it.

Each of these parameters impacts treatment needs and/or technology determinations. The radiological parameter influences the design of the treatment facility to control radioactive releases and to prevent worker exposure. The matrix parameter identifies the physical/chemical properties of the waste and influences the facility design and technology selection. The contaminant parameter of the waste determines the type of treatment requirements from a regulatory and technical perspective. The contaminant parameter also influences any necessary follow-up or residual treatment and dictates any necessary effluent controls required. Combined, the parameters define a treatability group for the waste. Figure 1 displays the logic flow for identifying the relevant characteristic parameters for each waste type.

Sections 3, 4, and 5 of this report discuss the various categories under each characteristic parameter and provide definitions for these categories. The primary focus of this guidance document is to assign each waste to the lowest level subcategory based on the data available at the site on a given waste stream. Having detailed treatability group data could potentially influence the design of a planned treatment facility, enabling it to manage all wastes within a single (or set of) treatability group(s). In preparation of the national summary of the STPs, lower level subcategories may be rolled-up to the higher level categories for various general cross-cut evaluations. Detailed data will not be lost during the roll-up but will be available for more specific treatment and technology analyses. Section 6 provides guidelines for implementing the methodology and example applications. As more detailed characterization data becomes available the treatability group assignment of a waste stream may change. The most current, accurate information should be used in making the treatability group assignment.

1. Definition of "waste stream" from the Definitions for Key Mixed Waste Data Elements; Draft -- August 26, 1993.

Figure 1. Treatability Group Assignment Logic

3. RADIOLOGICAL PARAMETER

This section presents the categories and definitions for the radiological parameter. The radiological categories are based on the activity level of the waste and will influence the design of the facility to control radioactive releases and operator exposure. As shown in Figure 2, the primary radiological categories include:

- naturally occurring and accelerator produced radioactive materials,
- low-level waste,
- transuranic waste, and
- high-level waste.

These categories for the radiological parameter are based on definitions established in DOE Order 5820.2A. Following are the more specific categories and definitions within each of these general radiological categories.

3.1 NATURALLY OCCURRING AND ACCELERATOR PRODUCED RADIOLOGICAL CATEGORIES

Naturally occurring and accelerator produced radioactive materials (NARM) are defined by DOE Order 5820.2A as any radioactive material that can be considered naturally occurring and is not source, special nuclear, or byproduct material or that is produced in a charged particle accelerator. DOE Order 5820.2A specifies that NARM be managed as low-level waste or as tailings under the Uranium Mill Tailings Radiation control Act of 1978 (Public Law 95-604). The radiological hazards posed by these materials are similar to those from low-level waste. These materials are not included in the definition of mixed waste.

3.2 LOW-LEVEL WASTE RADIOLOGICAL CATEGORIES

Low-level waste is defined by DOE Order 5820.2A as all radioactive waste that are not classified as high-level waste, TRU waste, spent fuel, or uranium or thorium mill tailings. Mixed low-level waste is further categorized according to beta-gamma activity levels and levels of transuranic alpha contamination. Following are the category definitions.

3.2.1 Contact-Handled LLW

LL/CH Contact-Handled LLW

This category includes low-level waste that has an exposure rate of 200 mR/hr or less on contact.

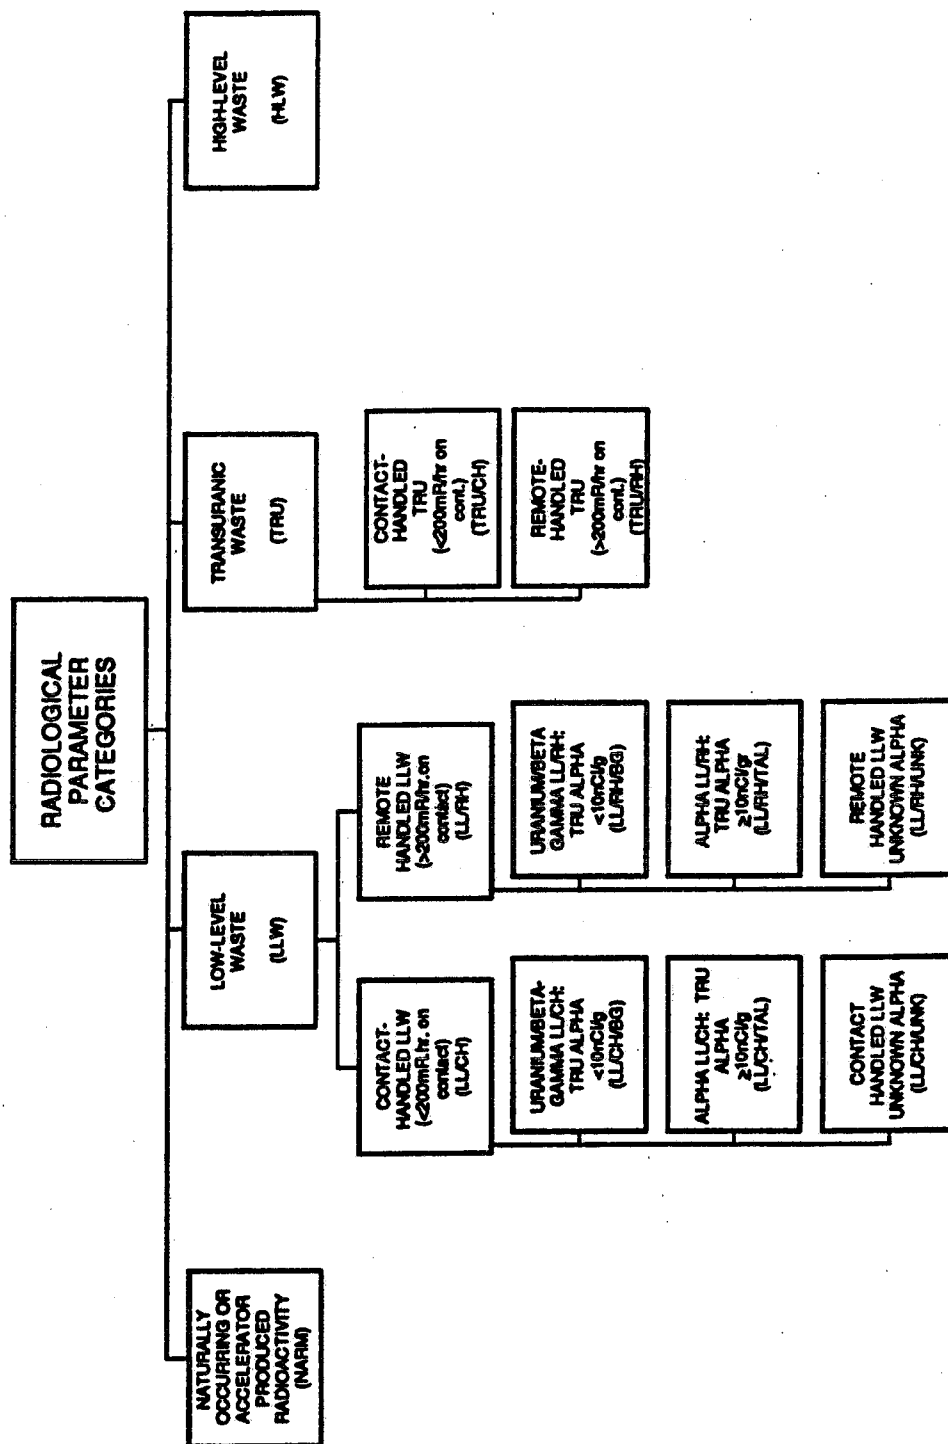

LL/CH/BG Uranium/Beta-Gamma LL/CH

This category includes contact handled low-level waste that contains transuranic isotopes with a combined transuranic alpha activity of less than 10 nCi/g. Alpha activity from uranium is not included in the limit.

LL/CH/TAL Transuranic Alpha LL/CH

This category includes contact handled low-level waste that contains transuranic isotopes with a combined alpha activities of greater than or equal to 10 nCi/g. Alpha activity from uranium is not included in this limit.

Figure 2. Radiological Parameter Categories

LL/CH/UNK Contact Handled LLW Unknown Alpha

This category includes contact handled low-level waste which has not been sufficiently characterized to determine the transuranic alpha activity.

3.2.2 Remote-Handled LLW

LL/RH Remote-Handled LLW

This category includes mixed low-level waste that has an exposure rate greater than 200 mR/hr on contact.

LL/RH/BG Uranium/Beta-Gamma LL/RH

This category includes remote handled low-level waste that contains transuranic isotopes with a combined transuranic alpha activity of less than 10 nCi/g. Alpha activity from uranium is not included in the limit.

LL/RH/TAL Transuranic Alpha LL/RH

This category includes remote handled low-level waste that contains transuranic isotopes with a combined alpha activities of greater than or equal to 10 nCi/g. Alpha activity from uranium is not included in this limit.

LL/RH/UNK Remote Handled LLW Unknown Alpha

This category includes remote handled low-level waste which has not been sufficiently characterized to determine the transuranic alpha activity.

3.3 TRANSURANIC WASTE RADIOLOGICAL CATEGORIES

Transuranic (TRU) waste, as defined by DOE Order 5820.2A refers to all radioactive waste that contain more than 100 nCi/g of alpha-emitting isotopes with atomic numbers greater than 92 and half-lives greater than 20 years. This definition includes isotopes of neptunium (Np), plutonium (Pu), americium (Am), curium (Cm), and californium (Cf). Transuranic waste is categorized according to beta-gamma activity levels as follows.

3.3.1 Contact-Handled TRU

TRU/CH Contact-Handled TRU

This category includes TRU waste having an exposure rate of 200 mR/hr or less on contact.

3.3.2 Remote-Handled TRU

TRU/RH Remote-Handled TRU

This category includes TRU waste having an exposure rate greater than 200 mR/hr on contact.

3.4 HIGH-LEVEL WASTE RADIOLOGICAL CATEGORIES

High-level waste (HLW) is defined by DOE Order 5820.2A as "... the highly radioactive waste material that results from the reprocessing of spent nuclear fuel, including the liquid waste produced directly in the reprocessing, and any solid waste derived from the liquid that contains a combination of transuranic waste and fission products in concentrations as to require permanent isolation." There are no definitive radiological subcategories defined in this guidance for HLW. Typically, waste determined to be high-level contains transuranic isotopes and is remote-handled.

4. MATRIX PARAMETER

This section presents the categories and definitions for the matrix parameter. The matrix parameter describes the bulk physical/chemical form of the waste. The physical/chemical form of the waste affects both the appropriate regulatory treatment requirements and the applicability of specific treatment technologies. In some cases, the physical/chemical form of the waste may dictate some type of pretreatment or design modification to accommodate special handling of the waste.

The matrix parameter categories and definitions are presented in five subsections of this guidance according to generic physical/chemical waste form classifications. The generic physical/chemical waste form classifications are:

- Liquids
- Solids
- Specific Waste Forms
- Unknown Matrix
- Final Waste Forms

The matrix parameter categories are shown in Figure 3. The following subsections present the categories and definitions for each of the above classifications.

4.1 LIQUIDS

These categories address waste streams that are liquid, including pumpable slurries. In general, slurries are considered pumpable with a total suspended/settled solids (TSS) content of up to approximately 35% to 40%. Only liquids and slurries packaged in bulk, free form (e.g. drum, tank) are included in these categories. Liquids and slurries packaged as lab packs are addressed elsewhere (see Section 4.3). Following are the category definitions.

4.1.1 Aqueous Liquids/Slurries

1000 Aqueous Liquids/Slurries

This category includes liquids and slurries containing less than 1% total organic carbon (TOC).

1100 Wastewaters

This category includes aqueous liquids/slurries containing less than 1% TSS.

1110 Acidic Wastewaters

This category includes wastewaters with a $\text{pH} \leq 2.0$.

1120 Basic Wastewaters

This category includes wastewaters with a $\text{pH} \geq 12.5$. Basic wastewaters that contain cyanides at, or above, applicable LDR treatment standard levels are assigned to category 1140.

1130 Neutral Wastewaters

This category includes wastewaters with $2.0 < \text{pH} < 12.5$.

Figure 3. Matrix Parameter Categories

1140 Cyanide Wastewaters

This category includes basic wastewaters containing cyanides at, or above, applicable LDR treatment standard levels.

1190 Uncategorized Wastewaters

This category includes wastewaters that;

- 1) are insufficiently characterized to categorize more definitively into one of categories 1110 through 1140, or
- 2) do not meet the criteria for categorization into one of the 1110 through 1140 categories, or
- 3) are mixtures of two or more of the 1110 through 1140 categories.

1200 Aqueous Slurries

This category includes pumpable aqueous liquids/slurries with TSS \geq 1% or with an unknown TSS level.

1210 Acidic Aqueous Slurries

This category includes aqueous slurries with a pH \leq 2.0.

1220 Basic Aqueous Slurries

This category includes aqueous slurries with a pH \geq 12.5. Basic aqueous slurries that contain cyanides at, or above, applicable LDR treatment standard levels are assigned to category 1240.

1230 Neutral Aqueous Slurries

This category includes aqueous slurries with $2.0 < \text{pH} < 12.5$.

1240 Cyanide Aqueous Slurries

This category includes basic aqueous slurries containing cyanides at, or above, applicable LDR treatment standard levels.

1290 Uncategorized Aqueous Slurries

This category includes aqueous slurries that;

- 1) are insufficiently characterized to assign into one of categories 1210 through 1240, or
- 2) do not meet the criteria for assignment into one of the 1210 through 1240 categories, or
- 3) are mixtures of two, or more, of the 1210 through 1240 categories.

4.1.2 Organic Liquids

2000 Organic Liquids

This category includes liquids and slurries containing \geq 1% TOC.

2100 Aqueous/Organic Liquids

This category includes miscible and immiscible mixtures of aqueous and organic liquids. The TOC content of the mixture is at least 1% but less than about 99%.

2110 Aqueous/Halogenated Organic Liquids

This category includes aqueous/organic liquids that contain at least 1000 ppm halogenated organic compounds (HOC).

2120 Aqueous/Nonhalogenated Organic Liquids

This category includes aqueous/organic liquids that contain less than 1000 ppm HOC.

2190 Uncategorized Aqueous/Organic Liquids

This category includes aqueous/organic liquids for which it is not known whether the HOC content is less than, equal to, or greater than 1000 ppm.

2200 Pure Organic Liquids

This category includes liquids that are essentially purely organic (e.g. TOC > 99%).

2210 Halogenated Pure Organic Liquids

This category includes pure organic liquids that contain at least 1000 ppm HOC.

2220 NonHalogenated Pure Organic Liquids

This category includes pure organic liquids that contain less than 1000 ppm HOC.

2290 Uncategorized Pure Organic Liquids

This category includes pure organic liquids for which it is not known whether the HOC content is less than, equal to, or greater than 1000 ppm.

2900 Uncategorized Organic Liquids

This category includes liquids with TOC \geq 1% for which insufficient information is available to determine if the liquid is essentially purely organic (e.g. TOC > 99%).

4.2 SOLIDS

These categories address waste with physically solid matrices, including sludges. As opposed to slurries, sludges are considered nonpumpable. Solids are initially categorized according to the general classifications of process residues, soil, and debris. Figure 3 shows these general classifications and associated categories. Following are the category definitions.

4.2.1 Solid Process Residues

3000 Solid Process Residues

Solid Process Residues are defined in this guidance as solid materials, excluding soil, that do not meet the EPA criteria for classification as debris. Examples of solid process residues are sludge and particulate type materials. This category includes waste that are at least 50% by volume solid process residues. The balance of the matrix may be debris or soil.

3100 Inorganic Process Residues

This category includes waste that is at least 50% by volume inorganic process residues. These are defined as process residues with sufficient inorganic solids content such that a minimum of approximately 20% by weight of the waste would remain as residue (i.e. ash/solids) following incineration.

3110 Inorganic Particulates

This category includes waste that is at least 50% by volume inorganic particulates, including residual or absorbed liquids, if present. Typical examples of inorganic particulates are incinerator ash, dust, sand blasting residue, vermiculite, and ion exchange media.

3111 Ash

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) bottom or fly ash resulting from waste incineration.

3112 Sand Blasting Media

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) unused, or spent, surface cleaning or decontamination particulate material. Typical examples of surface cleaning or decontamination particulate materials are coarse sand and glass beads.

3113 Absorbed Aqueous Liquids

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) inorganic particulate absorbent materials, including absorbed aqueous liquids, if present. Typical examples of inorganic particulate absorbent materials are clay, vermiculite, and diatomaceous earth.

3114 Absorbed Organic Liquids

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) inorganic particulate absorbent materials with absorbed organic liquids. Typical examples of inorganic particulate absorbent materials are clay, vermiculite, and diatomaceous earth.

3115 Ion Exchange Media

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) unused, or spent, inorganic ion exchange resins.

3116 Calcined Solids

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) solid materials generated from the calcination of liquids. A specific example is the HLW calcine at the INEL.

3119 Uncategorized Inorganic Particulates

This category includes waste that is;

- 1) consistent with the definition for inorganic particulates but lack adequate characterization information for assignment into one of the 3111 through 3116 categories, or

- 2) consistent with the definition for inorganic particulates but inconsistent with the definitions for categories 3111 through 3116, or
- 3) a mixture of categories 3111 through 3116 with none contributing at least 50% by volume to the matrix.

3120 Inorganic Sludges

This category includes waste that is at least 50% by volume inorganic sludges. The inorganic sludge may be mixed with stabilization agents, such as cement, provided the mixture has not properly cured to form a solidified monolith (see category 3150). The inorganic sludge may also be mixed with inorganic particulate absorbent materials.

3121 Wastewater Treatment Sludges

This category includes waste that is at least 50% by volume secondary sludge or filtercake from wastewater treatment processes.

3122 Pond Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from the remediation of surface impoundments, such as evaporation or sedimentation basins.

3123 Off-Gas Treatment Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from wet off-gas treatment systems.

3124 Plating Waste Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from plating operations.

3125 Reprocessing Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from nuclear fuel reprocessing operations.

3129 Uncategorized Inorganic Sludges

This category includes waste that is;

- 1) consistent with the definition for inorganic sludges but lack adequate characterization information for assignment into one of the 3121 through 3125 categories, or
- 2) consistent with the definition for inorganic sludges but inconsistent with the definitions for categories 3121 through 3125, or
- 3) a mixture of categories 3121 through 3125 with none contributing at least 50% by volume to the matrix.

3130 Paint Waste

This category includes waste that is at least 50% by volume new, used, or removed paint.

3131 Paint Chips/Solids

This category includes waste that is at least 50% by volume solid, or unpourable paint. Examples of waste that might be included in this category are dried paint chips or containers filled with dried paint. Painting equipment (e.g. brushes, rollers, etc) are categorized as debris.

3132 Paint Liquids/Sludge

This category includes waste that is at least 50% by volume pourable paint. Examples of waste that might be included in this category are opened or unopened cans of paint.

3139 Uncategorized Paint Waste

This category includes waste that is;

- 1) consistent with the definition for salt waste but lack adequate characterization information for assignment into one of the 3131 and 3132 categories, or
- 2) consistent with the definition for salt waste but inconsistent with the definitions for categories 3131 and 3132.

3140 Salt Waste

This category includes waste that is at least 50% by volume salts, including interstitial liquids, if present.

3141 Chloride Salts

This category includes waste that is at least 50% by volume salts and contain more than trace (i.e. > 1000 ppm) levels of chlorides or other halogens.

3142 Sulfate Salts

This category includes waste that is at least 50% by volume salts and contain more than trace (i.e. > 1000 ppm) levels of sulfur compounds.

3143 Nitrate Salts

This category includes waste that is at least 50% by volume salts. The salts are predominantly nitrates.

3149 Uncategorized Salt Waste

This category includes waste that is;

- 1) consistent with the definition for salt waste but lack adequate characterization information for assignment into one of the 3141 through 3143 categories, or
- 2) consistent with the definition for salt waste but inconsistent with the definitions for categories 3141 through 3143, or
- 3) a mixture of categories 3141 through 3143 with none contributing at least 50% by volume to the matrix.

3150 Solidified Process Residues

This category includes waste that has been immobilized with cement, or other inorganic stabilization agents, and cured into a solidified form but do not meet disposal criteria.

3190 Uncategorized Inorganic Process Residues

This category includes waste that is;

- 1) consistent with the definition for inorganic homogeneous solids but lack adequate characterization information for assignment into one of the 3110 through 3150 categories, or
- 2) consistent with the definition for inorganic homogeneous solids but inconsistent with the definitions for categories 3110 through 3150, or
- 3) a mixture of categories 3110 through 3150 with none contributing at least 50% by volume to the matrix.

3200 Organic Process Residues

This category includes waste that is at least 50% by volume organic process residues. These are defined as process residues with a base structure that is primarily organic. The matrix may contain some inorganic solids content such that up to approximately 20% by weight of the waste would remain as residue (i.e. ash/solids) following incineration.

3210 Organic Particulates

This category includes waste that is at least 50% by volume organic particulates, including residual or absorbed liquids, if present. Typical examples of organic particulates are resins and activated carbon used in wastewater treatment, or particulate organic absorbent materials.

3211 Activated Carbon

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) spent or unused activated carbon. Activated carbon is typically used for removal of organic materials during off-gas or wastewater treatment operations.

3212 Organic Resins

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) spent or unused organic based resins, other than activated carbon, used in wastewater treatment or other applications. An example of waste that might be included in this category is organic ion exchange resins.

3213 Organic Absorbents

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) organic particulate absorbent materials, including any absorbed aqueous or organic liquids. Examples of waste that might be included in this category are sawdust or ground corn cobs with absorbed aqueous or organic liquids.

3219 Uncategorized Organic Particulates

This category includes waste that is;

- 1) consistent with the definition for organic particulates but lack adequate characterization information for assignment into one of the 3211 through 3213 categories, or
- 2) consistent with the definition for organic particulates but inconsistent with the definitions for categories 3211 through 3213, or
- 3) mixtures of categories 3211 through 3213 with none contributing at least 50% by volume to the matrix.

3220 Organic Sludges

This category includes waste that is at least 50% by volume organic sludges. Examples of waste streams included in this category are biological sludges and heavy, unpourable organic materials, such as tars or greases.

3221 Biological Materials

This category includes waste that is at least 50% by volume biological materials generated in treating wastewater from animals or people, or other biological materials that can not be classified as debris.

3222 Halogenated Organic Sludges

This category includes waste that is at least 50% by volume organic sludges which contain at least 1000 ppm HOC.

3223 Nonhalogenated Organic Sludges

This category includes waste that is at least 50% by volume organic sludges which contain less than 1000 ppm HOC.

3229 Uncategorized Organic Sludges

This category includes waste that is;

- 1) consistent with the definition for organic sludges but lack adequate characterization information for assignment into one of the 3221 through 3223 categories, or
- 2) consistent with the definition for organic sludges but inconsistent with the definitions for categories 3221 through 3223, or
- 3) mixtures of categories 3221 through 3223 with none contributing at least 50% by volume to the matrix.

3230 Organic Chemicals

This category includes waste that is at least 50% by volume solid, unused organic chemicals packaged in bulk form that are either being excessed or have expired. This category does not include solid organic chemicals packaged as lab packs (see Section 4.3).

3290 Uncategorized Organic Process Residues

This category includes waste that is;

- 1) consistent with the definition for organic homogeneous solids but lack adequate characterization information for assignment into one of the 3210 through 3230 categories, or
- 2) consistent with the definition for organic homogeneous solids but inconsistent with the definitions for categories 3210 through 3230, or
- 3) mixtures of categories 3210 through 3230 with none contributing at least 50% by volume to the matrix.

3900 Uncategorized Process Residues

This category includes waste that is;

- 1) consistent with the definition for homogeneous solids but lack adequate characterization information for assignment into one of the 3100 or 3200 categories, or
- 2) consistent with the definition for homogeneous solids but inconsistent with the definitions for categories 3100 or 3200.

4.2.2 Soils

4000 Soils

This category includes waste streams that are at least 50% by volume soil, including contamination from spills, etc. Soils are further categorized based on the amount of debris included in the matrix.

4100 Contaminated Soils

This category includes waste that is greater than approximately 95% by volume soil and rock, including contamination from spills, etc.

4200 Contaminated Soils/Debris

This category includes waste that is at least 50% by volume soil and 5% by volume other debris, not including rock. Rock materials that meet the criteria for debris should be included in the contaminated soil category (4100). This category includes contaminated soil and rock from spills etc., with the balance of the matrix being debris.

4900 Uncategorized Soils

This category includes waste that are;

- 1) consistent with the definition for soils but lack adequate characterization information for assignment into one of the 4100 or 4200 categories, or
- 2) consistent with the definition for soils but inconsistent with the definitions for categories 4100 or 4200.

4.2.3 Debris Waste

5000 Debris Waste

This category includes waste that is at least 50% by volume materials which meet the EPA criteria for classification as debris. These criteria are as follows:

"Debris means solid material exceeding a 60 mm particle size that is intended for disposal and that is: 1) a manufactured object, or 2) plant or animal matter, or 3) natural geologic material. However, the following materials are not debris: 1) any material for which a specific treatment standard is provided in Subpart D, Part 268, 2) process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges, or air emission residues; and 3) intact containers of hazardous waste that are not ruptured and that retain at least 75% of their original volume. A mixture of debris that has not been treated to the standards provided by §268.45 and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume, based on visual inspection." [40 CFR §268.2(g)]

"Hazardous Debris means debris that contains a hazardous waste, listed in Subpart D of Part 261, or that exhibits a characteristic of hazardous waste identified in Subpart C of Part 261." [40 CFR §268.2(h)]

5100 Metal Debris

This category includes debris that is approximately 95% by volume, or more, metal. Metal debris is further categorized according to lead and cadmium content.

5110 Metal Debris without Pb or Cd

This category includes debris that is approximately 95% by volume, or more, metal and do not contain any bulk, separable or bonded, lead or cadmium as part of the matrix.

5120 Lead Containing Metal Debris

This category includes debris that is approximately 95% by volume, or more, metal and contain bulk, separable or bonded, lead as part of the matrix. Examples of waste that might be included in this category are glovebox parts with lead clad in stainless steel or scrap metal that includes some lead bricks. This category does not include waste that meets the criteria for categorization as elemental lead or lead acid batteries (see Section 4.4).

5130 Cadmium Containing Metal Debris

This category includes debris that is approximately 95% by volume, or more, metal and contain bulk, separable or bonded, cadmium as part of the matrix. This category includes debris that is essentially entirely elemental cadmium, such as cadmium sheets. This category does not include cadmium batteries (see Section 4.4).

5190 Uncategorized Metal Debris

This category includes debris that is consistent with the definition for category 5100 but;

- 1) lack adequate characterization information for assignment into one of the 5110 through 5130 categories, or
- 2) contain both lead and cadmium, separable or bonded, as part of the bulk matrix.

5200 Inorganic Non-Metal Debris

This category includes waste that is approximately 95% by volume, or more, inorganic nonmetal debris.

5210 Concrete Debris

This category includes debris that is approximately 95% by volume, or more, concrete. An example of waste that might be included in this category is concrete chunks and blocks from decontamination and decommissioning activities. This category does not include waste solidified with cementitious stabilization agents (see Section 4.2).

5220 Glass Debris

This category includes debris that is approximately 95% by volume, or more, glass. Examples of waste that might be included in this category is leaded glass windows, bottles, or light bulbs. Crushed glass may be included in this category provided it meets the EPA particle size criteria for classification as debris.

5230 Ceramic/Brick Debris

This category includes debris that is approximately 95% by volume, or more, ceramic or brick materials. Examples of waste that might be included in this category are bricks, ceramic crucibles, and ceramic refractories.

5240 Rock Debris

This category includes debris that is approximately 95% by volume, or more, rock or gravel materials provided the particle size meets the EPA criteria for classification as debris.

5250 Asbestos Debris

This category includes debris that is approximately 95% by volume, or more, asbestos or asbestos based materials. Examples of waste that might be included in this category are asbestos containing gloves, firehoses, aprons, flooring tiles, pipe insulation, boiler jackets, and laboratory tabletops.

5290 Uncategorized Inorganic Non-Metal Debris

This category includes debris that is consistent with the definition for category 5200 but;

- 1) lack adequate characterization information for assignment into one of the 5210 through 5250 categories, or
- 2) inconsistent with the definitions for categories 5210 through 5250, or
- 3) is a mixture of the debris materials included in categories 5210 through 5250 with none contributing approximately 95% by volume, or more, to the matrix.

5300 Combustible Debris

This category includes debris that is approximately 95% by volume, or more, combustible materials. Examples of combustible debris are materials constructed of plastic, rubber, wood, paper, cloth, and graphite and biological materials.

5310 Plastic/Rubber Debris

This category includes debris that is approximately 95% by volume, or more, plastic and/or rubber materials. Examples of waste that might be included in this category

are plastic or rubber sheeting, containers, gloves, gaskets, and components of benelex or plexiglass.

5311 Leaded Gloves/Aprons Debris

This category includes debris that is approximately 95% by volume, or more, rubber materials which contain a high fraction of lead or lead compounds. Examples of waste that might be included in this category are leaded glovebox gloves or aprons.

5312 Halogenated Plastic Debris

This category includes debris that is approximately 95% by volume, or more, plastic/rubber materials which contain halogenated plastics, such as PVC, as part of the matrix.

5313 Nonhalogenated Plastic Debris

This category includes debris that is approximately 95% by volume, or more, plastic/rubber materials, excluding leaded gloves and aprons, which do not contain halogenated plastics as part of the matrix.

5319 Uncategorized Plastic/Rubber Debris

This category includes debris that is consistent with the definition for category 5310 but;

- 1) lack adequate characterization information for assignment into one of the 5311 through 5313 categories, or
- 2) inconsistent with the definitions for categories 5311 through 5313, or
- 3) is a mixture of the debris materials included in categories 5311 through 5313 with none contributing approximately 95% by volume, or more, to the matrix.

5320 Wood Debris

This category includes debris that is approximately 95% by volume, or more, wood or wood products other than paper. Examples of waste that might be included in this category are structural timbers, boxes, or pallets.

5330 Paper/Cloth Debris

This category includes debris that is approximately 95% by volume, or more, paper or cloth materials. Examples of waste that might be included in this category are protective clothing, rags, or wipes. Rags and wipes may contain some absorbed organic or aqueous liquids.

5340 Graphite Debris

This category includes debris that is approximately 95% by volume, or more, graphite based solid materials. Examples of waste that might be included in this category are crucibles, graphite components, and pure graphite.

5350 Biological Debris

This category includes debris that is approximately 95% by volume, or more, biological materials, including any chemical agents such as lime or formaldehyde.

Examples of waste that might be included in this category are biological samples and animal carcasses.

5390 Uncategorized Combustible Debris

This category includes debris that is consistent with the definition for category 5300 but;

- 1) lack adequate characterization information for assignment into one of the 5310 through 5350 categories, or
- 2) inconsistent with the definitions for categories 5310 through 5350, or
- 3) is a mixture of the debris materials included in categories 5310 through 5350 with none contributing approximately 95% by volume, or more, to the matrix.

5400 Heterogeneous Debris

This category includes waste that is at least 50% by volume debris materials which do not meet the criteria for assignment into categories 5100, 5200, or 5300 and associated subcategories. An example is waste that is essentially entirely debris but is not dominant (i.e. approximately 95% by volume, or more) in either metal, inorganic nonmetal, or combustible debris materials. Another example is waste that is at least 50% by volume debris materials with the balance being soil or solid process residues.

5410 Composite Filters

This category includes debris that is approximately 50% by volume, or more, HEPA or other filters constructed of more than one material type (i.e. metal, inorganic nonmetal, and combustible). Filters constructed of a single material type are assigned into the appropriate metal, inorganic nonmetal, combustible, or heterogeneous debris category depending on the composition of the entire waste matrix.

5420 Predominantly Metal Debris

This category includes debris that contains approximately 50% by volume, or more, but less than approximately 95% by volume metal materials. The balance of the matrix may be other types of debris materials (i.e. inorganic nonmetal, combustible), soil, or solid process residues.

5430 Predominantly Inorganic Non-Metal Debris

This category includes debris that contains approximately 50% by volume, or more, but less than approximately 95% by volume inorganic nonmetal materials. The balance of the matrix may be other types of debris materials (i.e. metal, combustible), soil, or solid process residues.

5440 Predominantly Combustible Debris

This category includes debris that contains approximately 50% by volume, or more, but less than approximately 95% by volume combustible materials. The balance of the matrix may be other types of debris materials (i.e. metal, inorganic nonmetal), soil, or solid process residues.

5450 Asphalt Debris

This category includes debris that is approximately 50% by volume, or more, asphalt or other bituminous materials. Examples of waste that might be included in this category are asphalt materials from roadways shingles, bituminous cement or other materials containing both tar and gravel.

5490 Uncategorized Heterogeneous Debris

This category includes debris that is consistent with the definition for category 5400 but;

- 1) lack adequate characterization information for assignment into one of the 5410 through 5450 categories, or
- 2) inconsistent with the definitions for categories 5410 through 5450, or
- 3) is a mixture of heterogeneous debris materials included in categories 5410 through 5450 with none contributing approximately 50% by volume, or more, to the matrix.

4.3 SPECIFIC WASTE FORMS

These categories address certain waste forms which require specific treatment technologies not expected to be common with other waste forms. Specific waste forms are initially categorized according to the general classifications of special waste or inherently hazardous waste. Figure 3 shows these general classifications and associated categories. Following are the category definitions.

4.3.1 Special Waste

6000 Special Waste

This category includes various specific waste forms which will require specific treatment methods that are not expected to be common with other waste forms. The waste forms include lab packs, reactive metals, explosives, and compressed gases and aerosols.

6100 Lab Packs

This category includes waste packaged as lab packs. In this guidance, lab packs are defined as waste with inner containers of free liquids or solid chemicals surrounded by absorbents and packaged within a larger outer container. The absorbents can be solid process residues materials or debris. Examples of absorbent materials include rags, vermiculite, diatomaceous earth, and paper wipes. This category does not include lab packs of elemental liquid mercury (see Section 4.3.2).

6110 Organic Lab Packs

This category includes lab packs that contain only organic liquids. This category does not include organic scintillation fluids contained in vials that are packaged in a lab pack configuration (see Category 6140).

6120 Aqueous Lab Packs

This category includes lab packs that contain only aqueous liquids. This category does not include aqueous scintillation fluids contained in vials that are packaged in a lab pack configuration (see Category 6140).

6130 Solid Lab Packs

This category includes lab packs of only solid chemicals or other solid materials.

6140 Scintillation Cocktails

This category includes scintillation fluids contained in vials that are packaged in a lab pack configuration.

6190 Uncategorized Lab Packs

This category includes lab packs that;

- 1) lack adequate characterization information for assignment into one of the 6110 through 6140 categories, or
- 2) are inconsistent with the definitions for categories 6110 through 6140, or
- 3) contain two, or more, of the above listed specific lab pack category materials (organic liquids, aqueous liquids, and solid chemicals).

6200 Reactive Metals

This category includes reactive metal waste. In this guidance, these are defined as waste meeting the criteria for classification as water reactive or ignitable reactive per the Third Third LDR rule (55FR 22545 and 22553). Typically these waste streams are sodium metal or sodium metal alloys, but can also include particulate fines of aluminum, uranium, zirconium, or other pyrophoric materials. The waste may be mixed with stabilizing materials.

6210 Bulk Reactive Metals

This category includes waste that is essentially bulk reactive metals and meets the criteria for classification as water reactive per the Third Third LDR rule. Typically this waste is sodium metal or sodium metal alloys.

6220 Components Contaminated with Reactive Metals

This category includes piping, pumps and other retired equipment waste that is considered water reactive per the Third Third LDR rule due to reactive metal contamination. The bulk of the material is not reactive metals, but the reactive metals require treatment before disposal.

6230 Pyrophoric Fines

This category includes waste that is essentially bulk materials which meets the criteria for classification as ignitable reactive per the Third Third LDR rule. Examples are fines of aluminum, uranium, zirconium, or other pyrophoric materials. The waste may be mixed with stabilizing materials.

6290 Uncategorized Reactive Metals

This category includes reactive metal waste with characteristics that are not consistent with the definitions for categories 6210 through 6230.

6300 Explosives/Propellants

This category includes waste consisting of substances which undergo rapid chemical transformations which produce large amounts of gases and heat. The gases rapidly expand at velocities exceeding the speed of sound (due to the heat of reaction), which creates a shock

wave and explosion. Waste that meets this definition should be identified here regardless of the specific physical form. Liquid nitroglycerine, for instance, should be categorized as explosive and not organic liquid. Similarly, TNT would be categorized as explosive rather than solid process residue.

6400 Compressed Gases/Aerosols

This category includes waste meeting the criteria for classification as ignitable compressed gases per the Third Third LDR rule (55FR 22545). Typically, this is waste consisting of pressurized gas cylinders or aerosol cans. Depressurized gas cylinders or aerosol cans would not be included in this category. These would be categorized into the appropriate debris category (see Section 4.2.2).

4.3.2 Inherently Hazardous Waste

7000 Inherently Hazardous Waste

This category includes waste in which the entire matrix is hazardous, such as elemental lead, or which the entire waste form is regulated, such as batteries.

7100 Elemental Mercury

This category includes waste that is bulk, pourable liquid mercury. The liquid mercury may be packaged in small containers within a larger container holding other materials (e.g. lab pack configuration).

7200 Elemental Lead

This category includes waste that contain at least 50% by volume bulk elemental lead. Examples of waste in this category are lead bricks, sheets, and pipes.

7210 Non-Activated Lead

This category includes waste meeting the above criteria for categorization as elemental lead in which the elemental lead shapes are only surface contaminated with radionuclides.

7220 Activated Lead

This category includes waste meeting the above criteria for categorization as elemental lead in which the elemental lead shapes are activated.

7300 Beryllium Waste

This category includes waste that is essentially beryllium dust or beryllium chips and fines that may also contain beryllium dust. This category does not include debris waste that is contaminated with beryllium dust.

7400 Batteries

This category includes waste consisting of batteries. The batteries may be packaged with absorbent materials (e.g. particulates, rags, etc.).

7410 Lead Acid Batteries

This category includes waste consisting of drained or undrained lead acid batteries.

7420 Cadmium Batteries

This category includes waste consisting of cadmium batteries.

7490 Uncategorized Batteries

This category includes waste consisting of batteries that;

- 1) lack adequate characteristic information to determine battery type, or
- 2) is of a type other than lead acid or cadmium, or
- 3) is a mixture of the above, or other, types.

4.4 UNKNOWN MATRIX

These categories address waste with insufficient characterization information to enable assignment into any of the categories addressed in Sections 4.1, 4.2, and 4.3. The categories are shown in Figure 3. Following are the category definitions.

4.4.1 Unknown Matrix

8000 Unknown Matrix

There are three unknown matrix subcategories as defined below.

8100 Unknown Liquids

This category includes bulk liquid or slurry waste which can not be further categorized as aqueous or organic (see Section 4.1) because it is not known if the TOC level is less, or greater than 1%.

8200 Unknown Solids

This category includes solid waste for which insufficient characterization information exists to further categorize as a solid process residue, soil, or debris per the definitions of Section 4.2.

8900 Uncategorized Unknown

This category includes waste for which insufficient characterization information is known to enable categorization as a liquid or solid (see Sections 4.1 and 4.2) or as one of the specific waste forms (see Section 4.3).

4.5 FINAL WASTE FORMS

These categories address final waste forms that meet disposal criteria, including applicable LDR treatment standards. Figure 3 shows the categories. Following are the category definitions.

4.5.1 Final Waste Forms

9000 Final Waste Forms

There are five subcategories of final waste forms as defined below.

9100 Cement Forms

This category includes waste that has been immobilized with grout or other cement type binders and meet disposal criteria, including applicable LDR treatment standards.

9200 Vitrified Forms

This category includes waste that has been immobilized via vitrification and meet disposal criteria, including applicable LDR treatment standards.

9300 Metal Forms

This category includes metal waste that has been consolidated or decontaminated and are ready for disposal or recycle.

9400 Polymer Forms

This category includes waste that has been immobilized with organic binders and meet disposal criteria, including applicable LDR treatment standards.

9900 Other Forms

This category includes all other final waste forms not addressed by categories 9100 through 9400 which meet disposal criteria, including applicable LDR treatment standards. Examples are amalgamated mercury and macroencapsulated lead.

5. CONTAMINANT PARAMETER

This section presents the categories and definitions for the contaminant parameter and instructions for assigning these categories. The contaminant categories are identified by the waste regulatory authority(s) and, for Federally RCRA regulated waste, is further defined by the types of hazardous contaminants and characteristics associated with the waste. These categories influence the treatment requirements for the waste from both a technical and regulatory perspective.

The regulatory authority classifications, used to identify the contaminant parameter, are as follows:

- Federally RCRA Regulated
- TSCA (PCB) Regulated
- State Regulated Hazardous Waste

The contaminant parameter is represented by a combination of all of the specific categories that are applicable to the waste. A waste stream may have more than one applicable contaminant category. The contaminant categories are shown in Figure 4.

A complete treatability group assignment for the contaminant parameter is represented by listing the combined contaminant categories that are applicable to the waste. The applicable categories should be listed in the following order:

| | |
|-----------------|------------|
| Organics | ORG |
| Metals | MET or MHG |
| Ignitable | I1...I9 |
| Corrosive | C9 |
| Reactive | R9 |
| TSCA Regulated | PCB |
| State Regulated | ST |

Various combinations of the contaminant categories can result in numerous possible contaminant parameters for Federally RCRA regulated waste. Following are the more specific category definitions.

5.1 FEDERALLY RCRA REGULATED

These wastes are hazardous pursuant to RCRA regulations promulgated by the EPA (i.e., 40 CFR 261). The contaminant parameter for waste in this regulatory authority classification are defined by five categories including:

- hazardous organics,
- metals,
- ignitability,
- corrosivity, and
- reactivity.

Following are the guidelines for determining the contaminant categories.

5.1.1 Organic Contaminants

ORG Organics

This category includes Federally RCRA regulated waste if the waste is assigned one, or more, of the EPA codes in Appendix A, Tables A-1 through A-8 indicating the presence of hazardous organics. The organic component is not included in cases where the only indicator of organic contamination is the presence of a listed EPA code for which LDR treatment standards have been met.

5.1.2 Metal Contaminants

MHG Metals With Mercury

This category includes Federally RCRA regulated waste if the waste is assigned one, or more, EPA hazardous waste codes indicating the presence of toxic metals, but specifically mercury, identified in Appendix A, Table A-12. Mercury is specifically emphasized over other toxic metals because of its prevalence in DOE waste and its effect on appropriate treatment technology selection, particularly with respect to effluent controls and recovery. This category is not included in cases where the only indicator of metal contamination is the presence of a listed EPA code for which LDR treatment standards have been met.

MET Metals Without Mercury

This category includes Federally RCRA regulated waste if the waste is assigned one, or more, EPA hazardous waste codes indicating the presence of toxic metals but does not include mercury, identified in Appendix A, Tables A-9 through A-11, but none of the EPA codes in Appendix A, Table A-12. This category is not included in cases where the only indicator of metal contamination is the presence of a listed EPA code for which LDR treatment standards have been met.

5.1.3 Ignitable Characteristic

I1 Ignitable Liquids

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable liquids in the Third Third LDR rule (55 FR 22543).

I2 Ignitable Compressed Gases

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable compressed gases in the Third Third LDR rule (55 FR 22543).

I3 Ignitable Reactives

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable reactives in the Third Third LDR rule (55 FR 22543).

I4 Ignitable Oxidizers

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable oxidizers in the Third Third LDR rule (55 FR 22543).

I9 Ignitable Other

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, but;

- 1) lacks adequate characterization information for assignment into one of the other ignitable categories, or
- 2) is a mixture of the other ignitable categories.

5.1.4 Corrosive Characteristic

C9 Corrosive

This category includes Federally RCRA regulated waste if the waste exhibits the characteristic of corrosivity as defined in 40 CFR 261 and is assigned the EPA hazardous waste code D002. More specific subcomponents of corrosivity to represent the LDR subcategories of acid, alkaline, and other are not included. The majority of waste that exhibits the characteristic of corrosivity will be acidic or basic aqueous liquids. These more specific corrosive characteristics are identified through assignment of the matrix category (see Section 4.1).

5.1.5 Reactive Characteristic

R9 Reactive

This category includes Federally RCRA regulated waste if the waste exhibits the characteristic of reactivity as defined in 40 CFR 261 and is assigned the EPA hazardous waste code D003. More specific subcomponents of reactivity to represent the LDR subcategories of reactive cyanides, reactive sulfides, reactive explosives, water reactives and other reactives are not included. These specific characteristics of reactivity are, in most cases, identified through assignment of the matrix category (see Sections 4.1 and 4.3).

5.2 TSCA (PCB) REGULATED PCBS

PCB TSCA

This category includes waste that is subject to TSCA regulation due to the presence of PCBs.

5.3 STATE REGULATED HAZARDOUS WASTE

ST State Regulated

This category includes waste that is defined as hazardous only under State regulations. Due to variations in the more stringent State regulations, this guidance does not propose a method of establishing more detailed contaminant categories based on State hazardous waste codes.

6. METHODOLOGY APPLICATION

This section provides some sample applications to demonstrate the treatability group assignment process. This section also provides examples of complete treatability group names.

6.1 SAMPLE APPLICATIONS

Example 1

Waste Data

A waste stream is comprised of several 55 gallon drums containing waste from closure of a wastewater treatment facility. Physically, the waste is sludge consisting of metal hydroxide precipitates and water. On average, each drum contains over 90%, by volume, sludge.

Radiologically, the waste contains low-levels of miscellaneous fission products with exposure rates $< < 100$ mR/hr at drum surface. The waste contains transuranic isotopes $< < 10$ nCi/g. Sampling and analysis revealed the waste to contain levels of barium (D005), chromium (D007), and lead (D008) regulated by the EPA. The pH of the residual liquid was measured at 12.8 (D002). The waste is not PCB contaminated.

Parameter Category Assignments

Radiologically, the waste is low-level, contact-handled, and contains transuranic isotopes < 10 nCi/g. Referring to Section 3, the radiological category code for the waste is LL/CH/BG.

Referring to Section 4.1, the matrix characteristics meet the criteria for categorization as a process residue solid (Category 3000). The matrix characteristics further meet the criteria for assignment to the following successive subcategories associated with homogeneous solids:

Categorizing to the lowest level of detail, the matrix category is Wastewater Treatment Sludges.

Based on the EPA codes, the applicable components for defining the contaminant category are metals and corrosive. For metals, the most specific, applicable subcomponent is Metals Without Mercury (MET). Therefore, the contaminant category code for the waste is MET/C9.

Example 2

Waste Data

A waste stream is comprised of several 55 gallon drums containing "legacy" waste from past plutonium processing operations. Physically, each drum contains over 75% by volume of material meeting the LDR criteria for classification as debris. Available data indicates that, on average, each drum contains approximately 60% by volume combustible debris materials, such as plastic, paper and rags. On average,

the balance of each drum is approximately 20% by volume metal debris materials and 20% by volume vermiculite added as a drum filler.

Radiologically, the waste was considered transuranic when generated due to the presence of ≈ 80 nCi/g transuranic isotopes. Presently, however, the waste is considered low-level. The beta-gamma activity level is negligible. Based as process knowledge, the waste was assigned the F002 and D008 EPA codes. The waste is not PCB contaminated.

Parameter Category Assignment

Radiologically, the waste is low-level, contact-handled, and contains transuranic isotopes > 10 nCi/g. Referring to Section 3, the radiological parameter category code is LL/CH/TAL.

Referring to Section 4.1, the matrix characteristics meet the criteria for categorization as debris (Category 5000). The matrix characteristics further meet the criteria for assignment to the following successive subcategories associated with debris:

| | | |
|-----------------------------------|--------|--|
| Heterogeneous Debris (5400) | —————> | Predominantly Combustible Debris (5440) |
|-----------------------------------|--------|--|

Categorizing to the lowest level of detail, the matrix category is Predominantly Combustible Debris.

Based on the EPA codes, the applicable components for defining the contaminant category are organics and metals. For metals, the most specific, applicable subcomponent is Metals Without Mercury (MET). Therefore, the contaminant category code for the waste is ORG/MET.

6.2 EXAMPLE TREATABILITY GROUP NAMES

The complete treatability group name for a given waste is a combination of the applicable radiological, matrix, and contaminant categories as follows:

Radiological Category - Matrix Category - Contaminant Category

Following this logic, the complete treatability group names for the above two examples are:

Example 1: LL/CH/BG - Wastewater Treatment Sludges - MET/C9

Example 2: LL/CH/TAL - Predominantly Combustible Debris - ORG/MET

APPENDIX A

EPA CODES BY CONTAMINANT CATEGORY COMPONENTS

Table A-1. Nonhalogenated Toxicity Characteristic Organics

| EPA Code | Chemical Name |
|-----------------|----------------------|
| D018 | benzene |
| D023 | o-cresol |
| D024 | m-cresol |
| D025 | p-cresol |
| D026 | cresol |
| D030 | 2,4-dinitrotoluene |
| D035 | methyl ethyl ketone |
| D036 | nitrobenzene |
| D038 | pyridine |

Table A-2. Nonhalogenated Spent Solvents

| EPA Code | Chemical Name |
|-----------------|------------------------|
| F003 | Xylene |
| F003 | Acetone |
| F003 | Ethyl Acetate |
| F003 | Ethyl Benzene |
| F003 | Ethyl Ether |
| F003 | Methyl Isobutyl Ketone |
| F003 | n-Butyl Alcohol |
| F003 | Cyclohexanone |
| F003 | Methanol |
| F004 | Cresols |
| F004 | Cresylic Acid |
| F004 | Nitrobenzene |
| F005 | Toluene |
| F005 | Methyl Ethyl Ketone |
| F005 | Carbon Disulfide |
| F005 | Isobutanol |
| F005 | Pyridine |
| F005 | Benzene |
| F005 | 2-Ethoxyethanol |
| F005 | 2-Nitropropane |

Table A-3. Nonhalogenated P & U Listed Organics

| EPA Code | Chemical Name |
|----------|--------------------------------------|
| P001 | Warfarin (>0.3%) |
| P002 | 1-Acetyl-2-thiourea |
| P003 | Acrolein |
| P005 | Allyl alcohol |
| P007 | 5-Aminoethyl 3-isoxazolol |
| P008 | 4-Aminopyridine |
| P014 | Thiophenol (Benzene thiol) |
| P018 | Brucine |
| P020 | 2-sec-Butyl-4,6-dinitrophenol |
| P022 | Carbon Disulfide |
| P031 | Cyanogen |
| P034 | 2-Cyclohexyl-4,6-dinitrophenol |
| P038 | Diethylarsine |
| P039 | Disulfoton |
| P040 | Diethyl-p-pyrazinyl phosphorothioate |
| P041 | Diethyl-p nitrophenyl phosphate |
| P042 | Epinephrine |
| P044 | Dimethoate |
| P045 | Thiofanox |
| P046 | alpha, alpha-Dimethylphenethylamine |
| P047 | 4,6 Dinitrocresol |
| P048 | 2,4-Dinitrophenol |
| P049 | 2,4-Dithiobiuret |
| P054 | Aziridine |
| P062 | Hexaethyltetraphosphate |
| P064 | Isocyanic acid, ethyl ester |
| P066 | Methomyl |
| P067 | 2-Methylaziridine |
| P068 | Methyl hydrazine |
| P069 | Methylacetoneitrile |
| P070 | Aldicarb |
| P071 | Methyl parathion |
| P072 | 1-Naphthyl-2-thiourea |
| P075 | Nicotine and salts |
| P077 | p-Nitroaniline |
| P081 | Nitroglycerin |
| P082 | N-Nitrosodimethylamine |
| P084 | N-Nitrosomethylvinylamine |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|---------------------|-------------------------------|
| P085 | Octamethylpyrophosphoramide |
| P088 | Endothall |
| P089 | Parathion |
| P092 | Phenyl Mercury Acetate |
| P093 | N-Phenylthiourea |
| P094 | Phorate |
| P097 | Famphur |
| P101 | Ethyl cyanide |
| P102 | Propargyl alcohol |
| P108 | Strychnine and salts |
| P109 | Tetraethyldithiopyrophosphate |
| P110 | Tetraethyl Lead |
| P111 | Tetraethyl Pyrophosphate |
| P112 | Tetranitromethane |
| P116 | Thiosemicarbazide |
| U001 | Acetaldehyde |
| U002 | Acetone |
| U003 | Acetonitrile |
| U004 | Acetophenone |
| U007 | Acrylamide |
| U008 | Acrylic acid |
| U009 | Acrylonitrile |
| U010 | Mitomycin C |
| U011 | Amitrole |
| U012 | Aniline |
| U014 | Auramine |
| U015 | Azaserine |
| U016 | Benz (c) acridine |
| U018 | Benz(a)anthracene |
| U019 | Benzene |
| U021 | Benzidine |
| U022 | Benzo(a)pyrene |
| U028 | Bis(2-ethylhexyl) pthalate |
| U031 | n-Butyl alcohol |
| U050 | Chrysene |
| U051 | Creosote |
| U052 | Cresols (Cresylic acid) |
| U053 | Crtonaldehyde |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|-----------------|-------------------------------------|
| U055 | Cumene |
| U056 | Cyclohexane |
| U057 | Cyclohexanone |
| U059 | Daunomycin |
| U063 | Dibenzo(a,h)anthracene |
| U064 | 1,2,7,8-Dibenzopyrene |
| U069 | Di-n-butyl phthalate |
| U085 | 1,2,3,4-Diepoxybutane |
| U086 | N,N-Diethylhydrazine |
| U087 | O,O-Diethyl S-methyldithiophosphate |
| U088 | Diethyl phthalate |
| U089 | Diethyl stilbestrol |
| U090 | Dihydrosafrole |
| U091 | 3,3-Dimethoxybenzidine |
| U092 | Dimethylamine |
| U093 | p-Dimethylaminoazobenzene |
| U094 | 7,12-Dimethyl benz(a)anthracene |
| U095 | 3,3'-Dimethylbenzidine |
| U096 | a,a-Dimethyl benzyl hydroperoxide |
| U098 | 1,1-Dimethylhydrazine |
| U099 | 1,2-Dimethylhydrazine |
| U101 | 2,4-Dimethylphenol |
| U102 | Dimethyl phthalate |
| U103 | Dimethyl sulfate |
| U105 | 2,4-Dinitrotoluene |
| U106 | 2,6-Dinitrotoluene |
| U107 | Di-n-octyl phthalate |
| U108 | 1,4-Dioxane |
| U109 | 1,2-Diphenylhydrazine |
| U110 | Dipropylamine |
| U111 | Di-n-propylnitrosoamine |
| U112 | Ethyl acetate |
| U113 | Ethyl acrylate |
| U114 | Ethylene bis-dithiocarbamic acid |
| U116 | Ethylene Thiourea |
| U117 | Ethyl ether |
| U118 | Ethyl methacrylate |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|-------------|--------------------------------------|
| U119 | Ethyl methane sulfonate |
| U120 | Fluoranthene |
| U122 | Formaldehyde |
| U123 | Formic acid |
| U124 | Furan |
| U125 | Furfural |
| U126 | Glycidyaldehyde |
| U137 | Indeno(1,2,3-c,d)pyrene |
| U140 | Isobutyl alcohol |
| U141 | Isosafrole |
| U143 | Lasiocarpine |
| U144 | Lead acetate |
| U146 | Lead subacetate |
| U147 | Maleic anhydride |
| U148 | Maleic hydrazide |
| U149 | Malononitrile |
| U152 | Methacrylonitrile |
| U153 | Methane thiol |
| U154 | Methanol |
| U155 | Methapyrilene |
| U157 | 3-Methylchloanthrene |
| U159 | Methyl ethyl ketone |
| U160 | Methyl ethyl ketone peroxide |
| U161 | Methyl isobutyl ketone |
| U162 | Methyl methacrylate |
| U163 | N-Methyl N'-nitro N-Nitrosoguanidine |
| U164 | Methylthiouracil |
| U165 | Naphthalene |
| U166 | 1,4-Naphthoquinone |
| U167 | 1-Naphthylamine |

| U328 | Benzenamine, 2-methyl |
| U353 | Benzenamine, 4-methyl |
| U359 | 2-ethoxyethanol |

Table A-4. Halogenated Toxicity Characteristic Pesticides

| EPA Code | Chemical Name |
|-----------------|----------------------|
| D012 | Endrin |
| D013 | Lindane |
| D014 | Methoxychlor |
| D015 | Toxaphene |
| D016 | 2,4-D |
| D017 | Silvex |

Table A-5. Halogenated Toxicity Characteristic Organics

| EPA Code | Chemical Name |
|-----------------|-----------------------|
| D019 | Carbon tetrachloride |
| D020 | Chlordane |
| D021 | Chlorobenzene |
| D022 | Chloroform |
| D027 | 1,4-dichlorobenzene |
| D028 | 1,2-dichloroethane |
| D029 | 1,1-dichloroethylene |
| D031 | Heptachlor |
| D032 | Hexachlorobenzene |
| D033 | Hexachlorobutadiene |
| D034 | Hexachloroethane |
| D037 | Pentachlorophenol |
| D039 | Tetrachloroethylene |
| D040 | Trichloroethylene |
| D041 | 2,4,5-trichlorophenol |
| D042 | 2,4,6-trichlorophenol |
| D043 | Vinyl Chloride |

Table A-6. Halogenated Spent Solvents

| EPA Code | Chemical Name |
|----------|---------------------------------------|
| F001 | Tetrachloroethylene |
| F001 | Trichloroethylene |
| F001 | Methylene Chloride |
| F001 | 1,1,1-trichloroethane |
| F001 | Carbon Tetrachloride |
| F002 | 1,1,1-trichloroethane |
| F002 | Methylene Chloride |
| F002 | Trichloroethylene |
| F002 | Tetrachloroethylene |
| F002 | Chlorobenzene |
| F002 | 1,1,2-trichloro-1,2,2-trifluoroethane |
| F002 | Ortho-dichlorobenzene |
| F002 | Trichlorofluoromethane |
| F002 | 1,1,2-trichloroethane |

Table A-7. Halogenated Dioxins

| EPA Code | Chemical Name |
|----------|--|
| F020 | Tetra- and pentachlorodibenzo-p-dioxins; tetra- and pentachlorodi-benzofurans; tri- and tetrachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |
| F021 | penta- and hexachlorodibenzo-p-dioxins; penta- and hexachlorodibenzofurans; pentachlorophenol and its derivatives |
| F022 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans |
| F023 | tetra-, and pentachlorodibenzo-p-dioxins; tetra- and pentachlorodibenzofurans; tri- and tetrachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |
| F024 | Numerous chlorinated hydrocarbons; benzene; toluene; naphthalene |
| F025 | Numerous chlorinated hydrocarbons; benzene; toluene; naphthalene |
| F026 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans |
| F027 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans; tri-, tetra-, and pentachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |
| F028 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans; tri-, tetra-, and pentachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |

Table A-8. Halogenated P & U Listed Organics

| EPA Code | Chemical Name |
|---------------------|---------------------------------|
| P004 | Aldrin |
| P016 | Bis(chloromethyl)-ether |
| P017 | Bromoacetone |
| P023 | Chloroacetaldehyde |
| P024 | p-Chloroaniline |
| P026 | 1-(o-Chlorophenyl) thiourea |

| P106 | Sodium cyanide |
| P121 | Zinc cyanide |

APPENDIX D

APPENDIX D NON RADIONUCLIDE INVENTORY DATA SUMMARY

This Appendix presents a summary of the IDCs used in this report from the Non Radionuclide Inventory Database. The appendix is divided into two sections. The first section presents data for the IDCs used for solidified waste streams and the second section presents data for the IDCs used for heterogeneous and soil waste streams.

This appendix contains a summary of the data and does not present details on individual elements or chemical compounds which were listed for some IDCs. Instead this data presents data for chemical forms such as inorganics, organics, etc.

APPENDIX E

APPENDIX E

WASTE STREAM PROFILES

FOOTNOTES FOR THE WASTE STREAM PROFILES

1. Liquid waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidification.
2. WMCs 3000, 3900, 9100, and 9200 are placed in "solidified inorganic waste," "salt waste," or "solidified organic waste," depending on the information provided in the MWIR.
3. Particulate waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidifying particulate waste.
4. WMCs 6100 and 6190 are placed in "solidified organic waste," or "solidified inorganic waste," depending on the information provided in MWIR. Volume conversion is described in footnote 5.
5. Liquid lab pack waste is assumed to be solidified prior to sending to WIPP. It is assumed that the packing material in lab packs will be low-level waste when the liquid containers are removed. A volume conversion of 2.5:1 is assumed for solidification.
6. In error, mixed-residues were not reported in the MWIR for this waste stream (per verbal discussions with Rocky Flats Plant). Mixed residues were added as follows (GAO, 1992):
 - Incinerator Ash (IDCs 419, 420, 421, 425)
 - stored volume - 234 m³
 - projected volume - 0 m³
 - stored volume (to meet criticality and WIPP WAC requirements) - 1202 m³
7. WMCs 6200 and 6290 are placed in "solidified inorganic waste," "solidified inorganic waste," or "heterogeneous waste" if the waste stream must be solidified. They are placed in "unspecified metal waste," or "lead/cadmium metal waste" if they are primarily nonreactive metal contaminated with reactive metal. Reactive waste streams must be treated prior to shipment to WIPP.
8. Waste stream is assumed to be treated prior to shipment to WIPP. Volume change is dependent of the waste stream and treatment.
9. WMC 5000 is placed in "unspecified metal waste," "lead/cadmium metal waste," "inorganic nonmetal waste," "combustible waste," "graphite waste," "heterogeneous waste," or "filter waste," depending on the information in MWIR.
10. WMC 7000 and 9300 are placed in "unspecified metal waste" or "lead/cadmium metal waste," depending on the information in MWIR.
11. WMCs 7400, 7410, 7420, and 7490 are assumed to be drained of liquid and contain only metal waste.
12. These waste streams are excluded from disposal in WIPP at this time.
13. Adequate information is provided in MWIR to change the WMC from "unknown" to a more descriptive WMC. If there is not enough information in MWIR, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

14. The TRU (non-mixed) volume and classification information were taken from the Phase I MWIR.
15. THESE ARE NOT ACTUAL SITE-GENERATED WASTE STREAMS. The TRU (non-mixed) volume was calculated from the difference between the 1993 IDB and the MWIR (Phase II). These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major TRU mixed streams.
16. The amount of steel in the container represents the drum only. The amount of metal in the disposal canister and plug is provided in the Section 5.
17. IDC was changed/assigned for the purposes of this report per the methodology described in Appendix J.
18. The Waste Matrix Code Grouping and/or IDC were assigned based on the distribution of the TRU-Mixed Waste from this site.
19. WMC was changed to be consistent with similar waste streams.
20. This TRU waste stream is classified as "unknown" because there was not adequate information available at the time of publication of this report to classify the waste stream. It is anticipated that characterization information can be generated by the site.
21. Insufficient information is available to determine the appropriate TRUCON code.
22. Insufficient information is available to determine the appropriate NMVP code.
23. Insufficient information is available to determine the Part B category.
24. This waste stream includes residues. The volume of the residue portion of this waste stream is consistent with the volumes reported by Rocky Flats Plant in their "ship as waste" residue scenarios, repackaged/processed to meet criticality and WIPP WAC requirements only (GAO, 1992).
25. The site IDC is not listed in TRUCON. The TRUCON and NMVP codes were assigned based on the TRUCON codes provided in the MWIR (Phase II).
26. There is not adequate information in MWIR to define this waste stream. It will remain in the "unknown" category and will be excluded from disposal in WIPP until characterized.
27. Part B codes are not applicable for non-mixed waste.

WASTE STREAM PROFILES

CAO-94-1005, Rev. 0
June 1994

29-Jun-94

| | | | | | |
|---------------------------------------|--------------------------------|--------------------------------|----|---------------------|------------------------|

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

Footnotes: 15, 20, 21, 22, 27

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

Footnotes: 15, 17, 18, 21, 22, 27

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

APPENDIX G

Sandia National Laboratories

Managed and Operated by Sandia Corporation
a subsidiary of Martin Marietta Corporation
Albuquerque, New Mexico 87185-1328

date : June 24, 1994
to : P.E. Drez, [Drez Environmental Associates]
from :  L. C. Sanchez, Org 6342, MS-1328 (505)848-0685
subject : Comments on May 9, 1994 Communications

The following is a synopsis of communications that took place on May 9, 1994 [1]. In those communications you requested responses to the following two questions:

- [1] In the radionuclide table (Table 3-3.1) located in SAND92-0700/3, there are a series of radionuclide inventories listed by isotope. This is the list that we have to replace in the WTWBIR. On the list, I thought that only isotopes with half-lives greater than 20 years were listed, but for instance, Cf-252 is listed which has a half-life of 2.64 years. Is this because it decays to Cm-248, which has a long half life? There are other isotopes which have half-lives greater than 20 years which are not reported in Table 3-3.1. Is this because of their overall low curie content in the inventory? If so what is the "cut-off" used as to whether an isotope appears in the table?
- [2] One of the strong comments by Karen Knudtsen was that we need to put in a strong justification for the different waste parameters that will be documented in the inventory. Can one or both of you work with the PA and model development people (e.g., Larry Brush) and fill in the table attached?

Per your request [1] I had talked with several people to get responses to your two questions. The responses obtained on May 9, 1994 and relayed to you were [2]:

- [1] In talking to Andy Peterson, he said that the table of radionuclides (Table 3.3-1) is a synopsis of all the available data from the sites. Any radionuclides not reported were probably due to the sites: 1) not identifying them in the waste, 2) they had been of undetectable quantities, etc. Also, the decay chains of interest (Figure 3.3-5) were those identified by SNL scientists as being the chains of interest.
- [2] The matrix which identifies the justification of waste parameters was reviewed by (see attachment):

| Matrix Column | Reviewer |
|-------------------|--|
| Current Models | Palmer Vaughn Andy Peterson Jim Schreiber Barry Butcher |
| Under Development | Larry Brush |
| Possible Future | Larry Brush |
| Overall | (none) |

1 Waste Stream Identifiers (continued)**E. Ignore this waste (IMWIR waste that is being revised):** No

If yes..

then complete the following and ignore the remain

F. IDs for the newly defined waste streams:

| | | | |
|--|--|--|--|
| | | | |
|--|--|--|--|

2.2 Waste Stream Description

IDC NO. 330, 336, 337, 831, 832, 833. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills, involving hazardous solvents. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be repackaged into DOT 7A, Type A metal boxes which are lined with a fiberboard and PVC liner. Inventory data include mixed residues within the same IDCs.

IDC 325 This IDC is a combination of any solid waste IDCs, i.e., combustibles, metal, glass, construction rubble, etc. This IDC may be used for waste originated outside the PA only, with the exception of the waste generated during Engineered and Maintenance non-routine work, i.e., Stripout Activity in Bldg 881 and it may not be used anytime for waste originated in Bldg 886. Mixed Waste.

IDC 330 no description available.

IDC 336 - Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 852, or 862 at the point of assay.

IDC831 - Dry combustibles such as paper, cloth, wood, etc. This waste has been identified as being low level mixed waste.

IDC 832 - Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture. these must be drained or wrung prior to packaging to prevent accumulation of free liquid.

2.3 Generation Site**A. Generation site name:** Rocky Flats Plant**B. Buildings and areas where waste generation activities are located:**

Numerous locations throughout RFP.

RF-W012

Combustibles/TRM

2.2 Waste Stream Description (continued)

~~IDC 833 - PVC sheeting, poly bottles, supplied air suits, and other plastics. This waste has been identified as being a low level mixed waste.~~

This waste consists of rags, paper, cloth, coveralls, plastics, rubber, and wood from the cleanup of spills and equipment.

Halogenated organics are used at RFP for degreasing. Methylene chloride is used for paint removal. Ignitables are characteristic of the solvents and/or filter media. The combustibles can be used for cleaning with these organics or used for the cleanup of spent solvents. Not all of the waste in the IDCs listed in the previous section contain solvents, but the nonsolvent waste is not segregated from the solvent bearing waste at this time. Therefore, all containers of waste with the above-mentioned IDCs are considered RCRA waste and LDR. No TCLP analysis of these wastes has been conducted at this time.

RF-W012

Combustibles/TRM

2 Generation Site (continued)**C. Operations performed in buildings:****D. Process generating waste:**

This waste consists of rags, paper, cloth, coveralls, plastic, rubber, and wood. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be packaged in DOT 7A Type A metal boxes which are lined with a fiberboard liner and a PVC liner or standard TRUPACT-II container. The containers are then assayed and transferred to interim status storage areas. These wastes have been shipped to the INEL for storage in the past.

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

2.3 Generation Site (continued)

E. Source classification:

| Applicable Sources of the Waste Stream | | | |
|--|-------------------------------|---------------------------|-----|
| Research and Development | Yes | Environmental Restoration | No |
| Operations Waste | Yes | Buried | No |
| Residues | Yes | Treatment of Waste | No |
| Retrieveably Stored Waste | No | Moratorium Waste | No |
| Decontamination and Decommissioning | Yes | Maintenance | Yes |
| EPA Source Code | A19 | | |
| EPA Waste Source | Other cleaning and degreasing | | |

2.4 Reclassification

A. Waste type: MTRU

B. Reclassified waste (< 100nCi/g of TRU): No

C. If waste is MTRU... UNKNOWN

D. Reclassification...

it could be reclassified:
or potential for reclassification:

Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.

RF-W012

Combustibles/TRM

Radiation Acceptance

3.1 Waste Radiation Characteristics

A. Handling: CH

B. Transuranic alpha emitter: >100

Units: nCi/g

C. Uranium/thorium alpha level: NC

Units:

D. Beta/gamma dose rate at the surface: NC

Units:

E. Beta/gamma dose rate 1m from the surface: NC

Units:

F. Surface neutron activity: NC

Units:

3.2 Radionuclides

A. Estimate of the uncertainty of radioactive concentration value and description of methods used to measure radioactive elements:

Concentrations based upon non-destructive analysis of waste packages. Process knowledge is also applied. The purpose of this assay is to determine whether the waste is above or below TRU threshold of 100 nCi per gram. Pu and U and their decay daughters, the only isotopes known to be used at RFP, are in the wastes.

Measurement Method: Passive-Active Counter / Crate Counter

Stored Waste (continued)

B. Gross stored waste information (continued): *

| | Volume (m3) | Mass (kg) |
|--|-------------|-----------|
| Gross stored LDR waste as of other date: | | |
| Numeric value is present | No | No |
| Numeric value | 0.00000 | 0.00000 |
| Units | | |

C. Basis for determining LDR storage prohibition status:

Net and gross weight data are not available for all container types.

RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988. RFP currently manages all of its mixed waste as LDR storage prohibited, independent of its generation date.

1. Variability surrounding fullness of containers precludes a meaningful computation of density.

2. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Analytical data are limited due to the lack of capacity to perform Toxicity Characterization Leaching Procedure (TCLP) on mixed waste at the Rocky Flats Plant.

** Note that rows in italics were added to facilitate processing numeric values.*

3. Total inventory volume for purpose of national summary (m3): 267.910000

7. Waste Packaging

This waste is stored in 55 gallon carbon steel drums with one rigid polyethylene liner and several bag liners and TRUPACT II Containers.

* Note that rows in italics were added to facilitate processing numeric values.

Combustibles/TRM

1 Type of Storage

[illegible]

RF-W012

Combustibles/TRM

7.2 Readiness of Existing TRU Waste for Shipping and Emplacement in WIPP

A. Percentage of existing TRU waste containers meeting the Operations and Safety (O&S) criteria in the WIPP Waste Acceptance Criteria (WAC).. Revision 4

___ % 55 gallon drums
___ % boxes
76 % Other: total

B. Treatment needed:

Repackaging to meet decay heat limit; completion of data package.

C. Percentage of existing waste containers that would be expected to meet the TRUPACT-II TRAMPAC requirements in the WIPP WAC.. Revision 4

___ % 55 gallon drums
___ % boxes
76 % Other: total

D. Waste stream is listed in the WIPP TRUPACT-II Content Code (TRUCON) document: Yes

E. TRUCON code: 116

F. Head space gas has been sampled from one or more waste containers: UNKNOWN

RF-W012

Combustibles/TRM

Waste Stream Management

8.1 Current Management

A. Current management:

C. Generated and Stored Only

B. Treatment or disposal rate for the waste stream expressed in volume per year:

* *Units (m³/yr):*

C. Treatment or disposal rate for the waste stream expressed in mass per year:

* *Units (kg/yr):*

8.2 Planned Management for LDRs

A. Future management of waste stream for complying with LDR treatment standards:

F. Planned to send to WIPP (TRU only).

* *Note that items in italics were added to facilitate processing numeric values.*

Treatment Technology (continued)

B. Assigned treatment facility name:

CTMP Treatment System Path F

C. Assigned treatment system name:

CTMP Treatment System Path F

Assigned treatment system ID:

D. Facility agrees to treat: UNKNOWN

E. Waste in assigned facility permit: UNKNOWN

F. Waste in future facility permit: UNKNOWN

G. Other pre-treatment requirements or treatment concerns:

Treatment of most mixed transuranic waste to meet LDR treatment standards is not applicable because DOE plans to ship these wastes to the Waste Isolation Pilot Plant (WIPP), pending issuance of a No-Migration Determination of the operational phase. Pretreatment to meet the WIPP Waste Acceptance Criteria may be required.

RF-W012

Combustibles/TRM

8.4 Technology Status

A. Status of the technology to treat this waste:

C. Technology exists but needs modification

B. Identified technologies:

Repackaging to meet WIPP WAC

RF-W012

Combustibles/TRM

Technology Status (continued)

C. Need..

reason and status for modification:

Testing is needed to adapt technology to site specific compositions and radionuclides.

D. Basis for the technology status:

The existing technologies are not directly suitable for use with radioactive mixed wastes and require development work to bridge the gap between non-radioactive and radioactive streams.

| | |

RF-W012

Combustibles/TRM

Treatment Concerns

A. Special or unique treatment or facility concerns that this waste stream presents and that may impact the use of standard treatment methods:

The radioactive nature of the waste stream requires that the candidate technologies be examined to identify necessary process or equipment modifications dictated by the radioactivity.

Regulatory Concerns

9.1 Compliance Agreements

**A. For waste covered by an EPA or state LDR compliance agreement..
and when it was issued:**

FFCA II - May 10,1991

RF-W012

Combustibles/TRM

9.2 Applicable Regulations

A. RCRA: Yes
B. State hazardous waste: Yes
C. TSCA: No
D. CERCLA: No

9.3 Waste meets LDR treatment standard: No

A. Basis for determination:

Process knowledge

9.4 Delisting

A. Waste stream has been delisted or is being considered for delisting: No
B. A petition has been submitted:
C. Date of submission:
D. Date of approval:

9.5 Waste Minimization Activities

A. Applicable activities:

A. Good operating practices
B. Technology changes
F. Changes in operating status

B. Appropriate waste minimization codes:

ASSUMPTIONS:

1. Activities reported by individual sites in 1993 IDB are complete and accurate except for values marked as UNK which are counted as 0.
2. Equivalent Pu239 Activities.
3. Calculations to "decay" values reported by DOE sites were performed correctly and assumptions stated in the 1993 IDB are valid.
4. Site reporting was done in accordance with the instructions in the 1993 IDB data call.
5. All values stated in curies in scientific notation.

METHODOLOGY:

The figures presented here were arrived at by summing the calculated decayed values in the 1993 IDB from data reported by DOE sites managing TRU waste in response to a formal nationwide data call.

NOTE: The figures here require scaling by an appropriate methodology to arrive at "WIPP Design" values.

APPENDIX J

APPENDIX J

METHODOLOGY FOR CHANGING TRU WASTE GENERATOR/STORAGE SITE IDCs

In order to develop a waste characterization package for each waste stream at each DOE TRU waste generator/storage site, it was necessary to correlate the information in the MWIR, the NID, and the IDB. Because these databases were generated at different times to meet different requirements, the nomenclature, waste descriptions, waste codes, waste groupings, and waste streams can be different in each database.

Changing TRU Waste Generator/Storage Site IDCs

An important step in developing the correlation between the three databases was to relate the waste streams in the MWIR with those in the NID. If the MWIR waste stream did not have a direct correlation with a NID waste stream (IDCs did not match), then the information in the MWIR was closely examined to determine the physical and chemical properties of the waste stream.

There are several sections in the MWIR that provide information on waste stream characterization. The first sections evaluated were the "Waste Stream Description" and the "Waste Matrix Code." The "Waste Stream Description" section generally provided a physical and chemical description of the stream. The detail of information provided varied by site and by waste stream. At times it provided information about the generating process and required treatment to meet WIPP WAC. The "Waste Matrix Code" section provided a general overview of the physical and chemical waste form. The WMCs were especially helpful in determining the physical state of the waste when the waste stream description did not define the waste as solid, particulate, liquid, or sludge. Additionally, if the waste stream description provided a variety of types of waste (e.g., sludge, combustibles, etc.) the WMC was helpful in determining the composition of the majority of the waste stream. A list of specific waste matrix constituents was provided for each waste stream. These were usually similar for each stream. At times, several dissimilar codes were provided for one stream. An overall composite matrix code was provided for these streams, which was assumed to be the characterization of the majority of the waste stream (as defined in Appendix C of the WTWBIR).

If the MWIR data were not adequate to describe the waste stream, other sections of the MWIR were evaluated. The "Generating Site" section was used primarily to determine the generating site of waste streams stored at the INEL. The "Waste Names/WS ID" section provided a brief description of the waste stream. This was especially helpful in characterizing IN waste streams. This section provided "Waste Stream IDs" and "Previous Waste Stream IDs." These IN identification numbers could be related to the identification numbers of the generating sites, thus making it possible to go to the waste descriptions of the generating sites.

The "Cation/Anion" section provided information regarding previous treatment of the waste. This was helpful in determining if the waste has been compacted or solidified. The "Other Characterization" section was used in determining if a waste stream was organic or inorganic. The "Waste Packaging" section provided some information on the physical state of the waste, especially for liquid waste streams. The "MTRU Readiness" section was helpful in determining if the waste stream required treatment prior to meeting the WIPP WAC. Liquid, particulate, and reactive waste streams were identified as requiring treatment. The "Treat./Tech.," "Treatment Concerns," and "Regulatory Concerns" sections provided additional details on the treatment requirements of the waste stream and descriptions of the final waste form.

After evaluating all information in the MWIR, the waste streams in the NID (for the same TRU waste generating/storage site) were reviewed to identify a similar waste stream. Most of the waste streams in the NID are described in detail in the TRUCON (DOE, 1992). If adequate information was not available in the NID to develop an understanding of the waste stream, further information in TRUCON was reviewed. If a similar waste stream from the same site could be identified in the NID, the waste material parameter data from this NID waste stream were assigned to the particular waste stream profile.

If a similar waste stream from the same site could not be identified in the NID, then waste streams in the NID from other sites were reviewed and a similar waste stream was identified. The waste material parameter data from this NID waste stream were assigned to the waste stream profile.

There were four conditions that required the site IDC to be modified for the purposes of the WTWBIR.

1. The waste stream description indicated that the waste was expected to be WIPP WAC certifiable, but there was no corresponding IDC in the NID for that waste stream.
2. The waste stream description indicated that the waste was a liquid waste. Liquid waste streams do not meet disposal criteria for WIPP. It was assumed that these waste streams will be solidified prior to emplacement in the WIPP. The waste stream was assigned an IDC and waste material parameter data that corresponds to the solidified final waste form. When solidification occurs, there will be a volume increase. This volume increase was assumed to be 5:1.
3. The waste stream description indicated that the waste was a particulate waste stream. Particulate waste streams do not meet disposal criteria for WIPP. It was assumed that these waste streams will be solidified prior to emplacement in the WIPP. The waste stream was assigned an IDC and waste material parameter data that corresponds to the solidified final waste form. When solidification occurs, there will be a volume increase. This volume increase was assumed to be 4:1.
4. The TRU waste generating/storage site listed the waste stream as "unknown," but the waste stream description provided enough information to reclassify the waste.

APPENDIX L

APPENDIX L WTWBIR DATABASE DESCRIPTION

A database was set up to support the WTWBIR. This database is referred to as the WTWBIR database and is used to roll up the waste data in the WTWBIR. The database is operated in the Microsoft Access Version 2.0 system.

The primary sources for the data used in the WTWBIR database are the Phase II MWIR and the NID. Both of these sources are described or defined in Section 1.3.4 of the WTWBIR. The data dictionary for the WTWBIR is listed in Table L-2 of this appendix. The table is organized in groups based on the source of the data.

L.1 MIXED WASTE INVENTORY REPORT DATA

Each record in the database represents one waste stream as defined by a unique waste stream (UNIQUE_WS) that directly corresponds to the same field in the MWIR database. Only the mixed TRU waste records were imported. The data from some MWIR fields were not imported directly, but were used to produce new fields in the WTWBIR database. The MWIR-projected volume fields were added to produce one field in the WTWBIR database for a total projected volume. The total stored volume (TOTVOL) was imported directly from the similarly named field in the MWIR. The PCB-related fields in the MWIR were used to define a negative or positive entry for a new field, called PCBQ, which was used to determine whether a stream was regulated for PCBs. This field is similar to the ASBESTOSQ field imported from the MWIR used to determine whether a stream was regulated for asbestos. The data in other fields were imported directly without change.

The reports and tables produced for the WTWBIR are produced from different data sorts based on the MWIR fields and some modified MWIR fields added based on expert judgment. The data are sorted into waste stream profiles based on WMCs, WMCGs by site, CH or RH requirements, and the total WIPP inventory. Waste streams are defined by the unique waste stream identification number in the field UNIQUE_WS. The sites are defined in the field WS_SITE. The WMC was assigned to each stream in the MWIR in the field WS_MATCODE. This parameter is described in the MWIR form instructions as a "treatability group" and definitions are provided for each treatability group number based on waste forms and potential treatment options (see WTWBIR Appendix C). The WS_MATCODE represents a general description of the waste form and contents. The field ASSIGN_MTCDD10 was added by the WTWBIR team to identify the WMC used for sorting data for the tables and reports in the WTWBIR.

The field MATRIX_NAME was also added to describe groups of WMCs. In the WTWBIR the WMCs are sorted into a final set of 11 WMCGs. These WMCGs are based on similar physical and chemical properties. The names for the final WMCGs and the associated WMCs are shown in Table 1-2 in Chapter 1 of the WTWBIR. The names from Table 1-2 appear in the MATRIX_NAME field for each waste stream record. This field was used to sort for those tables and reports based on the 11 WMCGs assigned by the WTWBIR team.

A field called SCALED_VOL has been added for the total volume of each waste stream that will be disposed in the WIPP. This is a calculated field used only for the CH-TRU waste streams and is the amount of waste necessary to fill WIPP to its capacity. Additional waste volume was calculated for each waste stream proportionate to the sum of stored and projected volumes for each stream such that the sum of the scaled volumes for CH-TRU

waste equaled 180,000 m³. Enough waste is already identified to fill the WIPP to the regulatory capacity for RH-TRU waste.

Additional waste stream records were added to the database for non-mixed TRU waste at each site. The Phase II MWIR report includes only the mixed waste streams at each TRU waste generator/storage site. The INEL non-mixed TRU waste streams were included in the Phase I MWIR report but not in the Phase II report. Therefore, for INEL, the non-mixed TRU waste streams are imported from the Phase I MWIR. For other sites, non-mixed TRU waste streams were estimated based on expert judgement and the IDB for 1993. The IDB includes total volumes for all TRU waste for each waste storage/generator site. The amount of non-mixed TRU waste was estimated by subtracting the volumes for each site (except INEL) reported in the MWIR from the total TRU waste volumes reported in the IDB. These volumes for each site were then assigned to several different waste streams related to specific WMCs. The WMCs, volumes, IDCs, etc. were assigned based on expert judgement, previous site data, and informal contacts with knowledgeable site personnel. These waste streams can be identified by the UNIQUE_WS number. For mixed TRU waste streams from the MWIR, the number is of the form RF-W110 whereas for WTWBIR added streams the number is of the form RF-T110. This numbering system does not apply to the INEL non-mixed TRU waste streams because the numbering used in the phase I MWIR was retained.

L.2 NONRADIONUCLIDE INVENTORY DATABASE

The NID information was not imported directly, but was processed to produce the parameter information required for each record. The fields derived from the NID are identified in Table L-1 of this report. The NID information was rolled up into the parameters as identified by these fields. For example, weights of metals such as brass, copper, tantalum, and materials simply described as "metals" were rolled up under the field INOTMxxx (where xxx is minimum, maximum, or average) which stands for "inorganic other metals." Note that because some materials are described only as metals, aluminum and iron can be in the INOTMxxx field as well as in the INFExxx or INALxxx fields.

It is assumed for the purposes of this version of the WTWBIR (Revision 0) that all CH-TRU waste is packaged in standard 55-gallon steel drums with plastic liners and RH-TRU waste is packaged in the RH shipping containers. Because this is the case for every container and stream, it also is assumed unnecessary for this data to be explicitly entered in the database. The amount of steel in the drums is reported separately in the waste stream profiles.

Two categories of sludges and solidified materials are represented by fields. These are solidified inorganic solids (SINxxx) and solidified organic solids (SORxxx). The particular category into which a sludge or solidified material is placed is determined by the overall matrix of the resulting material after any solidification or stabilization efforts. For example, a small amount of organic liquids/sludges solidified in cement would be placed in the "inorganic solids" category and a drum of organic-based resin beads would be placed in the "organic solids" category.

The rest of the fields are reasonably self explanatory, but additional discussion on ORGCxxx, ORGRxxx, and ORGPxxx, may be helpful. The field ORGCxxx includes all cellulose-based materials and will typically include paper, cloth, wood, kimwipes and other materials derived from plant based materials. It is assumed that cloth is plant-derived material such as cotton and not plastic-based material such as rayon or nylon. The data does not describe the type of cloth. ORGRxxx consists of rubber-based materials. Included in this category are hypalon,

neoprene, and surgeons gloves. ORGPxxx represents plastics such as Lucite, polyethylene, Tyvek, Teflon and polyvinyl chloride. Plastic bags are used extensively in packaging the waste and would be included in this category. The plastic drum liners are not included in this category and are listed separately.

Each record derived from the NID is associated with an IDC number by the site as an identification code for a particular waste stream or type of waste. Expert judgement was used to assign an appropriate IDC to each MWIR waste stream (see Appendix J of the WTWBIR). The IDC then represented the relationship between an MWIR waste stream and the NID-derived material parameter data. The NID information provided weights for materials in an average drum and sometimes provided minimum and maximum weights for the materials. These data were used to calculate densities of particular materials for each IDC. These weights for each material parameter represent the waste profile for each IDC and, hence, for each MWIR waste stream.

Waste material parameters from the NID were rolled up into more general categories. The best way to describe this is with a hypothetical example in Table L-1.

TABLE L-1. NID INFORMATION

| Waste Material Parameter | Minimum (wt%) | Average (wt%) | Maximum (wt%) |
|--------------------------------|---------------|---------------|---------------|
| Paper | 10 | 30 | 80 |
| Kimwipes | 5 | 15 | 40 |
| Cloth | 0 | 5 | 10 |
| Cellulosics | | | |
| Drum Weights (kg) (waste only) | 50 | 95 | 150 |

The average weight percent does not add to 100 percent because other parameters, such as metals, make up the rest of an average drum. As shown in the fourth line of Table L-1, the data would roll up into the WTWBIR database as cellulosic materials. The result in the WTWBIR would be as follows:

Weight per drum (Kg)

| Parameter | Min | Avg | Max |
|-----------|-----|------|-----|
| Cellulose | 7.5 | 47.5 | 150 |

The minimum is the sum of the minimum weight percents in the NID, multiplied by the minimum weight of waste (i.e., 15 percent x 50 kg = 7.5 kg) in the drum. The average is the sum of the average weight percents multiplied by the average weight of waste (i.e., 50 percent x 95 kg = 42.5 kg) in the drum. The maximum is the sum of the maximum weight percentages multiplied by the maximum weight of waste (i.e., 100 percent x 150 kg = 150 kg) in the drum. In this case the maximum weight percentages add to more than 100 percent, which is physically impossible; therefore, 100 percent is used for the maximum weight percentage. When tables and reports are computed for the WTWBIR, the weights per drum are converted to weight per cubic meter based on 0.208 cubic meters per 55-gallon drum.

The rollups of these material parameters by WMCGs or by site use the volumes from the MWIR information in the WTWBIR database. The rollups by WMCGs or by site require combining data for several MWIR waste streams. The averages for the material parameters are calculated from the NID-derived average densities modified by the MWIR volume fractions and summed as follows:

$$\text{Average Density of rollup group} = \text{Average Density,} \quad \times \quad \frac{(\text{Volume MWIR Stream}_i)}{(\text{Total Volume of Group})} \quad + \quad \bullet \quad \bullet \quad \bullet$$

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the MWIR waste streams in a particular site-specific rollup. The maximum density is chosen in a similar manner, except that the largest maximum density was chosen.

In many cases, the NID does not have data for minimum and maximum percentages, even though average percentages are provided. In these cases, for rollup purposes only, the minimum is assumed to be zero and the maximum is assumed to be equal to the average. This ensures that the calculated and rolled up maximum densities are greater than the average densities. However, the maximum density may not be a true maximum but the maximum average density.

L.3 TABLES AND REPORTS FOR THE WTWBIR

The tables and reports for the WTWBIR were produced using the facilities provided by the Microsoft Access Version 2.0 database system. These tables and reports consist primarily of various sorts based on waste streams, WMCs, sites, etc. and summations of volumes and material parameter weights. Queries and report specifications were set up as defined within the Access system and quality controlled in compliance with the Quality Assurance Plan CTS_WTAC_0001.

L.4 WTWBIR TEAM

The data entry, manipulations, and reporting was conducted in conformance to a Quality Assurance Plan (CTS-WTAC-0001). The basic concept of the plan was to:

- Maintain record copies of the database at different points in the development.
- Maintain a paper trail of additions and changes to the database.
- Document and verify the correct use of the database to produce the reports and tables used in the WTWBIR.

This was accomplished by documenting and verifying the changes, additions, corrections, and report and table generation through the use of formal change forms signed and dated by the implementor and checker. The implementor is the individual who initially makes the changes or develops the report or table and the checker is a another individual who checks and verifies that the initial work was correct. If the initial implementation was not correct, the checker confers with the implementor, changes are agreed upon, and the checker and implementor both check that the changes are properly implemented.

The change form is also used by anyone on the WTWBIR team to request a change or addition to the database. In this case, the form also includes the requestors name and the date requested. The requestor can also be the checker or implementor but not both.

The database manager is responsible for maintaining the record copies of the database, tracking and ensuring proper use of change forms and ensuring that the technical lead for the WTWBIR team is cognizant of changes being made to the data.

L.5 NONRADIONUCLIDE DATABASE

The data in the NID was provided by IT. A quality control check of the data was conducted by IT using internal quality assurance plans. The WTWBIR team's quality assurance plan accepted the data as received from IT and ensured that the data was correctly manipulated and imported into the WTWBIR database.

L.6 MIXED WASTE INVENTORY REPORT

This is a published database used extensively to develop the WTWBIR database. The WTWBIR quality assurance plan accepted the data as published and ensured that the data was correctly manipulated and imported into the WTWBIR database.

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|----------------------|--|
| UNIQUE_WS | Waste stream identification number from Phase II MWIR |
| WASTESTREA | Short for "Waste Stream Description": descriptive information attached to the waste stream record by the interim storage site. From Phase II MWIR |
| WASTETYPE | For the purposes of the WTWBIR, a binary choice between mixed TRU waste and TRU waste. |
| WS_ID_IMWR | Waste stream identification in the Interim Mixed Waste Inventory Report, if applicable and reported |
| WS_ID_SITE | Waste stream identification assigned locally at the interim storage site |
| Field_Office | Abbreviation of DOE field office responsible for interim storage site |
| Generator | Abbreviation of the site where the waste was generated |
| ID Code | Site-specific IDCs assigned to the specified stream by the interim storage site |
| IDC1 | IDC, first reported by site, if applicable |
| WS-SITE | Interim storage site abbreviation |
| WS_TRUCON | First TRUCON assigned by site, if applicable |
| WS_TRUCON1 | Second TRUCON assigned by site, if applicable |
| WS_MATCODE | Waste stream treatability group number assigned by the site for the Phase II MWIR |
| WS_MATNAME | Name associated with the treatability group number assigned by the site for the Phase II MWIR |
| Assign_MTCD10 | Treatability group number assigned by WTWBIR team on the basis of professional judgement and review of reported and available data |
| MATRIX_NAME | The name assigned by the WTWBIR team to group waste streams by common waste parameters. Used to roll up waste streams for the WTWBIR (See Table 1-2) |
| ASBESTOSQ | Binary response as to whether or not the waste stream is regulated for asbestos (YES or NO) |

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|---------------|--|
| PCBQ | Binary response as to whether or not the waste stream is regulated for PCBs |
| Cunit | Units of volume used to specify CVolume, normally g for gallons |
| CVolume | Internal volume of the container specified. Normally 55-gal. drums for Rev. 0 |
| Stored_Volume | Total volume in m ³ stored at the specified site at end of 1992; extracted from the Phase II MWIR, including WTWBIR adjustments |
| PROJ_SUM | Projected additional amount generated in the future that will go to the WIPP; extracted from the Phase II MWIR, including WTWBIR adjustments |
| Scaled | The additional volume needed to fill the WIPP with CH-TRU waste to 180,000m ³ |
| INALavg | Aluminum-based materials, density in kg/m ³ for a specific waste stream |
| INALmax | Aluminum-based materials, maximum reported density in kg/m ³ for a specific waste stream |
| INALmin | Aluminum-based materials, minimum reported density in kg/m ³ for a specific waste stream |
| INFEavg | Iron-based materials, volume-weighted average, for a specific waste stream |
| INFEmax | Iron-based materials, maximum reported, for a specific waste stream |
| INFEmin | Iron-based materials, minimum reported, for a specific waste stream |
| INOTMavg | Other inorganic metals, volume-weighted average, for a specific waste stream |
| INOTMmax | Other inorganic metals, maximum reported, for a specific waste stream |
| INOTMmin | Other inorganic metals, minimum reported, for a specific waste stream |
| INOTOavg | Other inorganic materials, other materials, volume-weighted average, for a specific waste stream |
| INOTOmax | Other inorganic materials, other materials, maximum reported, for a specific waste stream |
| INOTOmin | Other inorganic materials, other materials, minimum reported, for a specific waste stream |

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|----------|--|
| ORGCavg | Organic materials, cellulose, volume-weighted average, for a specific waste stream |
| ORGCmax | Organic materials, cellulose, maximum reported, for a specific waste stream |
| ORGCmin | Organic materials, cellulose, minimum reported, for a specific waste stream |
| ORGOTavg | Organic materials, other, volume-weighted average, for a specific waste stream |
| ORGOTmax | Organic materials, other, maximum reported, for a specific waste stream |
| ORGOTmin | Organic materials, other, minimum reported, for a specific waste stream |
| ORGPavg | Organic materials, plastic, volume-weighted average, for a specific waste stream |
| ORGPmax | Organic materials, plastic, maximum reported, for a specific waste stream |
| ORGPmin | Organic materials, plastic, minimum reported, for a specific waste stream |
| ORGRavg | Organic materials, rubber, volume-weighted average, for a specific waste stream |
| ORGRmax | Organic materials, rubber, maximum reported, for a specific waste stream |
| ORGRmin | Organic materials, rubber, minimum reported, for a specific waste stream |
| SINavg | Solidified materials, inorganic matrix, volume-weighted average, for a specific waste stream |
| SINmax | Solidified materials, inorganic matrix, maximum reported, for a specific waste stream |
| SINmin | Solidified materials, inorganic matrix, minimum reported, for a specific waste stream |
| SLavg | Soils, volume-weighted average, for a specific waste stream |
| SLmax | Soils, maximum reported, for a specific waste stream |
| SLmin | Soils, minimum reported, for a specific waste stream |
| SORavg | Solidified materials, organic matrix, volume-weighted average, for a specific waste stream |

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|--------|---|
| SORmax | Solidified materials, organic matrix, maximum reported, for a specific waste stream |
| SORmin | Solidified materials, organic matrix, minimum reported, for a specific waste stream |

APPENDIX M

APPENDIX M
MWIR CODE DESIGNATIONS AND DESCRIPTIONS

| Code | Description | Code | Description |
|-------|---|-----------|---|
| D001A | High TOC Ignitable Liquids | F001-F005 | Pharmaceutical Industry Wastewaters |
| D001B | Descr. Based on 40 CFR 261.21, High TOC Subcat., Managed CWA | F005A | Spent Nonhalogenated Solvents |
| D001C | Descr. Based on 40 CFR 261.21, High TOC Subcat., Non-CWA | F005B | Listed for 2-Nitropropane |
| D002A | Acid, Alkaline, & Other Subcat Based on 40 CFR 261.22 CWA | F005C | Listed for 2-Ethoxyethanol |
| D002B | Acid, Alkaline, & Other Subcat Based on 40 CFR 261.22 Non-CWA | F025A | Light Ends |
| D002C | High Level Wastes | F025B | Spent Filters/Aids and Desiccants |
| D003A | Reactive Cyanides | K006A | Anhydrous |
| D003B | Reactive Sulfides | K006B | Hydrated |
| D003C | Explosives | K061A | High Zinc |
| D003D | Water Reactives | K061B | Low Zinc |
| D003E | Other Reactives | K069A | Calcium Sulfate |
| D004A | TCLP Toxic for Arsenic | K069B | Non Calcium Sulfate |
| D004B | High Level Wastes | K071A | Low Mercury |
| D005A | TCLP Toxic for Barium | K071B | High Mercury |
| D005B | High Level Wastes | K106A | Low Mercury |

PREFACE

The information in this report summarizes the U.S. Department of Energy's (DOE) transuranic (TRU) waste inventory, projections, and characteristics. Revision 0 of the Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR) published in June 1994, was the first attempt ever made by the DOE complex to report all of its TRU waste at the waste stream level. The waste data reported in Revision 0 was considered preliminary until quality checks of the data were completed by the DOE TRU waste generator/storage sites. Data changes resulting from the site reviews are contained herein.

The primary differences between Revision 0 and Revision 1 of the WTWBIR are as follows:

- The WIPP baseline inventory reported in Revision 0 was compiled from three existing DOE databases, whereas, inventory data in Revision 1 was collected directly from the sites through a request made by the National TRU Program Office.
- The nonmixed, TRU waste streams reported in Revision 0 were derived from the volume differences between the Integrated Data Base (IDB) and Mixed Waste Inventory Report (MWIR), while the nonmixed TRU waste streams contained in Revision 1 are as reported by the TRU waste generator/storage sites.
- Revision 1 of the WTWBIR reports radionuclide data at the waste stream level. Where sites provided radionuclide data as the waste stream level, it is replicated in Appendix A. A WIPP radionuclide inventory is provided in Table 4-2. This table is derived from the data submitted to support the IDB. Revision 0 reported the radionuclide data at the WIPP level.
- Revision 1 reports the waste volumes in the final waste form that will be sent to WIPP. All previous databases, including Revision 0 of WTWBIR, report the waste in terms of volumes in storage before processing to meet WIPP requirements.
- The total radionuclide inventory for contact-handled (CH) TRU waste is much higher in Revision 1 than reported in Revision 0. This is due to two reasons: 1) Savannah River Site waste that was previously reported as "unknown" had not been included in the estimates, and 2) the "projected" part (1993-2022) of the CH-TRU radionuclide inventory was inadvertently left out of the totals reported in Revision 0, causing the inventory to be approximately 25% low. Revision 1 corrects the inventory reporting error.
- The total radionuclide inventory for remote-handled (RH) TRU waste is also much higher in Revision 1. During calculation of the RH-TRU inventory the volume defined by the sites included more waste than the repository is authorized to accept. During those calculations, the IDB radionuclide numbers only covered the "stored" part of the inventory. This made the RH-TRU inventory reported in Revision 0 to be low by a factor of approximately 3-4. Revision 1 corrects the inventory reporting error.
- Oak Ridge National Laboratory has reported a very conservative inventory for U-235 in its RH-TRU waste (≈ 367 curies). In order to provide a more realistic estimate of the U-235 inventory, an anticipated transportation requirement for the RH-TRU cask was imposed in Revision 1. This requirement modifies the U-235 estimate reported in Revision 0.

EXECUTIVE SUMMARY

The *Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR)* establishes a methodology for grouping wastes of similar physical and chemical properties, from across the U.S. Department of Energy (DOE) transuranic (TRU) waste system, into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies. The majority of this document reports TRU waste inventories of DOE defense sites. An appendix is included which provides estimates of commercial TRU waste from the West Valley Demonstration Project.

The WIPP baseline inventory is estimated using waste streams identified by the DOE TRU waste generator/storage sites, supplemented by information from the Mixed Waste Inventory Report (MWIR) and the 1994 Integrated Data Base (IDB). The sites provided and/or authorized all information in the Waste Stream Profiles except the EPA (hazardous waste) codes for the mixed inventories. These codes were taken from the MWIR (if a WTWBIR mixed waste stream was not in MWIR, the sites were consulted). The IDB was used to generate the WIPP radionuclide inventory. Each waste stream is defined in a waste stream profile and has been assigned a waste matrix code (WMC) by the DOE TRU waste generator/storage site. Waste stream profiles with WMCs that have similar physical and chemical properties can be combined into a waste matrix code group (WMCG), which is then documented in a site-specific waste profile for each TRU waste generator/storage site that contains waste streams in that particular WMCG.

Based on methodology presented in this WTWBIR, a maximum of 11 site-specific waste profiles have been identified for contact-handled (CH) TRU waste and a maximum of 11 have been identified for remote-handled (RH) TRU waste for each site. Each of these site-specific waste profiles have unique WMCG criteria and they are developed, if appropriate, for each of the TRU waste generator/storage sites. A particular site-specific waste profile, with a specific WMCG, can be combined with other site-specific waste profiles having identical WMCGs from the TRU waste generator/storage sites to derive a WIPP waste profile.

The anticipated inventory of TRU waste is defined as the sum of retrievably stored waste (waste generated after 1970) plus currently projected TRU waste volumes. The anticipated inventory for CH-TRU waste is not sufficient to fill the maximum allowed capacity of WIPP (calculated: 6.2 million cubic feet [$\approx 176,000$ cubic meters]), and scaling has been developed as a means for Sandia National Laboratories' model to examine the impacts of the full repository. Scaling has also been applied to the RH-TRU inventory since sufficient volume has not been identified in the anticipated RH-TRU inventory to fill WIPP to the RH-TRU design capacity (≈ 7080 cubic meters). Additionally, there is a high uncertainty in and a current lack of data on wastes produced from decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the anticipated CH-TRU inventory has been "scaled" to the maximum allowed WIPP capacity and the RH-TRU to the design capacity. The scaling of the inventories in this and future revisions of the WTWBIR will be derived from the best available data and assumptions.

An example of five waste streams at two sites (Figure 3-2 in the main body of the report) has been used to illustrate the waste profile methodology. Total WIPP inventory volumes for the WIPP waste profiles are provided.

Using the same waste profile methodology, the WTWBIR also estimates the WIPP disposal inventory (anticipated inventory that has been scaled to WIPP design capacity) in terms of 10 waste material parameters and additional packaging materials that have been identified as inputs needed for the system prioritization methodology (SPM) and performance assessment (PA) calculations. The 10 waste material parameters and additional packaging materials are waste constituents that occur in TRU waste and are input parameters for one or more SPM and PA models or are required to adequately describe the waste form. These parameters may change as a result of SPM and PA efforts.

The 10 waste material parameters have been grouped by their chemical/physical properties and are indicated in bold lettering. The 10 waste material parameters and additional packaging materials that are defined and included in the WTWBIR are:

- Inorganics
 - **Iron-based metals/alloys**
 - **Aluminum-based metals/alloys**
 - **Other metals**
 - **Other inorganic materials**
- Organics
 - **Cellulosics**
 - **Rubber**
 - **Plastics**
- Solidified Materials
 - **Inorganic matrix**
 - **Organic matrix**
- Soils
- Packaging Materials
 - **Steel**
 - **Plastic**
 - **Lead**

The waste material parameter information is reported in kilograms per cubic meter of waste matrix (kg/m^3). The waste material parameters in the waste stream, site-specific, and WIPP waste profiles are expressed on a weight/volume basis. However, the occurrence of more than one waste material parameter at the maximum value within a waste stream is highly unlikely. If needed, during SPM and PA (Tables 5-1 and 5-2) calculations, the sampling statistics (if used) must be controlled so that several waste material parameters do not get sampled all at their maximum value (weight/volume), lest the average weight/volume is exceeded. To illustrate the waste profile methodology, five waste streams from two sites are used as examples. This revision of the WTWBIR provides a diskette that contains the WIPP TRU Waste Baseline Inventory Database in Microsoft Access®.

Although the initial purpose of this report is to provide data to be included in the Sandia National Laboratories/New Mexico SPM and PA processes, all data are presented and explained in such a way that they can be adapted as needed for other applications. The WTWBIR, Revision 1, is presented in three parts: Volume 1 contains this Executive Summary through Chapter 9 and the WTWBID diskette; Volume 2 contains Appendix A, Waste Stream Profiles; and Volume 3 Appendices B through J.

1. INTRODUCTION

1.1 BACKGROUND

The Waste Isolation Pilot Plant (WIPP) is a transuranic (TRU) waste management facility operated by the U.S. Department of Energy (DOE). The WIPP is currently identified as the permanent disposal site for DOE TRU waste.

TRU waste is defined as waste that is contaminated with alpha-emitting radionuclides with an atomic number greater than 92, with half-lives greater than 20 years, and concentrations of TRU isotopes greater than 100 nanocuries per gram of waste (DOE, 1988). TRU wastes are classified as either contact-handled (CH) waste or remote-handled (RH) waste, depending on the dose rate at the surface of the waste container. CH-TRU wastes are packaged TRU wastes with an external surface dose rate of 200 millirems (mrem) or less per hour, while RH-TRU wastes are packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour. Unless otherwise indicated, for purposes of this document, all references to TRU waste include TRU waste and mixed TRU waste (waste that contains both radioactive and hazardous components, as defined by the Atomic Energy Act and the Resource Conservation and Recovery Act [RCRA] as codified in Title 40 Code of Federal Regulations [CFR] Parts 264, 265, 268, and 270 [EPA, 1980a; 1980b; 1986; and 1983]).

The DOE is committed to demonstrating compliance with all applicable regulations prior to permanent disposal of TRU wastes in the WIPP repository. These regulations are the environmental standards for management and disposal of TRU wastes as mandated in 40 CFR Part 191 (EPA, 1993) and Part 194 (DOE, 1995), and the RCRA regulations. Compliance will be demonstrated through Sandia National Laboratory/New Mexico (SNL/NM) performance assessment (PA) calculations based on the inventory of existing and currently projected waste streams developed in this document, as reported by the DOE TRU waste generator/storage sites. The WIPP is scheduled to receive and dispose of TRU wastes from 10 major and several minor DOE TRU waste generator/storage sites (see Figure 1-1).

1.2 PURPOSE

The purpose of this report, the *Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report* (WTWBIR), is to document the disposal inventory of TRU waste to be emplaced in WIPP as defined by the DOE TRU waste generator/storage sites. This inventory of CH-TRU and RH-TRU waste will be used in the SNL/NM systems prioritization methodology (SPM)/PA calculations and sensitivity analyses that will support the development of compliance applications to the appropriate regulatory agencies regarding the operations and post-closure timeframes of the WIPP repository.

To accomplish this purpose, the WTWBIR has been developed from the best available information and process knowledge provided by the DOE TRU waste generator/storage sites. In support of SPM/PA, the WTWBIR describes a process for grouping individual waste streams with similar physical and chemical properties into waste profiles, based on their waste matrix code (WMC) (DOE, 1993a) assigned by the DOE TRU waste generator/storage sites. Waste profiles with similar WMCs, are then combined across the DOE TRU waste system to provide estimated total volumes and total waste material parameters. The methodology for this grouping and combining is discussed in detail in Section 2.3, Methodology for Development of Disposal Inventory.

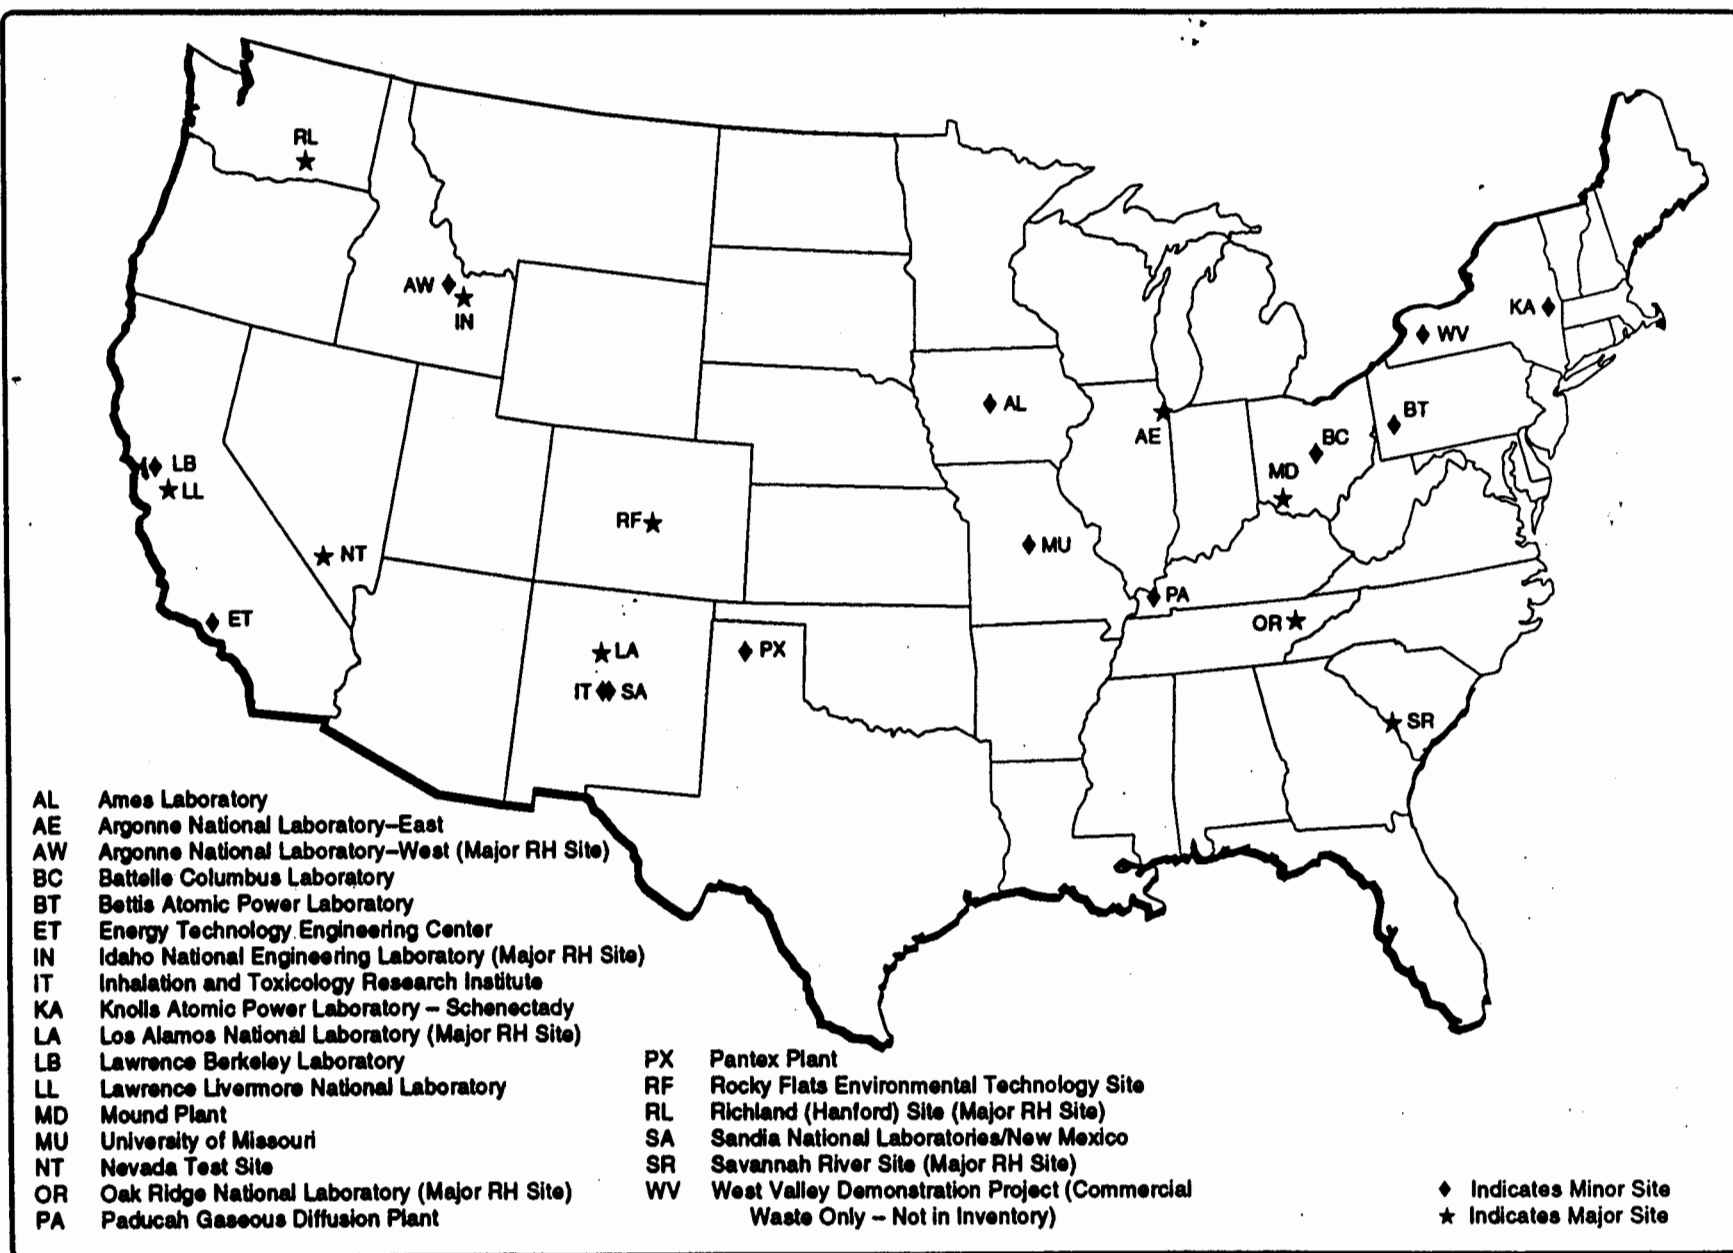

Figure 1-1. U.S. Department of Energy Transuranic Waste Generator/Storage Sites.

The individual waste streams also are evaluated to estimate the occurrence and quantities of non-radioactive waste material parameters as defined in Appendix C and listed in Table 1-1 (e.g., cellulose, plastics, iron-based metals/alloys, etc.) that have been identified by SNL/NM as being potentially important to the performance of the WIPP repository. The methodology, assumptions, and totals of these waste material parameters are described in Chapter 5, Waste Material Parameters.

**TABLE 1-1. TECHNICAL DATA NEEDS FOR SYSTEMS PRIORITIZATION
METHODOLOGY/PERFORMANCE ASSESSMENT WASTE MATERIAL PARAMETERS**

| Waste Material Parameter | Input Variable in Current SPM/PA Models | | Input Variable in SPM/PA Models Under Development | Input Variable in Possible Future SPM/PA Models |
|------------------------------|---|----------------------------|---|---|
| | Gas Generation | Mechanical Characteristics | | |

| Solidified Organic Matrix | | YES | YES | YES |
| Soils | | YES | | |

(1) Only 50 weight percent included

(2) Added for SPM-2 (Sanchez, 1995)

The information/data presented in this report is derived from the WIPP Transuranic Waste Baseline Inventory Database (WTWBID). The only currently defined application of the WTWBID in this revision of the WTWBIR is in support of the SPM/PA calculations. However, the WTWBID can support other projects and applications requiring waste information in formats different than that used in the WTWBIR. The WTWBID structure and a data dictionary are included in Chapter 7 of this report.

1.3 WASTE INVENTORY TERMINOLOGY

The derivation of a disposal inventory from individual waste streams is a formidable and complex process. To document each step of this process, a system of waste inventory terminology needs to be defined so the reader may more easily follow the process. The following sections provide definitions of terminology used throughout the WTWBIR. These definitions also are summarized in Chapter 8, Glossary. A list of acronyms and abbreviations used are provided in the front of the document.

1.3.1 Inventory Terminology

Stored Inventory – That part of the TRU inventory currently in retrievable storage at the time of the last data call for inventory information is known as "stored inventory." For Revision 1, stored waste includes that waste in storage as of December 31, 1993. Retrievably stored waste includes waste stored since approximately 1970 in buildings or in berms with earthen cover and **does not include any waste that was buried prior to 1970** (DOE, 1994b).

Projected Inventory – That part of the TRU inventory that has not been generated but is currently estimated to be generated at some time in the future by the TRU waste generator/storage sites is considered "projected inventory." Because of the uncertainty associated with ER and D&D waste inventory projections, the ER and D&D wastes are not included in the projected inventory. For Revision 1, a projected inventory includes waste scheduled for generation between calendar years (CY) 1994 and 2022. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Anticipated Inventory – For the WTWBIR, this is the sum of the stored and projected inventories, calculated:

$$\begin{array}{ccccc} \text{Stored} & & & & \text{Projected} & & & & \text{Anticipated} \\ \text{Inventory} & + & & \text{Inventory} & = & & \text{Inventory} \end{array}$$

Scaling – The process for adjusting, if needed, the projected inventory to the design limit (disposal inventory) of the WIPP repository is called "scaling." Section 2.3, describes the scaling process used for developing the WTWBIR.

$$\text{Projected Inventory} \xrightarrow{\text{Scaling}} + \text{Stored Inventory} = \text{Disposal Inventory}$$

Disposal Inventory – The total design ($\approx 176,000 \times 10^5 \text{ m}^3$ for CH-TRU and 7080 m^3 for RH-TRU) inventory defined for WIPP emplacement (after scaling, if necessary) to be used for SPM and PA calculations is the "disposal inventory."

1.3.2 Waste Matrix Code Terminology

Waste Matrix Code (WMC) - The WMCs were developed by DOE, in response to the Federal Facilities Compliance Act (FFCA)(Public Law 102-386, 1992), as a methodology to aid in classifying mixed waste streams in the DOE system into a series of four-digit codes (e.g., 5400; Heterogeneous Waste) that represent different physical/chemical matrices. The WMC is assigned

by the TRU waste generator/storage sites. The WTWBIR has adopted this system to remain consistent with the Mixed Waste Inventory Report (MWIR)(DOE, 1994a) which was a database-derived report to meet the first deliverable under the FFCAct. The WMC methodology has been applied to nonmixed TRU waste streams for consistency.

Waste Matrix Code Group (WMCG) – A WMCG consists of a series of WMCs that for SPM or PA purposes have similar physical and chemical properties. An example of combining three WMCs which either contain particulates or are cemented particulate waste is presented below:

| | | |
|--|---|-----------------------|
| WMC 3100 (inorganic process residues) | } | Solidified Inorganics |
| WMC 3110 (inorganic particulates) | | |
| WMC 3150 (solidified process residues) | | |

Because of the restriction on particulate wastes in the *TRU Waste Acceptance Criteria (WAC) for the Waste Isolation Pilot Plant*, Revision 4 (DOE, 1991), all particulate waste will usually be immobilized prior to shipment to WIPP. Therefore, all three of these WMCs would be the same basic waste form when emplaced in WIPP and have similar physical and chemical properties. The combined WMCG for this example is solidified inorganics. Table 1-2 presents all anticipated WMCs for TRU waste and indicates in which WMCG each WMC occurs for the WTWBIR. There are 11 WMCGs used in this WTWBIR. The last two rows in Table 1-2 group WMCs that will not be accepted at WIPP unless additional characterization and/or processing occurs to meet the WIPP WAC (DOE, 1991).

1.3.3 Waste Profile Terminology

Waste Stream Profile – This is a description of a CH-TRU or RH-TRU waste stream potentially destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies. The waste stream profile is presented in tabular format and is intended to provide a summary of important information about a particular waste stream. Examples of information included in a waste stream profile are:

- Currently used identification codes, including the DOE TRU waste site matrix description;
- WMC assigned by the TRU waste generator/storage sites;
- Volumes of waste currently in retrievable storage and waste projected to be generated: estimated minimum, average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.);
- Indication as to whether the waste is CH-TRU or RH-TRU; and
- Hazardous waste codes (EPA codes) from MWIR or as assigned by the DOE TRU waste generator/storage sites for the RCRA regulated portion of the waste stream. Some waste streams (waste stream profiles) contain hazardous waste codes that would not be currently acceptable for disposal in WIPP (e.g., D001, D002, and D003) under the most recent WIPP Part B Permit Application (DOE, 1993b). These hazardous waste codes are applied to the waste in its current physical form. These waste streams will have to be treated for any unacceptable hazardous waste codes prior to transport to WIPP for disposal.

TABLE 1-2. WASTE MATRIX CODE GROUP NAMES

| Waste Matrix Code Group | Waste Matrix Codes |
|---|--|
| Solidified Inorganics | 1000 ¹ , 1100 ¹ , 1110 ¹ , 1120 ¹ , 1130 ¹ , 1140 ¹ , 1190 ¹ , 1200 ¹ , 1210 ¹ , 1220 ¹ , 1230 ¹ , 1240 ¹ , 1290 ¹ , 3000 ² , 3100, 3110 ³ , 3111 ³ , 3112 ³ , 3113, 3115 ³ , 3116 ³ , 3119 ³ , 3120, 3121, 3122, 3123, 3124, 3125, 3129, 3130, 3131 ³ , 3132 ¹ , 3139 ^{1 or 3} , 3150, 3190, 3900 ² , 6100 ⁴ , 6120 ⁵ , 6130 ⁶ , 6140 ⁵ , 6190 ⁴ , 6200 ⁷ , 6210 ⁸ , 6230 ⁸ , 6290 ⁷ , 7300 ³ , 9100 ² , 9200 ² |

TABLE 1-2. WASTE MATRIX CODE GROUP NAMES (CONTINUED)

- ¹ Liquid waste streams are assumed to be solidified prior to sending to WIPP.
- ² WMCs 3000, 3900, 9100, and 9200 are placed in "solidified inorganics," "salt waste," or "solidified organics," depending on the information provided by the TRU waste generator/storage site.
- ³ Particulate waste streams are assumed to be solidified prior to sending to WIPP.
- ⁴ WMCs 6100 and 6190 are placed in "solidified organics," or "solidified inorganics," depending on the information provided by the TRU waste generator/storage site.
- ⁵ Liquid lab pack waste is assumed to be solidified prior to sending to WIPP.
- ⁶ Solid lab packs are assumed to be solidified prior to sending to WIPP.
- ⁷ WMCs 6200 and 6290 are placed in "solidified organics," "solidified inorganics," or "heterogeneous" if the waste stream must be solidified per the generator/storage site. They are placed in "uncategorized metal," or "lead/cadmium metal waste" if they are primarily nonreactive metal contaminated with reactive metal. Reactive waste streams must be treated prior to shipment to WIPP.
- ⁸ Waste stream is assumed to be treated prior to sending to WIPP. Volume change is provided by the TRU waste generator/storage site.
- ⁹ WMC 5000 is placed in "uncategorized metal," "lead/cadmium metal," "inorganic non-metal," "combustible," "graphite," "heterogeneous," or "filter," depending on the information provided by the generator/storage site.
- ¹⁰ WMC 7000 and 9300 are placed in "uncategorized metal" or "lead/cadmium metal," depending on the information provided by the generator/storage site.
- ¹¹ WMCs 7400, 7410, 7420, and 7490 are assumed to be drained of liquid and contain only metal waste.
- ¹² These waste streams are excluded from disposal in WIPP at this time, e.g., PCB and asbestos wastes (see Table 3-2).
- ¹³ If adequate information is provided by the generator/storage site, these WMCs are changed. If there is not enough information, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

- Comments provided by the TRU waste generator/storage sites to further explain the data provided.
- Footnotes generated by the WTWBIR team to explain information provided by the generator/storage sites.
- TRUPACT-II Content (TRUCON) Codes (DOE, 1992) and No Migration Variance Petition (NMVP) (DOE, 1990) identifiers.

Figure 1-2 provides an example of a blank waste stream profile form. The methodology for developing waste stream profiles is provided in Chapter 3 and printouts of TRU waste stream profiles are provided in Appendix A.

Site-Specific Waste Profile – This represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles at a particular DOE TRU waste site, that have been placed in the same WMCG, are summarized in the site-specific waste profile. Examples of information included in a site-specific waste profile are:

- DOE TRU waste generator/storage site identification;
- The WMCG that the profile represents;
- Listing of the waste streams (represented by waste stream profiles provided by the TRU waste generator/storage sites) that are included in the site-specific waste profile, including the waste stream identification;
- Volumes of stored and currently projected waste; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

Figure 1-3 provides an example of a blank site-specific waste profile form. The methodology for developing site-specific waste profiles is provided in Chapter 3 and printouts of TRU site-specific waste profiles are provided in Appendix B.

WIPP Waste Profile – The WIPP waste profile represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG. Examples of information included in a WIPP waste profile are:

- Profile name;
- The WMCG that the profile represents;
- Listing of the DOE TRU waste sites (represented by the same WMCG) that are included in the WIPP waste profile, including the name of the DOE TRU waste site;
- Volumes of stored and currently projected waste for each site for the particular WMCG represented; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

1.3.4 Database Terminology

Mixed Waste Inventory Report (MWIR) – The MWIR refers to the latest release of information from the MWIR database that supports requirements under the FFCAct of 1992 (Public Law 102-386). The latest version of the MWIR documentation/files is *Distribute [Distribution] of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a).

Integrated Data Base (IDB) – The IDB refers to the latest version of the Integrated Data Base: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics (DOE, 1994b).

WIPP Transuranic Waste Baseline Inventory Database (WTWBID) – The WTWBID is the database specifically developed to support the WTWBIR and any other applications that might need waste information on a waste-stream basis or for higher-level roll-ups.

1.3.5 Other Terminology

Waste Material Parameter – This is one or more nonradioactive waste constituents that occur in a TRU waste stream that is an input parameter into one or more current SPM or PA models, an SPM or PA model under development, a potential future model, or is required to adequately describe the waste form (see Appendix C). The 10 waste material parameters have been grouped by their chemical/physical properties and are indicated in bold lettering. The 10 waste material parameters and additional packaging materials that are reported in densities and included in the WTWBIR are:

- Inorganics
 - **Iron-based metals/alloys**
 - **Aluminum-based metals/alloys**
 - **Other metals**
 - **Other inorganic materials**
- Organics
 - **Cellulosics**
 - **Rubber**
 - **Plastics**
- Solidified Materials
 - **Inorganic matrix**
 - **Organic matrix**
- Soils
- Packaging Materials
 - **Steel**
 - **Plastic**
 - **Lead**

Definitions for these waste material parameters can be found in Chapter 5.

Figure 1 - 4. Blank WIPP Waste Profile Form

1.4 OBJECTIVES

The objectives of the WTWBIR are threefold:

1. **Establish a consistent DOE complex-wide methodology for grouping wastes of similar physical and chemical composition.** A consistent methodology, in support of SPM/PA, for grouping TRU wastes of similar physical and chemical properties into "waste profiles" will provide a common frame of reference for discussion of TRU waste issues with regulatory organizations.
2. **Define the anticipated disposal inventory of TRU wastes destined for WIPP.** The anticipated inventory of CH-TRU and RH-TRU wastes is defined as the sum of the existing volumes of stored and currently projected waste streams at each of the TRU waste generator/storage sites. The design capacities of WIPP are calculated as follows:
 - Maximum CH-TRU capacity = 6.2 million cubic feet (~176,000 cubic meters) (Public Law 102-579, 1992),
 - RH-TRU design capacity = 7080 cubic meters = 7955 canisters x 0.89 cubic meters/canister

Scaling of the CH-TRU and RH-TRU waste projected inventories is necessary to attain the WIPP design limit. There is a high level of uncertainty in and a current lack of data on waste produced by decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the projected inventory has been scaled to the WIPP capacity (disposal inventory). The scaling of the inventory in this and future revisions of the WTWBIR is derived from the best available data and assumptions.

3. **Calculate the disposal inventory in terms of waste material parameters.** Several waste material parameters (e.g., iron-based metals/alloys, rubber, plastics, etc.) have been identified by SNL/NM as being potentially significant in relation to the performance of the WIPP repository (see Table 1-1). Calculating the WIPP disposal inventory in terms of these parameters provides input for the SPM and PA calculations and sensitivity analyses needed to determine compliance with federal standards.

1.5 TRU SYSTEM-WIDE DATA ASSUMPTIONS

As stated earlier, the WTWBIR was developed using the best available information from the TRU waste generator/storage sites. Some sites used different assumptions and methodologies for reporting its waste stream data. Because of these differences, the WTWBIR team had to make assumptions and take specific steps to ensure consistency among the sites' reported data. This section addresses the system-wide assumptions and actions taken by the WTWBIR team in rolling up the waste stream data. For a description of site-specific assumptions, see Appendix A.

1.5.1 Waste Material Parameter Assumptions

The waste material parameter information reported by the sites must be summed and averaged to obtain data at the site-specific and WIPP waste profile levels. For some waste streams, however, not all of the waste parameter data were available from the sites. In order to calculate

material parameters from the waste stream data provided by the sites, the following assumptions were made by the WTWBIR team:

- If only the average waste material value was provided for a specific waste stream, the average value was assigned to the minimum and maximum values.
- If the maximum value was provided and the minimum value was zero, the average value was computed as half of the maximum value.
- If only the minimum value was provided, the minimum was assigned to both the maximum and average values.
- If only the final waste form group was provided, the average set of parameters was calculated by volume averaging the parameters from other waste streams of the same final waste form group.

Waste material parameter data contained in the body of this report are based on these assumptions, whereas, individual waste stream profiles included in Appendix A contain the original, unchanged data as reported by the generator/storage sites.

1.5.2 Inventory Volume Assumptions

Other assumptions had to be made by the WTWBIR team to ensure consistency in WIPP inventory volumes:

- The volume reported for the years 1992 and 1993 was supposed to be cumulative, whereas, the values for the remaining years were to be reported as generation volume per year. Since not all of the sites reported their inventory in this manner, the WTWBIR team had to recalculate the volumes provided to attain a cubic meter/year basis for some waste stream volumes;
- Many sites did not provide final waste form volumes. Final waste form volumes are used in determining the overall WIPP inventories. In those instances, the WTWBIR team assumed that the reported, current volume would be the same as the final waste form volume.

1.5.3 Packaging Material Assumptions

The TRU waste container data was not reported consistently. While most did, many of the sites did not provide data for final form in WIPP approved containers. Some reported their waste in current containers while others did not provide container information. Adjustments had to be made to the data to:

- Achieve consistency at the waste stream level in the presentation of data in the waste stream profiles (Appendix A)
- Produce the upper-level waste packaging rollups needed by SPM/PA as inputs to the modeling activities.

Waste Profile Assumptions

The WTWBIR team assigned the TRUCON and NMVP codes based on the best available information. Each waste stream profile in Appendix A was reviewed for consistency in reporting packaging configurations. In cases where incomplete information was submitted by the TRU

sites, clarifications were requested from the TRU waste generator/storage sites. In those cases where clarifications were not received from the TRU sites, the following assumptions were made, concerning the waste stream profiles:

- If the site provided final form containers, the final form containers (i.e., drums, standard waste boxes [SWB], or RH canisters) were used.
- In some cases where final waste form containers were not provided a 55-gallon drum was assumed.
- If a particular waste container was reported by the sites (but no further information was provided) or was assigned by the WTWBIR team (e.g., 55-gallon drum), "standard" values of the waste container properties (see Table 1-3) were added to the waste profile forms. An example of this process is listed below for a reported 55-gallon drum without any additional information:
 - Type of material used to fabricate the waste container (steel)
 - The internal volume of the container (0.208 m^3)
 - Inclusion of a "standard" density for the container (131 kg/m^3).
- If sites reported a "plastic" or "rigid" liner without any further definition of the liner then the values in Table 1-3 were used in the waste stream profiles:
 - A 90-mil high density polyethylene (HDPE) liner was assumed
 - The density for that type of liner was assumed (37 kg/m^3).
- If the container fields called "Number Stored" and "Number Projects" are left blank, it is because of one of the following reasons:
 - There is a change from one type of waste container to another on the waste profile form page 2 (different internal container volumes) and therefore the number of containers stored and projected represent different volumes and a direct comparison is not possible.
 - There is an unresolved discrepancy between the number of containers and the volumes quoted on the waste stream profile. It has been assumed that the waste volumes are the most accurate information provided by the TRU waste sites.

For CH-TRU waste containers, the following assumptions were also made:

- If waste was reported in containers larger than drums, then the waste was divided into SWBs with standard plastic bag liners. The standard internal volume for SWBs (Table 1-3) and the reported waste stream volume were used to determine the number of SWBs.
- If the waste was reported in a liquid or sludge form (i.e., tanks), the WTWBIR team assumed that the waste will be placed in drums with rigid liners. No treatment volume expansion was included unless reported as such by the sites.

For RH-TRU waste, the following assumptions were made:

- If the waste was reported in drums, the drums were assumed to be overpacked in RH canisters at three drums per canister.
- If the waste was not reported to be in drums, the waste was assumed to be direct loaded into RH canisters. The standard internal volume for RH canisters and the reported waste stream volume were used to determine the number of RH canisters.
- The lead in the RH canister (465 kg/m^3) is assumed in the packaging rollups even if it is not stated on each RH waste stream profile.

Table 1-3. Packaging Material Assumptions

| Container Configuration | Steel (kg/m^3) | Plastic (kg/m^3) | Lead (kg/m^3) | Volume (m^3) |
|---|------------------------------|--------------------------------|-----------------------------|----------------------------|
| 55-gallon drum | 131 | 37 | N/A | 0.208 |
| SWB (direct load) | 154 | 1.2 | N/A | 1.89 |
| SWB (overpack) (4 55-gallon drums) | 210 | 16 | N/A | 1.89 |
| RH-TRU Canister | 435 | 0 | 465 | 0.89 |
| RH-TRU Canister (overpack of 3 55-gallon drums) | 527 | 26 | 465 | 0.89 |

Assumptions to Produce Packaging Estimates on a System-Wide Basis

In order to add up the packaging materials for the waste as it would arrive at WIPP, the following standard container configuration was used for computing waste packaging materials from all sites. If the site provided final waste form containers, the final form containers (i.e., drums, standard waste boxes [SWB], or RH Canisters) were used, but standard liners were assumed. This was done because many sites did not provide liner information. The inclusion of standard liners produces a conservative estimate for PA and SPM calculations.

1.5.4 Radionuclide Information Assumptions

There are some waste streams from TRU waste sites which report for some waste streams incomplete radionuclide information (e.g., some show mixed fission products but no transuranic isotopes). These waste streams are expected to be demonstrated to be TRU upon completion of the radionuclide characterization.

The waste stream profiles provided in Appendix A contain waste stream specific radionuclide information, if provided by the TRU waste sites. Some sites provided only isotopic mixes, which are explained in Appendix H.

1.5.5 Comparison of IDB versus WTWBIR Waste Volumes

Differences occur between the waste volumes reported in the draft Revision 10 of the IDB (Appendix I) and those reported in Chapter 6 on a site level. Listed below is the currently-known logic for some of the differences:

- In the IDB, 40% of the INEL CH-TRU waste and 50% of the Hanford CH-TRU waste reported is assumed to be low-level waste by INEL and Hanford and is not included in the WTWBIR
- Some of the projected waste at ANL-E in the WTWBIR is accounted for in the Hanford projections. This is not the case for the IDB.
- The ANL-W waste reported for WTWBIR is included in the INEL IDB waste volumes.
- The totals for SRS CH-TRU and RH-TRU projected waste volumes in the draft Revision 10 IDB are in error. The corrected IDB total projected CH-TRU is 13,700 m³ and for RH-TRU, 35.9 m³.

These inconsistencies and others between the WTWBIR and IDB for TRU waste volumes is a main focus of the Revision 2 data update of the WTWBIR.

1.6 BASELINE INVENTORY UPDATES

The WTWBIR represents the best available TRU waste inventory information in support of the WIPP Project. It is anticipated that the WTWBIR will be updated periodically. This update cycle will be modified based on the availability of additional waste information or the data needs of the WIPP Project as determined by the DOE.

1.7 DOCUMENT ORGANIZATION

The WTWBIR is organized into chapters of text, figures, tables and supporting appendices. It flows from specific, detailed TRU waste information (provided by the TRU waste generator/storage sites) to the top level development and description of waste profiles and waste material parameters. The contents of remaining chapters in this document are summarized below:

- Chapter 2 discusses the methodology used to define the TRU waste disposal inventory.
- Chapter 3 outlines the methodology used to derive waste stream profiles, site-specific waste profiles, and WIPP waste profiles.
- Chapter 4 provides the WIPP disposal radionuclides inventory. The methodology used for deriving the inventories is also included.
- Chapter 5 rolls up the waste material parameter information assigned at the waste stream profile level in Chapter 3 to obtain parameter totals. These totals are presented as parameter weights per volume.
- Chapter 6 presents stored and projected CH-TRU and RH-TRU inventories by site and a system-wide rollup of CH-TRU and RH-TRU volumes.
- Chapter 7 contains a description of the WTWBIR and a data dictionary.
- Chapter 8 contains a glossary of important terms used in this document.
- Chapter 9 lists references cited in the WTWBIR.
- Several appendices also are provided to either present more detailed waste inventory information or to describe the methodology in more detail. The appendices are provided in Volumes 2 and 3 of this WTWBIR.

2. TRU WASTE DISPOSAL INVENTORY

2.1 INTRODUCTION

The TRU waste disposal inventory is derived from existing information on waste, which has been provided by the DOE TRU waste generator/storage sites and is predominately based on process knowledge. In addition to the general process knowledge of a waste stream for nonradionuclide parameters, the radionuclide inventories from the IDB TRU waste site submittals (DOE, 1994b) are derived from non-destructive assay, with some analytical analyses (to detect isotopes that do not lend themselves to non-destructive analyses or to evaluate waste streams that cannot be effectively analyzed through non-destructive methods), and on-site accountability and tracking records of special nuclear materials including any changes of isotopic ratios during processing. This chapter is designed to assist the reader by describing the existing waste information used to derive the inventory and the methodology used to correlate and combine the existing data into a WIPP disposal inventory.

2.2 SOURCE OF TRU WASTE INFORMATION

Transuranic waste information primarily exists in two forms within the DOE TRU waste system:

- On-site documentation developed by the TRU waste generator/storage sites during the history of their operations.
- Summary reports, usually prepared to support WIPP documentation requirements. These summary reports have either been generated by the DOE area office in charge of WIPP or at the DOE-Headquarters (HQ) level. The information contained in these reports is derived from the TRU waste generator/storage sites.

2.2.1 Site-Specific Waste Information

The TRU waste generator/storage sites use a variety of on-site documents and records in order to derive the information listed in the individual waste streams in Appendix A. The documents/records can include many different sources, some of which might be the following: procurement records, waste stream process manuals, operating procedures, on-site safety documentation, process diagrams, waste production records, storage records, on-site waste database management systems, interviews with existing and former workers, transportation records, waste container tracking records, on-site documentation prepared for local, state, or regional regulators. This list is not meant to be inclusive or representative of all records used at every site. It is intended to be used for example purposes only. The number and types of documents can vary greatly from site-to-site so it is impractical to list them as references in this document.

Each DOE TRU waste site was provided, by the WTWBIR team, WTWBIR Revision 0 data packages defining the characterization of each TRU waste stream at their site. The generator/storage sites reviewed, changed, and authorized the characterization as valid for use in developing the WIPP inventory.

2.2.2 Existing Summary Documents on TRU Waste Information

In support of various programs, the DOE has published a series of documents over the years in support of various programs which contain varying amounts of waste information. Listed below are those documents that have formed the foundation of summary TRU waste information prior to the publication of the WTWBIR.

Mixed Waste Inventory Report

The FFCAct required that the DOE, within 180 days of enactment of the FFCAct, submit to the EPA Administrator and the governor of each state in which the DOE stores or generates mixed wastes a report that contains:

- National inventory of all mixed wastes, regardless of the time they were generated, on a state-by-state basis and
- National inventory of mixed waste treatment capacities and technologies.

The FFCAct also stipulated specific reporting requirements for each of these inventories. The DOE submitted the six-volume set entitled: *U.S. Department of Energy Interim Mixed Waste Inventory Report: Waste Streams, Treatment Capacities and Technologies*, DOE/NBM-1100, dated April 1993 (DOE, 1993c), to fulfill these requirements. Since issuance of the "interim" report, DOE has requested additional information from the DOE TRU waste generator/storage sites and published two updated reports entitled:

- *Release of Phase I Mixed Waste Inventory Report Data*, dated April 1, 1994 (Phase I MWIR) (DOE, 1994c), which includes a data diskette (Version .97B) and the draft *Mixed Waste Inventory Report Data Base System User's Guide*.
- *Distribute [Distribution] of the Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (Phase II MWIR) (DOE, 1994a), which includes a data diskette (Version 1.00) and the draft *User's Guide for National Data Base System for the Final Mixed Waste Inventory Report* (May 1994).

The Phase II MWIR was the basis of the mixed waste streams that were included in Revision 0 of the WTWBIR. The DOE waste generator/storage sites have reviewed the existing waste streams from Revision 0 of the WTWBIR and have updated the information. In a very few cases mixed waste streams from the Phase II MWIR have been deleted by the generating/storage sites from Revision 1 of the WTWBIR. Any waste stream that was published in the Phase II MWIR and has a waste stream profile in the WTWBIR contains an identification code in the "MWIR ID" and "WIPP ID" fields on the waste stream profile forms (see Figure 1-2). The identification codes are assigned using the following format:

- DD-WXXX;
 - DD = Site Identification Code (from Figure 1-1)
 - XXX = Three digit numerical code assigned by DOE-HQ

Some sites have submitted "new" mixed waste streams with the Revision 1 WTWBIR data call, which were not in the Phase II MWIR. Therefore, these waste streams have not been assigned DD-WXXX identification numbers by DOE-HQ. Those mixed TRU waste streams which have been reported for the first time in Revision 1 of the WTWBIR have been designated as:

- DD-MXXX (DD and XXX have same meaning as for the MWIR waste streams, except that the three digit numerical code was assigned by the WTWBIR team)

Waste streams that are nonmixed TRU waste do not appear in the Phase II MWIR. Nonmixed TRU waste streams that appear in the WTWBIR have been designated as follows:

- DD-TXXX (DD and XXX have the same meaning as for MWIR waste streams, except that the three digit numerical code was assigned by the WTWBIR team)

INEL included some nonmixed waste streams in the Phase I MWIR which had the MWIR characteristic DD-WXXX identification. These have been retained in the WTWBIR, but all other nonmixed TRU waste streams have used the DD-TXXX designation, including some "new" nonmixed waste streams from INEL.

Integrated Data Base

The IDB (DOE, 1994b) is published by Oak Ridge National Laboratory (ORNL) for the DOE. The ORNL assembles radioactive waste inventories provided by DOE TRU waste generator/storage sites. This database does not report by waste stream, but rather, by the total inventory at each DOE site. The IDB also contains the radionuclide isotopic distribution for the waste stored at each site. Because consistent reporting is not available at the waste stream level, the radionuclide information in the IDB is the basis for the Revision 1 WTWBIR inventory for radionuclides (see Chapter 4). Where sites provided radionuclide data, it is replicated in Appendix A. A WIPP disposal radionuclide inventory is provided in Table 4-2. This table is derived from unpublished IDB submittals from the TRU waste sites.

Other Sources of TRU Waste Information

There are three additional summary documents that have been produced which contain extensive information about TRU waste. The amount and form of the documentation varies between documents due to the initial purpose for including waste information. These include:

- TRUCON (DOE, 1992) - The TRUPACT-II Content (TRUCON) Code document was developed to provide waste information to the Nuclear Regulatory Commission in support of the TRUPACT-II certification application. The TRUCON concentrated on those waste parameters that were important for safe transportation of TRU waste (e.g., thermal heat loading, criticality, free liquids, etc.)
- NMVP (DOE, 1990) - The No-Migration Variance Petition (NMVP) was developed by DOE to obtain a variance from the land disposal restrictions for mixed waste as allowed under 40 CFR 268.6 (EPA, 1986). The NMVP waste information concentrated on defining the volumes of various known TRU and MTRU waste streams in the DOE system at that time, and identifying the hazardous constituents expected to be found in the MTRU waste streams. Text was provided in the NMVP on each known waste stream at that time which summarized the process knowledge and sampling and analysis information available (many WTWBIR waste streams were not defined at the time the NMVP was developed).
- WIPP RCRA Part B Permit Application (DOE, 1993b) - This document which will be revised and submitted to obtain a Part B Permit for WIPP to the State of New Mexico. This document will represent in some parts an update of the NMVP and will incorporate much information from the WTWBIR.

TRU waste streams that are included in the TRUCON and the NMVP are cross correlated, if possible, to WTWBIR waste streams in Appendix F. The designation of each waste stream in the TRUCON and NMVP, if applicable, can be found on the waste stream profile (Figure 1-2). The WTWBIR should be considered the most current source of waste stream information when there is a discrepancy in information between the WTWBIR and the TRUCON or NMVP documents.

2.3 METHODOLOGY FOR DEVELOPMENT OF DISPOSAL INVENTORY

Development of the WIPP TRU waste disposal inventory is accomplished by a series of steps starting with the individual waste streams submitted by the TRU waste generator/storage sites that are identified in Appendix A. These waste stream profiles are grouped together, based on similar physical and chemical properties, into common "WIPP waste profiles," which should facilitate discussions concerning the disposal waste inventory with regulatory agencies and stakeholders. The waste profiles also contain information on waste material parameters that could affect the performance of the WIPP repository and that may be direct inputs to the SPM and PA models. A more detailed explanation of the waste profile methodology is found in Chapter 3.

Because the existing stored and currently projected CH-TRU waste streams do not contain sufficient volume to fill the maximum allowed (designed) capacity of WIPP, scaling of the projected inventories is necessary to attain the following WIPP design inventory:

- Maximum CH-TRU design inventory = 6.2 million cubic feet (~176,000 cubic meters) (Public Law 102-579, 1992)

The anticipated inventory (as defined in Section 1.3.1) consists of 11 overall CH-TRU WIPP waste profiles based on the physical and chemical properties of the waste streams. The CH-TRU scaling factor is computed as follows:

- For CH waste:

$$\frac{\text{design inventory} - \text{stored inventory}}{\text{projected inventory}} = \text{CH-TRU scaling factor}$$

The RH-TRU anticipated inventory would be scaled using the same methodology. If the anticipated RH-TRU and CH-TRU inventories are less than the WIPP design limits, the projected inventory in future revisions of the WTWBIR will include volumes of waste anticipated from D&D and ER activities as these estimates are made available.

The disposal inventory is the total inventory to be used in SPM and PA calculations. To calculate the disposal inventory by WMCG for CH-TRU waste, the projected inventory is multiplied by the scaling factor, added to the stored inventory for each WMCG and summed together. See Section 3.3.2 for further details.

3. WASTE PROFILE METHODOLOGY

3.1 WASTE STREAM PROFILE METHODOLOGY

3.1.1 Introduction

The lowest tier of information in the WTWBIR is the waste stream profile, which documents specific information for each separate TRU waste stream identified by each DOE TRU waste generator/storage site. In this chapter the waste stream profile will be discussed along with the methodology for grouping waste streams into site-specific profiles and WIPP waste profiles.

3.1.2 Waste Stream Profile Description

Each DOE TRU waste generator/storage site was provided data packages that contained the waste material parameter characterization as defined in the WIPP disposal inventory (WTWBIR, Revision 0). Each DOE site was asked to review the data packages and update the information as necessary (see Appendix D for the WTWBIR Revision 1 Questionnaire). Additionally, the sites were required to generate data packages for waste streams that were not defined. This data submittal from the DOE generator/storage sites provided approximately 360 individual TRU waste streams that were used in developing the waste stream profiles (see Appendices A and J). These waste stream profiles were developed using information from the sources listed in Section 2.2. Figure 3-1 provides an example TRU waste stream profile for an INEL waste stream.

In addition to presenting the quantity of waste material parameters in each DOE waste stream, the waste stream profile also provides a cross-reference (top of the waste stream profile form) to the different waste stream nomenclature used in previously generated DOE documents (i.e., TRUCON, NMVP). Appendix F provides a cross correlation table for a WTWBIR waste stream with the NMVP and the TRUCON. The fields utilized on the waste stream profile, the sources of the information, and a short explanation of the data located in a particular field are described in Table 3-1. A complete set of the waste stream profiles is provided in Appendices A and J. Because the West Valley Demonstration Project (WVDP) is a commercial TRU waste site, it is not part of the WIPP inventory, but the WVDP waste stream profiles are provided in Appendix J for information purposes.

The sites were not requested to provide the EPA codes as this information was derived from the Phase II MWIR. EPA codes for mixed waste streams not defined in MWIR were provided by the generator/storage site. During development of the MWIR, DOE directed the TRU waste generator/storage sites to append their hazardous waste codes (EPA codes) to further define the waste in order to develop an appropriate treatment technology. These code designations and descriptions are presented in Appendix G. For example, D003 is defined by EPA as reactive. DOE further defined this code as D003A (reactive cyanide), D003B (reactive sulfides), D003C (explosives), D003D (water reactives), and D003E (other reactives).

3.1.3 Assignment of the Waste Matrix Code Group

The DOE TRU waste generator/storage sites have assigned an overall WMC to each waste stream based on the current form of the waste. The WIPP Project has developed the WIPP WAC (DOE, 1991) for any waste packages to be shipped to WIPP to ensure the safe handling and emplacement of the waste packages in the WIPP. In general, the waste forms acceptable for emplacement in WIPP are described in Table 1-2. Each waste stream has been assigned a WMC by the TRU waste generator/storage site that defines the general physical and chemical properties of the waste.

**Table 3-1. SOURCES OF INFORMATION USED IN
WASTE STREAM PROFILES (continued)**

| Information Field | Source of Information | Explanation |
|---|------------------------------------|---|
| MATERIAL PARAMETERS | TRU waste sites | Record the "Upper Limit"; "Lower Limit"; and "Average" in kg/m ³ for each waste material parameter, if known |
| <u>STORED TRU WASTE AND ESTIMATED RATES OF WASTE GENERATION</u> | TRU waste sites | Provides estimate of stored volumes of waste at the "End of 1992"; "End of 1993" and estimated projections for waste generation. Information is recorded for waste stream volumes as stored or generated and in terms of "final volume" for shipment to WIPP. |
| <u>TYPICAL ISOTOPIC COMPOSITION</u> | TRU waste sites | Provides estimate of "typical" radionuclide concentration expected in waste stream in a curies/m ³ basis; if concentrations are unknown, only isotopes may be listed. |
| TYPICAL EPA CODES APPLICABLE | MWIR or TRU generator/storage site | Identifies the applicable EPA codes for waste for as it exists at sites;. |
| <u>COMMENTS</u> | TRU waste sites | Lists comments/assumptions on the container information provided by TRU waste sites. |
| <u>FOOTNOTES</u> | WTWBIR | Explain data provided by TRU waste generating/storage sites and/or list assumptions made by the WTWBIR. |

The WMC is located on the first page of each waste stream profile. The assignment of the WMC is based on DOE guidance document (DOE, 1993a).

For the purpose of this document, TRU waste generator/storage sites were requested to provide WMCGs for final waste forms; that is, after the sites process, treat, or repackage the waste. The WMCG is indicated on page 1 of the waste stream profile. For most waste stream profiles, the TRU waste generator/storage sites have provided estimates of the waste material parameters (e.g., an INEL waste stream profile is used for illustrative purposes in Figure 3-1). However, in some cases the TRU waste generator/storage sites were unable to provide waste material parameter values for some waste streams. This resulted in two possible changes to the overall methodology presented in this chapter:

- In many cases the TRU waste generator/storage site could categorize the waste stream profile into one of the final 11 WIPP WMCGs (Table 1-2) but could not give any waste material parameter information. In these cases, the WTWBIR assumes the same range and average waste material parameters for the particular WIPP waste profile. For example, if a salt waste stream did not contain any waste material parameter information, but has been

identified by a TRU waste generator/storage site as being a salt waste form, then the volume of that waste stream was added to the total volume of all other salt waste streams.

- In a few cases, TRU waste generator/storage sites were unable to categorize a TRU waste stream into one of the final WIPP WMCGs (Table 1-2). In these cases the waste stream profile is placed in the "unknown" category. The "unknown" waste streams are documented as part of the WIPP inventory, but are not used in any of the scaling of CH-TRU waste volumes necessary to fill WIPP to its design capacity. "Unknown" wastes will have to be characterized and may require treatment prior to emplacement in WIPP.

The TRU waste generator/storage sites have identified several waste streams that are regulated under the Toxic Substances Control Act (TSCA) (i.e., containing asbestos or polychlorinated biphenyls [PCBs]). Because the concentration of the asbestos and/or PCBs is unknown, it is assumed that these waste streams cannot be accepted at WIPP under the proposed draft WIPP RCRA Part B Permit Application. These waste streams are summarized in Table 3-2 and are not included in the WTWBIR.

3.2 SITE-SPECIFIC WASTE PROFILE METHODOLOGY

Waste streams at each TRU waste generator/storage site with similar WMCs can be grouped together into WMCGs (Table 1-2) for a site-specific waste profile. The methodology for grouping waste streams from two different generator/storage sites is shown in Figure 3-2. The grouping of individual waste stream profiles into a site-specific waste profile is based on the similar physical and chemical properties of the waste streams and how that information is used in the SPM and PA models. In the example in Figure 3-2, due to their similar mechanical properties, concrete waste, glass waste, firebrick waste, and ceramic waste mainly influence the estimation of porosity and permeability in the SPM/PA calculations. Therefore, the three waste streams at DOE TRU Waste Site #1 and the two at DOE TRU Waste Site #2 can be grouped together at each site based on similar physical and chemical properties and placed into the site-specific waste profile "inorganic non-metal" waste, with the WMCG defined in Table 1-2.

A site-specific waste profile is developed at each of the TRU waste generator/storage sites for each of the WMCGs that have individual waste streams at the site. These site-specific waste profiles provide a roll-up of the waste material parameter and volume information found in the waste stream profiles for each site. Since there are 11 WMCGs, there are a maximum of 11 possible CH-TRU and 11 possible RH-TRU site-specific waste profiles at any generator/storage site; however, most sites have fewer profiles due to differences in waste segregation practices. An example site-specific waste profile is provided in Figure 3-3. Table 3-3 lists the sources of information for site-specific waste profiles. All the site-specific waste profiles for TRU waste are provided in Appendix B.

3.3 WIPP WASTE PROFILE METHODOLOGY

3.3.1 Introduction and Methodology

The WIPP waste profiles are the highest tier of information in the WTWBIR. Site-specific waste profiles with the same WMCGs are combined across the TRU waste generator/storage sites into what is defined as an overall WIPP waste profile.

TABLE 3-2. TOXIC SUBSTANCES CONTROL ACT (TSCA) TRU WASTE

| WIPP ID | WASTE STREAM NAME | ASBESTOS | PCBs |
|---------|---|----------|------|
| IN-W309 | Absorbed Organic Liquids | No | Yes |
| MD-W002 | Absorbed Aqueous Liquids | No | Yes |
| LL-T005 | HEPA filters | Yes | No |
| MD-M001 | Asbestos Debris | Yes | No |
| MD-T013 | Leaded gloves/aprons | No | Yes |
| MD-T008 | Uncategorized plastics/rubber debris | No | Yes |
| MD-T012 | Uncategorized heterogeneous debris | Yes | No |
| RL-M005 | TRU Mixed Inorganic Homogeneous Solids with Mercury | No | Yes |
| RL-M021 | TRU Mixed Inorganic Debris PCBs with Mercury | No | Yes |
| RL-M022 | TRU Mixed Leaded Gloves/Aprons PCBs with Mercury | No | Yes |
| RL-M023 | TRU Mixed Organic Debris PCBs with IGN, CORR, REAC | No | Yes |
| RL-M024 | TRU Mixed Organic Labpacks with PCBs | No | Yes |
| RL-T030 | Non-mixed Inorganic Debris with PCBs | No | Yes |

As described in Sections 3.1 and 3.2, each waste stream from each TRU waste generator/storage site is defined in a waste stream profile, then grouped by site WMCGs into site-specific waste profiles. These site-specific waste profiles are then rolled-up into WIPP waste profiles by combining identical WMCGs from all the TRU waste generator/storage sites. For example, all site-specific waste profiles for "inorganic non-metal" waste are grouped together to generate the WIPP waste profile, "inorganic non-metal" waste. The WIPP waste profiles are presented in Figures 3-4 through 3-23 at the end of this chapter.

3.3.2 WIPP Waste Profile Roll-Ups

To illustrate the methodology for grouping similar site-specific waste profiles into WIPP waste profiles, the WIPP waste profile for "inorganic non-metal" waste (exemplified in Figure 3-2) is provided in Figure 3-8. As with site-specific waste profiles, there can be a maximum of 11 possible WIPP waste profiles for CH-TRU and 11 possible WIPP waste profiles for RH-TRU

**TABLE 3-3. SOURCES OF INFORMATION USED IN
SITE-SPECIFIC WASTE PROFILES**

| Information Field | Source of Information | Explanation |
|---------------------------|---------------------------|--|
| DOE TRU Site | TRU Waste Sites | The code for the DOE site. Codes are as follows: AL - Ames Laboratory AE - Argonne National Laboratory - East AW - Argonne National Laboratory - West BC - Battelle Columbus BT - Bettis Atomic Power Laboratory ET - Energy Technology Engineering Center IN - Idaho National Engineering Laboratory IT - Inhalation Toxicology Research Institute KA - Knolls Atomic Power Laboratory - Schenectady LA - Los Alamos National Laboratory LB - Lawrence Berkeley Laboratory LL - Lawrence Livermore National Laboratory MD - Mound Plant MU - University of Missouri NT - Nevada Test Site OR - Oak Ridge National Laboratory PA - Paducah Gaseous Diffusion Plant PX - Pantex Plant RF - Rocky Flats Environmental Technology Site RL - Richland (Hanford) Site SA - Sandia National Laboratories/NM SR - Savannah River Site WV - West Valley Demonstration Project |
| WMCG | WTWBIR or TRU waste sites | Groups waste streams that have similar chemical and physical properties (see Table 1-2). |
| Waste Stream Volume | TRU waste sites | Provides estimates of retrievably stored, projected, and total volumes of TRU and mixed TRU wastes by waste stream. |
| Waste Material Parameters | TRU waste sites | Provides total density estimates of selected waste materials in a particular WMCG for the entire site. |

waste. Table 3-4 lists the sources of information used for the WIPP waste profiles. Using volumes for all the TRU waste streams (including the mixed and non-mixed TRU waste volumes) in the WTWBID, a disposal inventory of TRU waste has been developed using the methodology described in this and the preceding sections. This inventory is presented in Table 3-5 (by WMCGs) and depicts both the anticipated and disposal inventory volumes.

**TABLE 3-4. SOURCES OF INFORMATION USED
IN WIPP WASTE PROFILES**

| Information Field | Source of Information | Explanation |
|--------------------------------|---------------------------|--|
| Waste Matrix Code Group (WMCG) | WTWBIR or TRU waste sites | Groups waste streams that have similar chemical and physical properties (Table 1-2) |
| DOE Site Volumes | TRU waste sites | Provides estimates of retrievably stored, projected, and total volumes of TRU and TRU mixed wastes by DOE site |
| Waste Material Parameters | TRU waste sites | Provides weight estimates of selected waste materials in a particular WMCG for the DOE Complex |

The anticipated CH-TRU inventory volumes are the sum of the "stored" and "projected" volumes in Table 3-5. The procedure to scale to the disposal inventory is summarized below:

- The target design volume of CH-TRU waste beyond that identified by the generator/storage sites is decreased by the "unknown" waste volume ($176,000 - 1700 = 176,000$ [there is no significant increase due to rounding]).

The "unknown" volume of waste in Table 3-5 is subtracted from the stored inventory and from the projected inventory.

- The "unknown" waste will have to be added back into the total scaled inventory because it is assumed that this waste will be characterized and then shipped to WIPP.
- Applying a modified version of the formula given in Section 2.3:

$$\frac{1.76 \times 10^5 - 7.13 \times 10^4}{5.1 \times 10^4} = 2.05 \text{ (scaling factor)}$$

(modified design inventory) – (modified stored inventory)
(modified projected inventory)

- Multiply the CH-TRU waste projected inventory volumes by the scaling factor 2.05 for all the WMCGs, except for the "unknown" waste and add the stored volumes (which results in the numbers in the "Disposal Inventory" column of Table 3-5).
- Add the CH-TRU waste volumes in the fourth column, including the "unknown" waste, to attain the estimated WIPP disposal inventory volume).

The CH-TRU waste stream volume on a system-wide WMCG basis is increased by 42 percent to account for the difference between the anticipated inventory and the repository design limit.

A similar methodology has been developed to scale the RH-TRU inventory. The anticipated RH-TRU inventory volumes are the sum of the "stored" and "projected" volumes in Table 3-5. The procedure to scale to the disposal inventory is summarized below:

- The target design volume of RH-TRU waste beyond that identified by the generator/storage sites is decreased by the "unknown" waste volume (7080 - 35 = 7045).

The "unknown" volume of waste in Table 3-5 is subtracted from the stored inventory and from the projected inventory.

- The "unknown" waste will have to be added back into the total scaled inventory because it is assumed that this waste will be characterized and then shipped to WIPP.
- Applying a modified version of the formula given in Section 2.3:

$$\frac{7045 \text{ (modified design inventory)} - 1158 \text{ (modified stored inventory)}}{3595 \text{ (modified projected inventory)}} = 1.64 \text{ (scaling factor)}$$

- Multiply the RH-TRU waste projected inventory volumes by the scaling factor 1.64 for all the WMCGs, except for the "unknown" waste and add the stored volumes (which results in the numbers in the "Disposal Inventory" column of Table 3-5).
- Add the RH-TRU waste volumes in the fourth column, including the "unknown" waste, to attain the estimated WIPP disposal inventory volume).

The RH-TRU waste stream volume on a system-wide WMCG basis is increased by 48 percent to account for the difference between the anticipated inventory and the repository design limit.

4. WIPP DISPOSAL RADIONUCLIDE INVENTORY

4.1 INTRODUCTION

The TRU waste generator/storage sites were requested in the Revision 1 data call to submit estimates of the radionuclide inventory on a waste stream basis. Most sites complied with the data request, but many waste streams submitted to the WTWBID did not contain this information. Due to the short timeframe given the TRU waste generator/storage sites for the Revision 1 data call, sufficient time was not available to derive the data to support each waste stream. The radionuclide data provided on a waste stream basis in Appendix A of the WTWBIR is currently for information purposes only.

4.2 METHODOLOGY

Since the waste-stream specific radionuclide data is insufficient to derive a radionuclide inventory, the site-wide radionuclide inventories reported in the Integrated Data Base (IDB) were used. The most recent IDB (DOE, 1994b) will be used which contains unpublished radionuclide data by site for stored TRU wastes as of December 31, 1993 (Appendix I).

There are still some volume differences at a TRU waste generator/storage site level between the IDB and the WTWBIR (see Section 1.5.4). Closure between the two data sets should be achieved with the Revision 2 WTWBIR data call and publication of Revision 2 of the WTWBIR. Therefore, the volume data from the IDB database (DOE, 1994b) has been used to make the estimates of stored and projected volumes used in deriving the radionuclide information. By using the volume and radionuclide data from the IDB database, there exists one internally consistent set of data for estimating the radionuclide inventory.

IDB radionuclide data is only available for stored TRU waste. Therefore, this historical radionuclide data will also be used to make estimates of the projected radionuclide inventories and for any necessary scaling. Until estimates are available from the TRU waste generator/storage sites on projected radionuclide inventories, the IDB represents the only comprehensive database.

The WIPP radionuclide disposal inventory for CH-TRU waste has been calculated as follows:

- The stored and projected volumes from the IDB (DOE, 1994b) data have been used for the volume estimates and are included in Table 4-1.
- The radionuclide data included as part of the data submitted for the IDB (DOE, 1994b) represents the stored waste only. Appendix E provides the radionuclide inventory by TRU waste site for the stored inventories listed in Table 4-1. These numbers have been decayed to December 1993, using the Radioactive Decay and Accumulation Code (RADAC) System (DOE, 1994d).
- For a particular site and radionuclide, divide the reported inventory for that radionuclide from the IDB (Appendix E) by the volume of stored waste at that site from the IDB (Table 4-1). This results in a curies/m³ estimate for all reported radionuclides at each site.
- The projected volumes of waste are assumed to have the same radionuclide concentrations on a cubic meter basis as the stored waste at each site.

- Since Bettis Atomic Power Laboratory (BT) and Ames Laboratory (AL) reported no existing CH-TRU waste volume inventory, there is no radionuclide inventory for these sites in the IDB. The projected volumes from these two sites, BT (123.5 m³), and AL (0.09 m³) have been grouped with the INEL projected CH-TRU waste and assumed to have the same isotopic composition.
- The total volume of projected CH-TRU waste from the IDB in Table 4-1, if added to the stored waste volumes from the IDB, exceeds the capacity of WIPP (176,000 m³)
- To calculate the radionuclide inventory the total projected CH-TRU waste is adjusted as follows:
 - Maximum design capacity for CH-TRU = 176,000 m³
 - Stored CH-TRU volume = 104,000 m³
 - Allowable projected volume = (176,000 - 104,000) × 10⁵ m³ = 72,000 m³
 - Projected waste adjustment factor =

$$\frac{\text{Allowable projected volume}}{\text{Projected volume reported by sites}} = \frac{72,000 \text{ m}^3}{64,600 \text{ m}^3} = 1.11$$

- Therefore, the projected radionuclide inventory for each radionuclide at each site is calculated as follows:

$$\text{Stored Radionuclide Inventory} + \left(\text{Concentration of radionuclide in stored waste in curies/m}^3 \times \text{Volume of projected waste at site} \times 0.65 \right) = \text{Total CH-TRU inventory for radionuclide at that site}$$

The building of the WIPP radionuclide disposal inventory for RH-TRU waste has been calculated similar to the CH-TRU radionuclide inventory, with the exception of the following:

- Three RH-TRU waste streams that are projected waste streams only were submitted with no accompanying isotopic information: RL-M201, RL-T202, and SR-T001. THESE WASTE STREAMS, WHICH ACCOUNT FOR THE PROJECTED HANFORD AND SRS RH-TRU WASTE VOLUMES, HAVE BEEN OMITTED FROM THE RADIONUCLIDE INVENTORY CALCULATIONS due to the lack of radionuclide information. The RH-TRU projected volumes in the Draft Revision 10 IDB (Appendix I) include both the reported volumes in the two projected Hanford RH-TRU waste streams and the "suspect" volumes reported in the comment field of the two Hanford waste streams (RL-M201 and RL-T202 Appendix A).
- BT did not report stored RH-TRU inventories and the projected inventories have been omitted because no radionuclide information is available.
- The sum of the stored and projected volumes of RH-TRU waste from the TRU waste sites is less than the design capacity of WIPP (7080 m³) for RH-TRU waste.

- To calculate the radionuclide inventory the total projected RH-TRU waste is adjusted as follows:

- Design capacity for RH-TRU = 7080 m³
- Stored RH-TRU volume = 941 m³
- Therefore the needed projected waste volume is:

$$7080 \text{ m}^3 - 941 \text{ m}^3 = 6139 \text{ m}^3$$

- The projected RH-TRU waste volume (excluding the 2 RL and SR waste streams) is 957 m³
- The projected waste volume must be increase by the following factor to "scale" to fill the RH-TRU design capacity:

$$\frac{6139 \text{ m}^3}{957 \text{ m}^3} = 6.41$$

- Therefore, the projected radionuclide inventory for each radionuclide at each site is calculated as follows:

$$\text{Stored Radionuclide Inventory} + \left(\text{Concentration of radionuclide in stored waste in curies/m}^3 \times \text{Volume of projected waste at site} \times 6.41 \right) = \text{Total RH-TRU inventory for radionuclide at that site}$$

Table 4-2 represents the total radionuclide inventory for CH-TRU and RH-TRU wastes as derived from the Revision 10 IDB database, including any adjustment needed to the projected volumes of waste in order to fill the WIPP to the maximum CH-TRU and RH-TRU design limit.

A comparison of the disposal radionuclide inventories in Revision 0 and in Revision 1 of the WTWBIR shows large changes. Listed below are the dominant reasons for these changes:

- The total radionuclide inventory for CH-TRU waste is much higher than that included in the Revision 0 of the WTWBIR. This is primarily due to two changes:
 - The SR has reported a large volume of CH-TRU projected waste in the IDB ($\approx 62,000 \text{ m}^3$), which was previously reported as "unknown." With the historically high Pu-238 content, this considerably raises the total curies in the CH-TRU inventory.
 - During the calculations for the Revision 0 inventory, the "projected" part (1994–2022) of the CH-TRU radionuclide inventory was inadvertently left out of the totals reported, causing the inventory numbers to be low ($\approx 25\%$). This has been corrected in this inventory definition.

- The total radionuclide inventory for RH-TRU waste is also much higher than that included in the Revision 0 of the WTWBIR. During calculation of the RH-TRU inventory the volume defined by the sites included more waste than the repository could hold. During those calculations, a misunderstanding occurred about the fact that the IDB radionuclide numbers only covered the "stored" part of the inventory. This caused the Revision 0 WTWBIR reported RH-TRU inventory to be low by a factor of approximately 3 – 4. This has been corrected in this inventory definition.
- Oak Ridge National Laboratory (ORNL) has reported a very conservative inventory for U-235 in RH-TRU waste (≈ 367 curies before scaling). In order to provide a less conservative estimate of the U-235 inventory, an anticipated transportation requirement of the RH-TRU cask has been imposed.

The new estimate for U-235 in ORNL RH-TRU waste has been calculated from the anticipated initial transportation limit in the RH-TRU cask of 325 grams (DOE, 1991) of Pu-239 fissile gram equivalent (FGE). Assuming a 1:1 equivalence of U-235 FGE (as required by the TRUPACT-II SARP; Nuclear Packaging, 1991) to Pu-239, this provides a bounding limit of 325 grams of U-235/canister \times 7955 canisters \times 2.19×10^{-6} curies/gram = 5.66 curies of U-235 in RH-TRU waste inventory. This number has been substituted in Table 4-2 to replace the overly conservative data reported by ORNL.

* Excluded from the IDB-based RH-TRU radionuclide inventory rollups because no radionuclide information was submitted.

1. 40% of this stored inventory assumed to be low-level waste.
2. 50% of this stored inventory assumed to be low-level waste.
3. Does not include 5.3 m³ of RH-TRU at NTS which is anticipated to be CH-TRU after repackaging.
4. The IDB volumes for SRS projected CH-TRU and RH-TRU waste have been corrected since issuance of the Draft Revision 10 IDB (Appendix I).

5. WASTE MATERIAL PARAMETERS

5.1 INTRODUCTION

Some waste materials that occur in TRU waste may degrade over the 10,000-year regulatory period and estimates of masses/volume are needed for performance modeling (Table 1-1). Some of these waste materials may produce gas by either chemical, microbial, or radiolytic processes (WIPP PA, 1993). These types of processes need to be evaluated as part of the WIPP SPM and PA modeling effort to analyze their impact on repository behavior.

5.2 PARAMETER DESCRIPTION

This chapter identifies and defines the waste material parameters to be evaluated in performance assessment calculations. The same methodology used for defining waste stream profiles and combining them into site-specific and WIPP waste profiles is used to develop a disposal inventory for WIPP by waste material parameters (see Figure 3-2). Waste material parameter information is provided for each waste stream profile by the TRU waste generator/storage sites (Figure 1-2). In those cases where waste material parameter information could not be provided by the TRU waste generator/storage sites, an alternative methodology was adopted as described in Section 3.1.3. This waste material parameter information is used to estimate the anticipated WIPP inventory, which is then scaled to obtain the repository design limit (disposal inventory), if needed. This inventory is presented as a weighted average with a maximum and minimum expected weight/volume for each waste material parameter.

The waste material parameter information, which is provided by the TRU waste generator/storage sites, consists of 10 waste material parameters and additional packaging materials that are direct inputs into the SPM and PA models. These are presented below.

Inorganics

- Iron-based metals/alloys – This designation is meant to include iron and steel alloys in the waste and does not include the waste container materials.
- Aluminum-based metals/alloys – Aluminum or aluminum-based alloys in the waste materials.
- Other Metals – All other metals found in the waste materials (e.g., copper, lead, zirconium, tantalum, etc.). The lead portion of lead rubber gloves/aprons is also included in this category.
- Other Inorganic Materials – Include inorganic non-metal waste materials such as concrete, glass, firebrick, ceramics, sand, and inorganic sorbents.

Organics

- Cellulosics – Includes those materials generally derived from high polymer plant carbohydrates. Examples are paper, cardboard, kimwipes, wood, cellophane, cloth, etc.
- Rubber – Includes natural or manmade elastic latex materials. Examples are Hypalon®, neoprene, surgeons' gloves, leaded-rubber gloves (rubber part only), etc.

- Plastics – Includes generally manmade materials, often derived from petroleum feedstock. Examples are polyethylene, polyvinylchloride, Lucite, Teflon, etc.

Solidified Materials

- Inorganic Matrix – This includes any homogenous materials consisting of sludge or aqueous-based liquids that are solidified with cement, Envirostone[®], or other solidification agents. Examples are wastewater treatment sludge, cemented aqueous liquids, and inorganic particulates, etc.
- Organic Matrix – This includes cemented organic resins, solidified organic liquids, and sludges.

Soils

- Generally consists of naturally occurring soils that have been contaminated with inorganic waste materials.

Packaging Materials

The TRU waste generator/storage sites have been asked to define waste streams in each waste stream profile expressed as final waste form and volumes in containers that are currently approved for shipment. Listed below are the currently approved CH-TRU packaging configurations for TRUPACT-II (DOE, 1991) and anticipated approved RH-TRU packaging configurations (DOE, 1991):

- TRUPACT-II
 - 55-gallon drum
 - Standard Waste Box (SWB)
 - 55-gallon drums overpacked in SWB.
- RH-TRU cask (anticipated acceptable packaging configurations for the RH-TRU cask)
 - RH-TRU canister
 - three 55-gallon or 30-gallon drums overpacked in a RH-TRU canister.

In cases where the sites defined a type of waste container, but not the weight/volume of the packaging, assumptions were made about the weight of the containers in order to include these estimates as part of the overall inventory destined for WIPP. If overpacking a waste container was necessary for transport in a shipping cask, overpacking was assumed. The densities assumed are included as part of the "TRU system-wide data assumptions" included in Section 1.5.

- Steel – The weight of the steel part of the packaging from container information provided by the TRU waste generator/storage sites. Any necessary overpacking is included in the weight.
- Plastics – The weight of any plastic packaging submitted by the TRU sites. When weight of a rigid liner is not given a 90-mil HDPE liner is assumed.

- Lead – The weight of the Pb shielding in a RH canister is assumed if not provided by the TRU waste sites. The weight is included in the "Packaging Material Assumptions" in Chapter 1.5.3.

5.3 METHODOLOGY

The rollups of waste material parameters by WMCGs or by site use the volumes from the WTWBID. The roll ups by WMCGs or by site require combining data from several WTWBID waste streams. The averages for the material parameters are calculated from the average densities provided by the TRU waste generator/storage sites modified by the WTWBID volume fractions and summed as follows:

$$\begin{array}{l} \text{Average Density} \\ \text{of waste material} \\ \text{parameter} \end{array} = \text{Average Density}_i \times \frac{\begin{array}{c} \text{(Volume WTWBIR} \\ \text{Stream}_i) \end{array}}{\begin{array}{c} \text{(Total Volume of} \\ \text{WMCG)} \end{array}} + \dots$$

where i is an index representing individual waste streams of the same WMCG

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the WTWBID waste streams in a particular site-specific rollup. The maximum density is chosen in a similar manner, except that the largest maximum density was chosen.

In many cases, the TRU waste generator/storage sites did not have data for minimum and maximum percentages, even though average percentages are provided. In these cases, for rollup purposes only, the minimum is assumed to be zero and the maximum is assumed to be equal to the average. This ensures that the calculated and rolled up maximum densities are greater than the average densities. However, the maximum density may not be a true maximum but the maximum average density (see Chapter 7 for further WTWBID information).

5.4 WIPP WASTE MATERIAL PARAMETER ROLLUPS

The waste material parameters that are inputs into the SPM process and PA models are presented in Table 5-1 for CH-TRU waste and Table 5-2 for RH-TRU waste. These tables represent the WIPP disposal inventory of waste material parameters. These waste material parameters are the final rollups of the WIPP waste profiles in Figures 3-4 to 3-23.

5.5 UTILIZATION OF WASTE MATERIAL PARAMETER DATA IN APPLICATIONS

The waste material parameter data presented in Tables 5-1 and 5-2 must be used with certain limitations. If the "average" weight/volume (density) composition of CH-TRU and RH-TRU wastes in terms of the waste material parameters is needed then the middle column of Tables 5-1 and 5-2 labelled "Average" should be used in the calculations. If the task requires a distribution of values then the "Maximum" and "Minimum" columns should be used in conjunction with the "Average" column with the following limitations:

Table 5-1

WIPP CH-TRU Waste Material Parameter Disposal Inventory

| | | (Kg/m3) | | |

Table 5-2

WIPP RH-TRU Waste Material Parameter Disposal Inventory

| | | (Kg/m3) | | |
|-----------------------------|-------------------------|----------------|----------------|----------------|
| | <u>Materials</u> | <u>Maximum</u> | <u>Average</u> | <u>Minimum</u> |
| Inorganics | Iron Based | 1.7E+03 | 9.4E+01 | 0.0E+00 |
| | Aluminum Based | 2.6E+02 | 1.8E+01 | 0.0E+00 |
| | Other Metals | 9.1E+02 | 1.0E+01 | 0.0E+00 |
| | Other Inorganics | 2.0E+03 | 3.1E+01 | 0.0E+00 |
| Organics | Cellulose | 9.6E+02 | 2.7E+01 | 0.0E+00 |
| | Rubber | 1.9E+02 | 4.8E+00 | 0.0E+00 |
| | Plastics | 5.5E+02 | 2.4E+01 | 0.0E+00 |
| Solidified Materials | Inorganic | 1.1E+03 | 1.3E+02 | 0.0E+00 |
| | Organic | 3.7E+00 | 1.7E-03 | 0.0E+00 |
| Soils | | 1.9E+02 | 1.8E+00 | 0.0E+00 |
| Container Materials | | | | |
| | Steel | | 447 | |
| | Plastic/Liners | | 3.2 | |
| | Lead | | 465 | |
| | Steel Plug | | 2145 | |

- The sum of all the waste material parameters in the "average" column represents the "average" weight of a cubic meter of CH-TRU or RH-TRU expected at WIPP. For instance, the "average" cubic meter of CH-TRU waste expected at WIPP is (see Table 5-1):

$$559.5 \text{ kg/m}^3 \text{ CH-TRU waste} + 173 \text{ kg/m}^3 \text{ of packaging} = 732.5 \text{ kg/m}^3$$

- The weight of packaging is not expected to vary, so if any "sampling" of distributions of densities is required, the sampling should only be on the waste part of the above equation.
- If sampling of the waste material parameters is needed, the sum of the densities of all waste material parameters sampled for any iteration **SHOULD NOT EXCEED THE AVERAGE DENSITY OF THE WASTE AS DEFINED IN THE "AVERAGE" COLUMN SUMMATION.** That is, one cannot sample on the upper range for all waste material parameters or sample all waste material parameters at the lower end of the range. By default, if some waste material parameters are sampled at higher values than the average some will have to be sampled at lower values than average so that the density of the waste always remains the same (sum of the "average" column).

The same sampling methodology, if needed, should be used for the RH-TRU waste as reported in Table 5-2.

TO OBTAIN THE TOTAL WASTE MATERIAL PARAMETER WEIGHTS FOR THE DISPOSAL INVENTORY, USERS OF THE DATA SHOULD MULTIPLE THE AVERAGE DENSITIES OF THE WASTE MATERIAL PARAMETERS FOR CH-TRU (TABLE 5-1) AND RH-TRU (TABLE 5-2) BY THE DESIGN BASIS VOLUME.

For example:

The expected (average) CH-TRU inventory of combustibles for WIPP is (Table 5-1):

$$170 \text{ kg/m}^3 \times 176,000 \text{ m}^3 \text{ (design basis)} = 29,900,000 \text{ kg combustibles}$$

For steel in CH-TRU waste:

$$83 \text{ kg/m}^3 \text{ (waste)} + 140 \text{ kg/m}^3 \text{ (container)} = 223 \text{ kg/m}^3$$

$$223 \text{ kg/m}^3 \times 176,000 \text{ m}^3 = 3,900,000 \text{ kg steel}$$

6. STORED AND PROJECTED CH-TRU AND RH-TRU INVENTORIES BY SITE

As described in Chapter 3, each waste stream from each waste generating/storage site is characterized in a waste stream profile (Appendix A). These waste stream profiles are rolled up by WMCGs for each generator/storage site. Summary tables of contact-handled and remote-handled waste volumes are provided in Tables 6-1 and 6-2. Summary profiles of waste volumes by WMCG for each site are provided in Tables 6-3 through 6-22.

TRANSURANIC WASTE DISPOSAL INVENTORY BY SITE

| Contact Handled Waste | | (Cubic Meters) | |

7. WIPP TRANSURANIC WASTE BASELINE INVENTORY DATABASE

A WIPP Transuranic Waste Baseline Inventory Database (WTWBID) has been developed to support the Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report (WTWBIR). This database was used to roll up the waste data and print out the various tables and reports used in the WTWBIR. The database is operated in the Microsoft Access Vs. 2.0 system.

7.1 DATABASE DESCRIPTION

The database actually consists of two databases with essentially the same primary data tables. The first database is WTWBIR.MDB. This database contains the original data submitted by the sites or agreed with the sites through discussions with WTWBIR personnel. This database is used to produce the forms in Appendix A. The second database is called REPORTS.MDB and is used to produce the tables and figures in the rest of the report. There are two databases because the basic data in WTWBIR.MDB must be manipulated to produce rational roll ups of the data for the reports and figures. These manipulations are described in this section of the report.

Each record in the database represents one waste stream as defined by a unique waste stream ID (WIPP_ID). In the case where the WTWBIR waste stream is the same as a waste stream reported in phase 2 of the MWIR, the WIPP_ID is the same as the MWIR ID (UNIQUE_WS). Some streams, primarily non mixed and a few mixed waste streams, were not reported in the MWIR. In these cases, if the site did not assign a proper ID, a WIPP_ID was assigned by the WTWBIR team.

The reports and tables produced for the WTWBIR are produced from different data sorts based on the WTWBIR-ID, Site_Name, Handling and Final_Waste_Form fields. The Site_Name refers to the sites as defined in the field WS_SITE. The Site_Name specifies the site which reported and is typically storing the waste. The generator site may differ from the storage site. The Handling field defines whether the waste is categorized as CH or RH waste. The Final_Waste_Form defines a general grouping based on the physical and chemical properties in the waste stream. These are broader waste matrix code groupings (WMCG) (Table 1-2) based generally on the MWIR treatability groups which are described in the MWIR form instructions. In Revision 0 of the WTWBIR, these Final_Waste_Forms were referred to as Matrix_Names.

The volumes are rolled up from the cumulative stored volumes and projected volumes provided by the sites. The stored volumes are based on the cumulative end of 1993 volumes in the database. Some sites provided stored volumes for 1992 and projected volumes for 1993 while other sites provided stored volumes for 1993. In order to be consistent, the stored volumes for sites that based their stored volumes on 1992 were calculated by adding the 1992 volume to the 1993 projected volume. Projected volumes were calculated by adding the volumes for 1994 through 2022.

In Table 3-5, a column was calculated to match the maximum design capacity of WIPP for CH waste. This was done by increasing all the Final_Waste_Form projected volumes proportionately, except Unknown, so that the total CH volume would equal the maximum WIPP capacity. Additional waste volume was calculated for each waste stream proportionate to the projected volumes for each stream such that the sum of the scaled volumes for contact handled waste equaled 175,600 cubic meters. Enough waste is already identified to fill the WIPP to capacity for remote handled waste.

The other fields used to develop roll ups for the tables in the reports are the waste material parameters. The sites were asked to estimate an average, minimum and maximum concentration of materials in each waste stream. For example, weights of metals such as brass, copper, tantalum and materials simply described as metals were rolled up under the field OM_xxx (where xxx is min, max, or avg) which stands for "Other Metals" (see the data dictionary; Table 7-1). Note that because some materials are described only as metals, aluminum and iron can be in the OM_xxx field as well as in the IB_xxx or AB_xxx fields.

Two categories of sludges and solidified materials are represented by fields. These are solidified inorganic solids (SIM_xxx) and solidified organic solids (SOM_xxx). The particular category into which a sludge or solidified material is placed is determined by the overall matrix of the resulting material after any solidification or stabilization steps. For example, a small amount of organic liquids/sludges solidified in cement would be placed in the solidified inorganics category and a drum of organic based resin beads solidified would be placed in the solidified organics category.

The rest of the fields are reasonably self explanatory, but additional discussion on Cel_xxx, Rub_xxx, and Plas_xxx, may be helpful. Cel_xxx includes all cellulose base materials and will typically include paper, cloth, wood, kimwipes and other materials derived from plant based materials. It is assumed that cloth is plant derived material such as cotton and not plastic based such as rayon or nylon. Rub_xxx consists of rubber based materials. Included in this category are Hypalon®, neoprene, and surgeons gloves. Plas_xxx represents plastics such as Lucite®, polyethylene, Tyvek®, teflon and polyvinyl chloride. Plastic bags are used extensively in packaging the waste and would be included in this category. The plastic drum or container liners were not included in this category and were requested separately.

The parameter information is manipulated so that the waste material parameters can be added up and averaged at WIPP, site and Final Waste Form levels. Waste streams for which no waste parameters are provided or for which average, minimum and maximum parameters are not all provided cannot be rationally averaged and summed. Therefore, in order to calculate averaged parameters from the waste stream data provided, certain manipulations on the data are necessary. These manipulations are summarized below. If the parameters for a particular waste material were incomplete, the following assumptions were used to adjust the data so that rational averages and sums could be accomplished:

- If no minimum was provided, but a maximum was provided, the minimum was assumed to be zero.
- If a maximum was provided, but no average, the average was assumed to be one half the sum of the maximum and minimum.
- If an average was provided but no minimum or maximum, the average was assigned to the minimum and maximum.
- If only a minimum was provided, the minimum was assigned to both the maximum and the average.

For those waste streams that did not have any waste parameter information provided, but which could be assigned to a final waste form, an average set of parameters was calculated and used. This average set of parameters was calculated by volume averaging the parameters provided for other waste streams with the same final waste form.

The data that is printed out on all the tables in the report is based on these calculations and assumptions. The individual stream data printed out in Appendix A is the original unmanipulated data submitted by the generator/storage sites or agreed to by the sites through discussions and questions with the WTWBIR team.

The roll ups of these material parameters for tables in the report by Final_Waste_Form or by site were performed using a volume weighted averaging procedure. The averages for the material parameters for a Final_Waste_Forms (FWF) are calculated as follows:

$$\text{Average Density of FWF parameter}_i = \text{Density of Parameter}_i \times \frac{(\text{Volume in Stream}_i)}{(\text{Total Volume in FWF})} + \dots$$

where i is an index representing individual waste streams of the same FWF.

The minimum density is chosen as the smallest minimum density of a particular material parameter in the WTWBIR streams in a particular Final_Waste_Form. The maximum density is chosen in a similar manner except that the largest maximum density was chosen. Note that the maximum and minimum densities apply to individual containers and cannot be used to directly calculate a maximum and minimum density of particular material parameters for the entire WIPP inventory. Also note, that it is possible, that the maximum density may not be a true maximum but a maximum average density, if a site provided only averages and no maximums and these averages are higher than other sites' maximums.

The amount of and type of materials in the containers and liners was requested separately in the waste stream profiles. Many of the sites did not provide data for final form WIPP approved containers. Some sites provided current containers, some did not provide containers and some provided final form containers. In order to add up packaging materials for the waste as it would arrive at WIPP, standard container configurations were assumed for waste from all sites.

If the site provided final form containers, the final form containers (drums, SWBs, or RH Canisters) were used, but standard liners were assumed. This was done because many sites did not provide liner information and assuming standard liners will generally maximize the amount of liner material.

For CH waste containers, the following assumptions were used:

- If the type of container was unclear, it was assumed to be drums. (This was rare.)
- If drums were reported they are assumed to be WIPP approved drums with rigid liners. Many sites have a mixture of liner types in a stream or are unsure of liners.
- If waste was reported in containers larger than drums, then the waste was divided into (Standard Waste Boxes) SWBs with standard plastic bag liners; using the standard internal volume for SWBs and the reported waste stream volumes to determine the number of SWBs.
- If the waste was reported in a liquid or sludge form (i.e. tanks), it was assumed to be placed in drums with rigid liners. No treatment volume expansion was included unless provided by the site.

For RH waste, the following assumptions were used:

- If the waste was reported in drums, the drums were assumed to be overpacked in RH canisters at 3 drums per canister.
- If the waste was not reported to be in drums, the waste was assumed to be direct loaded into RH canisters; using the standard internal volume for RH canisters and the reported waste stream volumes to determine the number of RH canisters.

Packaging material weights used in the WTWBIR report are shown in the table below:

Table 7-1. Table of Materials for CH and RH Waste Containers
(Weights in kg per container, Volume in m³ per container)

| CH Waste | | | |
|-----------------------------|------------------|---------|-----------------------------------|
| Container Characteristic | Drum | SWB | SWB Overpack ¹ |
| Steel Weight | 27.3 | 290.9 | 400.1 (include. 4 drums |
| Liner Type | Rigid Drum Liner | Bag | Rigid Drum Liners and Bag |
| Liner Material | 90 mil HDPE | Plastic | 90 mil HDPE and Plastic |
| Liner Weight | 7.7 | 2.2 | 33 |
| Volume (Capacity) | 0.208 | 1.89 | 1.89 |
| Payload Volume ² | 0.208 | 1.89 | 0.832 (4 drums) |
| RH Waste | | | |
| Container Characteristics | RH Canister | | RH Canister Overpack ³ |
| Steel Weight | 387.3 | | 469.2 (3 drums) |
| Lead Weight | 413.6 | | 413.6 |
| Steel Plug Weight | 1909.1 | | 1909.1 |
| Liner Type | None | | Rigid Liner in Drums |
| Liner Material | N/A | | 90 mil HDPE |
| Liner Weight | N/A | | 23.1 |
| Volume (Capacity) | 0.89 | | 0.89 |
| Payload Volume ² | 0.89 | | 0.624 (3 drums) |

¹ Four drums overpacked in an SWB

² Payload volume is the actual volume of waste which can be placed in the container.

³ Three drums overpacked in an RH Canister

The tables and reports for the WTWBIR were produced using the facilities provided by the Microsoft Access Vs 2.0 database system. These tables and reports consist primarily of various sorts based on waste streams, final waste forms, sites, etc. and summations of volumes and material parameter weights.

7.2 DATA DICTIONARY

Table 7-2. WTWBID Data Dictionary

| Field/Table Name | Notes | Description |
|---|---|---|
| Table: Container_Data WIPP_ID | Key Field Index Relating from Page_1 data table | The unique waste stream identification number as assigned by the WTWBIR Team |
| MWIR_ID | | The unique waste stream identification number as listed in the Mixed Waste Inventory Report |
| Cont | Key Field to relate to Nuclides data table | Container (SWB, Std Drum, or RH Canister) |
| Counter | | Access 2.0-generated record identifier |
| MWIR_Cont | | The type of container as listed in the MWIR |
| Type/Size | | type and/or size of container |
| Param | | Parameter Information Reported? |
| RAD | | Yes - Isotopes listed; No - None Listed; Quan - Concentrations listed |
| Container Material | | Material of which the waste container is made |
| Ext_Volume | | cubic meters per container |
| Liner_type | | Nomenclature identifying the type and size of liner. |
| Liner_material | | composition of liner |
| Nbr_Stored | | number of this type of container stored. |
| Nbr_Projected | | Total number of this container for this waste stream projected through the life of the WIPP |
| IB_avg | | Iron-based constituents, Average, in kg/m3 |
| IB_min | | Iron-based constituents, Minimum, in kg/m3 |
| IB_max | | Iron-based constituents, Maximum, in kg/m3 |
| AB_avg | | Aluminum-based constituents, Average, in kg/m3 |
| AB_min | | Aluminum-based constituents, Minimum, in kg/m3 |
| AB_max | | Aluminum-based constituents, Maximum, in kg/m3 |
| OM_avg | | Other metals constituents, Average, in kg/m3 |
| OM_min | | Other metals constituents, Minimum, in kg/m3 |
| OM_max | | Other metals constituents, Maximum, in kg/m3 |
| OI_avg | | Other inorganics constituents, Average, in kg/m3 |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|------------------------|-------|---|
| OI_Min | | Other inorganics constituents, Minimum, in kg/m3 |
| OI_max | | Other inorganics constituents, Maximum, in kg/m3 |
| Cel_avg | | Cellulosics constituents, Average, in kg/m3 |
| Cel_min | | Cellulosics constituents, Minimum, in kg/m3 |
| Cel_max | | Cellulosics constituents, Maximum, in kg/m3 |
| Rub_avg | | Rubber constituents, Average, in kg/m3 |
| Rub_min | | Rubber constituents, Minimum, in kg/m3 |
| Rub_max | | Rubber constituents, Maximum, in kg/m3 |
| Plas_avg | | Plastic constituents, Average, in kg/m3 |
| Plas_min | | Plastic constituents, Minimum, in kg/m3 |
| Plas_max | | Plastic constituents, Maximum, in kg/m3 |
| SIM_avg | | Solidified Inorganic Materials constituents, Average, in kg/m3 |
| SIM_min | | Solidified Inorganic Materials constituents, Minimum, in kg/m3 |
| SIM_max | | Solidified Inorganic Materials constituents, Maximum, in kg/m3 |
| SOM_avg | | Solidified Organic Materials constituents, Average, in kg/m3 |
| SOM_min | | Solidified Organic Materials constituents, Minimum, in kg/m3 |
| SOM_max | | Solidified Organic Materials constituents, Maximum, in kg/m3 |
| SL_avg | | Soils, Average, kg/m3 |
| SL_min | | Soils, Minimum, kg/m3 |
| SL_max | | Soils, Maximum, kg/m3 |
| PM_Steel | | Packaging materials, steel, kg/m3 |
| PM_Plastic | | Packaging materials, plastic, kg/m3 |
| End_of_92 | | Volume of this waste stream as of the end of 1992 |
| Projected_end_of_92 | | Projected volume of this waste stream as of the end of 1992 |
| FF_End_of_92 | | The Volume of this waste stream on hand at end of 1992 in it's estimated final waste form to ship to the WIPP |
| FF_Projected_end_of_92 | | Not used. |
| End_of_93 | | The cumulative waste volume at the end of the year. |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|-----------------------------------|--|--|
| FF_End_of_93 | | The cumulative waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP. |
| End_of_94 | | The new waste volume at the end of the year; the increment added during the year |
| FF_End_of_94 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| End_of_95 | | The new waste volume at the end of the year; the increment added during the year |
| FF_End_of_95 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| End_of_96 | | The waste volume at the end of the year; the increment added during the year |
| FF_End_of_96 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| End_of_97 | | The waste volume at the end of the year; the increment added during the year |
| FF_End_of_97 | | The new waste volume of the waste on hand at end of year in its estimated final form for shipment to the WIPP, the increment added during the year |
| 98-2002 | | The waste volume added per year during the period. |
| FF_98-2002 | | The waste volume added per year during the period in its estimated final form for shipment to the WIPP. |
| 03-2022 | | The waste volume added per year during the period. |
| FF_03-2022 | | The waste volume added per year during the period in its estimated final form for shipment to the WIPP. |
| Comments | | Miscellaneous comments applicable to page 2 of the data form |
| Container_- Footnotes | | Footnotes applicable to a specific container type in a waste stream. |
| <i>Table: Page_1</i> Site_Name | | Name of site, text spelled out as specified in a look-up table (ANL-E, Hanford, INEL, AMES, etc.). |
| MWIR_ID | | Unique Waste Stream Number derived from the Mixed Waste Inventory Report. |
| WIPP_ID | Key field to relate to container_data and EPACodes data tables | WIPP specific identification number assigned by WTWBIR Team. |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|-------------------------------|-------|---|
| LOCAL_ID | | Locally assigned ID number for the waste stream |
| Gen_Site | | The name of the site that generated the waste, regardless of the actual storage site. |
| Waste_Type | | MTRU or TRU |
| Handling | | CH or RH |
| Stream_Name | | Abbreviation Description/Name of the Stream |
| Stream_description | | Memo field to describe the type of stream |
| MWIR_matrix_code | | Matrix Code, from MWIR if applicable and relevant |
| Assigned_matrix_code | | Matrix Code assigned by WTWBIR analysts... to be left blank by sites |
| Final_Waste_Form | | This is the code of the final (to WIPP) form of the waste stream |
| Matrix_Description | | Description and comments for the waste matrix in its final form for the WIPP |
| TRUCON | | Assigned TRUCON Code |
| NoMigrationAssign | | Code assigned for purposes of the WIPP No Migration Variance Petition. |
| IDC_from_Site_- Final_Form | | IDC supplied by Site for this stream. |
| IDC_Assigned_Final_ Form | | Equivalent IDC assigned by WTWBIR analysts based on their judgement |
| Waste_Ownership | | Defense, non-defense, commercial, or unknown |
| Waste_mixed_type | | Mixed, non-mixed, suspect mixed, or unknown |
| Waste_source | | R&D, Operational, Residues, ER and D&D, ER, D&D, or Unknown |

Table 7-2. WTWBID Data Dictionary (continued)

| Field/Table Name | Notes | Description |
|--|--|---|
| TSCA_data | | Asbestos, PCBs, Asbestos & PCBs, Other (describe in comment), No, N/A, or Unknown |
| Storage_data | | Retrievably stored, Buried, Building Storage, or Bermed Storage |
| Page 1_Footnotes | | Footnotes applicable to the whole waste stream. |
| <i>Table: epacodes</i> UNIQUE_WS | Key Field, related to Page_1, WIPP_ID | Unique waste stream identifier number. |
| EPA_CODE | | EPA code associated with a specific waste stream. |
| <i>Table: Nuclides</i> Cont_Counter | Key Field related to Container_Data, Counter | Relation to Container data counter, lock the record to a specific container/stream record in Container_Data. |
| Nuclide | | Nuclide designation in form Element Abbreviation, Atomic Weight, and excitation indicator if applicable (Ba137M). |
| Activity | | Scientific notation of activity in Pu239 equivalents in Curies/m3. |

7.3 DATABASE OPERATING INSTRUCTIONS

The WIPP Transuranic (TRU) Waste Baseline Inventory Report (WTWBIR), Revision 1, database is a Microsoft Access 2.0 database. It requires the user to possess a copy of Access 2.0 and be running under the Windows 3.1 operating system. Access, unlike most other databases, provides a single structure that contains objects such as queries, reports, program segments, macros, indexes, relations, and multiple data tables. This means there is only one file to work with, one with the suffix, .MDB. A second file normally accompanies the database file, one with the suffix .LDB and having the same name. It is not normally used except for certain file maintenance operations.

Two databases are provided as part of the compressed file on the distribution disk. The first database is WTWBIR_1, which contains the original data by waste streams from all generator/storage sites. This is the database used to print out the individual stream data in

Appendix A. The second database is called REPORTS. This is the database used to produce the other tables and figures in Volume 1 and Appendix B of the report. The databases are separate because the roll ups of data require some changes to the data to produce rational numbers in the tables and figures. These changes were described in section 7.2.

INSTALLATION: The two databases are compressed into a file on the distribution disk called WTWBIR.EXE. Approximately 6 megabytes of hard disc space should be available to install the database. To install the WTWBIR Rev. 1 database, copy WTWBIR.EXE to a convenient directory on your hard disk, go to the directory containing WTWBIR.EXE, type WTWBIR and press the enter key. The database should be expanded into the directory. The directory should now contain WTWBIR.EXE, WTWBIR1.MDB, WTWBIR1.LDB, WTWBIR.HLP, REPORTS.MDB, and REPORTS.LDB. WTWBIR.HLP contains the data field descriptions. This procedure can be performed either in DOS, a DOS prompt in Windows or from File Manager in Windows. Enter Windows and start Access, and open the WTWBIR_1 or REPORTS database. See the Access User's Manual in case of difficulty.

WTWBIR_1 INSTRUCTIONS: The WTWBIR Rev. 1 database has a built-in program (a macro called "autoexec") which takes control immediately upon opening the database file. It brings up a screen from which the user can view, edit, and locate various waste streams using the normal Access 2.0 tool bar features. In addition, a large printer icon button appear midway down the left side of the screen. This button affords the user the opportunity of printing the waste stream being viewed, waste streams for a specific site, or waste streams for all sites in the database. Scroll bars are provided to scroll between waste streams at the bottom left of the screen. For a given waste stream, the gray section contains waste container data for the various containers used to store this stream, and a scroll bar is provided in the bottom left to scroll among the types of containers for that waste stream. For a given type of container, the typical nuclides for that type of container are listed in a white area inset into the gray and a scroll bar provided.

Mirroring the contraction of the view screen, the WTWBIR data table set consists of the main table, Page_1, which contains site and stream data applicable to all container types used for the stream. Using the waste stream identification code (WIPP_ID) as a key, container-specific data in the Container_Data data table is related to the Page_1 table. Where radionuclides exist in a waste stream, they are listed in the Nuclides table and related to the Container_Data using record counters. For mixed streams, another data table, EPACodes, is related from Page_1's MWIR_ID field to EPACodes' UNIQUE_WS field. This structure affords a considerable savings in database size and is implemented in Access in such a way that they effectively function as one large, compact table.

Descriptions of the data fields can be viewed by opening the desired data table in Access's Table Mode, Design View. If the WTWBIR_1.HLP file was copied into the directory occupied by the WTWBIR database files, limited descriptions of the data fields in the WTWBIR database are available when you place the cursor in a data box and then press the F1 function key.

Reports Instructions:

Open the database REPORTS.MDB. An "autoexec" macro executes when the database opens. This macro presents a form, titled "Figure and Table Viewer", listing the reports available for viewing.

The reports and tables available for review are listed with a number on the left side. There should be eleven entries. If all entries cannot be seen, the scrolling arrows on the right side of the form can be used to scroll the entries. On the bottom of the form is a series of buttons numbered 1 to 11. Each form can be viewed (in report preview mode) by clicking on the command button with the same number as the number to the left of the list of figures and tables.

When the table appears on screen, the size of the window for viewing the table can be adjusted by clicking on the upper right corner up or down arrow in the report window. The report preview window also permits moving between pages of multi-page sets of figures and tables by using the arrows on the lower left corner.

The table or figure can be printed from the report preview window. The tables and figures were originally printed from and formatted for a Laserjet III. When printing the tables and figures, make sure the margins are set so that the entire table or figure is contained on one page, otherwise blank pages may be printed.

The first 8 tables and figures are the same as the tables and figures printed in volume 1 and Appendix B of this report. The figure and table numbers listed are the same as the figure and table numbers in the report. Figures number 9 and 10 show the average material parameters by site for contact handled and remote handled waste. These figures were not used in the report. The last table shows the estimated WIPP packaging material parameters. These numbers are also presented on Tables 5-1 and 5-2 in this viewer and in Volume 1 of the report.

7.4 WTWBID QUALITY CONTROL

To ensure that proper controls and documentation were in place during development and population of the WTWBID, several quality control activities were implemented by the WTWBIR Team. Project quality control objectives were to:

- Define a method for receiving, tracking, reviewing, updating, and documenting data received from the waste generator/storage sites.
- Identify and document the contents of each project baseline.
- Establish and implement a process for releasing and maintaining the WTWBID.
- Create a master library for WTWBID software and documentation.
- Ensure that WTWBID-generated reports and database copies are produced from released database revisions.

The activities performed to meet these objectives are described in the Waste Isolation Pilot Plant Baseline Inventory Report Database Management Procedure (DOE, 1995). The procedure identifies the responsible individuals and required actions for developing, populating, and maintaining the WTWBID, and for managing the data used to produce the WTWBIR and other summary documents.

8. GLOSSARY

40 CFR Part 191, Protection of Environment. EPA: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and TRU Radioactive Wastes – The EPA's environmental standards for the storage (Subpart A) and disposal (Subpart B) of spent nuclear fuel, and high-level and TRU radioactive wastes. This is the primary post-closure standard that applies to WIPP. It limits annual radiation doses to the public from waste management storage and disposal facilities.

40 CFR Part 268, Protection of Environment. EPA: Land Disposal Restrictions – Restricts the land disposal of all hazardous wastes and specifies strict treatment standards that must be met before these wastes can be land-disposed.

Americium (Am) – A TRU radionuclide having an atomic number of 95, containing 95 electrons and 95 protons. Am-241 (half-life 432.7 y) results from the decay of Pu-241 (half-life 14.4 y). Waste initially rich in Pu-241 will therefore "grow" in Am-241 for several decades as the Pu decays. Am-241 exists in finite amounts in TRU waste at some DOE sites.

Anticipated Inventory – The sum of the stored and projected inventories, as defined in this document.

Buried Waste – TRU waste buried in shallow trenches prior to the 1970 Atomic Energy Commission policy that required TRU waste to be retrievably stored.

Californium (Cf) – A TRU element having an atomic number 98 (the number of protons in the nucleus). An alpha emitter (half-life 2.64 y), Cf-252 also spontaneously fissions, thus making it desirable as a neutron source. Cf-252 is created by neutron bombardment of Cm-244 targets. OR is the only production agency for Cf. As a result, the OR inventory is the only TRU waste inventory showing finite quantities of this element.

Code of Federal Regulations (CFR) – (1) A codification of the general and permanent rules published in the **Federal Register** by the department and agencies of the federal government. The CFR is divided into 50 titles that represent broad areas subject to federal regulation. It is issued quarterly and revised annually. (2) All federal regulations in force are published annually in codified form in the CFR.

Contact-Handled (CH) TRU Waste – Packaged TRU wastes with an external surface dose rate of 200 mrem or less per hour.

Curie – A quantitative measure of radioactivity equal to 3.7×10^{10} disintegrations per second.

Curium (Cm) – A TRU element having an atomic number of 96 (the number of protons in the nucleus). An alpha emitter (half-life 18.1 y), Cm-244 is used for neutron bombardment of targets for the production of Cf-252 at OR. In spite of its half-life being less than 20 years, OR considers and handles Cm-244 as a TRU nuclide. Some TRU waste at both OR and SR contains Cm-244.

Decontamination and Decommissioning (D&D) – The process through which DOE facilities which are no longer operational are cleared of contamination and removed from service. In particular, a reference to D&D waste is a reference to the waste materials that are generated during D&D activities.

Defense Waste – (1) Radioactive waste from any activity performed in whole or in part in support of DOE atomic energy defense activities; excludes waste under purview of the Nuclear Regulatory Commission or generated by the commercial nuclear power industry. (2) Nuclear waste derived mostly from the manufacture of nuclear weapons, weapons-related research programs, the operation of naval reactors, and the decontamination of production facilities.

Department of Energy Site – A DOE-owned or -controlled tract used for DOE operations. Either a tract owned by DOE or a tract leased or otherwise made available to the federal government under terms that afford to DOE rights of access and control substantially equal to those that DOE would possess if it were the holder of the fee (or pertinent interest therein) as agent of and on behalf of the government. One or more DOE operations/program activities are carried out within the boundaries of the described tract.

Design Capacity – The planned waste capacity of the Waste Isolation Pilot Plant.

Disposal – Emplacement of waste in a manner that assures isolation from the biosphere for the foreseeable future with no intent of retrieval and that requires deliberate action to regain access to the waste. For example, disposal of wastes in a mined geologic repository occurs when all of the shafts to the repository area are backfilled and sealed.

Disposal Inventory – The total inventory defined for WIPP emplacement (after scaling) to be used for SPM and PA calculations.

Environmental Restoration (ER) – Those activities associated with the remediation of sites contaminated with hazardous and/or radioactive materials. In particular, a reference to remediation activities conducted under the auspices of the DOE Office of Environmental Restoration and Waste Management, Office of Environmental Restoration, EM-40.

Federal Facility Compliance Act (FFCAct) – Public law 102-386, 1992.

Gas Production – Three gas generation processes are expected to be a factor in the degradation of TRU wastes in the WIPP repository. The generation of gaseous species is expected to occur through chemical (i.e., corrosion), microbial, and radiolytic processes.

Generator/Storage Sites – See Waste Generator/Storage Sites.

Hazardous Waste – Those wastes that are designated hazardous by EPA (or state) regulations through the RCRA.

Integrated Data Base (IDB) – The latest version of the IDB, the *Integrated Data Base for [CY]: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1994b)

Mixed TRU Waste – TRU waste that contains both radioactive and hazardous components as defined by the Atomic Energy Act and the RCRA as codified in 40 CFR Parts 263, 265, 268, and 270 (EPA, 1980a; 1980b; 1986; and 1983).

Mixed Waste Inventory Report (MWIR) – The latest release of information from the MWIR database that supports requirements under the FFCA of 1992 (Public Law 102-386). The latest version of the MWIR documentation/files is *Distribute of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a). This information replaces the Phase I MWIR release (DOE, 1994c).

Newly Generated Wastes – See Projected Inventory.

No-Migration Variance Petition (NMVP) – Section 3004 of RCRA allows EPA to grant a variance from the land disposal restrictions when a determination can be made that, to a reasonable degree of certainty, there will be no migration of hazardous constituents from the disposal unit for as long as the waste remains hazardous. Specific requirements for making this demonstration are found in 40 CFR 268.6, and EPA has published a draft guidance document to assist petitioners in preparing a variance request.

Non-Mixed TRU Waste – Transuranic waste that does not contain hazardous constituents or exhibit hazardous characteristics, as identified in 40 CFR 261, Subparts C and D.

Performance Assessment (PA) – (1) A systematic analysis of the potential risks posed by waste management systems to the public and environment and a comparison of those risks to established performance objectives. (2) An analysis that (a) identifies the processes and events that might affect the disposal system, (b) examines the effects of these processes and events on the performance of the disposal system, and (c) estimates the cumulative releases of radionuclides, considering the associated uncertainties, caused by all significant processes and events. These estimates shall be incorporated into an overall probability distribution of cumulative release to the extent practicable. (3) A term used to denote all activities (qualitative and quantitative) carried out to (a) determine the long-term ability of a site/facility to effectively isolate the waste and ensure the long-term health and safety of the public and (b) provide the basis for demonstrating regulatory compliance.

Plutonium (Pu) – A radionuclide having an atomic number of 94. Pu isotopes exist in some TRU waste at all the major DOE storage facilities. The significant isotopes that may exist in measurable quantities at these facilities are Pu-238 through Pu-242. Each isotope is an alpha emitter; the respective half-lives in years are: 238=87.7, 239=24,000, 240=6,563, 241=14.4, 242=376,000. Because of its high activity, Pu-238 can contribute significantly to the thermal loading on some TRU waste. Pu-241 decays, primarily by beta emission, to Am-241.

Process Knowledge – A qualitative evaluation of the contents of a waste container through the study of existing records of production history of the waste.

Projected Inventory – That part of the inventory that has not been generated but is estimated to be generated at some time in the future by the TRU waste generator/storage sites. The estimated timeframe may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Radioactive – The emission of radiation from unstable atomic nuclei.

Radionuclide – (1) A species of atom having an unstable nucleus, that is subject to spontaneous decay or disintegration and usually accompanied by the emission of ionizing radiation. (2) Any nuclide that emits radiation. A nuclide is a species of atom characterized by the constitution of its nucleus and hence by the number of protons, the number of neutron, and the energy content.

Remote-Handled (RH) TRU Waste – Packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour.

Repository – Designated location for disposal of transuranic wastes; the Waste Isolation Pilot Plant.

Resource Conservation and Recovery Act (RCRA) – (1) Establishes a system for controlling hazardous waste from generation to disposal. (2) A Federal law passed in 1976, and amended under the HSWA of 1984, that established a structure to track and regulate hazardous wastes from the time of generation to disposal. The law requires safe and secure procedures to be used in treating, handling, transporting, storing, and disposing of hazardous substances. RCRA is designed to prevent new uncontrolled hazardous waste sites. The law also regulates the disposal of solid waste that may not be considered hazardous. (3) Specifically, Subtitle D of RCRA governs the management of solid waste. (Note: 40 CFR Parts 260-281 are the regulations for complying with RCRA with respect to hazardous waste and hazardous waste treatment, storage, and disposal facilities.)

Retrievable Storage – Designated storage location for transuranic wastes that is designed, operated, and maintained in such a manner that the wastes remain accessible for subsequent retrievable operations.

Scaling – The process for adjusting the anticipated inventory to the design limit (disposal inventory) of the WIPP repository.

Site-Specific Waste Profile – Represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles, at a particular DOE TRU waste site, that have been placed in the same WMCG are summarized in the site-specific waste profile.

Stakeholders – Those persons and/or groups of people and organizations who are affected or perceive they are affected by the DOE waste management program. Stakeholders include DOE management, employees, and contractors (internal); and executive, legislative, and regulatory groups, public representatives, the general public, intervenor groups, special interest groups, contractors, suppliers, and universities (external).

Stored Inventory – That part of the TRU inventory currently in retrievable storage as of the time of the last data call for inventory information. Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and does not include any waste that was buried prior to 1970.

System Prioritization Methodology (SPM) – The SPM is a process formulated to identify a set of activities (required experiments, modeling, engineering design, and waste acceptance criteria) that will lead to regulatory compliance. The process is formulated such that it also: (1) addresses stakeholder and regulator concerns early and throughout the regulatory process and (2) leads to a fully defensible performance assessment to be used in demonstrating regulatory compliance. Ultimate products and associated customers are:

- (1) A decision matrix containing the most likely sets of activities that will lead to compliance as a function of time and budget to be delivered to the WIPP program manager,
- (2) A performance assessment built on assumptions and data that are defensible in the eyes of the stakeholders and the regulators to be delivered to the regulatory compliance branch of Carlsbad Area Office/WIPP through the Westinghouse Waste Isolation Division and ultimately to the EPA, and
- (3) A set of regulatory issues and their current status that result from the SPM process and are to be included in compliance packages by the Westinghouse Waste Isolation Division.

Thorium (Th) – A radionuclide having an atomic number of 90. Although not TRU, Th-232 is an alpha emitter (half-life 14 billion years) and exists in finite amounts in some TRU waste at HA, IN, and OR. [Note: Thorium is naturally occurring and contributes to background radiation at some sites (e.g., IN)]

Transuranic – Pertaining to elements that have atomic numbers greater than 92, including neptunium, plutonium, americium, and curium; all are radioactive, are products of artificial nuclear changes, and are members of the actinide group.

Transuranic (TRU) Waste – (1) Waste containing alpha-emitting radionuclides with an atomic number greater than 92 and half-lives greater than 20 years, at concentrations of TRU isotopes greater than 100 nanocuries per gram of waste. **This core definition appears in modified form in various relevant documents as follows:** (a) For purposes of management, DOE Order 5820.2A: (i) considers TRU waste, as defined above, "without regard to source or form" (*The proposed revision to the Order [DOE Order 5820.2A Major Issues for Revision, May 6, 1992]* contemplates removing this clause); (ii) allows head of field elements to determine that wastes containing other alpha-emitting radionuclides must be managed as TRU waste; and (iii) adds "at time of assay," implying both that the classification of a waste as TRU waste is to be made based on an assay, and that such classification can be superseded only by another assay. (b) For purposes of setting standards for management and disposal, 40 CFR 191.02(i) adds "except for: (i) high-level wastes; (ii) wastes that the DOE has determined, with the concurrence of the EPA Administrator, do not need the degree of isolation required by this part; or (iii) wastes that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61. (2) Waste materials contaminated with U-233 (and its daughter products), with certain isotopes of plutonium, or with other nuclides with atomic numbers greater than 92. In order to be classified as TRU waste, the long-lived alpha activity from subject isotopes must exceed 100 nanocuries per gram of waste material and from the use of plutonium in the fabrication of nuclear weapons. (3) Wastes that are contaminated with radioactive elements heavier than uranium, thus the name trans-(or beyond) uranic.

TRUCON – See TRUPACT-II Content Code.

TRUPACT-II Content Codes (TRUCON) – The document containing a description of the waste stream, waste form, and package configuration for each waste content code authorized for shipment in TRUPACT-II containers.

Unknown Waste Stream – Those waste streams for which there is insufficient process knowledge to assign a specific WMC.

Uranium (U) – A naturally radioactive element with the atomic number of 92 (number of protons in the nucleus) and an atomic weight of approximately 238. The two principal naturally occurring isotopes are the fissionable U-235 (0.7 percent of natural uranium) and the fertile U-238 (99.3 percent of natural uranium). (Note: An alpha emitter [half-life 159,000 y], U-233 also spontaneously fissions; it is present in finite quantities in some TRU waste inventories at INEL and ORNL.)

Waste Acceptance Criteria (WAC) – The criteria used to determine if waste packages are acceptable.

Waste Form – The physical form of the waste such as sludges, combustibles, metals, etc.

Waste Generator/Storage Sites – The 10 largest DOE facilities and several smaller sites throughout the U.S. that produce and store TRU waste.

Waste Isolation Pilot Plant (WIPP) – (1) The project authorized under Section 213 of the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (Public Law 96-164; 93 Stat. 1259, 1265) to demonstrate the safe, and environmentally sound, disposal of radioactive waste materials generated by atomic energy defense activities. (2) A research and development facility, located near Carlsbad, New Mexico, to be used for demonstrating a practical, long-term solution to a complex problem: the safe disposal in deep geologic repositories of TRU waste resulting from DOE activities. (3) The WIPP has two primary objectives. First, the WIPP is investigating the behavior of salt rock and interactions between the salt rock and radioactive wastes in a variety of forms. Second, the WIPP seeks to demonstrate the safe and efficient handling, transportation, and disposal of TRU waste in an actual facility.

Waste Material Parameter – A waste material that occurs in TRU waste that is an input parameter into one or more current SPM or PA models, an SPM or PA model under development, a potential future model, or is required to adequately describe the waste form.

Waste Matrix Code (WMC) – A DOE-developed coding system for organizing waste streams by their physical and chemical properties. A WMC is assigned to each waste stream by the DOE TRU waste generator/storage site. The WMC for each waste stream can be found in the Mixed Waste Inventory Report (DOE, 1994a). This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. Appendix C contains the DOE guidance document to help categorize individual waste streams. An example of a WMC for "heterogeneous waste" would be 5400.

Waste Matrix Code Group (WMCg) – Consists of a series of WMCs that for SPM or PA purposes has similar physical and chemical properties.

Waste Stream – Individually, those stored or projected wastes that are defined by a unique identifier in the MWIR.

Waste Stream Name – A site-specific, unique descriptive identifier for a TRU waste stream.

Waste Stream Profile – A description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of the important information about a particular waste stream.

Waste Stream Site ID – A site-specific alphanumeric identification code which provides a unique identifier for an individual TRU waste stream.

WIPP Waste Profile – Represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG.

**STATE OF NEW MEXICO
BEFORE THE SECRETARY OF THE ENVIRONMENT**

**IN THE MATTER OF THE FINAL PERMIT
ISSUED TO THE UNITED STATES
DEPARTMENT OF ENERGY AND
WESTINGHOUSE ELECTRIC COMPANY
WASTE ISOLATION DIVISION FOR
A HAZARDOUS WASTE ACT PERMIT
FOR THE WASTE ISOLATION PILOT
PLANT; USEPA No. NM4890139088**

HRM 98-04(P)

REPORT OF THE HEARING OFFICER

**STATEMENT OF THE CASE
ISSUE
FINDINGS OF FACT
DISCUSSION
CONCLUSIONS OF LAW
RECOMMENDED DECISION AND PROPOSED FINAL ORDER**

STATEMENT OF THE CASE

The United States Department of Energy ("DOE") is the owner and operator, and the Westinghouse Waste Isolation Division ("WID"), a private corporation, is the co-operator (collectively "Applicants") of the Waste Isolation Pilot Plant ("WIPP"). The WIPP facility is located in southeastern New Mexico, approximately 26 miles east of the City of Carlsbad. WIPP was designed and constructed to store and dispose transuranic ("TRU") nuclear waste and TRU waste that is mixed with hazardous waste ("TRU mixed waste") in an underground geologic repository, mined within a bedded salt formation. Owners and operators of facilities located in New Mexico that store or dispose TRU mixed waste must apply for a permit from the New Mexico Environment Department. Accordingly, Applicants seek a permit under the New

(Miscertification) *supra*; NMED's Response to Public Comment (June 25, 1999); Proposed Final Permit of June 25, 1999.

CONCLUSIONS OF LAW

Based upon the foregoing Findings of Fact and Discussion, the Hearing Officer renders the following legal conclusions:

1. The Secretary of NMED ("the Secretary") has jurisdiction to require all persons that manage, store or dispose TRU mixed waste to submit an application and obtain a final permit that includes corrective action requirements under the HWA and 20 NMAC 4.1. *et seq.*
2. The WIPP repository is a "miscellaneous unit" under 20 NMAC 4.1.101 (incorporating 40 C.F.R. §260.10); 20 NMAC 4.1.300 (incorporating 40 C.F.R. § 262.10) and subject to the standards under 20 NMAC 4.1.500 (incorporating 40 C.F.R. § 264.600 (Subpart X)).
3. DOE is a "person" under Section 74-4-3.K of the HWA and the owner and operator of WIPP under 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.2). WID is also a "person" under Section 74-4-3.K of the HWA and a co-operator of WIPP under 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.2).
4. The Secretary has authority to require and issue a final permit to Applicants for the management, storage or disposal of TRU mixed waste at WIPP under the HWA and 20 NMAC 4.1. *et seq.* Under NMED regulations, the burden of proof for issuance of a HWA permit, shall be on the Applicants. 20 NMAC 4.1.901.E.6.
5. NMED has complied with all administrative and procedural laws and regulations

respecting the application and permitting process including the pertinent provisions of 40 C.F.R. §124.32(b)(1), 270.10(c) and 20 NMAC 4.1.900, 901.

6. Pursuant to 20 NMAC 1.4.401.A. and 20 NMAC 4.1.901.E.6, Applicants are charged with the burden of proving that the permit application should be granted and a HWA permit issued. NMED has the burden of proving that the conditions it proposes in the Proposed Final Permit are justified. After establishment of a *prima facie* case, any person opposed to the Permit, or to any imposed condition therein, has the burden of going forward with any adverse evidence proving that the Permit should not be granted.

7. Pursuant to 20 NMAC 4.1.901.A.7, the Secretary must give due consideration and weight to all comments received during the public comment period and to all relevant facts presented at the public hearing.

8. Based upon the full record, Applicants have met their burden of proving that a HWA permit should be granted. Notwithstanding certain findings and recommendations of the Hearing Officer set forth herein [*see Discussion* (TRU Non-Mixed Waste and RH TRU Waste) *supra*], NMED has met its burden of proving that the conditions it proposes to impose in the Proposed Final Permit of June 25, 1999, along with all attachments thereto, are justified. Those opposed to issuance of the Proposed Final Permit, or to any conditions set forth therein, have failed to meet their burdens of proof.

9. Each permit for an interim status or new hazardous waste management facility shall contain terms and conditions as necessary to protect human health and the environment. 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.32(b)(2)).

10. Each permit must include permit conditions necessary to achieve compliance with

the HWA and regulations, including each of the applicable requirements specified in 20 NMAC 4.1.500 (incorporating 40 C.F.R. Part 264), 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.32(b)(1))

11. The audit requirement as proposed by NMED in Permit Condition³³ II.C.2 of the Proposed Final Permit of June 25, 1999, is a condition necessary for approval of the WAP in order to protect human health and the environment. 20 NMAC 4.1.901.A.8 and NMSA 1978 §74-4-4.2(C) (Repl. Pamp. 1993).

12. Permit Condition II.C.2 is a condition necessary to achieve compliance with 20 NMAC 4.1.900 (incorporating 40 C.F.R. §270.14 (b)(2) and §270.32(b)(1)) in order to address permit application deficiencies; to demonstrate compliance with the WAP; and to obtain all the information which must be known to manage, store and dispose TRU mixed waste at WIPP in accordance with 40 C.F.R. Part 264. 20 NMAC 4.1.901.A.8 and NMSA 1978 §74-4-4.2(C) (Repl. Pamp. 1993).

13. No Party or commentator has met their burden in challenging NMED's determination to impose Permit Condition II.C.2 by presenting substantial evidence that this condition is unreasonable or inconsistent with the HWA. *See* 20 NMAC 4.1.901.E.6 and 20 NMAC 1.4.401.A.

14. Permit Condition II.C.3.h is necessary to protect human health and the environment consistent with NMAC 4.1.500, .900 (incorporating 40 C.F.R. §§264.13, 270.14(b)(2)).

15. No Party or commentator has met their burden in challenging NMED's

³³ Hereinafter, unless otherwise specified, "Permit Conditions" refers to those conditions proposed by NMED in the proposed Final Permit of June 25, 1999.

EXECUTIVE SUMMARY

The *Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR)* establishes a methodology for grouping wastes of similar physical and chemical properties, from across the U.S. Department of Energy (DOE) transuranic (TRU) waste system, into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies.

The WIPP baseline inventory is estimated using waste streams identified in the recent information released in the *Mixed Waste Inventory Report (MWIR)*, supplemented by information from the Nonradionuclide Inventory Database (NID) and the 1993 Integrated Data Base (IDB). Each waste stream is defined in a waste stream profile and has been assigned a waste matrix code (WMC) by a DOE TRU waste generator/storage site. Waste stream profiles with WMCs that have similar physical and chemical properties can be combined into a waste matrix code group (WMCG), which is then documented in a site-specific waste profile for each TRU waste generator/storage site that contains waste streams in that particular WMCG.

Based on methodology presented here in the WTWBIR, a maximum of 11 site-specific waste profiles have been identified for contact-handled (CH) TRU waste and a maximum of 11 have been identified for remote-handled (RH) TRU waste. Based on analyses of existing inventories, no site has more than 10 site-specific CH-TRU waste profiles, nor more than 5 site-specific RH-TRU waste profiles. Each of these site-specific waste profiles have unique WMCG criteria and they are developed, if appropriate, for each of the TRU waste generator/storage sites. A particular site-specific waste profile, with a specific WMCG, can be combined with other site-specific waste profiles having identical WMCGs from the TRU waste generator/storage sites to derive a WIPP waste profile. Therefore, a maximum of 11 WIPP waste profiles for CH-TRU waste and a maximum of 6 WIPP waste profiles for RH-TRU waste have been identified that describe the different TRU wastes across the DOE system.

The anticipated inventory of TRU waste is defined as the sum of retrievably stored waste plus currently projected TRU waste volumes. The anticipated inventory is not sufficient to fill the allowed capacity of WIPP (calculated: $6.2 \times 10^6 \text{ ft}^3$ [$\sim 1.76 \times 10^5 \text{ m}^3$]), and scaling has been developed as a means of examining the impacts of the full repository. Additionally, there is a high uncertainty in and a current lack of data on wastes produced from decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the anticipated inventory has been "scaled" to the WIPP capacity. The scaling of the inventory in future revisions of the WTWBIR will be derived from the best available data and assumptions.

An example of five waste streams at two sites (Idaho National Engineering Laboratory and Rocky Flats Plant) has been used to illustrate the waste profile methodology. Preliminary total WIPP inventory volumes for the 11 CH-TRU and 6 RH-TRU WIPP waste profiles are provided; final volumes will be provided in Revision 1 of this document after the DOE TRU waste generator/storage sites have reviewed the data and after quality checks of the data have been completed.

Using the same waste profile methodology, the WTWBIR also estimates the WIPP disposal inventory (anticipated inventory that has been scaled to WIPP design capacity) in terms of 10 waste material parameters and packaging materials that have been identified as inputs needed

for the system prioritization (SP) and performance assessment (PA) calculations. The 10 waste material parameters and packaging materials are waste constituents that occur in TRU waste and are input parameters for one or more SP and PA models or are required to adequately describe the waste form. These parameters may change as a result of SP and PA efforts.

The 10 waste material parameters and packaging materials that are defined and included in the WTWBIR are:

- Inorganics
 - Iron-based metals/alloys
 - Aluminum-based metals/alloys
 - Other metals
 - Other inorganic materials
- Organics
 - Cellulosics
 - Rubber
 - Plastics
- Solidified Materials
 - Inorganic matrix
 - Organic matrix
- Soils
- Packaging Materials
 - Steel
 - Plastic or lead

The waste material parameter information is reported in kilograms per cubic meters (kg/m^3) and estimates of the uncertainty in the waste material parameters have been calculated, based on data derived from the NID (i.e., average, minimum, and maximum estimates of waste material parameters on a per-waste-stream basis). The maximum values for waste material parameters in the waste stream, site-specific, and WIPP waste profiles are expressed on a weight/volume basis. However, the occurrence of more than one waste material parameter at the maximum value within a waste stream is highly unlikely. During SP and PA calculations, the sampling statistics must be controlled so that several waste material parameters do not get sampled all at their maximum value (weight/volume), lest the maximum weight/volume is exceeded. A five-waste-stream/two-site example is used to illustrate the methodology for estimating quantities of waste material parameters. **The preliminary total WIPP inventory for the waste material parameters is provided and should be used in any SP and PA calculations until Rev. 1 of the WTWBIR is published, pending completion of quality checks of the data used. The nonradionuclide and radionuclide inventory presented in this report replaces any previously used information in SP and PA calculations.**

Although the initial purpose of this report is to provide data to be included in the Sandia National Laboratories/New Mexico SP and PA processes, all data are presented and explained in such a way that they can be adapted as needed for other applications. The WTWBIR, Revision 0, is presented in two parts: Book 1 contains this Executive Summary through Chapter 7, References; Book 2 contains Appendix A, Glossary, through Appendix M, MWIR Code Designations and Descriptions.

CHAPTER 1

1. INTRODUCTION

1.1 BACKGROUND

The Waste Isolation Pilot Plant (WIPP) is a transuranic (TRU) waste management facility operated by the U.S. Department of Energy (DOE). The WIPP is currently identified as the permanent disposal site for DOE TRU waste.

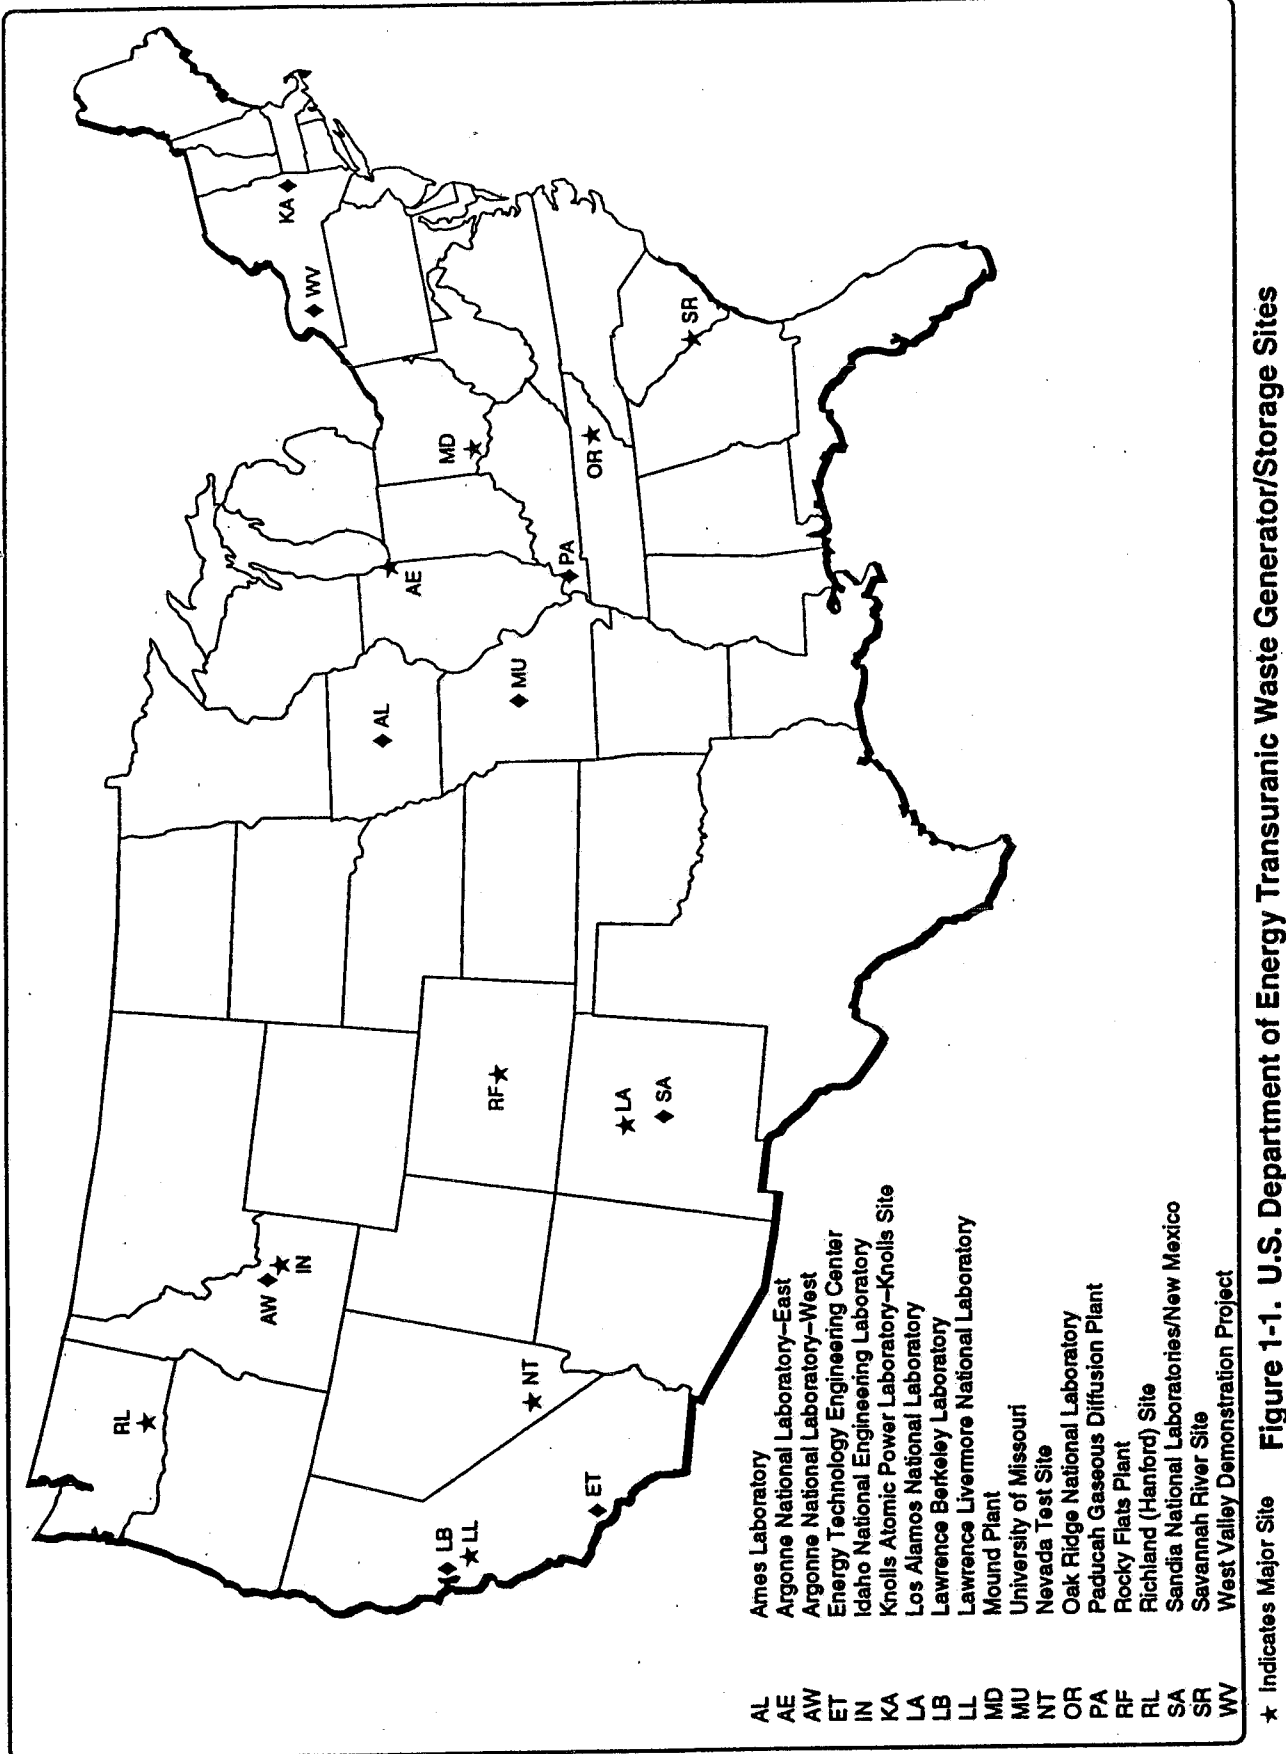

TRU waste is defined as waste that is contaminated with alpha-emitting radionuclides with an atomic number greater than 92, with half-lives greater than 20 years, and concentrations of TRU isotopes greater than 100 nanocuries per gram of waste (DOE, 1988). TRU wastes are classified as either contact-handled (CH) waste or remote-handled (RH) waste, depending on the dose rate at the surface of the waste container. CH-TRU wastes are packaged TRU wastes with an external surface dose rate of 200 millirems (mrem) or less per hour, while RH-TRU wastes are packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour. Unless otherwise indicated, for purposes of this document, all references to TRU waste include TRU waste and mixed TRU waste (waste that contains both radioactive and hazardous components, as defined by the Atomic Energy Act and the Resource Conservation and Recovery Act [RCRA] as codified in Title 40 Code of Federal Regulations [CFR] Parts 264, 265, 268, and 270 [EPA, 1980a; 1980b; 1986; and 1983]).

The DOE is committed to demonstrating compliance with all applicable regulations prior to permanent disposal of TRU wastes in the WIPP repository. These regulations are the environmental standards for management and disposal of TRU wastes as mandated in 40 CFR Part 191 (EPA, 1993b) and Part 194 (EPA, 1993a), and the RCRA regulations. The WIPP is scheduled to receive and dispose of TRU wastes from 10 major and several minor DOE TRU waste generator/storage sites (see Figure 1-1). Compliance will be demonstrated through performance assessment (PA) calculations based on the inventory of existing and currently projected waste streams developed in this report, and as reported by the DOE TRU waste generator/storage sites.

1.2 PURPOSE

The purpose of this document, the *Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report* (WTWBIR), is to document the disposal inventory of TRU waste to be emplaced in WIPP from the DOE TRU waste generator/storage sites. This inventory of CH-TRU and RH-TRU waste will be used in systems prioritization (SP) and PA calculations and sensitivity analyses that will support the development of compliance applications to the appropriate regulatory agencies regarding the operations and post-closure timeframes of the WIPP repository.

To accomplish this purpose, the WTWBIR has been developed from the best available information and process knowledge provided by the DOE TRU waste generator/storage sites. The WTWBIR describes a process for grouping individual waste streams with similar physical and chemical properties into waste profiles, based on their waste matrix code (WMC) assigned by the DOE TRU waste generator/storage sites. Waste profiles with similar WMCs, are then combined across the DOE TRU waste system to provide estimated total volumes and total waste material parameters. The methodology for this grouping and combining is discussed in detail in Section 2.3, Methodology for Development of Disposal Inventory, of this document.

The individual waste streams also are evaluated to estimate the occurrence and quantities of waste material parameters (e.g., cellulose, plastics, iron-based metals/alloys, etc.) that have been identified by Sandia National Laboratories/New Mexico (SNL/NM) as being potentially important to the performance of the WIPP repository as defined in Appendix G (see Table 1-1). The methodology, assumptions, and totals of these waste material parameters are described in Chapter 6, Waste Material Parameters.

**TABLE 1-1. TECHNICAL DATA NEEDS FOR PERFORMANCE ASSESSMENT
WASTE MATERIAL PARAMETERS**

| Waste Material Parameter | Input Variable in <u>Current</u> SP/PA Models | | Input Variable in SP/PA Models <u>Under Development</u> | Input Variable in Possible <u>Future</u> PA Models |
|------------------------------|---|----------------------------|---|--|
| | Gas Generation | Mechanical Characteristics | | |
| Iron-Based Metals/Alloys | YES | YES | YES | YES |
| Aluminum-Based Metals/Alloys | | YES | YES | YES |
| Other Metals | | YES | | YES |
| Other Inorganic Material | | YES | YES | YES |
| Cellulose | YES | YES | YES | YES |
| Plastics | | YES | YES | YES |
| Rubber | YES ⁽¹⁾ | YES | YES | YES |
| Solidified Inorganic Matrix | | YES | YES | YES |
| Solidified Organic Matrix | | YES | YES | YES |
| Soils | | YES | | |

⁽¹⁾ Only 50 weight percent included

Although the initial purpose of this report is to provide data to be included in the SNL/NM SP and PA processes, all data are presented and explained in such a way that they can be adapted for other applications.

1.3 WASTE INVENTORY TERMINOLOGY

The derivation of a disposal inventory from individual waste streams is a formidable and complex process. To document each step of this process, a system of waste inventory terminology needs to be defined so the reader may more easily follow the process. The following sections provide definitions of terminology used throughout the WTWBIR. These

definitions also are summarized in Appendix A, Glossary, of the WTWBIR. Appendix B provides a list of acronyms and abbreviations used in this document.

1.3.1 Inventory Terminology

Stored Inventory – That part of the TRU inventory currently in retrievable storage as of the time of the last data call for inventory information is known as "stored inventory." Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and does not include any waste that was buried prior to 1970 (DOE, 1994b).

Projected Inventory – That part of the inventory that has not been generated but is currently estimated to be generated at some time in the future by the TRU waste generator/storage sites is considered "projected inventory." The estimated timeframe for the projections may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Anticipated Inventory – For the WTWBIR, this is the sum of the stored and projected inventories, calculated:

$$\begin{array}{ccccccc} \text{Stored} & & & & \text{Projected} & & \text{Anticipated} \\ \text{Inventory} & + & & & \text{Inventory} & = & \text{Inventory} \end{array}$$

Scaling – The process for adjusting the anticipated inventory to the design limit (disposal inventory) of the WIPP repository is called "scaling." Section 2.3.2 describes the scaling process.

$$\text{Anticipated Inventory} \xrightarrow{\text{Scaling}} \text{Disposal Inventory}$$

Disposal Inventory – The total inventory defined for WIPP emplacement (after scaling) to be used for SP and PA calculations is the "disposal inventory."

1.3.2 Waste Matrix Code Terminology

Waste Matrix Code (WMC) – The WMC is a DOE-developed coding system for organizing waste streams by their physical and chemical properties. A WMC is assigned to each waste stream by the DOE TRU waste generator/storage site. The WMC for each waste stream can be found in the Mixed Waste Inventory Report (MWIR) (DOE, 1994a). This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. Appendix C contains the DOE guidance document used to help categorize individual waste streams. An example of a WMC for "heterogeneous waste" would be 5400.

Waste Matrix Code Group (WMCG) – A WMCG consists of a series of WMCs that for SP or PA purposes have similar physical and chemical properties. An example of combining WMCs

is the following three WMCs, which either contain particulates or are cemented particulate waste:

- WMC 3100 (inorganic process residues)
- WMC 3110 (inorganic particulates)
- WMC 3150 (solidified process residues)

Because of the restriction on particulate wastes in the *TRU Waste Acceptance Criteria, (WAC) for the Waste Isolation Pilot Plant*, Revision 4.0 (DOE, 1991), all particulate waste will usually be solidified prior to shipment to WIPP. Therefore, all three of these WMCs would be the same basic waste form when emplaced in WIPP and have similar physical and chemical properties. Table 1-2 presents all anticipated WMCs for TRU waste and indicates in which WMCG each WMC occurs for the WTWBIR. There are 11 WMCGs used in this WTWBIR. The last two rows in Table 1-2 group WMCs that will not be acceptable to WIPP unless characterized and/or processed using a yet-to-be-developed treatment technology. The combined WMCG for this example is:

Solidified Inorganic Waste

1.3.3 Waste Profile Terminology

Waste Stream Profile – This is a description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of important information about a particular waste stream. Examples of information included in a waste stream profile are:

- Currently and previously used identification codes, including the DOE TRU waste site identification;
- Assigned WMC;
- Volumes of waste currently in retrievable storage and waste projected to be generated: estimated minimum, average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.);
- Whether the waste is CH-TRU or RH-TRU; and
- Hazardous waste codes (EPA codes) as assigned by the DOE TRU waste generator/storage sites for the RCRA-regulated portion of the waste stream.

Figure 1-2 provides an example of a blank waste stream profile form. The methodology and assumptions for developing waste stream profiles are provided in Chapter 3 and printouts of waste stream profiles are provided in Appendix E.

Site-Specific Waste Profile – This represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles, at a particular DOE TRU waste site, that have been placed in the same WMCG are summarized in the site-specific waste profile. Examples of information included in a site-specific waste profile are:

- DOE TRU waste generator/storage site identification;

| | |

| Unknown Waste ¹³ | 8000, 8100, 8200, 8900 |

TABLE 1-2. WASTE MATRIX CODE GROUP NAMES (CONTINUED)

¹ Liquid waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidification.

² WMCs 3000, 3900, 9100, and 9200 are placed in "solidified inorganic waste," "salt waste," or "solidified organic waste," depending on the information provided in the MWIR.

³ Particulate waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidifying particulate waste.

⁴ WMCs 6100 and 6190 are placed in "solidified organic waste," or "solidified inorganic waste," depending on the information provided in MWIR. Volume conversion is described in footnotes 5 and 6.

⁵ Liquid lab pack waste is assumed to be solidified prior to sending to WIPP. It is assumed that the packing material in lab packs will be low-level waste when the liquid containers are removed. A volume conversion of 2.5:1 is assumed for solidification.

⁶ Solid lab packs are assumed to be solidified prior to sending to WIPP. It is assumed that the packing material in lab packs will be low-level waste when solidifying. Because lab packs have a 3:1 ratio of waste to absorbent material, it is assumed that when the chemicals are removed from the drum and solidified, there will not be a volume increase.

⁷ WMCs 6200 and 6290 are placed in "solidified inorganic waste," "solidified inorganic waste," or "heterogeneous waste" if the waste stream must be solidified. They are placed in "unspecified metal waste," or "lead/cadmium metal waste" if they are primarily nonreactive metal contaminated with reactive metal. Reactive waste streams must be treated prior to shipment to WIPP.

⁸ Waste stream is assumed to be treated prior to shipment to WIPP. Volume change is dependent of the waste stream and treatment.

⁹ WMC 5000 is placed in "unspecified metal waste," "lead/cadmium metal waste," "inorganic nonmetal waste," "combustible waste," "graphite waste," "heterogeneous waste," or "filter waste," depending on the information in MWIR.

¹⁰ WMC 7000 and 9300 are placed in "unspecified metal waste" or "lead/cadmium metal waste," depending on the information in MWIR.

¹¹ WMCs 7400, 7410, 7420, and 7490 are assumed to be drained of liquid and contain only metal waste.

¹² These waste streams are excluded from disposal in WIPP at this time.

¹³ If adequate information is provided in MWIR, these WMCs are changed. If there is not enough information in MWIR, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

- The WMCG that the profile represents;
- Listing of the waste streams (represented by waste stream profiles at the site) that are included in the site-specific waste profile, including the waste stream identification and volumes of stored and currently projected waste; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

Figure 1-3 provides an example of a blank site-specific waste profile form. The methodology and assumptions for developing site-specific waste profiles are provided in Chapter 4 and printouts of site-specific waste profiles are provided in Appendix F.

WIPP Waste Profile – The WIPP waste profile represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG. Examples of information included in a WIPP waste profile are:

- Profile name;
- The WMCG that the profile represents;
- Listing of the DOE TRU waste sites (represented by the same WMCG) that are included in the WIPP waste profile, including the name of the DOE TRU waste site and volumes of stored and currently projected waste for each site for the particular WMCG represented; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

Figure 1-4 provides an example of a blank WIPP waste profile form. The methodology and assumptions for developing WIPP waste profiles are provided in Chapter 5.

1.3.4 Database Terminology

Mixed Waste Inventory Report (MWIR) – The MWIR refers to the latest release of information from the MWIR database that supports requirements under the Federal Facilities Compliance Act (FFCA) of 1992 (Public Law 102-386). The latest version of the MWIR documentation/files is *Distribute [Distribution] of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a). This information replaces the MWIR Phase I release (DOE, 1994c).

Integrated Data Base (IDB) – The IDB refers to the latest version of the *Integrated Data Base for 1993: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1994b).

Nonradionuclide Inventory Database (NID) – The NID is the database of nonradionuclide constituents in the TRU inventory that was originally developed by International Technology Corporation (IT) during 1988/1989 in support of the SNL/NM PA effort. A summary of the database was transmitted to SNL/NM in a letter report dated May 1989 (WIPP PA, 1991). A

Figure 1-4. Blank WIPP Waste Profile Form

copy of the NID waste stream information used in the WTWBIR is included in Appendix D.

In cases where additional information/process knowledge was used that is not contained in the three databases just mentioned, the source of the information will be included in the text.

1.3.5 Other Terminology

Waste Material Parameter – This is a waste material that occurs in TRU waste that is an input parameter into one or more current SP or PA models, an SP or PA model under development, a potential future model, or is required to adequately describe the waste form (see Section 3.3.1). The 10 waste material parameters and packaging materials that are defined and included in the WTWBIR are:

- Inorganics
 - Iron-based metals/alloys
 - Aluminum-based metals/alloys
 - Other metals
 - Other inorganic materials
- Organics
 - Cellulosics
 - Rubber
 - Plastics
- Solidified Materials
 - Inorganic matrix
 - Organic matrix
- Soils
- Packaging Materials
 - Steel
 - Plastic or lead

Definitions for these waste material parameters can be found in Chapter 6.

1.4 OBJECTIVES

The objectives of the WTWBIR are threefold:

1. **Establish a methodology for grouping wastes of similar physical and chemical composition.** A methodology for grouping wastes of similar physical and chemical properties into "waste profiles" will provide a common frame of reference for discussion of TRU waste issues with regulatory organizations.
2. **Define the anticipated disposal inventory of TRU wastes destined for WIPP.** The anticipated inventory of CH-TRU and RH-TRU wastes is defined as the sum of the existing volumes of stored and currently projected waste streams at each of the TRU waste generator/storage sites. Because the existing stored and currently projected waste streams do not contain sufficient volume (CH-TRU waste only) to fill the allowed capacity of WIPP, calculated: $6.2 \times 10^6 \text{ ft}^3$ ($\sim 1.76 \times 10^5 \text{ m}^3$) (Public Law 102-579, 1992), scaling of the CH-TRU waste anticipated inventory is necessary to attain the WIPP design limit. Additionally,

there is a high uncertainty in and a current lack of data on waste produced by decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the anticipated inventory has been scaled to the WIPP capacity (disposal inventory). The scaling of the inventory in future revisions of the WTWBIR will be derived from the best available data and assumptions.

3. **Calculate the disposal inventory in terms of waste material parameters.** Several waste material parameters (e.g., iron-based metals/alloys, rubber, plastics, etc.) have been identified as being potentially significant in relation to the performance of the WIPP repository (see Table 1-1). Calculating the WIPP disposal inventory in terms of these parameters provides input for the SP and PA calculations and sensitivity analyses needed to determine compliance with federal standards.

1.5 BASELINE INVENTORY UPDATES

The WTWBIR represents the best available TRU waste inventory information in support of the WIPP Project. It is anticipated that the WTWBIR will be updated periodically. This update cycle will be modified based on the availability of additional waste information or the data needs of the WIPP Project.

1.6 DOCUMENT ORGANIZATION

The WTWBIR is organized into chapters of text, figures, tables and supporting appendices. It flows from specific, detailed TRU waste information (provided by the TRU waste generator/storage sites) to the development and description of waste profiles and waste material parameters. The contents of remaining chapters in this document are summarized in the following:

- Chapter 2 discusses the three main databases and the methodology used to define the TRU waste disposal inventory.
- Chapter 3 describes the correlation of individual waste streams among the three databases and outlines the methodology and assumptions used to derive waste stream profiles.
- Chapter 4 describes the WMCGs used to combine waste stream profiles with similar physical and chemical properties to provide site-specific waste profiles, and provides estimations of non-mixed TRU waste volumes derived from the waste stream profiles identified in Chapter 3.
- Chapter 5 discusses the methodology for "rolling up" the site-specific waste profiles into WIPP waste profiles. Total weights per volume of waste material parameters are provided for each of the WIPP waste profiles. Radionuclide totals in curies are provided from site-specific data.
- Chapter 6 rolls up the waste material parameter information assigned at the waste stream profile level in Chapter 3 to obtain parameter totals. These totals are presented as parameter weights per volume.

- Chapter 7 lists references cited in the WTWBIR.
- Several appendices also are provided to either present more detailed waste inventory information or to describe the methodology in more detail. The appendices are provided in Book 2 of this WTWBIR.

CHAPTER 2

2. TRU WASTE DISPOSAL INVENTORY

2.1 INTRODUCTION

The TRU waste disposal inventory is derived from existing information on waste, which has been provided by the DOE TRU waste generator/storage sites and is predominately based on process knowledge. This chapter is designed to assist the reader by describing the existing waste information used to derive the inventory and developing the methodology used to correlate and combine the existing data into a WIPP disposal inventory.

2.2 SOURCES OF TRU WASTE INFORMATION

Several sources of information have been used to compile the WTWBIR. The three primary databases used are: (1) the MWIR (DOE, 1994a) (see Appendix H), (2) the IDB (DOE, 1994b), and (3) the NID (summarized in Appendix D). Although the bulk of the information used to compile the inventory was extracted from these three databases, several other resources also were used. These are the *Transuranic Package Transporter-II (TRUPACT-II) Content Codes* (TRUCON) (DOE, 1992), the *No-Migration Variance Petition* (NMVP) (DOE, 1990), and the draft *RCRA Part B Permit Application* (DOE, 1993a). These sources are discussed further in the following sections.

2.2.1 Mixed Waste Inventory Report

The FFCA of 1992 (Public Law 102-386, 1992; Section 105) required that the DOE, within 180 days of enactment of the FFCA, submit to the EPA Administrator and the governor of each state in which the DOE stores or generates mixed wastes a report that contains:

- National inventory report of all mixed wastes, regardless of the time they were generated, on a state-by-state basis and
- National inventory of mixed waste treatment capacities and technologies.

The FFCA also stipulated specific reporting requirements for each of these inventories. The DOE submitted the six-volume set entitled: *U.S. Department of Energy Interim Mixed Waste Inventory Report: Waste Streams, Treatment Capacities and Technologies*, DOE/NBM-1100, dated April 1993 (DOE, 1993b), to fulfill these requirements. Since issuance of the "interim" report, DOE has requested additional information from the DOE TRU waste generator/storage sites and published two updated reports entitled:

- *Release of Phase I Mixed Waste Inventory Report Data*, dated April 1, 1994 (DOE, 1994c), which includes a data diskette (Version .97B) and the draft *Mixed Waste Inventory Report Data Base System User's Guide*.
- *Distribute [Distribution] of the Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a), which includes a data diskette (Version 1.00) and the draft *User's Guide for National Data Base System for the Final Mixed Waste Inventory Report* (May 1994).

The waste-stream specific information contained in the Phase II MWIR report is the basis for defining waste streams and building a CH-TRU and RH-TRU waste disposal inventory for

WIPP. The Phase II MWIR report has the following information about each mixed TRU waste stream by generator/storage site:

- Physical and chemical description,
- Retrievably stored and projected inventory volumes (in cubic meters),
- Source of the waste stream (including process descriptions),
- Toxic Substances Control Act (TSCA) constituents,
- Hazardous (EPA) waste codes,
- Radionuclide characterization data (generally qualitative), and
- WMCs for treatability, developed by the DOE to group waste streams with similar physical and chemical properties (see Appendix C).

Although the Phase II MWIR contains fields for all the information listed here, some fields are left blank or limited information is provided by the sites. Volumes, RCRA constituents, and WMCs are provided for each waste stream reported. Generally, the TRU waste generator/storage sites provide some information in the other fields, but its completeness ranges from very detailed to extremely sparse. Source information, TSCA constituents, and radionuclide characterization fields often contain incomplete information or are left blank.

The Phase II MWIR (DOE, 1994a) database is used for this revision of the WTWBIR for mixed TRU waste streams. Idaho National Engineering Laboratory (INEL) non-mixed TRU waste stream information from the Phase I MWIR (DOE, 1994c) is used to define non-mixed waste streams for TRU waste at INEL.

2.2.2 Nonradionuclide Inventory Database

The NID was developed in 1988/1989 by IT for SNL/NM in support of initial PA calculations. This database defines each waste stream that was planned for WIPP disposal in 1989, on which sufficient information existed about the waste materials. Most waste streams in the NID also are described in detail in the TRUCON document (DOE, 1992). The NID contains estimated numerical information (minimum, maximum, and average weights), based on process knowledge and limited visual examination (a qualitative technique that involves human judgment) on many different types of waste materials for each waste stream included in the database.

The waste material parameters listed in Section 1.3.5 occur in the NID and are the emphasis of the waste stream profile. Although these waste material parameters are deemed important for SP and PA model evaluations, their effect on repository performance may prove to be insignificant as determined by sensitivity analyses.

The NID information was summarized in 1989 for inclusion in the PA calculations (WIPP PA, 1991). Most of the information (except that for the waste material parameters) has been superseded by the MWIR database. The waste material parameter information used to define the WTWBIR is presented in Appendix D.

2.2.3 Integrated Data Base

In the IDB, radionuclide inventory is reported at the top level only (at the TRU waste site level). The IDB is published by Oak Ridge National Laboratory (ORNL) for the DOE. The ORNL assembles radioactive waste inventories provided by DOE TRU waste generator/storage sites. The IDB contains site inventory estimates for retrievably stored and currently projected waste (i.e., waste projections are made for 1993 until the year 2020). This database does not report by waste stream, but rather, by the total inventory at each DOE site. The IDB also contains the radionuclide isotopic distribution for the waste generated/stored at each site. Because consistent reporting is not available at the waste stream level in the MWIR, the radionuclide information in the IDB is the basis for the WTWBIR inventory for radionuclides.

2.2.4 Other Sources of TRU Waste Information

The three main databases described here in Section 2.2.1, MWIR (DOE, 1994a); Section 2.2.2, IDB (DOE, 1994b); and Section 2.2.3, NID (WIPP PA, 1991), represent the bulk of the data used to build the WIPP disposal inventory. Table 2-1 lists the information that was used from each database to compose the waste stream profiles for each TRU waste stream in the MWIR. In addition to the database records, several other resources have been used. These include:

- TRUCON (DOE, 1992) – Waste streams that are included in TRUCON have been indicated by recording the designation in the waste stream profile for each MWIR waste stream (see Appendix E).
- NMVP (DOE, 1990) – Waste streams that are covered by the NMVP have been indicated by recording the designation in the waste stream profile for each MWIR waste stream (see Appendix E).
- RCRA Part B Permit Application (DOE, 1993a) – Waste streams across the DOE TRU system have been summarized in the WIPP RCRA Part B Permit Application by general categories. The name of these general categories has been included on the waste stream profile for each MWIR waste stream (see Appendix E).

2.3 METHODOLOGY FOR DEVELOPMENT OF DISPOSAL INVENTORY

Development of the WIPP TRU waste disposal inventory is accomplished by a series of steps starting with the individual waste streams identified in the MWIR (DOE, 1994a). These waste streams are grouped together, based on similar physical and chemical properties, into common "waste profiles," which should facilitate discussions concerning the disposal waste inventory with regulatory agencies and stakeholders. The waste profiles also contain information on waste material parameters that could affect the performance of the WIPP repository and that, therefore, may be direct inputs to SP and PA models. A more detailed explanation of these processes is found in the following sections.

TABLE 2-1. SOURCES OF INFORMATION FOR WASTE STREAM PROFILES

| Mixed Waste Inventory Report ¹ | Nonradionuclide Inventory Database ² | Integrated Data Base ³ |

¹ Phase II MWIR (DOE, 1994a).

² A summary of the database output is provided as Appendix D.

³ Current version is Revision 9, published March 1994.

⁴ For INEL, the Phase I MWIR also contains non-mixed TRU waste volumes.

2.3.1 Estimation of Anticipated Inventory

The anticipated inventory is the sum of the stored and currently projected wastes including the non-mixed waste that is **not** included in the MWIR (DOE, 1994a). The methodology for deriving the anticipated inventory is as follows:

- Approximately 260 individual TRU waste streams are defined in the Phase II MWIR (DOE, 1994a). Each of these waste streams is identified in the WTWBIR as a waste stream profile (see Appendix E). These waste stream profiles were developed using information from the sources listed in Section 2.2; these profiles are the lowest tier of information in the WTWBIR. Five TRU waste streams are used throughout this report to illustrate the methodology for this process.
- Each waste stream in the MWIR has been assigned a WMC by the TRU waste generator/storage site that defines the general physical and chemical properties of the waste. The WMC is located in the upper portion of each waste stream profile. The assignment of the WMC is based on DOE guidance, which can be found in Appendix C.
- Waste streams at each TRU waste generator/storage site with similar WMCs can be grouped together into a site-specific waste profile. The methodology for grouping waste streams is shown in Figure 2-1. The grouping of individual waste stream profiles into a site-specific waste profile is based on the similar physical and chemical properties of the waste streams and how that information is used in the SP and PA models. In the

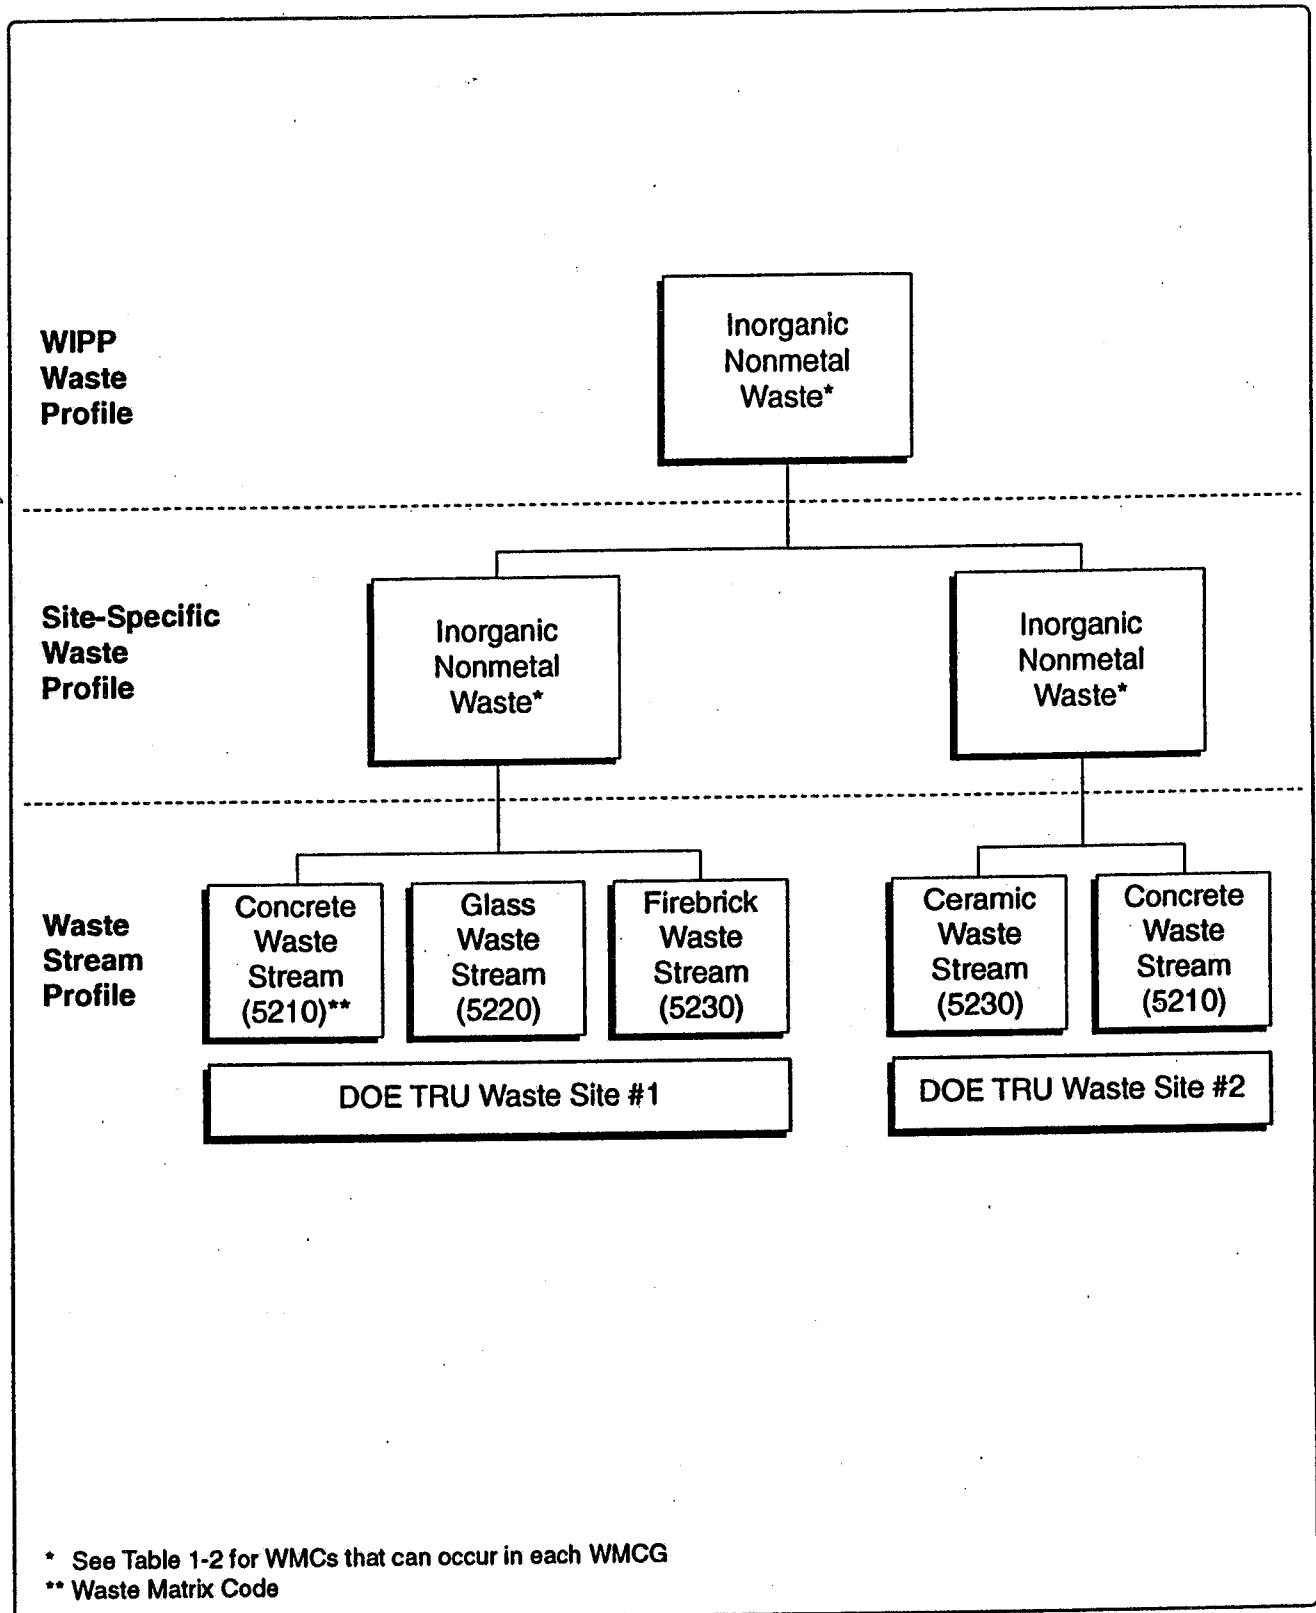

Figure 2-1. Schematic of Waste Stream Profile Methodology

example in Figure 2-1, due to their similar mechanical properties, concrete waste, glass waste, firebrick waste, and ceramic waste mainly influence the estimation of porosity and permeability in the SP and PA calculations. Therefore, the three waste streams at DOE TRU Waste Site #1 and the two at DOE TRU Waste Site #2 can be grouped together at each site based on similar physical and chemical properties and placed into the site-specific waste profile "inorganic nonmetal waste," with the WMCG defined in Table 1-2.

A more detailed description of the methodology for grouping waste stream profiles into site-specific waste profiles is presented in Section 4.3 and is illustrated with examples of five actual TRU waste streams. There are a maximum of 11 possible CH-TRU and RH-TRU site-specific waste profiles at any generator/storage site; however, most sites have fewer profiles due to differences in waste segregation practices. All the site-specific waste profiles for TRU waste are provided in Appendix F.

- Site-specific waste profiles from different waste generator/storage sites that contain the same WMCG (e.g., inorganic nonmetal waste for the example in Figure 2-1) can be combined together into a WIPP waste profile similar to that presented in Figure 2-1. As with site-specific waste profiles, there can only be a maximum of 11 possible WIPP waste profiles for CH-TRU or RH-TRU waste.
- Definition of the anticipated WIPP inventory is based on summing volumes of waste from each DOE TRU waste generator/storage site by site-specific waste profiles to synthesize the overall WIPP waste profiles. In the example in Figure 2-1, the inventories of inorganic nonmetal waste for Site #1 and Site #2 are added together to define a WIPP waste profile. To define the anticipated total WIPP inventory for inorganic nonmetal waste, all site-specific waste profiles for this waste category are combined to determine the WIPP waste profile for inorganic nonmetal waste.
- The anticipated inventory of TRU wastes for disposal at WIPP is determined from stored and currently projected waste streams as identified in the MWIR (DOE, 1994a) and/or the IDB (DOE, 1994b). The MWIR reports only volumes of mixed TRU waste. To estimate the volume of non-mixed TRU waste, the MWIR volumes by TRU waste site were subtracted from the 1993 IDB total volumes. The resultant total, which was always positive, was assumed to be non-mixed TRU waste.

In the Phase I MWIR (DOE, 1994c), INEL reported non-mixed TRU waste streams. These waste streams and their associated volumes have been used instead of the extrapolation of non-mixed TRU waste from the difference in volume of the MWIR and IDB.

Because the non-mixed TRU waste volumes are derived by the difference between the IDB and the MWIR, there are no WMCs associated with these volumes. Generally, mixed TRU and non-mixed TRU waste streams have similar physical and chemical properties. Based on this assumption, the non-mixed TRU waste was proportionally distributed among the predominant WMCs for each site using the combined stored and projected volumes. Therefore, the volumes reported in the site-specific waste profiles include both mixed and non-mixed TRU wastes. Appendix F provides a percentage breakout of mixed TRU and non-mixed TRU waste by site and WMCGs.

2.3.2 Estimation of Scaling Factor

Because the existing stored and currently projected waste streams, including non-mixed TRU waste, do not contain sufficient volume to fill the allowed capacity of WIPP, $6.2 \times 10^6 \text{ ft}^3$ ($\sim 1.76 \times 10^5 \text{ m}^3$) (Public Law 102-579, 1992), scaling of the CH-TRU inventory is necessary to attain the WIPP capacity. The scaling is accomplished by:

- The anticipated inventory (as defined in Section 1.3.1) consists of 11 overall CH-TRU and RH-TRU WIPP waste profiles based on the physical and chemical properties of the waste streams. The sum of the anticipated inventory is subtracted from the allowable WIPP inventory ($1.76 \times 10^5 \text{ m}^3$) and divided by the anticipated inventory, then added with 1:

$$\frac{1.8\text{E} + 05 \text{ m}^3 - \text{anticipated inventory}}{\text{anticipated inventory}} + 1 = \text{scaling factor}$$

The scaling of the inventory, in future revisions of the WTWBIR, will include volumes of waste anticipated from D&D and ER activities as these estimates are made available.

2.3.3 Estimation of Disposal Inventory

The disposal inventory is the total inventory to be used in SP and PA calculations. To calculate the disposal inventory by WMCG, the anticipated inventory is multiplied by the scaling factor for each WMCG and summed together. See Section 5.3 for further details.

2.3.4 Estimation of Waste Material Parameters

Some waste materials that exist in TRU waste may degrade, to some extent, over the 10,000-year period for performance modeling (WIPP PA, 1993). Some waste may produce gas by either chemical, microbial, or radiolytic degradation processes. The WIPP SP and PA models will evaluate the impacts of these processes on repository performance. The waste material parameters that are direct inputs into the SP process and PA models or potential models being considered or developed have been included in the WTWBIR and are documented in Section 6.2. These parameters will be evaluated in the SP process and PA modeling to determine the sensitivity of each parameter to repository performance.

Each TRU waste stream identified in the MWIR (DOE, 1994a) was reviewed. An example of a Phase II MWIR printout can be found in Appendix H. The item description codes (IDCs) and general waste information in the MWIR were compared with the NID (see Appendix D). The comparison of the MWIR and NID information on a waste stream basis resulted in one of two scenarios:

1. The MWIR waste stream correlates directly with NID waste stream.
2. The MWIR waste stream does not correlate directly with NID waste stream.

If a direct match was made between a waste stream in the MWIR and a waste stream in the NID (i.e., both had the same IDC), the waste parameter information from the NID was used in the waste stream profile for the MWIR waste stream. This information included the minimum, average, and maximum quantities of waste material parameters reported within the waste stream. If there was not a direct match, a comparison of the general waste information

between the MWIR and the NID was used to assign a waste material parameter distribution from another waste stream in the NID to the one under consideration in the MWIR to produce the waste stream profile. A more detailed explanation of the methodology used for assignment of waste material parameter information is provided in Section 3.3 and Appendix J.

CHAPTER 3

3. WASTE STREAM PROFILE METHODOLOGY

3.1 INTRODUCTION

The lowest tier of information in the WTWBIR is the waste stream profile, which documents specific information for each separate waste stream identified in the MWIR at each DOE TRU waste generator/storage site. In order to develop a waste characterization package for each waste stream at each site, it was necessary to correlate the information between the MWIR, NID, and IDB. Because these databases were generated at different times to meet different requirements, the nomenclature, waste description codes, waste groupings, and waste streams can be different in each database.

3.2 WASTE STREAM PROFILE DESCRIPTION

Each DOE waste stream was reviewed and, using the MWIR (DOE, 1994a) waste streams as the basis, those which were identified as acceptable for disposal under the WIPP WAC (DOE, 1991) were developed into waste stream profiles. Figure 3-1 provides an example TRU waste stream profile for a waste stream at INEL. In addition to presenting the quantity of waste material parameters in each DOE waste stream, the waste stream profile also provides a cross-reference table (top of the waste stream profile form) to list the different nomenclature used in previously generated DOE documents to identify the waste stream. Appendix K provides a cross correlation table for an MWIR waste stream with the NMVP, the draft *RCRA Part B Permit Application*, and the TRUCON. Table 3-1 lists the fields utilized on the waste stream profile, the sources of the information, and a short explanation of the data located in a particular field. A complete set of the waste stream profiles is provided in Appendix E.

In development of the MWIR, DOE directed the TRU waste generating/storage site to append their hazardous waste codes (EPA codes) to further define the waste in order to develop an appropriate treatment technology. These code designations and descriptions are presented in Appendix M. For example, D003 is defined by EPA as reactive. DOE further defined this code as D003A (reactive cyanide), D003B (reactive sulfides), D003C (explosives), D003D (water reactives), and D003E (other reactives). Other EPA codes are further defined as listed in Appendix M.

There are three waste volumes reported in the waste stream profiles: retrievable, projected, and total. On some waste stream profiles there can be a rounding error. If retrievable plus projected do not equal the total, it is due to a rounding error.

3.3 WASTE STREAM PROFILE METHODOLOGY AND ASSUMPTIONS

3.3.1 Assignment of Waste Material Parameters to MWIR Waste Stream

Each waste stream described in the MWIR (DOE, 1994a) is evaluated to determine the physical and chemical properties of the waste. This information is then compared with the NID (Appendix D). As a result of this comparison, two scenarios are possible (see Appendix J):

1. **MWIR Waste Stream Correlates Directly with NID Waste Stream** – If the MWIR waste stream has a direct correlation with a NID waste stream (i.e., they both have the same

IDC), the waste parameter information from the NID is placed on the waste stream profile for that particular waste stream.

2. **MWIR Waste Stream Does Not Correlate with NID Waste Stream** – If the MWIR waste stream does not have a direct correlation with a NID waste stream (i.e., IDCs do not match), the Waste Stream Description (See Section 2.2 in Appendix H) and the Specific Matrix Constituents (See Section 4.2 in Appendix H) are examined to determine the physical and chemical properties of the waste stream. Based on that information, a NID waste stream is found that closely approximates the MWIR waste stream description. The waste material parameter data from the similar NID waste stream are assigned to the particular waste stream profile.

3.3.2 Assignment of WMC to MWIR Waste Stream

The DOE TRU waste generator/storage sites have assigned an overall WMC to each waste stream based on the current form of the waste (see Section 4.1 in Appendix H). The WIPP Project has developed the WIPP WAC (DOE, 1991) for any waste packages to be shipped to WIPP to ensure the safe handling and emplacement in the WIPP. In general, the waste forms acceptable for emplacement in WIPP are described in Table 1-2. For the purpose of this document, waste streams that are in a physical or chemical form that is unacceptable for WIPP disposal are assumed to be processed to meet WIPP WAC. To accomplish the grouping of WMCs, the waste streams were evaluated as follows:

- Documented physical and chemical properties were revised as described in the MWIR database.
- If the waste stream documentation was sufficient, a treatment was assumed for the waste stream (e.g., solidification of inorganic liquids [1000 series] or organic liquids [2000 series]) and grouped with similar WMCs. Other waste streams in the 6000, 7000, 8000, and 9000 series have also been grouped with the 3000, 4000, or 5000 series using similar methodology to address any waste characteristics that would be unacceptable for emplacement in WIPP. Some sites have reported "unknown" (e.g., WMC 8900) for some waste streams. In a few cases, WMCs have been assigned through expert judgement to the waste stream when sufficient information has been included in the waste stream description. Any waste streams that have been changed from "unknown" to another WMC have been documented on the waste stream profiles. Those waste streams that cannot be placed in a new WMC have been grouped together under the WMC 8900. The "unknown" waste streams are documented as part of the WIPP inventory, but are not used in any of the scaling of TRU waste volumes necessary to fill WIPP to its design capacity. "Unknown" wastes will have to be characterized and may require treatment prior to emplacement in WIPP.
- The TRU waste generator/storage sites have identified several waste streams that are regulated under the TSCA (i.e., containing asbestos or polychlorinated biphenyls [PCBs]). Because the concentration of the asbestos and/or PCBs is unknown, it is assumed that these waste streams cannot be accepted at WIPP under the proposed draft WIPP RCRA Part B Permit Application. These waste streams are summarized in Table 3-2 and are not included in the WTWBIR.

TABLE 3-1. SOURCES OF INFORMATION USED IN WASTE STREAM PROFILES

| INFORMATION FIELD | SOURCE OF INFORMATION | EXPLANATION |

Key: WS = waste stream ID = identification

- All "particulate" wastes have been assumed to be solidified prior to shipment to WIPP.
- Rocky Flats Plant (RFP) residue wastes are included in the MWIR, and are reported at the volumes represented in *Removing Plutonium Residues from Rocky Flats Will Be Difficult and Costly*, a U.S. General Accounting Office (GAO) report to Congress (GAO, 1992). Many of these wastes will have to be repackaged or treated to meet the WIPP WAC, which will result in a volume change.

CHAPTER 4

4. SITE-SPECIFIC WASTE PROFILE METHODOLOGY

4.1 INTRODUCTION

Waste streams with similar physical and chemical properties can be grouped together using WMCs. For example, the following four waste streams from INEL are identified in Figure 4-1:

- Dry paper and rags (IN-W169);
- Combustible equipment boxes (IN-W203);
- Benelex and Plexiglas (IN-W225); and
- Miscellaneous paper, metal, etc., (IN-W285).

These waste streams are all "heterogeneous waste" and can be combined into one site-specific waste profile because it is assumed that for long-term compliance purposes (i.e., SP and PA modeling inputs), all four waste streams have essentially the same physical and chemical properties. At INEL, there are additional waste streams grouped under the "heterogeneous waste" profile; but only these four have been included to simplify the example.

For the other site example identified in Figure 4-1, the combustibles waste stream profile RF-W012 is the only one that occurs in the "heterogeneous waste" classification and is, therefore, placed under that site-specific waste profile for the RFP. This methodology of grouping waste streams by WMCs is similar at each DOE TRU waste generator/storage site.

4.2 SITE-SPECIFIC WASTE PROFILE DESCRIPTION

A site-specific waste profile is developed at each of the TRU waste generator/storage sites for each of the WMCGs (listed previously in Table 1-2) that have individual waste streams at each site. These site-specific waste profiles provide a rollup of the waste material parameter and volume information found in the waste stream profiles for each site.

4.3 SITE-SPECIFIC WASTE PROFILE METHODOLOGY

The general methodology for combining waste streams at a site into WMCGs is similar to that shown in Figure 4-1. The WMCGs are then converted directly into site-specific waste profiles to be used to build the WIPP disposal inventory. An example site-specific waste profile is presented in Figure 4-2 using the IN example waste streams from Figure 4-1. Table 4-1 lists the sources of information for site-specific waste profiles. All site-specific waste profiles are provided in Appendix F.

4.3.1 Grouping of WMCs

For the purposes of this document, 11 WMCGs have been identified. The WMCGs were developed by combining waste streams with similar physical and chemical properties by using WMCGs as defined in the *DOE Waste Treatability Groups Guidance* (see Appendix C) and after reviewing the individual waste stream descriptions in the MWIR. Table 1-2 (in Chapter 1) displays the WMCGs and associated WMCs.

| Waste Material Parameters | NID | Provides total weight estimates of selected waste materials in a particular WMCG for the entire site. |

4.3.2 Assignment of WMCGs to Site-Specific Waste Profiles

Once the waste stream(s) at a particular site have been reviewed and grouped under the appropriate WMCG(s), a site-specific waste profile is developed for each WMCG, using the name of the appropriate WMCG to identify the site-specific waste profile. Although the maximum number of site-specific waste profiles for any given TRU waste generator/storage site is 11 CH and 11 RH, most sites possess fewer.

4.3.3 Estimation of Non-mixed TRU Waste Volumes

The Phase II MWIR (DOE, 1994a) reports only volumes of mixed TRU waste, except for INEL (reported in the Phase I MWIR; DOE, 1994c). To estimate the volume of non-mixed TRU waste (except for INEL), the MWIR volumes by TRU waste site were subtracted from the 1993 IDB total volumes, which report the total TRU and mixed TRU waste volume at each site (DOE, 1994b). The resultant total, which was always positive, was assumed to be non-mixed TRU waste:

$$\text{IDB (TRU and mixed TRU waste)} - \text{MWIR (mixed TRU waste)} = \text{TRU (non-mixed TRU waste)}$$

Because the non-mixed TRU waste volumes are derived from the difference between the IDB total TRU waste volumes and the MWIR total mixed TRU waste volumes per site, there are no WMCs associated with these volumes. Generally, mixed TRU and non-mixed TRU waste streams have similar physical and chemical properties (DOE, 1990).

Based on this assumption, the following example is presented only to illustrate the methodology used at most DOE TRU waste generator/storage sites:

- At a DOE TRU waste generator/storage site, three predominant WMCGs are assumed to occur (i.e., solidified inorganic waste, solidified organic waste, and combustible waste).
- The volume of the three WMCGs is calculated by combining stored and projected volumes of all waste stream profiles under each WMCG.
- For this example, the following partitioning of mixed TRU waste volumes among the WMCGs is assumed: 40 percent solidified inorganic waste, 10 percent solidified organic waste, and 50 percent combustible waste.
- Assuming that the difference between the IDB waste volume and the combined MWIR volume is 200 m³, then the non-mixed portion of the inventory would be distributed among the three WMCGs in the same ratio. That is: 80 m³ (solidified inorganic waste), 20 m³ (solidified organic waste), and 100 m³ (combustible waste). The volumes reported in the site-specific waste profiles include the non-mixed TRU waste.

Because of the disparity in available data on the non-mixed volumes of TRU waste, notations will be made on a waste stream basis, indicating which method was used to arrive at the non-mixed volume of the TRU waste. Appendix F includes tables that define the percentages of the WMCG that is TRU and mixed TRU waste.

CHAPTER 5

5. WIPP WASTE PROFILE METHODOLOGY

5.1 INTRODUCTION

The WIPP waste profiles are the highest tier of information in the WTWBIR. Site-specific waste profiles with the same WMCGs (see Table 1-2) can be combined across the TRU waste generator/storage sites into what is defined as an overall WIPP waste profile.

5.2 WIPP WASTE PROFILE METHODOLOGY

As described in chapters 3 and 4, each waste stream from each TRU waste generator/storage site is defined in a waste stream profile, then grouped by site WMCGs into site-specific waste profiles. These site-specific waste profiles are then rolled-up into WIPP waste profiles by combining identical WMCGs from all the TRU waste generator/storage sites. For example, all site-specific waste profiles for heterogeneous waste (see Table 1-2) can be grouped together to help generate the WIPP waste profile, "heterogeneous waste." The WIPP waste profiles are presented in Figures 5-1 through 5-17 at the end of this chapter.

5.3 WIPP WASTE PROFILE ROLL-UPS

To illustrate the methodology for grouping similar site-specific waste profiles into WIPP waste profiles, the WIPP waste profile for "heterogeneous waste" (based on the five example waste streams shown in Figure 4-1) is provided in Figure 5-4. Table 5-1 lists the sources of information used for the WIPP waste profiles.

TABLE 5-1. SOURCES OF INFORMATION USED IN WIPP WASTE PROFILES

| INFORMATION FIELD | SOURCE OF INFORMATION | EXPLANATION |
|--------------------------------|--|--|
| Waste Matrix Code Group (WMCG) | DOE Waste Treatability Groups Guidance and MWIR Database | Groups waste streams that have similar chemical and physical properties |
| DOE Site Volumes | 1993 IDB and/or MWIR Database | Provides estimates of retrievably stored, projected, and total volumes of TRU and TRU mixed wastes by DOE site |
| Waste Material Parameters | NID Database | Provides weight estimates of selected waste materials in a particular WMCG for the DOE Complex |

Using volumes for all the TRU waste streams (including the mixed and non-mixed TRU waste volumes) in the WIPP TRU Waste Baseline Inventory Database, disposal inventory of TRU waste has been developed using the methodology described in this and the preceding

chapters. This inventory is presented in Table 5-2 (by WMCGs) and depicts both the anticipated and disposal inventory volumes.

The anticipated inventory volumes are the sum of the "stored" and "projected" volumes in Table 5-2. The procedure to obtain the disposal inventory is summarized below:

- The total CH-TRU "stored" and "projected" waste volumes are added together ($8.6 \times 10^4 + 4.1 \times 10^4 = 1.3 \times 10^5 \text{ m}^3$)
- The "unknown" volume of waste in Table 5-2 ($4.2 \times 10^3 \text{ m}^3$) is subtracted from the anticipated inventory because DOE does not intend to produce any "unknown" waste in the future.
- The "unknown" waste will have to be added back into the total scaled inventory because it is assumed that this waste will be characterized and then shipped to WIPP. The target design volume of CH-TRU waste beyond that identified in the MWIR is decreased by $4.2 \times 10^3 \text{ m}^3$ ($1.8 \times 10^5 - 4.2 \times 10^3 = 1.8 \times 10^5 \text{ m}^3$ [there is no significant difference due to rounding]).
- Applying a modified version of the formula given in Section 2.3:

$$\frac{\begin{array}{c} 1.8 \times 10^5 \\ \text{(modified design} \\ \text{inventory)} \end{array} - \begin{array}{c} 1.3 \times 10^5 \\ \text{(modified anticipated} \\ \text{inventory)} \end{array}}{1.3 \times 10^5 \text{ (modified anticipated inventory)}} + 1 \approx 1.4 \text{ (scaling factor)}$$

- Multiply the CH-TRU waste modified anticipated inventory volumes by the scaling factor 1.4 for all the WMCGs, except for the "unknown" waste (which results in the numbers in the fourth column [Scaled Volumes] of Table 5-2).
- Add the CH-TRU waste volumes in the fourth column (Scaled Volumes), including the "unknown" waste, to attain the disposal inventory.

The waste stream volume on a system-wide WMCG basis is increased by 40 percent to account for the difference between the anticipated inventory and the repository design limit. The RH-TRU waste volumes have not been scaled because the volume of anticipated RH-TRU waste inventory already exceeds the design capacity by 21 percent (DOE, 1990).

5.4 RADIONUCLIDE ROLL-UPS

Quantitative radionuclide information is not available on a per-waste-stream basis, as is the nonradionuclide information that is summarized in the waste stream profiles. However, quantitative radionuclide information is available as part of the annual IDB submittal (DOE, 1994b). Table 5-3 contains a summary of the total radionuclide activity (curies) for CH-TRU and RH-TRU waste from information submitted by the DOE TRU waste generator/storage sites (Column 2 of Table 5-2) in support of the data call for the 1993 IDB (DOE, 1994b).

TABLE 5-2. TRANSURANIC WASTE DISPOSAL INVENTORY FOR WIPP

| Waste Matrix Groups | Stored Volumes m ³ | Projected Volumes m ³ | Scaled Volumes m ³ |
|------------------------------|----------------------------------|-------------------------------------|----------------------------------|

| Unknown | 5.6E+02 | 4.2E+02 | |
| Total | 2.0E+03 | 7.0E+03 | |
| Grand Total | 8.8E+04 | 4.8E+04 | |

¹ The projected "unknown" waste streams are calculated non-mixed TRU waste streams as defined in section 4.3.3. There was not enough information provided in the MWIR from the TRU waste generator/storage sites to assign these streams to a WMCG.

The curie totals for CH-TRU waste have been scaled (1.4) by the same percentage as the volume numbers in Section 5.3 for CH-TRU waste. The scaling will allow SP and PA modeling of the performance of the repository, with the inventory increased to the permitted volume limits. The curie totals presented in Column 4 (for RH-TRU) and Column 3 (for CH-TRU) in Table 5-3 are intended to replace the curie totals used by SNL/NM in the latest published data on waste parameters used in PA (Table 3.3-1 in Sandia WIPP Project, 1992). A more comprehensive listing of radionuclide inventories can be found in Appendix I.

TABLE 5-3. IDB TOTALS FOR SELECTED RADIONUCLIDES, DECAYED, AND ACCUMULATED TO DECEMBER 1992

| Th 232 | 1.01E-01 | 1.41E-01 | 3.33E-01 |
| U 233 | 2.14E+02 | 3.00E+02 | 1.04E+03 |
| U 235 | 9.94E-01 | 1.39E+00 | 3.67E+02 |
| U 238 | 6.08E+00 | 8.51E+00 | 2.30E+00 |

N/A = RH-TRU curie content was not scaled to fill the WIPP repository. (See Section 5.4 for details.)

* = Scaling factor is 1.4 from the volumes in Table 5-2.

ASSUMPTIONS:

1. Activities reported in 1993 are complete and accurate.
2. Equivalent Pu 239 activities.
3. Calculations to "decay" values reported by DOE sites were performed correctly and assumptions stated in 1993 IDB are valid.
4. Site reporting was done in accordance with the instructions in the 1993 IDB data call.
5. Reported values are scaled to design repository volume for CH-TRU waste only.

METHODOLOGY:

The figures presented were arrived at by summing the calculated decayed values in the 1993 IDB from data reported by DOE sites managing TRU waste in response to a formal, nationwide data call.

CHAPTER 6

6. WASTE MATERIAL PARAMETERS

6.1 INTRODUCTION

Some waste materials that occur in TRU waste may degrade over the 10,000-year period for performance modeling (EPA, 1993a). Some of these waste materials may produce gas by either chemical, microbial, or radiolytic processes (WIPP PA, 1993). These types of processes need to be evaluated as part of the WIPP SP and PA modeling effort to analyze their impact on repository behavior.

6.2 PARAMETER DESCRIPTION

This chapter identifies and defines the waste material parameters to be evaluated in performance assessment calculations. The same methodology used for identifying waste stream profiles and combining them into site-specific and WIPP waste profiles is used to develop a disposal inventory for WIPP by waste material parameters (see Figures 2-1 and 4-1). Waste material parameter information is provided for each waste stream profile (Figure 1-2). This waste material parameter information is used to estimate the anticipated WIPP inventory, which is then scaled to obtain the repository design limit (disposal inventory). This inventory is presented as a weighted average with a maximum and minimum expected weight/volume for each waste material parameter.

A discussion of the methodology for assignment of waste parameter information from the NID to WTWBIR waste streams is presented in Section 2.3.4 and Appendix J. The 10 waste material parameters and packaging materials that are direct inputs into the SP and PA models are:

Inorganics

- Iron-based metals/alloys – This designation is meant to include iron and steel alloys in the waste and does not include the waste container materials.
- Aluminum-based metals/alloys – Aluminum or aluminum-based alloys in the waste materials.
- Other Metals – All other metals found in the waste materials (e.g., copper, lead, zirconium, tantalum, etc.). The lead portion of lead rubber gloves/aprons are also included in this category.
- Other Inorganic Materials – Include inorganic nonmetal waste materials such as concrete, glass, firebrick, ceramics, sand, and inorganic sorbents.

Organics

- Cellulosics – Includes those materials, generally derived from high polymer plant carbohydrates. Examples are paper, cardboard, kimwipes, wood, cellophane, cloth, etc.
- Rubber – Includes natural or manmade elastic latex materials. Examples are Hypalon, Neoprene, surgeons' gloves, leaded-rubber gloves (rubber part only), etc.
- Plastics – Includes generally manmade materials, often derived from petroleum feedstock. Examples are polyethylene, polyvinylchloride, Lucite, Teflon, etc.

Solidified Materials

- Inorganic Matrix – This includes any homogenous materials consisting of sludge or aqueous-based liquids that are solidified with cement, Envirostone, or other solidification agents. Examples are wastewater treatment sludge, cemented aqueous liquids, and inorganic particulates, etc.
- Organic Matrix – This includes cemented organic resins, solidified organic liquids, and sludges.

Soils

- Generally consists of naturally occurring soils that have been contaminated with inorganic waste materials.

Packaging Materials

- Steel – For this revision of the WTWBIR all CH-TRU waste is **assumed** to be packaged in 55-gallon drums and RH-TRU waste is **assumed** to be packaged in the RH-TRU shipping container for disposal in WIPP. As additional data on other packaging configurations is specified by the TRU waste generator/storage sites, this information will be added to the WTWBIR.
- Plastics – For this revision of the WTWBIR, all CH-TRU waste is assumed to be packaged in ~80 mil high-density polyethylene liner with several layers of plastic bags inside.
- Lead – The RH-TRU canister contains lead as well as steel.

6.3 METHODOLOGY

If an MWIR waste stream is a direct match with a waste stream in the NID (i.e., has the same IDC), then that waste material parameter information is used in the WTWBIR. In cases where a direct match does not occur, the waste stream description and WMCs are used in conjunction with expert judgement and general process knowledge to assign waste parameter information from a particular NID waste stream to the particular MWIR waste stream (see Appendix J for additional information). In some cases, two or more NID waste streams could be combined on a weighted basis to provide the correct mix of waste materials for the MWIR waste stream.

The NID information provides weights for materials in an average drum and sometimes provides minimum and maximum weights for the materials. These data were used to calculate densities of particular materials for each IDC. These weights for each material parameter represent the waste profile for each IDC and, hence, for each MWIR waste stream.

Waste material parameters from the NID were rolled up into more general categories. The best way to describe this is with a **hypothetical example** as shown in Table 6-1.

TABLE 6-1. NID INFORMATION

| Waste Material Parameter | Minimum (wt%) | Average (wt%) | Maximum (wt%) |
|---------------------------------|----------------------|----------------------|----------------------|
| Paper | 10 | 30 | 80 |
| Kimwipes | 5 | 15 | 40 |
| Cloth | 0 | 5 | 10 |
| Cellulosics (summed) | 15 | 50 | |
| Drum Weights (kg) (waste only) | 50 | 95 | 150 |

The average weight percent does not add to 100 percent because other parameters such as metals make up the rest of an average drum. As shown in the fourth line, the data would roll up into the WTWBIR database as cellulosic materials. The result in the WTWBIR would be as follows:

| Weight per drum (Kg) | | | |
|----------------------|-----|------|-----|
| Parameter | Min | Avg | Max |
| Cellulose | 7.5 | 47.5 | 150 |

The minimum is the sum of the minimum weight percents in the NID multiplied by the minimum weight of waste (i.e., 15 percent x 50 kg = 7.5 kg) in the drum. The average is the sum of the average weight percents multiplied by the average weight of waste (i.e., 50 percent x 95 kg = 47.5 kg) in the drum. The maximum is the sum of the maximum weight percents multiplied by the maximum weight of waste (i.e., 100 percent x 150 kg = 150 kg) in the drum. In this case the maximum weight percents add to more than 100 percent which is physically impossible; therefore, 100 percent is used for the maximum weight percent. When tables and reports are computed for the WTWBIR, the weights per drum are converted to weight per cubic meter based on 0.208 cubic meters per 55-gallon drum.

The rollups of these material parameters by WMCGs or by site use the volumes from the MWIR data in the WTWBIR database. The roll ups by WMCGs or by site require combining data for several MWIR waste streams. The averages for the material parameters are calculated from the NID-derived average densities modified by the MWIR volume fractions and summed as follows:

$$\text{Average Density of rollup group} = \text{Average Density,} \quad \times \quad \frac{(\text{Volume MWIR Stream,})}{(\text{Total Volume of Group})} \quad + \dots$$

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the MWIR waste streams in a particular site-specific rollup. The maximum density is chosen in a similar manner, except that the largest maximum density was chosen.

In many cases, the NID does not have data for minimum and maximum percentages, even though average percentages are provided. In these cases, for rollup purposes only, the minimum is assumed to be zero and the maximum is assumed to be equal to the average. This ensures that the calculated and rolled up maximum densities are greater than the average densities. However, the maximum density may not be a true maximum but the maximum average density (see Appendix L for further WTWBIR Database information).

6.4 QUALITY ASSURANCE

WTWBIR Team – The data entry, manipulations, and reporting was conducted in conformance to a Quality Assurance Plan (CTS-WTAC-0001). The basic concept of the plan was to:

- Maintain record copies of the database at different points in the development.
- Maintain an auditable record of additions and changes to the database.
- Document and verify the correct use of the database to produce the reports and tables used in the WTWBIR.

This was accomplished by documenting and verifying the changes, additions, corrections, and report and table generation through the use of formal change forms signed and dated by the implementor and checker. The implementor is the individual who initially makes the changes or develops the report or table and the checker is another individual who checks and verifies that the initial work was correct. If the initial implementation was not correct, the checker confers with the implementor, changes are agreed upon, and the checker and implementor both check that the changes are properly implemented.

The change form is also used by anyone on the WTWBIR team to request a change or addition to the database. In this case the form also includes the requestor's name and the date requested. The requestor can also be the checker or implementor – but not both.

The database manager is responsible for maintaining the record copies of the database, tracking and ensuring proper use of change forms, and ensuring that the technical lead for the WTWBIR team is cognizant of changes being made to the data.

6.5 WIPP WASTE MATERIAL PARAMETER ROLLUPS

The waste material parameters that are inputs into the SP process and PA models are presented in Table 6-2 for CH-TRU waste and Table 6-3 for RH-TRU waste. These tables represent the WIP disposal inventory of waste material parameters. These waste material parameters are the final rollups of the WIPP waste profiles in Tables 5-1 through 5-17.

TABLE 6-2. WIPP CH-TRU WASTE MATERIAL PARAMETER DISPOSAL INVENTORY

| Radiological Desig: CH | | (Kg/m ³) | | |
|------------------------------|------------------|----------------------|---------|---------|
| | Materials | Maximum | Average | Minimum |
| Inorganics: | Iron Based | 1.7E+03 | 4.0E+01 | 0.0E+00 |

Book 2 of 2

APPENDIX A

APPENDIX A GLOSSARY

40 CFR Part 191, Protection of Environment. EPA: Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and TRU Radioactive Wastes – The EPA's environmental standards for the storage (Subpart A) and disposal (Subpart B) of spent nuclear fuel, and high-level and TRU radioactive wastes. This is the primary post-closure standard that applies to WIPP. It limits annual radiation doses to the public from waste management storage and disposal facilities.

40 CFR Part 268, Protection of Environment. EPA: Land Disposal Restrictions – Restricts the land disposal of all hazardous wastes and specifies strict treatment standards that must be met before these wastes can be land-disposed.

Americium (Am) – A TRU radionuclide having an atomic number of 95, containing 95 electrons and 95 protons. Am-241 (half-life 432.7 y) results from the decay of Pu-241 (half-life 14.4 y). Waste initially rich in Pu-241 will therefore "grow" in Am-241 for several decades as the Pu decays. Am-241 exists in finite amounts in TRU waste at INEL, LANL, LLNL, NTS, ORNL, RFP, and SRS.

Anticipated Inventory – The sum of the stored and projected inventories, as defined in this document.

Buried Waste – TRU waste buried in shallow trenches prior to the 1970 Atomic Energy Commission policy that required TRU waste to be retrievably stored.

Californium (Cf) – A TRU element having an atomic number 98 (the number of protons in the nucleus). An alpha emitter (half-life 2.64 y), Cf-252 also spontaneously fissions, thus making it desirable as a neutron source. Cf-252 is created by neutron bombardment of Cm-244 targets. OR is the only production agency for Cf. As a result, the OR inventory is the only TRU waste inventory showing finite quantities of this element.

Code of Federal Regulations (CFR) – (1) A codification of the general and permanent rules published in the **Federal Register** by the department and agencies of the federal government. The CFR is divided into 50 titles that represent broad areas subject to federal regulation. It is issued quarterly and revised annually. (2) All federal regulations in force are published annually in codified form in the CFR.

Contact-Handled (CH) TRU Waste – Packaged TRU wastes with an external surface dose rate of 200 mrem or less per hour.

Curie – A quantitative measure of radioactivity equal to 3.7×10^{10} disintegrations per second.

Curium (Cm) – A TRU element having an atomic number of 96 (the number of protons in the nucleus). An alpha emitter (half-life 18.1 y), Cm-244 is used for neutron bombardment of targets for the production of Cf-252 at ORNL. In spite of its half-life being less than 20 years, OR considers and handles Cm-244 as a TRU nuclide. Some TRU waste at both OR and SR contains Cm-244.

Decontamination and Decommissioning (D&D) – The process through which DOE facilities which are no longer operational are cleared of contamination and removed from service. In

particular, a reference to D&D waste is a reference to the waste materials that are generated during D&D activities.

Defense Waste – (1) Radioactive waste from any activity performed in whole or in part in support of DOE atomic energy defense activities; excludes waste under purview of the Nuclear Regulatory Commission or generated by the commercial nuclear power industry. (2) Nuclear waste derived mostly from the manufacture of nuclear weapons, weapons-related research programs, the operation of naval reactors, and the decontamination of production facilities.

Department of Energy Site – A DOE-owned or -controlled tract used for DOE operations. Either a tract owned by DOE or a tract leased or otherwise made available to the federal government under terms that afford to DOE rights of access and control substantially equal to those that DOE would possess if it were the holder of the fee (or pertinent interest therein) as agent of and on behalf of the government. One or more DOE operations/program activities are carried out within the boundaries of the described tract.

Design Capacity – The planned waste capacity of the Waste Isolation Pilot Plant.

Disposal – Emplacement of waste in a manner that assures isolation from the biosphere for the foreseeable future with no intent of retrieval and that requires deliberate action to regain access to the waste. For example, disposal of wastes in a mined geologic repository occurs when all of the shafts to the repository area are backfilled and sealed.

Disposal Inventory – The total inventory defined for WIPP emplacement (after scaling) to be used for SP and PA calculations.

Environmental Restoration (ER) – Those activities associated with the remediation of sites contaminated with hazardous and/or radioactive materials. In particular, a reference to remediation activities conducted under the auspices of the DOE Office of Environmental Restoration and Waste Management, Office of Environmental Restoration, EM-40.

Federal Facility Compliance Act (FFCA) – Public law 102-386, 1992.

Gas Production – Three gas generation processes are expected to be a factor in the degradation of TRU wastes in the WIPP repository. The generation of gaseous species is expected to occur through chemical (i.e., corrosion), microbial, and radiolytic processes.

Generator/Storage Sites – See Waste Generator/Storage Sites.

Hazardous Waste – Those wastes that are designated hazardous by EPA (or state) regulations through the RCRA.

Integrated Data Base (IDB) – The latest version of the IDB, the *Integrated Data Base for 1993: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics* (DOE, 1994b)

Mixed TRU Waste – TRU waste that contains both radioactive and hazardous components as defined by the Atomic Energy Act and the RCRA as codified in 40 CFR Parts 263, 265, 268, and 270 (EPA, 1980a; 1980b; 1986; and 1983).

Mixed Waste Inventory Report (MWIR) – The latest release of information from the MWIR database that supports requirements under the FFCA of 1992 (Public Law 102-386). The latest

version of the MWIR documentation/files is *Distribute of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a). This information replaces the Phase I MWIR release (DOE, 1994c).

Newly Generated Wastes – See Projected Inventory.

No-Migration Variance Petition (NMVP) – Section 3004 of RCRA allows EPA to grant a variance from the land disposal restrictions when a determination can be made that, to a reasonable degree of certainty, there will be no migration of hazardous constituents from the disposal unit for as long as the waste remains hazardous. Specific requirements for making this demonstration are found in 40 CFR 268.6, and EPA has published a draft guidance document to assist petitioners in preparing a variance request.

Non-Mixed TRU Waste – Transuranic waste that does not contain hazardous constituents or exhibit hazardous characteristics, as identified in 40 CFR 261, Subparts C and D.

Nonradionuclide Inventory Database (NID) – A database of the nonradionuclide constituents in the TRU inventory, originally developed by IT during 1988/1989 in support of SNL/NM PA efforts. A summary of the database was transmitted to SNL/NM in a letter report dated May 1989 (WIPP PA, 1991). A copy of the NID waste stream information used in the WTWBIR is provided in Appendix D.

Performance Assessment (PA) – (1) A systematic analysis of the potential risks posed by waste management systems to the public and environment and a comparison of those risks to established performance objectives. (2) An analysis that (a) identifies the processes and events that might affect the disposal system, (b) examines the effects of these processes and events on the performance of the disposal system, and (c) estimates the cumulative releases of radionuclides, considering the associated uncertainties, caused by all significant processes and events. These estimates shall be incorporated into an overall probability distribution of cumulative release to the extent practicable. (3) A term used to denote all activities (qualitative and quantitative) carried out to (a) determine the long-term ability of a site/facility to effectively isolate the waste and ensure the long-term health and safety of the public and (b) provide the basis for demonstrating regulatory compliance.

Plutonium (Pu) – A radionuclide having an atomic number of 94, the first TRU element. Pu isotopes exist in some TRU waste at all the major DOE storage facilities. The significant isotopes that may exist in measurable quantities at these facilities are Pu-238 through Pu-242. Each isotope is an alpha emitter; the respective half-lives in years are: 238=87.7, 239=24,000, 240=6,563, 241=14.4, 242=376,000. Because of its high activity, Pu-238 can contribute significantly to the thermal loading on some TRU waste. Pu-241 decays, primarily by beta emission, to Am-241.

Process Knowledge – The determination of waste container contents through the study of existing records on the production history of the waste.

Projected Inventory – That part of the inventory that has not been generated but is estimated to be generated at some time in the future by the TRU waste generator/storage sites. The estimated timeframe may vary, but is usually between 20 and 30 years. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Radioactive – Substances that emit radiation either naturally or as a result of scientific manipulation.

Radionuclide – (1) A species of atom having an unstable nucleus, that is subject to spontaneous decay or disintegration and usually accompanied by the emission of ionizing radiation. (2) Any nuclide that emits radiation. A nuclide is a species of atom characterized by the constitution of its nucleus and hence by the number of protons, the number of neutron, and the energy content.

Remote-Handled (RH) TRU Waste – Packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour.

Repository – Designated location for disposal of transuranic wastes; the Waste Isolation Pilot Plant.

Resource Conservation and Recovery Act (RCRA) – (1) Establishes a system for controlling hazardous waste from generation to disposal. (2) A Federal law passed in 1976, and amended under the HSWA of 1984, that established a structure to track and regulate hazardous wastes from the time of generation to disposal. The law requires safe and secure procedures to be used in treating, handling, transporting, storing, and disposing of hazardous substances. RCRA is designed to prevent new uncontrolled hazardous waste sites. The law also regulates the disposal of solid waste that may not be considered hazardous. (3) Specifically, Subtitle D of RCRA governs the management of solid waste. (Note: 40 CFR Parts 260-281 are the regulations for complying with RCRA with respect to hazardous waste and hazardous waste treatment, storage, and disposal facilities.)

Retrievable Storage – Designated storage location for transuranic wastes that is designed, operated, and maintained in such a manner that the wastes remain accessible for subsequent retrievable operations.

Scaling – The process for adjusting the anticipated inventory to the design limit (disposal inventory) of the WIPP repository.

Site-Specific Waste Profile – Represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles, at a particular DOE TRU waste site, that have been placed in the same WMCG are summarized in the site-specific waste profile.

Stakeholders – Those persons and/or groups of people and organizations who are affected or perceive they are affected by the DOE waste management program. Stakeholders include DOE management, employees, and contractors (internal); and executive, legislative, and regulatory groups, public representatives, the general public, intervenor groups, special interest groups, contractors, suppliers, and universities (external).

Stored Inventory – That part of the TRU inventory currently in retrievable storage as of the time of the last data call for inventory information. Retrievably stored waste includes waste stored in buildings or in berms with earthen cover since 1970 and **does not include any waste that was buried prior to 1970.**

System Prioritization (SP) – The SP is a process formulated to identify a set of activities (required experiments, modeling, engineering design, and waste acceptance criteria) that will lead to regulatory compliance. The process is formulated such that it also: (1) addresses stakeholder and regulator concerns early and throughout the regulatory process and (2) leads to a fully defensible performance assessment to be used in demonstrating regulatory compliance. Ultimate products and associated customers are:

- (1) A decision matrix containing the most likely sets of activities that will lead to compliance as a function of time and budget to be delivered to the WIPP program manager,
- (2) A performance assessment built on assumptions and data that are defensible in the eyes of the stakeholders and the regulators to be delivered to the regulatory compliance branch of Carlsbad Area Office/WIPP through the Westinghouse Waste Isolation Division and ultimately to the EPA, and
- (3) A set of regulatory issues and their current status that result from the SP process and are to be included in compliance packages by the Westinghouse Waste Isolation Division.

Thorium (Th) – A radionuclide having an atomic number of 90. Although not TRU, Th-232 is an alpha emitter (half-life 14 billion years) and exists in finite amounts in some TRU waste at HA, IN, and OR. [Note: Thorium is naturally occurring and contributes to background radiation at some sites (e.g., IN)]

Transuranic – Pertaining to elements that have atomic numbers greater than 92, including neptunium, plutonium, americium, and curium; all are radioactive, are products of artificial nuclear changes, and are members of the actinide group.

Transuranic (TRU) Waste – (1) Waste containing alpha-emitting radionuclides with an atomic number greater than 92 and half-lives greater than 20 years, at concentrations of TRU isotopes greater than 100 nanocuries per gram of waste. **This core definition appears in modified form in various relevant documents as follows:** (a) For purposes of management, DOE Order 5820.2A: (i) considers TRU waste, as defined above, "without regard to source or form" (*The proposed revision to the Order [DOE Order 5820.2A Major Issues for Revision, May 6, 1992]* contemplates removing this clause); (ii) allows head of field elements to determine that wastes containing other alpha-emitting radionuclides must be managed as TRU waste; and (iii) adds "at time of assay," implying both that the classification of a waste as TRU waste is to be made based on an assay, and that such classification can be superseded only by another assay. (b) For purposes of setting standards for management and disposal, 40 CFR 191.02(i) adds "except for: (i) high-level wastes; (ii) wastes that the DOE has determined, with the concurrence of the EPA Administrator, do not need the degree of isolation required by this part; or (iii) wastes that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61. (2) Waste materials contaminated with U-233 (and its daughter products), with certain isotopes of plutonium, or with other nuclides with atomic numbers greater than 92. In order to be classified as TRU waste, the long-lived alpha activity from subject isotopes must exceed 100 nanocuries per gram of waste material and from the use of plutonium in the fabrication of nuclear weapons. (3) Wastes that are contaminated with radioactive elements heavier than uranium, thus the name trans-(or beyond) uranic.

TRUCON – See TRUPACT-II Content Code.

TRUPACT-II Content Codes (TRUCON) – The document containing a description of the waste stream, waste form, and package configuration for each waste content code authorized for shipment in TRUPACT-II containers.

Unknown Waste Stream – Those waste streams for which there is insufficient process knowledge to assign a specific WMC.

Uranium (U) – A naturally radioactive element with the atomic number of 92 (number of protons in the nucleus) and an atomic weight of approximately 238. The two principal naturally occurring isotopes are the fissionable U-235 (0.7 percent of natural uranium) and the fertile U-

238 (99.3 percent of natural uranium). (Note: An alpha emitter [half-life 159,000 y], U-233 also spontaneously fissions; it is present in finite quantities in some TRU waste inventories at INEL and ORNL.)

Waste Acceptance Criteria (WAC) – The criteria used to determine if waste packages are acceptable.

Waste Form – The physical form of the waste such as sludges, combustibles, metals, etc.

Waste Generator/Storage Sites – The 10 largest DOE facilities and several smaller sites throughout the U.S. that produce and store TRU waste.

Waste Isolation Pilot Plant (WIPP) – (1) The project authorized under Section 213 of the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (Public Law 96-164; 93 Stat. 1259, 1265) to demonstrate the safe, and environmentally sound, disposal of radioactive waste materials generated by atomic energy defense activities. (2) A research and development facility, located near Carlsbad, New Mexico, to be used for demonstrating a practical, long-term solution to a complex problem: the safe disposal in deep geologic repositories of TRU waste resulting from DOE activities. (3) The WIPP has two primary objectives. First, the WIPP is investigating the behavior of salt rock and interactions between the salt rock and radioactive wastes in a variety of forms. Second, the WIPP seeks to demonstrate the safe and efficient handling, transportation, and disposal of TRU waste in an actual facility.

Waste Material Parameter – A waste material that occurs in TRU waste that is an input parameter into one or more current SP or PA models, an SP or PA model under development, a potential future model, or is required to adequately describe the waste form.

Waste Matrix Code (WMC) – A DOE-developed coding system for organizing waste streams by their physical and chemical properties. A WMC is assigned to each waste stream by the DOE TRU waste generator/storage site. The WMC for each waste stream can be found in the Mixed Waste Inventory Report (DOE, 1994a). This coding system allows waste streams within the DOE TRU waste system that have similar physical and chemical waste form properties to be categorized together. WMCs also have been called "waste treatability codes" in other DOE documents. Appendix C contains the DOE guidance document to help categorize individual waste streams. An example of a WMC for "heterogeneous waste" would be 5400.

Waste Matrix Code Group (WMCG) – Consists of a series of WMCs that for SP or PA purposes has similar physical and chemical properties.

Waste Stream – Individually, those stored or projected wastes that are defined by a unique identifier in the MWIR.

Waste Stream Name – A site-specific, unique descriptive identifier for a TRU waste stream.

Waste Stream Profile – A description of a CH-TRU or RH-TRU waste stream destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies for disposal in the WIPP repository. The waste stream profile is presented in tabular format and is intended to provide a summary of the important information about a particular waste stream.

Waste Stream Site ID – A site-specific alphanumeric identification code which provides a unique identifier for an individual TRU waste stream.

WIPP Waste Profile – Represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG.

1. INTRODUCTION

This guidance document provides a standard methodology for categorizing waste information that should be implemented at DOE sites. This methodology will assist in the development of the final mixed waste inventory report, the Site Treatment Plans, preparation of the national Site Treatment Plan summary, and analyzing different national treatment options.

The U.S. Department of Energy (DOE) is required by the Resource Conservation and Recovery Act (RCRA), as amended on October 6, 1992 by the Federal Facility Compliance Act, to prepare an inventory report of its mixed wastes and treatment capacities and technologies. The purpose of the inventory report is to identify all mixed waste in the DOE system that is currently stored or will be generated over the next five years, provide an inventory of the existing and planned treatment capacity, and identify DOE's technology development efforts. To aid in identifying the appropriate treatment needs, the waste streams must be grouped according to their technological requirements in a consistent manner. This grouping or characterization will enable the waste streams to be matched to available treatment capacities either at the site or at another DOE facility as well as to identify treatment and technology development needs.

The Federal Facility Compliance Act also requires DOE to develop site treatment plans for each facility at which DOE generates or stores mixed waste. The plans must describe the development of treatment capacities and technologies for treating the site's mixed waste. These plans must be submitted to the State in which the site is located or to the U.S. Environmental Protection Agency (EPA) for review and approval, approval with modification, or disapproval. As discussed in the schedule for the development of the plans, published in the Federal Register on April 6, 1993, DOE intends to prepare two interim versions of the plan (i.e., conceptual plan and draft plan), in addition to the final plan, to facilitate discussions among states and other interested parties. DOE also intends to prepare a summary document (or national "roll up") for each of the conceptual, draft, and final plans to provide a national picture of DOE's technology needs and possible options for treatment of its mixed waste. To properly integrate the site plans into a cohesive national summary and to be able to use the national summary to help identify and evaluate DOE-wide treatment needs against treatment capacities and capabilities, and to develop treatment options, each site plan must be developed using the same technically-based approach for categorizing waste streams and identifying appropriate treatment.

1.1 BACKGROUND

The need for a consistently applied, technically-based approach for categorizing waste information has been demonstrated by past national strategic planning efforts involving mixed waste. Since the 1987 byproduct rulemaking, several complex-wide reports and studies have been prepared on mixed waste characteristics and inventories, and associated treatment technology and capacity needs. Most notable of these were the:

- National Report on Prohibited Wastes and Treatment Options, submitted to the Environmental Protection Agency (EPA) in January 1990 as required by the Rocky Flats Plant Federal Facility Compliance Agreement;
- DOE complex-wide Land Disposal Restrictions Case-by-Case Extension Application for Thirds Radioactive Mixed Wastes, submitted to the EPA in November 1991; and
- Interim Mixed Waste Inventory Report, submitted to the EPA and the States in April 1993 as required by the Federal Facility Compliance Act.

Throughout these efforts, characteristic and inventory data on mixed waste streams were collected from the sites resulting in the development of a national data set.

Two significant problems that became apparent throughout these efforts were: 1) mixed waste streams were not always defined on a technical basis that supported assessment of treatment technology and capacity needs, and 2) information and data available on mixed waste streams have improved through time, resulting in apparent inconsistencies between reports. A contributing factor to both these problems has been the lack of a technically-based approach to defining waste streams and the lack of a standardized method to define treatability groups.

Section 102(a)(3) of the Federal Facility Compliance Act waives sovereign immunity for Federal facilities for fines and penalties for violations of federal, state, interstate, and local hazardous and solid waste management requirements. This waiver is delayed for three years for any violations of the land disposal restrictions storage prohibition, RCRA section 3004(j), involving mixed waste at DOE facilities. This waiver is contingent upon the management of the waste being in compliance with all other applicable requirements. The Act further delays the waiver of sovereign immunity beyond the three year period at a facility if DOE is in compliance with an approved plan for developing treatment capacity and technologies for mixed waste generated or stored at the facility and an order requiring compliance with the plan.

DOE published in the Federal Register on April 6, 1993 a schedule for the development of the plans for treating mixed waste for each facility at which DOE generates or stores mixed waste. These plans will describe the use of existing capabilities, and the development of treatment capacities and technologies for treating the site's mixed waste. The Act allows the Plans to provide for centralized, regional or on-site treatment of mixed waste, or any combination thereof. DOE has proposed to prepare two interim versions of the plan, the Conceptual Site Treatment Plan (CSTP) and the Draft Site Treatment Plan (DSTP), to facilitate discussion between the site and the regulatory agency and among states, EPA, and other interested parties on technical and equity issues. The interim plans will also facilitate information exchange among the sites and regulatory agencies and help identify common technical problems and needs. The interim plans will provide information about the technology needs, existing and planned treatment facilities, and treatment options, including potential options for treating off-site wastes. Each site, if possible, will discuss its CSTP framework with the appropriate State or EPA, and will submit to the State or EPA, by October 1993, a CSTP that will provide a preliminary identification of options for treating the site's waste. DOE will summarize all CSTPs by preparing a national roll-up for various cross-cut treatment options. Based on the CSTPs, the national summary, and discussions among states, EPA, DOE and others, each site will submit a DSTP not later than August 1994 to identify the preferred option for treating its mixed waste. Each DOE site will submit the final Site Treatment Plan not later than February 1995 to the appropriate State or EPA for review and approval.

In order to properly integrate the site treatment plans into a cohesive national summary, to be able to use the national summary to help identify and evaluate DOE-wide treatment needs against treatment capacity and capabilities, and to develop treatment options, each Site Treatment Plan must be developed using the same technically-based approach for categorizing waste streams and identifying appropriate treatment. By using the same methodology, DOE sites will be able to share information across the complex on potential treatment technologies/treatment capacities for any specific category of waste. Therefore, this should assist the site in the development of various options with the site treatment plan.

The Act also requires the DOE to prepare an inventory report of its mixed wastes and treatment capacities and technologies. The interim report was submitted to EPA and the States in April 1993 as required by the Act. The inventory report as required by the Act contains:

- a national inventory of all mixed waste in the DOE system that are currently stored or will be generated over the next five years, including waste stream name, description, EPA waste codes basis for characterization, quantity stored that is subject to the Land Disposal Restrictions (LDRs) storage prohibition, quantity stored that is not subject to the LDRs, expected generation over the next five years, Best Demonstrated Available Technology (BDAT) used for developing the LDR requirements, waste minimization activities, and a statement of whether and how the radionuclide content alters or affects the use of treatments technologies; and
- a national inventory of mixed waste treatment capacities and technologies, including information such as the description, capacities, and locations of all existing and proposed treatment facilities, explanations for not including certain existing facilities in capacity evaluation, information to support decisions on unavailability of treatment technologies for certain mixed wastes, and the planned technology development activities.

The purpose of the inventory report is to identify all mixed waste in the DOE system and to be able to match these waste streams to the appropriate treatment. To accomplish this, the waste streams and their associated treatability groups must be identified consistently at all DOE sites so that the waste streams can be matched to available treatment capacities and to identify treatment needs and technology development needs complex-wide. DOE intends to revise the interim inventory report and to update it on an annual basis. The inventory report will act as the most up-to-date information source for DOE's mixed waste.

When developing the site treatment plans and updating the interim mixed waste inventory report, this guidance provides a technically-based method for categorizing waste streams based on the regulatory and technological requirements from different waste streams/waste packages. While developed primarily for mixed waste, the method may be applied to other DOE waste types, e.g., radioactive waste and hazardous waste.

1.2 PURPOSE AND SCOPE

The purpose of the guidance is to provide a technically-based methodology for categorizing DOE waste information in a consistent, and technically valid manner to be used for the development of the Site Treatment Plans and to update the Mixed Waste Inventory Report. The methodology provides a formal approach for categorizing waste based on waste characteristics. This guidance includes:

- A methodology with standard definitions for aligning site-specific wastes into treatability groups that share similar treatment needs;
- A standard structure that will allow comparing waste treatability groups among sites, and combining all site-specific data into one data set for the national summary and the mixed waste inventory report;
- A technically-based approach to identify treatment technology needs, treatment capacity needs, technology development needs, and storage and disposal requirements for DOE mixed waste.

The treatability group assignments will allow comparisons of basic treatment needs to available and planned treatment capacity. The assignment of a treatability group to a waste stream is not intended to provide the detailed level of knowledge necessary to certify waste streams to treatment or disposal facility waste acceptance criteria (WAC), or to provide detailed characterization information required to proceed

beyond conceptual design to specific facilities. Additional characterization of waste streams will be required to accomplish facility design and WAC certification.

2. METHODOLOGY OVERVIEW

The methodology for categorizing waste streams into treatability grouping is based on the premise that the key information necessary for identifying treatment methods/or assessing technology needs can be identified from the radiological, physical, and chemical properties of the waste and its contaminants. This methodology uses three characteristic parameters: radiological, bulk physical/chemical matrix, and contaminants.

For the purposes of this guidance, waste streams should be consistent with those identified in the most current Mixed Waste Inventory report. For the Mixed Waste Inventory Report a waste stream is defined as "waste material generated from a single process or activity (e.g., a pipe or series of pipes from a single production process, replacement of a certain component of a production or support process (like a battery), or remediation activity like cleaning out a lagoon), covered by only one treatability group. For wastes stored in transportable containers, a waste stream should comprise at least one container (unless the material in the container is likely to be separated prior to sending it anywhere for processing). A single waste stream in storage may include several containers of waste material, but only if the material is from the same type of source and of essentially the same physical and chemical properties."¹ A single waste stream should be assigned to no more than one unique treatability group consisting of a single radiological and bulk physical/chemical matrix parameter. A single waste stream may have more than one contaminant parameter assigned to it.

Each of these parameters impacts treatment needs and/or technology determinations. The radiological parameter influences the design of the treatment facility to control radioactive releases and to prevent worker exposure. The matrix parameter identifies the physical/chemical properties of the waste and influences the facility design and technology selection. The contaminant parameter of the waste determines the type of treatment requirements from a regulatory and technical perspective. The contaminant parameter also influences any necessary follow-up or residual treatment and dictates any necessary effluent controls required. Combined, the parameters define a treatability group for the waste. Figure 1 displays the logic flow for identifying the relevant characteristic parameters for each waste type.

Sections 3, 4, and 5 of this report discuss the various categories under each characteristic parameter and provide definitions for these categories. The primary focus of this guidance document is to assign each waste to the lowest level subcategory based on the data available at the site on a given waste stream. Having detailed treatability group data could potentially influence the design of a planned treatment facility, enabling it to manage all wastes within a single (or set of) treatability group(s). In preparation of the national summary of the STPs, lower level subcategories may be rolled-up to the higher level categories for various general cross-cut evaluations. Detailed data will not be lost during the roll-up but will be available for more specific treatment and technology analyses. Section 6 provides guidelines for implementing the methodology and example applications. As more detailed characterization data becomes available the treatability group assignment of a waste stream may change. The most current, accurate information should be used in making the treatability group assignment.

1. Definition of "waste stream" from the Definitions for Key Mixed Waste Data Elements; Draft -- August 26, 1993.

Figure 1. Treatability Group Assignment Logic

3. RADIOLOGICAL PARAMETER

This section presents the categories and definitions for the radiological parameter. The radiological categories are based on the activity level of the waste and will influence the design of the facility to control radioactive releases and operator exposure. As shown in Figure 2, the primary radiological categories include:

- naturally occurring and accelerator produced radioactive materials,
- low-level waste,
- transuranic waste, and
- high-level waste.

These categories for the radiological parameter are based on definitions established in DOE Order 5820.2A. Following are the more specific categories and definitions within each of these general radiological categories.

3.1 NATURALLY OCCURRING AND ACCELERATOR PRODUCED RADIOLOGICAL CATEGORIES

Naturally occurring and accelerator produced radioactive materials (NARM) are defined by DOE Order 5820.2A as any radioactive material that can be considered naturally occurring and is not source, special nuclear, or byproduct material or that is produced in a charged particle accelerator. DOE Order 5820.2A specifies that NARM be managed as low-level waste or as tailings under the Uranium Mill Tailings Radiation control Act of 1978 (Public Law 95-604). The radiological hazards posed by these materials are similar to those from low-level waste. These materials are not included in the definition of mixed waste.

3.2 LOW-LEVEL WASTE RADIOLOGICAL CATEGORIES

Low-level waste is defined by DOE Order 5820.2A as all radioactive waste that are not classified as high-level waste, TRU waste, spent fuel, or uranium or thorium mill tailings. Mixed low-level waste is further categorized according to beta-gamma activity levels and levels of transuranic alpha contamination. Following are the category definitions.

3.2.1 Contact-Handled LLW

LL/CH Contact-Handled LLW

This category includes low-level waste that has an exposure rate of 200 mR/hr or less on contact.

LL/CH/BG Uranium/Beta-Gamma LL/CH

This category includes contact handled low-level waste that contains transuranic isotopes with a combined transuranic alpha activity of less than 10 nCi/g. Alpha activity from uranium is not included in the limit.

LL/CH/TAL Transuranic Alpha LL/CH

This category includes contact handled low-level waste that contains transuranic isotopes with a combined alpha activities of greater than or equal to 10 nCi/g. Alpha activity from uranium is not included in this limit.

Figure 2. Radiological Parameter Categories

LL/CH/UNK Contact Handled LLW Unknown Alpha

This category includes contact handled low-level waste which has not been sufficiently characterized to determine the transuranic alpha activity.

3.2.2 Remote-Handled LLW

LL/RH Remote-Handled LLW

This category includes mixed low-level waste that has an exposure rate greater than 200 mR/hr on contact.

LL/RH/BG Uranium/Beta-Gamma LL/RH

This category includes remote handled low-level waste that contains transuranic isotopes with a combined transuranic alpha activity of less than 10 nCi/g. Alpha activity from uranium is not included in the limit.

LL/RH/TAL Transuranic Alpha LL/RH

This category includes remote handled low-level waste that contains transuranic isotopes with a combined alpha activities of greater than or equal to 10 nCi/g. Alpha activity from uranium is not included in this limit.

LL/RH/UNK Remote Handled LLW Unknown Alpha

This category includes remote handled low-level waste which has not been sufficiently characterized to determine the transuranic alpha activity.

3.3 TRANSURANIC WASTE RADIOLOGICAL CATEGORIES

Transuranic (TRU) waste, as defined by DOE Order 5820.2A refers to all radioactive waste that contain more than 100 nCi/g of alpha-emitting isotopes with atomic numbers greater than 92 and half-lives greater than 20 years. This definition includes isotopes of neptunium (Np), plutonium (Pu), americium (Am), curium (Cm), and californium (Cf). Transuranic waste is categorized according to beta-gamma activity levels as follows.

3.3.1 Contact-Handled TRU

TRU/CH Contact-Handled TRU

This category includes TRU waste having an exposure rate of 200 mR/hr or less on contact.

3.3.2 Remote-Handled TRU

TRU/RH Remote-Handled TRU

This category includes TRU waste having an exposure rate greater than 200 mR/hr on contact.

3.4 HIGH-LEVEL WASTE RADIOLOGICAL CATEGORIES

High-level waste (HLW) is defined by DOE Order 5820.2A as "... the highly radioactive waste material that results from the reprocessing of spent nuclear fuel, including the liquid waste produced directly in the reprocessing, and any solid waste derived from the liquid that contains a combination of transuranic waste and fission products in concentrations as to require permanent isolation." There are no definitive radiological subcategories defined in this guidance for HLW. Typically, waste determined to be high-level contains transuranic isotopes and is remote-handled.

4. MATRIX PARAMETER

This section presents the categories and definitions for the matrix parameter. The matrix parameter describes the bulk physical/chemical form of the waste. The physical/chemical form of the waste affects both the appropriate regulatory treatment requirements and the applicability of specific treatment technologies. In some cases, the physical/chemical form of the waste may dictate some type of pretreatment or design modification to accommodate special handling of the waste.

The matrix parameter categories and definitions are presented in five subsections of this guidance according to generic physical/chemical waste form classifications. The generic physical/chemical waste form classifications are:

- Liquids
- Solids
- Specific Waste Forms
- Unknown Matrix
- Final Waste Forms

The matrix parameter categories are shown in Figure 3. The following subsections present the categories and definitions for each of the above classifications.

4.1 LIQUIDS

These categories address waste streams that are liquid, including pumpable slurries. In general, slurries are considered pumpable with a total suspended/settled solids (TSS) content of up to approximately 35% to 40%. Only liquids and slurries packaged in bulk, free form (e.g. drum, tank) are included in these categories. Liquids and slurries packaged as lab packs are addressed elsewhere (see Section 4.3). Following are the category definitions.

4.1.1 Aqueous Liquids/Slurries

1000 Aqueous Liquids/Slurries

This category includes liquids and slurries containing less than 1% total organic carbon (TOC).

1100 Wastewaters

This category includes aqueous liquids/slurries containing less than 1% TSS.

1110 Acidic Wastewaters

This category includes wastewaters with a $\text{pH} \leq 2.0$.

1120 Basic Wastewaters

This category includes wastewaters with a $\text{pH} \geq 12.5$. Basic wastewaters that contain cyanides at, or above, applicable LDR treatment standard levels are assigned to category 1140.

1130 Neutral Wastewaters

This category includes wastewaters with $2.0 < \text{pH} < 12.5$.

Figure 3. Matrix Parameter Categories

1140 Cyanide Wastewaters

This category includes basic wastewaters containing cyanides at, or above, applicable LDR treatment standard levels.

1190 Uncategorized Wastewaters

This category includes wastewaters that;

- 1) are insufficiently characterized to categorize more definitively into one of categories 1110 through 1140, or
- 2) do not meet the criteria for categorization into one of the 1110 through 1140 categories, or
- 3) are mixtures of two or more of the 1110 through 1140 categories.

1200 Aqueous Slurries

This category includes pumpable aqueous liquids/slurries with TSS \geq 1% or with an unknown TSS level.

1210 Acidic Aqueous Slurries

This category includes aqueous slurries with a pH \leq 2.0.

1220 Basic Aqueous Slurries

This category includes aqueous slurries with a pH \geq 12.5. Basic aqueous slurries that contain cyanides at, or above, applicable LDR treatment standard levels are assigned to category 1240.

1230 Neutral Aqueous Slurries

This category includes aqueous slurries with $2.0 < \text{pH} < 12.5$.

1240 Cyanide Aqueous Slurries

This category includes basic aqueous slurries containing cyanides at, or above, applicable LDR treatment standard levels.

1290 Uncategorized Aqueous Slurries

This category includes aqueous slurries that;

- 1) are insufficiently characterized to assign into one of categories 1210 through 1240, or
- 2) do not meet the criteria for assignment into one of the 1210 through 1240 categories, or
- 3) are mixtures of two, or more, of the 1210 through 1240 categories.

4.1.2 Organic Liquids

2000 Organic Liquids

This category includes liquids and slurries containing \geq 1% TOC.

2100 Aqueous/Organic Liquids

This category includes miscible and immiscible mixtures of aqueous and organic liquids. The TOC content of the mixture is at least 1% but less than about 99%.

2110 Aqueous/Halogenated Organic Liquids

This category includes aqueous/organic liquids that contain at least 1000 ppm halogenated organic compounds (HOC).

2120 Aqueous/Nonhalogenated Organic Liquids

This category includes aqueous/organic liquids that contain less than 1000 ppm HOC.

2190 Uncategorized Aqueous/Organic Liquids

This category includes aqueous/organic liquids for which it is not known whether the HOC content is less than, equal to, or greater than 1000 ppm.

2200 Pure Organic Liquids

This category includes liquids that are essentially purely organic (e.g. TOC > 99%).

2210 Halogenated Pure Organic Liquids

This category includes pure organic liquids that contain at least 1000 ppm HOC.

2220 NonHalogenated Pure Organic Liquids

This category includes pure organic liquids that contain less than 1000 ppm HOC.

2290 Uncategorized Pure Organic Liquids

This category includes pure organic liquids for which it is not known whether the HOC content is less than, equal to, or greater than 1000 ppm.

2900 Uncategorized Organic Liquids

This category includes liquids with TOC \geq 1% for which insufficient information is available to determine if the liquid is essentially purely organic (e.g. TOC > 99%).

4.2 SOLIDS

These categories address waste with physically solid matrices, including sludges. As opposed to slurries, sludges are considered nonpumpable. Solids are initially categorized according to the general classifications of process residues, soil, and debris. Figure 3 shows these general classifications and associated categories. Following are the category definitions.

4.2.1 Solid Process Residues

3000 Solid Process Residues

Solid Process Residues are defined in this guidance as solid materials, excluding soil, that do not meet the EPA criteria for classification as debris. Examples of solid process residues are sludge and particulate type materials. This category includes waste that are at least 50% by volume solid process residues. The balance of the matrix may be debris or soil.

3100 Inorganic Process Residues

This category includes waste that is at least 50% by volume inorganic process residues. These are defined as process residues with sufficient inorganic solids content such that a minimum of approximately 20% by weight of the waste would remain as residue (i.e. ash/solids) following incineration.

3110 Inorganic Particulates

This category includes waste that is at least 50% by volume inorganic particulates, including residual or absorbed liquids, if present. Typical examples of inorganic particulates are incinerator ash, dust, sand blasting residue, vermiculite, and ion exchange media.

3111 Ash

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) bottom or fly ash resulting from waste incineration.

3112 Sand Blasting Media

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) unused, or spent, surface cleaning or decontamination particulate material. Typical examples of surface cleaning or decontamination particulate materials are coarse sand and glass beads.

3113 Absorbed Aqueous Liquids

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) inorganic particulate absorbent materials, including absorbed aqueous liquids, if present. Typical examples of inorganic particulate absorbent materials are clay, vermiculite, and diatomaceous earth.

3114 Absorbed Organic Liquids

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) inorganic particulate absorbent materials with absorbed organic liquids. Typical examples of inorganic particulate absorbent materials are clay, vermiculite, and diatomaceous earth.

3115 Ion Exchange Media

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) unused, or spent, inorganic ion exchange resins.

3116 Calcined Solids

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) solid materials generated from the calcination of liquids. A specific example is the HLW calcine at the INEL.

3119 Uncategorized Inorganic Particulates

This category includes waste that is;

- 1) consistent with the definition for inorganic particulates but lack adequate characterization information for assignment into one of the 3111 through 3116 categories, or

- 2) consistent with the definition for inorganic particulates but inconsistent with the definitions for categories 3111 through 3116, or
- 3) a mixture of categories 3111 through 3116 with none contributing at least 50% by volume to the matrix.

3120 Inorganic Sludges

This category includes waste that is at least 50% by volume inorganic sludges. The inorganic sludge may be mixed with stabilization agents, such as cement, provided the mixture has not properly cured to form a solidified monolith (see category 3150). The inorganic sludge may also be mixed with inorganic particulate absorbent materials.

3121 Wastewater Treatment Sludges

This category includes waste that is at least 50% by volume secondary sludge or filtercake from wastewater treatment processes.

3122 Pond Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from the remediation of surface impoundments, such as evaporation or sedimentation basins.

3123 Off-Gas Treatment Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from wet off-gas treatment systems.

3124 Plating Waste Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from plating operations.

3125 Reprocessing Sludges

This category includes waste that is at least 50% by volume inorganic sludge generated from nuclear fuel reprocessing operations.

3129 Uncategorized Inorganic Sludges

This category includes waste that is;

- 1) consistent with the definition for inorganic sludges but lack adequate characterization information for assignment into one of the 3121 through 3125 categories, or
- 2) consistent with the definition for inorganic sludges but inconsistent with the definitions for categories 3121 through 3125, or
- 3) a mixture of categories 3121 through 3125 with none contributing at least 50% by volume to the matrix.

3130 Paint Waste

This category includes waste that is at least 50% by volume new, used, or removed paint.

3131 Paint Chips/Solids

This category includes waste that is at least 50% by volume solid, or unpourable paint. Examples of waste that might be included in this category are dried paint chips or containers filled with dried paint. Painting equipment (e.g. brushes, rollers, etc) are categorized as debris.

3132 Paint Liquids/Sludge

This category includes waste that is at least 50% by volume pourable paint. Examples of waste that might be included in this category are opened or unopened cans of paint.

3139 Uncategorized Paint Waste

This category includes waste that is;

- 1) consistent with the definition for salt waste but lack adequate characterization information for assignment into one of the 3131 and 3132 categories, or
- 2) consistent with the definition for salt waste but inconsistent with the definitions for categories 3131 and 3132.

3140 Salt Waste

This category includes waste that is at least 50% by volume salts, including interstitial liquids, if present.

3141 Chloride Salts

This category includes waste that is at least 50% by volume salts and contain more than trace (i.e. > 1000 ppm) levels of chlorides or other halogens.

3142 Sulfate Salts

This category includes waste that is at least 50% by volume salts and contain more than trace (i.e. > 1000 ppm) levels of sulfur compounds.

3143 Nitrate Salts

This category includes waste that is at least 50% by volume salts. The salts are predominantly nitrates.

3149 Uncategorized Salt Waste

This category includes waste that is;

- 1) consistent with the definition for salt waste but lack adequate characterization information for assignment into one of the 3141 through 3143 categories, or
- 2) consistent with the definition for salt waste but inconsistent with the definitions for categories 3141 through 3143, or
- 3) a mixture of categories 3141 through 3143 with none contributing at least 50% by volume to the matrix.

3150 Solidified Process Residues

This category includes waste that has been immobilized with cement, or other inorganic stabilization agents, and cured into a solidified form but do not meet disposal criteria.

3190 Uncategorized Inorganic Process Residues

This category includes waste that is;

- 1) consistent with the definition for inorganic homogeneous solids but lack adequate characterization information for assignment into one of the 3110 through 3150 categories, or
- 2) consistent with the definition for inorganic homogeneous solids but inconsistent with the definitions for categories 3110 through 3150, or
- 3) a mixture of categories 3110 through 3150 with none contributing at least 50% by volume to the matrix.

3200 Organic Process Residues

This category includes waste that is at least 50% by volume organic process residues. These are defined as process residues with a base structure that is primarily organic. The matrix may contain some inorganic solids content such that up to approximately 20% by weight of the waste would remain as residue (i.e. ash/solids) following incineration.

3210 Organic Particulates

This category includes waste that is at least 50% by volume organic particulates, including residual or absorbed liquids, if present. Typical examples of organic particulates are resins and activated carbon used in wastewater treatment, or particulate organic absorbent materials.

3211 Activated Carbon

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) spent or unused activated carbon. Activated carbon is typically used for removal of organic materials during off-gas or wastewater treatment operations.

3212 Organic Resins

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) spent or unused organic based resins, other than activated carbon, used in wastewater treatment or other applications. An example of waste that might be included in this category is organic ion exchange resins.

3213 Organic Absorbents

This category includes waste that is primarily (e.g. $\geq 50\%$ by volume) organic particulate absorbent materials, including any absorbed aqueous or organic liquids. Examples of waste that might be included in this category are sawdust or ground corn cobs with absorbed aqueous or organic liquids.

3219 Uncategorized Organic Particulates

This category includes waste that is;

- 1) consistent with the definition for organic particulates but lack adequate characterization information for assignment into one of the 3211 through 3213 categories, or
- 2) consistent with the definition for organic particulates but inconsistent with the definitions for categories 3211 through 3213, or
- 3) mixtures of categories 3211 through 3213 with none contributing at least 50% by volume to the matrix.

3220 Organic Sludges

This category includes waste that is at least 50% by volume organic sludges. Examples of waste streams included in this category are biological sludges and heavy, unpourable organic materials, such as tars or greases.

3221 Biological Materials

This category includes waste that is at least 50% by volume biological materials generated in treating wastewater from animals or people, or other biological materials that can not be classified as debris.

3222 Halogenated Organic Sludges

This category includes waste that is at least 50% by volume organic sludges which contain at least 1000 ppm HOC.

3223 Nonhalogenated Organic Sludges

This category includes waste that is at least 50% by volume organic sludges which contain less than 1000 ppm HOC.

3229 Uncategorized Organic Sludges

This category includes waste that is;

- 1) consistent with the definition for organic sludges but lack adequate characterization information for assignment into one of the 3221 through 3223 categories, or
- 2) consistent with the definition for organic sludges but inconsistent with the definitions for categories 3221 through 3223, or
- 3) mixtures of categories 3221 through 3223 with none contributing at least 50% by volume to the matrix.

3230 Organic Chemicals

This category includes waste that is at least 50% by volume solid, unused organic chemicals packaged in bulk form that are either being excessed or have expired. This category does not include solid organic chemicals packaged as lab packs (see Section 4.3).

3290 Uncategorized Organic Process Residues

This category includes waste that is;

- 1) consistent with the definition for organic homogeneous solids but lack adequate characterization information for assignment into one of the 3210 through 3230 categories, or
- 2) consistent with the definition for organic homogeneous solids but inconsistent with the definitions for categories 3210 through 3230, or
- 3) mixtures of categories 3210 through 3230 with none contributing at least 50% by volume to the matrix.

3900 Uncategorized Process Residues

This category includes waste that is;

- 1) consistent with the definition for homogeneous solids but lack adequate characterization information for assignment into one of the 3100 or 3200 categories, or
- 2) consistent with the definition for homogeneous solids but inconsistent with the definitions for categories 3100 or 3200.

4.2.2 Soils

4000 Soils

This category includes waste streams that are at least 50% by volume soil, including contamination from spills, etc. Soils are further categorized based on the amount of debris included in the matrix.

4100 Contaminated Soils

This category includes waste that is greater than approximately 95% by volume soil and rock, including contamination from spills, etc.

4200 Contaminated Soils/Debris

This category includes waste that is at least 50% by volume soil and 5% by volume other debris, not including rock. Rock materials that meet the criteria for debris should be included in the contaminated soil category (4100). This category includes contaminated soil and rock from spills etc., with the balance of the matrix being debris.

4900 Uncategorized Soils

This category includes waste that are;

- 1) consistent with the definition for soils but lack adequate characterization information for assignment into one of the 4100 or 4200 categories, or
- 2) consistent with the definition for soils but inconsistent with the definitions for categories 4100 or 4200.

4.2.3 Debris Waste

5000 Debris Waste

This category includes waste that is at least 50% by volume materials which meet the EPA criteria for classification as debris. These criteria are as follows:

"Debris means solid material exceeding a 60 mm particle size that is intended for disposal and that is: 1) a manufactured object, or 2) plant or animal matter, or 3) natural geologic material. However, the following materials are not debris: 1) any material for which a specific treatment standard is provided in Subpart D, Part 268, 2) process residuals such as smelter slag and residues from the treatment of waste, wastewater, sludges, or air emission residues; and 3) intact containers of hazardous waste that are not ruptured and that retain at least 75% of their original volume. A mixture of debris that has not been treated to the standards provided by §268.45 and other material is subject to regulation as debris if the mixture is comprised primarily of debris, by volume, based on visual inspection." [40 CFR §268.2(g)]

"Hazardous Debris means debris that contains a hazardous waste, listed in Subpart D of Part 261, or that exhibits a characteristic of hazardous waste identified in Subpart C of Part 261." [40 CFR §268.2(h)]

5100 Metal Debris

This category includes debris that is approximately 95% by volume, or more, metal. Metal debris is further categorized according to lead and cadmium content.

5110 Metal Debris without Pb or Cd

This category includes debris that is approximately 95% by volume, or more, metal and do not contain any bulk, separable or bonded, lead or cadmium as part of the matrix.

5120 Lead Containing Metal Debris

This category includes debris that is approximately 95% by volume, or more, metal and contain bulk, separable or bonded, lead as part of the matrix. Examples of waste that might be included in this category are glovebox parts with lead clad in stainless steel or scrap metal that includes some lead bricks. This category does not include waste that meets the criteria for categorization as elemental lead or lead acid batteries (see Section 4.4).

5130 Cadmium Containing Metal Debris

This category includes debris that is approximately 95% by volume, or more, metal and contain bulk, separable or bonded, cadmium as part of the matrix. This category includes debris that is essentially entirely elemental cadmium, such as cadmium sheets. This category does not include cadmium batteries (see Section 4.4).

5190 Uncategorized Metal Debris

This category includes debris that is consistent with the definition for category 5100 but;

- 1) lack adequate characterization information for assignment into one of the 5110 through 5130 categories, or
- 2) contain both lead and cadmium, separable or bonded, as part of the bulk matrix.

5200 Inorganic Non-Metal Debris

This category includes waste that is approximately 95% by volume, or more, inorganic nonmetal debris.

5210 Concrete Debris

This category includes debris that is approximately 95% by volume, or more, concrete. An example of waste that might be included in this category is concrete chunks and blocks from decontamination and decommissioning activities. This category does not include waste solidified with cementitious stabilization agents (see Section 4.2).

5220 Glass Debris

This category includes debris that is approximately 95% by volume, or more, glass. Examples of waste that might be included in this category is leaded glass windows, bottles, or light bulbs. Crushed glass may be included in this category provided it meets the EPA particle size criteria for classification as debris.

5230 Ceramic/Brick Debris

This category includes debris that is approximately 95% by volume, or more, ceramic or brick materials. Examples of waste that might be included in this category are bricks, ceramic crucibles, and ceramic refractories.

5240 Rock Debris

This category includes debris that is approximately 95% by volume, or more, rock or gravel materials provided the particle size meets the EPA criteria for classification as debris.

5250 Asbestos Debris

This category includes debris that is approximately 95% by volume, or more, asbestos or asbestos based materials. Examples of waste that might be included in this category are asbestos containing gloves, firehoses, aprons, flooring tiles, pipe insulation, boiler jackets, and laboratory tabletops.

5290 Uncategorized Inorganic Non-Metal Debris

This category includes debris that is consistent with the definition for category 5200 but;

- 1) lack adequate characterization information for assignment into one of the 5210 through 5250 categories, or
- 2) inconsistent with the definitions for categories 5210 through 5250, or
- 3) is a mixture of the debris materials included in categories 5210 through 5250 with none contributing approximately 95% by volume, or more, to the matrix.

5300 Combustible Debris

This category includes debris that is approximately 95% by volume, or more, combustible materials. Examples of combustible debris are materials constructed of plastic, rubber, wood, paper, cloth, and graphite and biological materials.

5310 Plastic/Rubber Debris

This category includes debris that is approximately 95% by volume, or more, plastic and/or rubber materials. Examples of waste that might be included in this category

are plastic or rubber sheeting, containers, gloves, gaskets, and components of benelex or plexiglass.

5311 Leaded Gloves/Aprons Debris

This category includes debris that is approximately 95% by volume, or more, rubber materials which contain a high fraction of lead or lead compounds. Examples of waste that might be included in this category are leaded glovebox gloves or aprons.

5312 Halogenated Plastic Debris

This category includes debris that is approximately 95% by volume, or more, plastic/rubber materials which contain halogenated plastics, such as PVC, as part of the matrix.

5313 Nonhalogenated Plastic Debris

This category includes debris that is approximately 95% by volume, or more, plastic/rubber materials, excluding leaded gloves and aprons, which do not contain halogenated plastics as part of the matrix.

5319 Uncategorized Plastic/Rubber Debris

This category includes debris that is consistent with the definition for category 5310 but;

- 1) lack adequate characterization information for assignment into one of the 5311 through 5313 categories, or
- 2) inconsistent with the definitions for categories 5311 through 5313, or
- 3) is a mixture of the debris materials included in categories 5311 through 5313 with none contributing approximately 95% by volume, or more, to the matrix.

5320 Wood Debris

This category includes debris that is approximately 95% by volume, or more, wood or wood products other than paper. Examples of waste that might be included in this category are structural timbers, boxes, or pallets.

5330 Paper/Cloth Debris

This category includes debris that is approximately 95% by volume, or more, paper or cloth materials. Examples of waste that might be included in this category are protective clothing, rags, or wipes. Rags and wipes may contain some absorbed organic or aqueous liquids.

5340 Graphite Debris

This category includes debris that is approximately 95% by volume, or more, graphite based solid materials. Examples of waste that might be included in this category are crucibles, graphite components, and pure graphite.

5350 Biological Debris

This category includes debris that is approximately 95% by volume, or more, biological materials, including any chemical agents such as lime or formaldehyde.

Examples of waste that might be included in this category are biological samples and animal carcasses.

5390 Uncategorized Combustible Debris

This category includes debris that is consistent with the definition for category 5300 but;

- 1) lack adequate characterization information for assignment into one of the 5310 through 5350 categories, or
- 2) inconsistent with the definitions for categories 5310 through 5350, or
- 3) is a mixture of the debris materials included in categories 5310 through 5350 with none contributing approximately 95% by volume, or more, to the matrix.

5400 Heterogeneous Debris

This category includes waste that is at least 50% by volume debris materials which do not meet the criteria for assignment into categories 5100, 5200, or 5300 and associated subcategories. An example is waste that is essentially entirely debris but is not dominant (i.e. approximately 95% by volume, or more) in either metal, inorganic nonmetal, or combustible debris materials. Another example is waste that is at least 50% by volume debris materials with the balance being soil or solid process residues.

5410 Composite Filters

This category includes debris that is approximately 50% by volume, or more, HEPA or other filters constructed of more than one material type (i.e. metal, inorganic nonmetal, and combustible). Filters constructed of a single material type are assigned into the appropriate metal, inorganic nonmetal, combustible, or heterogeneous debris category depending on the composition of the entire waste matrix.

5420 Predominantly Metal Debris

This category includes debris that contains approximately 50% by volume, or more, but less than approximately 95% by volume metal materials. The balance of the matrix may be other types of debris materials (i.e. inorganic nonmetal, combustible), soil, or solid process residues.

5430 Predominantly Inorganic Non-Metal Debris

This category includes debris that contains approximately 50% by volume, or more, but less than approximately 95% by volume inorganic nonmetal materials. The balance of the matrix may be other types of debris materials (i.e. metal, combustible), soil, or solid process residues.

5440 Predominantly Combustible Debris

This category includes debris that contains approximately 50% by volume, or more, but less than approximately 95% by volume combustible materials. The balance of the matrix may be other types of debris materials (i.e. metal, inorganic nonmetal), soil, or solid process residues.

5450 Asphalt Debris

This category includes debris that is approximately 50% by volume, or more, asphalt or other bituminous materials. Examples of waste that might be included in this category are asphalt materials from roadways shingles, bituminous cement or other materials containing both tar and gravel.

5490 Uncategorized Heterogeneous Debris

This category includes debris that is consistent with the definition for category 5400 but;

- 1) lack adequate characterization information for assignment into one of the 5410 through 5450 categories, or
- 2) inconsistent with the definitions for categories 5410 through 5450, or
- 3) is a mixture of heterogeneous debris materials included in categories 5410 through 5450 with none contributing approximately 50% by volume, or more, to the matrix.

4.3 SPECIFIC WASTE FORMS

These categories address certain waste forms which require specific treatment technologies not expected to be common with other waste forms. Specific waste forms are initially categorized according to the general classifications of special waste or inherently hazardous waste. Figure 3 shows these general classifications and associated categories. Following are the category definitions.

4.3.1 Special Waste

6000 Special Waste

This category includes various specific waste forms which will require specific treatment methods that are not expected to be common with other waste forms. The waste forms include lab packs, reactive metals, explosives, and compressed gases and aerosols.

6100 Lab Packs

This category includes waste packaged as lab packs. In this guidance, lab packs are defined as waste with inner containers of free liquids or solid chemicals surrounded by absorbents and packaged within a larger outer container. The absorbents can be solid process residues materials or debris. Examples of absorbent materials include rags, vermiculite, diatomaceous earth, and paper wipes. This category does not include lab packs of elemental liquid mercury (see Section 4.3.2).

6110 Organic Lab Packs

This category includes lab packs that contain only organic liquids. This category does not include organic scintillation fluids contained in vials that are packaged in a lab pack configuration (see Category 6140).

6120 Aqueous Lab Packs

This category includes lab packs that contain only aqueous liquids. This category does not include aqueous scintillation fluids contained in vials that are packaged in a lab pack configuration (see Category 6140).

6130 Solid Lab Packs

This category includes lab packs of only solid chemicals or other solid materials.

6140 Scintillation Cocktails

This category includes scintillation fluids contained in vials that are packaged in a lab pack configuration.

6190 Uncategorized Lab Packs

This category includes lab packs that;

- 1) lack adequate characterization information for assignment into one of the 6110 through 6140 categories, or
- 2) are inconsistent with the definitions for categories 6110 through 6140, or
- 3) contain two, or more, of the above listed specific lab pack category materials (organic liquids, aqueous liquids, and solid chemicals).

6200 Reactive Metals

This category includes reactive metal waste. In this guidance, these are defined as waste meeting the criteria for classification as water reactive or ignitable reactive per the Third Third LDR rule (55FR 22545 and 22553). Typically these waste streams are sodium metal or sodium metal alloys, but can also include particulate fines of aluminum, uranium, zirconium, or other pyrophoric materials. The waste may be mixed with stabilizing materials.

6210 Bulk Reactive Metals

This category includes waste that is essentially bulk reactive metals and meets the criteria for classification as water reactive per the Third Third LDR rule. Typically this waste is sodium metal or sodium metal alloys.

6220 Components Contaminated with Reactive Metals

This category includes piping, pumps and other retired equipment waste that is considered water reactive per the Third Third LDR rule due to reactive metal contamination. The bulk of the material is not reactive metals, but the reactive metals require treatment before disposal.

6230 Pyrophoric Fines

This category includes waste that is essentially bulk materials which meets the criteria for classification as ignitable reactive per the Third Third LDR rule. Examples are fines of aluminum, uranium, zirconium, or other pyrophoric materials. The waste may be mixed with stabilizing materials.

6290 Uncategorized Reactive Metals

This category includes reactive metal waste with characteristics that are not consistent with the definitions for categories 6210 through 6230.

6300 Explosives/Propellants

This category includes waste consisting of substances which undergo rapid chemical transformations which produce large amounts of gases and heat. The gases rapidly expand at velocities exceeding the speed of sound (due to the heat of reaction), which creates a shock

wave and explosion. Waste that meets this definition should be identified here regardless of the specific physical form. Liquid nitroglycerine, for instance, should be categorized as explosive and not organic liquid. Similarly, TNT would be categorized as explosive rather than solid process residue.

6400 Compressed Gases/Aerosols

This category includes waste meeting the criteria for classification as ignitable compressed gases per the Third Third LDR rule (55FR 22545). Typically, this is waste consisting of pressurized gas cylinders or aerosol cans. Depressurized gas cylinders or aerosol cans would not be included in this category. These would be categorized into the appropriate debris category (see Section 4.2.2).

4.3.2 Inherently Hazardous Waste

7000 Inherently Hazardous Waste

This category includes waste in which the entire matrix is hazardous, such as elemental lead, or which the entire waste form is regulated, such as batteries.

7100 Elemental Mercury

This category includes waste that is bulk, pourable liquid mercury. The liquid mercury may be packaged in small containers within a larger container holding other materials (e.g. lab pack configuration).

7200 Elemental Lead

This category includes waste that contain at least 50% by volume bulk elemental lead. Examples of waste in this category are lead bricks, sheets, and pipes.

7210 Non-Activated Lead

This category includes waste meeting the above criteria for categorization as elemental lead in which the elemental lead shapes are only surface contaminated with radionuclides.

7220 Activated Lead

This category includes waste meeting the above criteria for categorization as elemental lead in which the elemental lead shapes are activated.

7300 Beryllium Waste

This category includes waste that is essentially beryllium dust or beryllium chips and fines that may also contain beryllium dust. This category does not include debris waste that is contaminated with beryllium dust.

7400 Batteries

This category includes waste consisting of batteries. The batteries may be packaged with absorbent materials (e.g. particulates, rags, etc.).

7410 Lead Acid Batteries

This category includes waste consisting of drained or undrained lead acid batteries.

7420 Cadmium Batteries

This category includes waste consisting of cadmium batteries.

7490 Uncategorized Batteries

This category includes waste consisting of batteries that;

- 1) lack adequate characteristic information to determine battery type, or
- 2) is of a type other than lead acid or cadmium, or
- 3) is a mixture of the above, or other, types.

4.4 UNKNOWN MATRIX

These categories address waste with insufficient characterization information to enable assignment into any of the categories addressed in Sections 4.1, 4.2, and 4.3. The categories are shown in Figure 3. Following are the category definitions.

4.4.1 Unknown Matrix

8000 Unknown Matrix

There are three unknown matrix subcategories as defined below.

8100 Unknown Liquids

This category includes bulk liquid or slurry waste which can not be further categorized as aqueous or organic (see Section 4.1) because it is not known if the TOC level is less, or greater than 1%.

8200 Unknown Solids

This category includes solid waste for which insufficient characterization information exists to further categorize as a solid process residue, soil, or debris per the definitions of Section 4.2.

8900 Uncategorized Unknown

This category includes waste for which insufficient characterization information is known to enable categorization as a liquid or solid (see Sections 4.1 and 4.2) or as one of the specific waste forms (see Section 4.3).

4.5 FINAL WASTE FORMS

These categories address final waste forms that meet disposal criteria, including applicable LDR treatment standards. Figure 3 shows the categories. Following are the category definitions.

4.5.1 Final Waste Forms

9000 Final Waste Forms

There are five subcategories of final waste forms as defined below.

9100 Cement Forms

This category includes waste that has been immobilized with grout or other cement type binders and meet disposal criteria, including applicable LDR treatment standards.

9200 Vitrified Forms

This category includes waste that has been immobilized via vitrification and meet disposal criteria, including applicable LDR treatment standards.

9300 Metal Forms

This category includes metal waste that has been consolidated or decontaminated and are ready for disposal or recycle.

9400 Polymer Forms

This category includes waste that has been immobilized with organic binders and meet disposal criteria, including applicable LDR treatment standards.

9900 Other Forms

This category includes all other final waste forms not addressed by categories 9100 through 9400 which meet disposal criteria, including applicable LDR treatment standards. Examples are amalgamated mercury and macroencapsulated lead.

5. CONTAMINANT PARAMETER

This section presents the categories and definitions for the contaminant parameter and instructions for assigning these categories. The contaminant categories are identified by the waste regulatory authority(s) and, for Federally RCRA regulated waste, is further defined by the types of hazardous contaminants and characteristics associated with the waste. These categories influence the treatment requirements for the waste from both a technical and regulatory perspective.

The regulatory authority classifications, used to identify the contaminant parameter, are as follows:

- Federally RCRA Regulated
- TSCA (PCB) Regulated
- State Regulated Hazardous Waste

The contaminant parameter is represented by a combination of all of the specific categories that are applicable to the waste. A waste stream may have more than one applicable contaminant category. The contaminant categories are shown in Figure 4.

A complete treatability group assignment for the contaminant parameter is represented by listing the combined contaminant categories that are applicable to the waste. The applicable categories should be listed in the following order:

| | |
|-----------------|------------|
| Organics | ORG |
| Metals | MET or MHG |
| Ignitable | I1...I9 |
| Corrosive | C9 |
| Reactive | R9 |
| TSCA Regulated | PCB |
| State Regulated | ST |

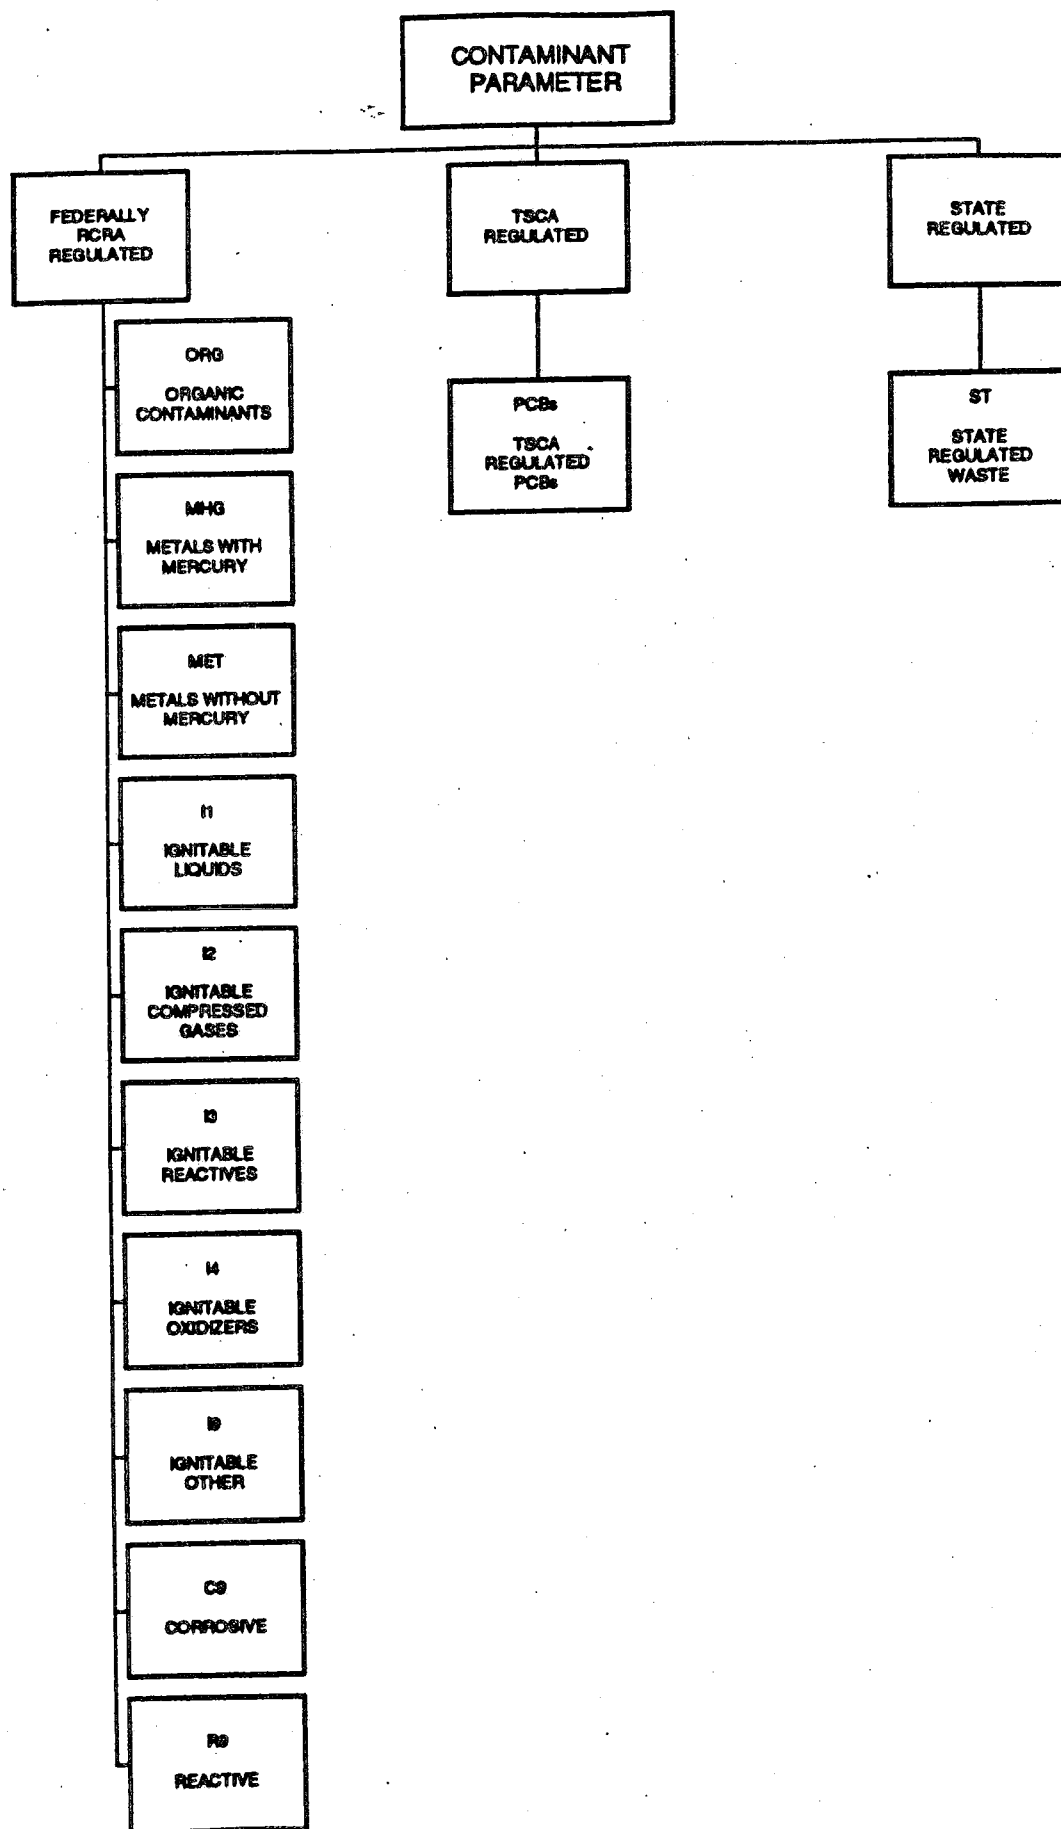

Various combinations of the contaminant categories can result in numerous possible contaminant parameters for Federally RCRA regulated waste. Following are the more specific category definitions.

5.1 FEDERALLY RCRA REGULATED

These wastes are hazardous pursuant to RCRA regulations promulgated by the EPA (i.e., 40 CFR 261). The contaminant parameter for waste in this regulatory authority classification are defined by five categories including:

- hazardous organics,
- metals,
- ignitability,
- corrosivity, and
- reactivity.

Following are the guidelines for determining the contaminant categories.

5.1.1 Organic Contaminants

ORG Organics

This category includes Federally RCRA regulated waste if the waste is assigned one, or more, of the EPA codes in Appendix A, Tables A-1 through A-8 indicating the presence of hazardous organics. The organic component is not included in cases where the only indicator of organic contamination is the presence of a listed EPA code for which LDR treatment standards have been met.

5.1.2 Metal Contaminants

MHG Metals With Mercury

This category includes Federally RCRA regulated waste if the waste is assigned one, or more, EPA hazardous waste codes indicating the presence of toxic metals, but specifically mercury, identified in Appendix A, Table A-12. Mercury is specifically emphasized over other toxic metals because of its prevalence in DOE waste and its effect on appropriate treatment technology selection, particularly with respect to effluent controls and recovery. This category is not included in cases where the only indicator of metal contamination is the presence of a listed EPA code for which LDR treatment standards have been met.

MET Metals Without Mercury

This category includes Federally RCRA regulated waste if the waste is assigned one, or more, EPA hazardous waste codes indicating the presence of toxic metals but does not include mercury, identified in Appendix A, Tables A-9 through A-11, but none of the EPA codes in Appendix A, Table A-12. This category is not included in cases where the only indicator of metal contamination is the presence of a listed EPA code for which LDR treatment standards have been met.

5.1.3 Ignitable Characteristic

I1 Ignitable Liquids

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable liquids in the Third Third LDR rule (55 FR 22543).

I2 Ignitable Compressed Gases

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable compressed gases in the Third Third LDR rule (55 FR 22543).

I3 Ignitable Reactives

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable reactives in the Third Third LDR rule (55 FR 22543).

I4 Ignitable Oxidizers

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, and meets the definition of ignitable oxidizers in the Third Third LDR rule (55 FR 22543).

I9 Ignitable Other

This category includes waste that is assigned the EPA hazardous waste code which indicates the characteristic of ignitability, D001, but;

- 1) lacks adequate characterization information for assignment into one of the other ignitable categories, or
- 2) is a mixture of the other ignitable categories.

5.1.4 Corrosive Characteristic

C9 Corrosive

This category includes Federally RCRA regulated waste if the waste exhibits the characteristic of corrosivity as defined in 40 CFR 261 and is assigned the EPA hazardous waste code D002. More specific subcomponents of corrosivity to represent the LDR subcategories of acid, alkaline, and other are not included. The majority of waste that exhibits the characteristic of corrosivity will be acidic or basic aqueous liquids. These more specific corrosive characteristics are identified through assignment of the matrix category (see Section 4.1).

5.1.5 Reactive Characteristic

R9 Reactive

This category includes Federally RCRA regulated waste if the waste exhibits the characteristic of reactivity as defined in 40 CFR 261 and is assigned the EPA hazardous waste code D003. More specific subcomponents of reactivity to represent the LDR subcategories of reactive cyanides, reactive sulfides, reactive explosives, water reactives and other reactives are not included. These specific characteristics of reactivity are, in most cases, identified through assignment of the matrix category (see Sections 4.1 and 4.3).

5.2 TSCA (PCB) REGULATED PCBS

PCB TSCA

This category includes waste that is subject to TSCA regulation due to the presence of PCBs.

5.3 STATE REGULATED HAZARDOUS WASTE

ST State Regulated

This category includes waste that is defined as hazardous only under State regulations. Due to variations in the more stringent State regulations, this guidance does not propose a method of establishing more detailed contaminant categories based on State hazardous waste codes.

6. METHODOLOGY APPLICATION

This section provides some sample applications to demonstrate the treatability group assignment process. This section also provides examples of complete treatability group names.

6.1 SAMPLE APPLICATIONS

Example 1

Waste Data

A waste stream is comprised of several 55 gallon drums containing waste from closure of a wastewater treatment facility. Physically, the waste is sludge consisting of metal hydroxide precipitates and water. On average, each drum contains over 90%, by volume, sludge.

Radiologically, the waste contains low-levels of miscellaneous fission products with exposure rates $< < 100$ mR/hr at drum surface. The waste contains transuranic isotopes $< < 10$ nCi/g. Sampling and analysis revealed the waste to contain levels of barium (D005), chromium (D007), and lead (D008) regulated by the EPA. The pH of the residual liquid was measured at 12.8 (D002). The waste is not PCB contaminated.

Parameter Category Assignments

Radiologically, the waste is low-level, contact-handled, and contains transuranic isotopes < 10 nCi/g. Referring to Section 3, the radiological category code for the waste is LL/CH/BG.

Referring to Section 4.1, the matrix characteristics meet the criteria for categorization as a process residue solid (Category 3000). The matrix characteristics further meet the criteria for assignment to the following successive subcategories associated with homogeneous solids:

Categorizing to the lowest level of detail, the matrix category is Wastewater Treatment Sludges.

Based on the EPA codes, the applicable components for defining the contaminant category are metals and corrosive. For metals, the most specific, applicable subcomponent is Metals Without Mercury (MET). Therefore, the contaminant category code for the waste is MET/C9.

Example 2

Waste Data

A waste stream is comprised of several 55 gallon drums containing "legacy" waste from past plutonium processing operations. Physically, each drum contains over 75% by volume of material meeting the LDR criteria for classification as debris. Available data indicates that, on average, each drum contains approximately 60% by volume combustible debris materials, such as plastic, paper and rags. On average,

the balance of each drum is approximately 20% by volume metal debris materials and 20% by volume vermiculite added as a drum filler.

Radiologically, the waste was considered transuranic when generated due to the presence of ≈ 80 nCi/g transuranic isotopes. Presently, however, the waste is considered low-level. The beta-gamma activity level is negligible. Based as process knowledge, the waste was assigned the F002 and D008 EPA codes. The waste is not PCB contaminated.

Parameter Category Assignment

Radiologically, the waste is low-level, contact-handled, and contains transuranic isotopes > 10 nCi/g. Referring to Section 3, the radiological parameter category code is LL/CH/TAL.

Referring to Section 4.1, the matrix characteristics meet the criteria for categorization as debris (Category 5000). The matrix characteristics further meet the criteria for assignment to the following successive subcategories associated with debris:

| | | |
|-----------------------------------|--------|--|
| Heterogeneous Debris (5400) | —————> | Predominantly Combustible Debris (5440) |
|-----------------------------------|--------|--|

Categorizing to the lowest level of detail, the matrix category is Predominantly Combustible Debris.

Based on the EPA codes, the applicable components for defining the contaminant category are organics and metals. For metals, the most specific, applicable subcomponent is Metals Without Mercury (MET). Therefore, the contaminant category code for the waste is ORG/MET.

6.2 EXAMPLE TREATABILITY GROUP NAMES

The complete treatability group name for a given waste is a combination of the applicable radiological, matrix, and contaminant categories as follows:

Radiological Category - Matrix Category - Contaminant Category

Following this logic, the complete treatability group names for the above two examples are:

Example 1: LL/CH/BG - Wastewater Treatment Sludges - MET/C9

Example 2: LL/CH/TAL - Predominantly Combustible Debris - ORG/MET

APPENDIX A

EPA CODES BY CONTAMINANT CATEGORY COMPONENTS

Table A-1. Nonhalogenated Toxicity Characteristic Organics

| EPA Code | Chemical Name |
|-----------------|----------------------|
| D018 | benzene |
| D023 | o-cresol |
| D024 | m-cresol |
| D025 | p-cresol |
| D026 | cresol |
| D030 | 2,4-dinitrotoluene |
| D035 | methyl ethyl ketone |
| D036 | nitrobenzene |
| D038 | pyridine |

Table A-2. Nonhalogenated Spent Solvents

| EPA Code | Chemical Name |
|-----------------|------------------------|
| F003 | Xylene |
| F003 | Acetone |
| F003 | Ethyl Acetate |
| F003 | Ethyl Benzene |
| F003 | Ethyl Ether |
| F003 | Methyl Isobutyl Ketone |
| F003 | n-Butyl Alcohol |
| F003 | Cyclohexanone |
| F003 | Methanol |
| F004 | Cresols |
| F004 | Cresylic Acid |
| F004 | Nitrobenzene |
| F005 | Toluene |
| F005 | Methyl Ethyl Ketone |
| F005 | Carbon Disulfide |
| F005 | Isobutanol |
| F005 | Pyridine |
| F005 | Benzene |
| F005 | 2-Ethoxyethanol |
| F005 | 2-Nitropropane |

Table A-3. Nonhalogenated P & U Listed Organics

| EPA Code | Chemical Name |
|-----------------|--------------------------------------|
| P001 | Warfarin (>0.3%) |
| P002 | 1-Acetyl-2-thiourea |
| P003 | Acrolein |
| P005 | Allyl alcohol |
| P007 | 5-Aminoethyl 3-isoxazolol |
| P008 | 4-Aminopyridine |
| P014 | Thiophenol (Benzene thiol) |
| P018 | Brucine |
| P020 | 2-sec-Butyl-4,6-dinitrophenol |
| P022 | Carbon Disulfide |
| P031 | Cyanogen |
| P034 | 2-Cyclohexyl-4,6-dinitrophenol |
| P038 | Diethylarsine |
| P039 | Disulfoton |
| P040 | Diethyl-p-pyrazinyl phosphorothioate |
| P041 | Diethyl-p nitrophenyl phosphate |
| P042 | Epinephrine |
| P044 | Dimethoate |
| P045 | Thiofanox |
| P046 | alpha, alpha-Dimethylphenethylamine |
| P047 | 4,6 Dinitrocresol |
| P048 | 2,4-Dinitrophenol |
| P049 | 2,4-Dithiobiuret |
| P054 | Aziridine |
| P062 | Hexaethyltetraphosphate |
| P064 | Isocyanic acid, ethyl ester |
| P066 | Methomyl |
| P067 | 2-Methylaziridine |
| P068 | Methyl hydrazine |
| P069 | Methylacetonitrile |
| P070 | Aldicarb |
| P071 | Methyl parathion |
| P072 | 1-Naphthyl-2-thiourea |
| P075 | Nicotine and salts |
| P077 | p-Nitroaniline |
| P081 | Nitroglycerin |
| P082 | N-Nitrosodimethylamine |
| P084 | N-Nitrosomethylvinylamine |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|---------------------|-------------------------------|
| P085 | Octamethylpyrophosphoramide |
| P088 | Endothall |
| P089 | Parathion |
| P092 | Phenyl Mercury Acetate |
| P093 | N-Phenylthiourea |
| P094 | Phorate |
| P097 | Famphur |
| P101 | Ethyl cyanide |
| P102 | Propargyl alcohol |
| P108 | Strychnine and salts |
| P109 | Tetraethyldithiopyrophosphate |
| P110 | Tetraethyl Lead |
| P111 | Tetraethyl Pyrophosphate |
| P112 | Tetranitromethane |
| P116 | Thiosemicarbazide |
| U001 | Acetaldehyde |
| U002 | Acetone |
| U003 | Acetonitrile |
| U004 | Acetophenone |
| U007 | Acrylamide |
| U008 | Acrylic acid |
| U009 | Acrylonitrile |
| U010 | Mitomycin C |
| U011 | Amitrole |
| U012 | Aniline |
| U014 | Auramine |
| U015 | Azaserine |
| U016 | Benz (c) acridine |
| U018 | Benz(a)anthracene |
| U019 | Benzene |
| U021 | Benzidine |
| U022 | Benzo(a)pyrene |
| U028 | Bis(2-ethylhexyl) pthalate |
| U031 | n-Butyl alcohol |
| U050 | Chrysene |
| U051 | Creosote |
| U052 | Cresols (Cresylic acid) |
| U053 | Crtonaldehyde |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|-----------------|-------------------------------------|
| U055 | Cumene |
| U056 | Cyclohexane |
| U057 | Cyclohexanone |
| U059 | Daunomycin |
| U063 | Dibenzo(a,h)anthracene |
| U064 | 1,2,7,8-Dibenzopyrene |
| U069 | Di-n-butyl phthalate |
| U085 | 1,2,3,4-Diepoxybutane |
| U086 | N,N-Diethylhydrazine |
| U087 | O,O-Diethyl S-methyldithiophosphate |
| U088 | Diethyl phthalate |
| U089 | Diethyl stilbestrol |
| U090 | Dihydrosafrole |
| U091 | 3,3-Dimethoxybenzidine |
| U092 | Dimethylamine |
| U093 | p-Dimethylaminoazobenzene |
| U094 | 7,12-Dimethyl benz(a)anthracene |
| U095 | 3,3'-Dimethylbenzidine |
| U096 | a,a-Dimethyl benzyl hydroperoxide |
| U098 | 1,1-Dimethylhydrazine |
| U099 | 1,2-Dimethylhydrazine |
| U101 | 2,4-Dimethylphenol |
| U102 | Dimethyl phthalate |
| U103 | Dimethyl sulfate |
| U105 | 2,4-Dinitrotoluene |
| U106 | 2,6-Dinitrotoluene |
| U107 | Di-n-octyl phthalate |
| U108 | 1,4-Dioxane |
| U109 | 1,2-Diphenylhydrazine |
| U110 | Dipropylamine |
| U111 | Di-n-propylnitrosoamine |
| U112 | Ethyl acetate |
| U113 | Ethyl acrylate |
| U114 | Ethylene bis-dithiocarbamic acid |
| U116 | Ethylene Thiourea |
| U117 | Ethyl ether |
| U118 | Ethyl methacrylate |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|-------------|--------------------------------------|
| U119 | Ethyl methane sulfonate |
| U120 | Fluoranthene |
| U122 | Formaldehyde |
| U123 | Formic acid |
| U124 | Furan |
| U125 | Furfural |
| U126 | Glycidyaldehyde |
| U137 | Indeno(1,2,3-c,d)pyrene |
| U140 | Isobutyl alcohol |
| U141 | Isosafrole |
| U143 | Lasiocarpine |
| U144 | Lead acetate |
| U146 | Lead subacetate |
| U147 | Maleic anhydride |
| U148 | Maleic hydrazide |
| U149 | Malononitrile |
| U152 | Methacrylonitrile |
| U153 | Methane thiol |
| U154 | Methanol |
| U155 | Methapyrilene |
| U157 | 3-Methylchloanthrene |
| U159 | Methyl ethyl ketone |
| U160 | Methyl ethyl ketone peroxide |
| U161 | Methyl isobutyl ketone |
| U162 | Methyl methacrylate |
| U163 | N-Methyl N'-nitro N-Nitrosoguanidine |
| U164 | Methylthiouracil |
| U165 | Naphthalene |
| U166 | 1,4-Naphthoquinone |
| U167 | 1-Naphthylamine |
| U168 | 2-Napthylamine |
| U169 | Nitrobenzene |
| U170 | 4-Nitrophenol |
| U171 | 2-Nitropropane |
| U172 | n-Nitroso-di-n-butylamine |
| U173 | N-Nitroso-di-n-ethanolamine |
| U174 | N-Nitrosodiethylamine |

Table A-3. Nonhalogenated P & U Listed Organics (Continued)

| EPA Code | Chemical Name |
|-------------|----------------------------|
| U176 | N-Nitroso-N-ethylurea |
| U177 | N-Nitroso-N-methylurea |
| U178 | N-Nitroso-N-methylurethane |
| U179 | N-Nitrosopiperidine |
| U180 | N-Nitrosopyrrolidine |
| U181 | 5-Nitro-o-toluidine |
| U182 | Paraldehyde |
| U186 | 1,3-Pentadiene |
| U187 | Phenacetin |
| U188 | Phenol |
| U189 | Phosphorus sulfide |
| U190 | Phthalic anhydride |
| U191 | 2-Picoline |
| U193 | 1,3-Propane sultone |
| U194 | n-Propylamine |
| U196 | Pyridine |
| U197 | p-Benzoquinone |
| U200 | Reserpine |
| U201 | Resorcinol |
| U202 | Saccharin and salts |
| U203 | Safrole |
| U206 | Streptozatocin |
| U213 | Tetrahydrofuran |
| U214 | Thallium (I) acetate |
| U218 | Thioacetamide |
| U219 | Thiourea |
| U220 | Toluene |
| U221 | Toluenediamine |
| U223 | Toluene diisocyanate |
| U234 | sym-Trinitrobenzene |
| U236 | Trypan Blue |
| U238 | Ethyl carbamate |
| U239 | Xylenes |
| U244 | Thiram |
| U248 | Warfarin ($\geq 3\%$) |
| U328 | Benzenamine, 2-methyl |
| U353 | Benzenamine, 4-methyl |
| U359 | 2-ethoxyethanol |

Table A-4. Halogenated Toxicity Characteristic Pesticides

| EPA Code | Chemical Name |
|-----------------|----------------------|
| D012 | Endrin |
| D013 | Lindane |
| D014 | Methoxychlor |
| D015 | Toxaphene |
| D016 | 2,4-D |
| D017 | Silvex |

Table A-5. Halogenated Toxicity Characteristic Organics

| EPA Code | Chemical Name |
|-----------------|-----------------------|
| D019 | Carbon tetrachloride |
| D020 | Chlordane |
| D021 | Chlorobenzene |
| D022 | Chloroform |
| D027 | 1,4-dichlorobenzene |
| D028 | 1,2-dichloroethane |
| D029 | 1,1-dichloroethylene |
| D031 | Heptachlor |
| D032 | Hexachlorobenzene |
| D033 | Hexachlorobutadiene |
| D034 | Hexachloroethane |
| D037 | Pentachlorophenol |
| D039 | Tetrachloroethylene |
| D040 | Trichloroethylene |
| D041 | 2,4,5-trichlorophenol |
| D042 | 2,4,6-trichlorophenol |
| D043 | Vinyl Chloride |

Table A-6. Halogenated Spent Solvents

| EPA Code | Chemical Name |
|----------|---------------------------------------|
| F001 | Tetrachloroethylene |
| F001 | Trichloroethylene |
| F001 | Methylene Chloride |
| F001 | 1,1,1-trichloroethane |
| F001 | Carbon Tetrachloride |
| F002 | 1,1,1-trichloroethane |
| F002 | Methylene Chloride |
| F002 | Trichloroethylene |
| F002 | Tetrachloroethylene |
| F002 | Chlorobenzene |
| F002 | 1,1,2-trichloro-1,2,2-trifluoroethane |
| F002 | Ortho-dichlorobenzene |
| F002 | Trichlorofluoromethane |
| F002 | 1,1,2-trichloroethane |

Table A-7. Halogenated Dioxins

| EPA Code | Chemical Name |
|----------|--|
| F020 | Tetra- and pentachlorodibenzo-p-dioxins; tetra- and pentachlorodi-benzofurans; tri- and tetrachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |
| F021 | penta- and hexachlorodibenzo-p-dioxins; penta- and hexachlorodibenzofurans; pentachlorophenol and its derivatives |
| F022 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans |
| F023 | tetra-, and pentachlorodibenzo-p-dioxins; tetra- and pentachlorodibenzofurans; tri- and tetrachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |
| F024 | Numerous chlorinated hydrocarbons; benzene; toluene; naphthalene |
| F025 | Numerous chlorinated hydrocarbons; benzene; toluene; naphthalene |
| F026 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans |
| F027 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans; tri-, tetra-, and pentachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |
| F028 | tetra-, penta-, and hexachlorodibenzo-p-dioxins; tetra-, penta-, and hexachlorodibenzofurans; tri-, tetra-, and pentachlorophenols and their chlorophenoxy derivative acids, esters, ethers, amine and other salts |

Table A-8. Halogenated P & U Listed Organics

| EPA Code | Chemical Name |
|-----------------|---------------------------------|
| P004 | Aldrin |
| P016 | Bis(chloromethyl)-ether |
| P017 | Bromoacetone |

APPENDIX D

APPENDIX D NON RADIONUCLIDE INVENTORY DATA SUMMARY

This Appendix presents a summary of the IDCs used in this report from the Non Radionuclide Inventory Database. The appendix is divided into two sections. The first section presents data for the IDCs used for solidified waste streams and the second section presents data for the IDCs used for heterogeneous and soil waste streams.

This appendix contains a summary of the data and does not present details on individual elements or chemical compounds which were listed for some IDCs. Instead this data presents data for chemical forms such as inorganics, organics, etc.

APPENDIX E

APPENDIX E WASTE STREAM PROFILES

FOOTNOTES FOR THE WASTE STREAM PROFILES

1. Liquid waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidification.
2. WMCs 3000, 3900, 9100, and 9200 are placed in "solidified inorganic waste," "salt waste," or "solidified organic waste," depending on the information provided in the MWIR.
3. Particulate waste streams are assumed to be solidified prior to sending to WIPP. A volume conversion of 2.5:1 is assumed for solidifying particulate waste.
4. WMCs 6100 and 6190 are placed in "solidified organic waste," or "solidified inorganic waste," depending on the information provided in MWIR. Volume conversion is described in footnote 5.
5. Liquid lab pack waste is assumed to be solidified prior to sending to WIPP. It is assumed that the packing material in lab packs will be low-level waste when the liquid containers are removed. A volume conversion of 2.5:1 is assumed for solidification.
6. In error, mixed-residues were not reported in the MWIR for this waste stream (per verbal discussions with Rocky Flats Plant). Mixed residues were added as follows (GAO, 1992):
 - Incinerator Ash (IDCs 419, 420, 421, 425)
 - stored volume - 234 m³
 - projected volume - 0 m³
 - stored volume (to meet criticality and WIPP WAC requirements) - 1202 m³
7. WMCs 6200 and 6290 are placed in "solidified inorganic waste," "solidified inorganic waste," or "heterogeneous waste" if the waste stream must be solidified. They are placed in "unspecified metal waste," or "lead/cadmium metal waste" if they are primarily nonreactive metal contaminated with reactive metal. Reactive waste streams must be treated prior to shipment to WIPP.
8. Waste stream is assumed to be treated prior to shipment to WIPP. Volume change is dependent of the waste stream and treatment.
9. WMC 5000 is placed in "unspecified metal waste," "lead/cadmium metal waste," "inorganic nonmetal waste," "combustible waste," "graphite waste," "heterogeneous waste," or "filter waste," depending on the information in MWIR.
10. WMC 7000 and 9300 are placed in "unspecified metal waste" or "lead/cadmium metal waste," depending on the information in MWIR.
11. WMCs 7400, 7410, 7420, and 7490 are assumed to be drained of liquid and contain only metal waste.
12. These waste streams are excluded from disposal in WIPP at this time.
13. Adequate information is provided in MWIR to change the WMC from "unknown" to a more descriptive WMC. If there is not enough information in MWIR, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

14. The TRU (non-mixed) volume and classification information were taken from the Phase I MWIR.
15. THESE ARE NOT ACTUAL SITE-GENERATED WASTE STREAMS. The TRU (non-mixed) volume was calculated from the difference between the 1993 IDB and the MWIR (Phase II). These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major TRU mixed streams.
16. The amount of steel in the container represents the drum only. The amount of metal in the disposal canister and plug is provided in the Section 5.
17. IDC was changed/assigned for the purposes of this report per the methodology described in Appendix J.
18. The Waste Matrix Code Grouping and/or IDC were assigned based on the distribution of the TRU-Mixed Waste from this site.
19. WMC was changed to be consistent with similar waste streams.
20. This TRU waste stream is classified as "unknown" because there was not adequate information available at the time of publication of this report to classify the waste stream. It is anticipated that characterization information can be generated by the site.
21. Insufficient information is available to determine the appropriate TRUCON code.
22. Insufficient information is available to determine the appropriate NMVP code.
23. Insufficient information is available to determine the Part B category.
24. This waste stream includes residues. The volume of the residue portion of this waste stream is consistent with the volumes reported by Rocky Flats Plant in their "ship as waste" residue scenarios, repackaged/processed to meet criticality and WIPP WAC requirements only (GAO, 1992).
25. The site IDC is not listed in TRUCON. The TRUCON and NMVP codes were assigned based on the TRUCON codes provided in the MWIR (Phase II).
26. There is not adequate information in MWIR to define this waste stream. It will remain in the "unknown" category and will be excluded from disposal in WIPP until characterized.
27. Part B codes are not applicable for non-mixed waste.

WASTE STREAM PROFILES

CAO-94-1005, Rev. 0
June 1994

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

These are not actual site-generated waste streams. The non-mixed TRU waste volume was calculated from the difference between the 1993 IDB and the Phase II MWIR. These IDCs, WMCs, and WMCGs were generated by portioning the TRU waste volumes to the major mixed TRU waste streams.

APPENDIX G

Sandia National Laboratories

Managed and Operated by Sandia Corporation
a subsidiary of Martin Marietta Corporation
Albuquerque, New Mexico 87185-1328

date : June 24, 1994
to : P.E. Drez, [Drez Environmental Associates]
from :  L. C. Sanchez, Org 6342, MS-1328 (505)848-0685
subject : Comments on May 9, 1994 Communications

The following is a synopsis of communications that took place on May 9, 1994 [1]. In those communications you requested responses to the following two questions:

- [1] In the radionuclide table (Table 3-3.1) located in SAND92-0700/3, there are a series of radionuclide inventories listed by isotope. This is the list that we have to replace in the WTWBIR. On the list, I thought that only isotopes with half-lives greater than 20 years were listed, but for instance, Cf-252 is listed which has a half-life of 2.64 years. Is this because it decays to Cm-248, which has a long half life? There are other isotopes which have half-lives greater than 20 years which are not reported in Table 3-3.1. Is this because of their overall low curie content in the inventory? If so what is the "cut-off" used as to whether an isotope appears in the table?
- [2] One of the strong comments by Karen Knudtsen was that we need to put in a strong justification for the different waste parameters that will be documented in the inventory. Can one or both of you work with the PA and model development people (e.g., Larry Brush) and fill in the table attached?

Per your request [1] I had talked with several people to get responses to your two questions. The responses obtained on May 9, 1994 and relayed to you were [2]:

- [1] In talking to Andy Peterson, he said that the table of radionuclides (Table 3.3-1) is a synopsis of all the available data from the sites. Any radionuclides not reported were probably due to the sites: 1) not identifying them in the waste, 2) they had been of undetectable quantities, etc. Also, the decay chains of interest (Figure 3.3-5) were those identified by SNL scientists as being the chains of interest.
- [2] The matrix which identifies the justification of waste parameters was reviewed by (see attachment):

| Matrix Column | Reviewer |
|-------------------|--|
| Current Models | Palmer Vaughn Andy Peterson Jim Schreiber Barry Butcher |
| Under Development | Larry Brush |
| Possible Future | Larry Brush |
| Overall | (none) |

1 Waste Stream Identifiers (continued)**E. Ignore this waste (IMWIR waste that is being revised):** No

If yes..

then complete the following and ignore the remain

F. IDs for the newly defined waste streams:

| | | | |
|--|--|--|--|
| | | | |
|--|--|--|--|

2.2 Waste Stream Description

IDC NO. 330, 336, 337, 831, 832, 833. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills, involving hazardous solvents. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be repackaged into DOT 7A, Type A metal boxes which are lined with a fiberboard and PVC liner. Inventory data include mixed residues within the same IDCs.

IDC 325 This IDC is a combination of any solid waste IDCs, i.e., combustibles, metal, glass, construction rubble, etc. This IDC may be used for waste originated outside the PA only, with the exception of the waste generated during Engineered and Maintenance non-routine work, i.e., Stripout Activity in Bldg 881 and it may not be used anytime for waste originated in Bldg 886. Mixed Waste.

IDC 330 no description available.

IDC 336 - Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture. Must be drained or wrung out prior to packaging to prevent an accumulation of free liquid. This IDC changes to 822, 832, 852, or 862 at the point of assay.

IDC831 - Dry combustibles such as paper, cloth, wood, etc. This waste has been identified as being low level mixed waste.

IDC 832 - Wet combustibles are paper, cloth, etc., which contain a discernible amount of moisture. these must be drained or wrung prior to packaging to prevent accumulation of free liquid.

2.3 Generation Site**A. Generation site name:** Rocky Flats Plant**B. Buildings and areas where waste generation activities are located:**

Numerous locations throughout RFP.

RF-W012

Combustibles/TRM

2.2 Waste Stream Description (continued)

~~IDC 833 - PVC sheeting, poly bottles, supplied air suits, and other plastics. This waste has been identified as being a low level mixed waste.~~

This waste consists of rags, paper, cloth, coveralls, plastics, rubber, and wood from the cleanup of spills and equipment.

Halogenated organics are used at RFP for degreasing. Methylene chloride is used for paint removal. Ignitables are characteristic of the solvents and/or filter media. The combustibles can be used for cleaning with these organics or used for the cleanup of spent solvents. Not all of the waste in the IDCs listed in the previous section contain solvents, but the nonsolvent waste is not segregated from the solvent bearing waste at this time. Therefore, all containers of waste with the above-mentioned IDCs are considered RCRA waste and LDR. No TCLP analysis of these wastes has been conducted at this time.

RF-W012

Combustibles/TRM

2 Generation Site (continued)**C. Operations performed in buildings:****D. Process generating waste:**

This waste consists of rags, paper, cloth, coveralls, plastic, rubber, and wood. The waste consists mainly of cloth and paper products from cleanup of gloveboxes and spills. The bulk of these wastes are packaged in 55-gallon drums with one rigid polyethylene liner and several bag liners. In addition, the waste may be packaged in DOT 7A Type A metal boxes which are lined with a fiberboard liner and a PVC liner or standard TRUPACT-II container. The containers are then assayed and transferred to interim status storage areas. These wastes have been shipped to the INEL for storage in the past.

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

2.3 Generation Site (continued)

E. Source classification:

| Applicable Sources of the Waste Stream | | | |
|--|-------------------------------|---------------------------|-----|
| Research and Development | Yes | Environmental Restoration | No |
| Operations Waste | Yes | Buried | No |
| Residues | Yes | Treatment of Waste | No |
| Retrieveably Stored Waste | No | Moratorium Waste | No |
| Decontamination and Decommissioning | Yes | Maintenance | Yes |
| EPA Source Code | A19 | | |
| EPA Waste Source | Other cleaning and degreasing | | |

2.4 Reclassification

A. Waste type: MTRU

B. Reclassified waste (< 100nCi/g of TRU): No
UNKNOWN

C. If waste is MTRU..

D. Reclassification..

it could be reclassified:
or potential for reclassification:

Rocky Flats assays wastes to determine waste type instead of relying on process knowledge or historical data. For this reason, the potential for reclassification has not been analyzed.

RF-W012

Combustibles/TRM

Radiation Acceptance

3.1 Waste Radiation Characteristics

A. Handling: CH

B. Transuranic alpha emitter: >100

Units: nCi/g

C. Uranium/thorium alpha level: NC

Units:

D. Beta/gamma dose rate at the surface: NC

Units:

E. Beta/gamma dose rate 1m from the surface: NC

Units:

F. Surface neutron activity: NC

Units:

3.2 Radionuclides

A. Estimate of the uncertainty of radioactive concentration value and description of methods used to measure radioactive elements:

Concentrations based upon non-destructive analysis of waste packages. Process knowledge is also applied. The purpose of this assay is to determine whether the waste is above or below TRU threshold of 100 nCi per gram. Pu and U and their decay daughters, the only isotopes known to be used at RFP, are in the wastes.

Measurement Method: Passive-Active Counter / Crate Counter

Combustibles/TRM

B. Last radionuclide analysis date:

C. Standard mix name: Weapons Grade Plutonium

D. Total activity level of the waste (nCi/g): NC

E. Radionuclides:

[illegible]

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

Secondary Waste Materials

A. Radionuclide distribution for this waste stream includes additional waste materials that are occasionally mixed in or included: No

B. Percent of radionuclide activity this additional waste contributes:

C. Secondary radionuclides:

[illegible]

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

3.4 Radionuclide Contamination Accessibility

- A. External surface only: No
B. Internal surface only: No
C. Contamination dispersed through matrix: Yes

4. Matrix

4.1 Overall Composite Matrix

- A. Waste matrix code: 5440
B. Waste matrix name: Predominantly Combustible Debris

4.2 Specific Matrix Constituents

- A. Percent is by weight or volume:
B. Sum: 0
C. Waste matrix type:

| WM Code | Matrices/Constituent Name | Average % | Lower Limit % | Upper Limit % |
|---------|--------------------------------|-----------|---------------|---------------|
| 5330 | Paper and rags | UNK | | |
| 5320 | Wood Debris | UNK | | |
| 5390 | Non-halogenated organic solids | UNK | | |
| 5310 | Plastics and rubber | UNK | | |
| 5190 | Metals | UNK | | |
| 5220 | Glass | UNK | | |
| | | | | |

|---------|------------------|

3 Cation/Anion

A. Cations and anions present in the waste and..

if available

Not applicable

4.4 Previous Treatment

A. Waste stream has been super-compacted: No

B. Waste stream has been shredded: No

C. Waste stream has been immobilized at the container level: No

D. Waste stream has been immobilized in sizes less than container level: No

E. Waste stream has been treated: No

If yes..

treatment was for LDR:

F. Waste stream can be removed easily from its container: Yes

4.5 Other Waste Characteristics (for Aqueous Streams Only)

A. Total dissolved solids (%):

B. Total suspended solids (%):

C. Total organic content (%):

D. pH:

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

4.5 Other Waste Characteristics (continued)

E. Other waste characteristics:

No information available

5. Regulated Characteristics and Contaminants

5.1 Characterization Basis

A. Uncertainty of the contamination concentration value:

A- Process knowledge based upon general knowledge of waste type or source.

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

..1 Characterization Basis (continued)

- B. Sampling program was a statistical program that was based on random sampling: No
 C. Concerning waste streams for which sampling and analysis has been initiated..
 approximate percentage of waste containers sampled:
 D. Total number of samples that have been analyzed:

5.2 Contaminant List

| EPA Code | Contaminant Name | Typical | Lower Limit | Upper Limit | Unit | Basis | TCLP Level |
|----------|----------------------|---------|-------------|-------------|------|-------|------------|
| F001 | 1.. | | | 1.. | | A | |
| F001 | Carbon Tetrachloride | | | | | A | |
| F002 | Freon | | | | | A | |
| F002 | Methylene Chloride | | | | | A | |
| F005A | Toluene | | | | | A | |
| F005A | Methyl ethyl ketone | | | | | A | |

| RF-W012 | Combustibles/TRM |
|---------|------------------|

Stored Waste (continued)

B. Gross stored waste information (continued): *

| | Volume (m3) | Mass (kg) |
|--|-------------|-----------|
| Gross stored LDR waste as of other date: | | |
| Numeric value is present | No | No |
| Numeric value | 0.00000 | 0.00000 |
| Units | | |

C. Basis for determining LDR storage prohibition status:

Net and gross weight data are not available for all container types.

RFP has assumed this waste to be LDR based on process knowledge characterization, and one sample analyzed for volatiles in 1988. RFP currently manages all of its mixed waste as LDR storage prohibited, independent of its generation date.

1. Variability surrounding fullness of containers precludes a meaningful computation of density.

2. Basis for determining LDR storage prohibition status is based primarily on process knowledge. Analytical data are limited due to the lack of capacity to perform Toxicity Characterization Leaching Procedure (TCLP) on mixed waste at the Rocky Flats Plant.

** Note that rows in italics were added to facilitate processing numeric values.*

3. Total inventory volume for purpose of national summary (m3): 267.910000

RF-W012

Combustibles/TRM

7.2 Readiness of Existing TRU Waste for Shipping and Emplacement in WIPP

A. Percentage of existing TRU waste containers meeting the Operations and Safety (O&S) criteria in the WIPP Waste Acceptance Criteria (WAC).. Revision

___ % 55 gallon drums
___ % boxes
76 % Other: total

B. Treatment needed:

Repackaging to meet decay heat limit; completion of data package.

C. Percentage of existing waste containers that would be expected to meet the TRUPACT-II TRAMPAC requirements in the WIPP WAC.. Revision 4

___ % 55 gallon drums
___ % boxes
76 % Other: total

D. Waste stream is listed in the WIPP TRUPACT-II Content Code (TRUCON) document: Yes

E. TRUCON code: 116

F. Head space gas has been sampled from one or more waste containers: UNKNOWN

RF-W012

Combustibles/TRM

Waste Stream Management

8.1 Current Management

A. Current management:

C. Generated and Stored Only

B. Treatment or disposal rate for the waste stream expressed in volume per year:

* *Units (m³/yr):*

C. Treatment or disposal rate for the waste stream expressed in mass per year:

* *Units (kg/yr):*

8.2 Planned Management for LDRs

A. Future management of waste stream for complying with LDR treatment standards:

F. Planned to send to WIPP (TRU only).

* *Note that items in italics were added to facilitate processing numeric values.*

Combustibles/TRM

Treatment Technology (continued)

B. Assigned treatment facility name:

CTMP Treatment System Path F

C. Assigned treatment system name:

CTMP Treatment System Path F

Assigned treatment system ID:

D. Facility agrees to treat: UNKNOWN

E. Waste in assigned facility permit: UNKNOWN

F. Waste in future facility permit: UNKNOWN

G. Other pre-treatment requirements or treatment concerns:

Treatment of most mixed transuranic waste to meet LDR treatment standards is not applicable because DOE plans to ship these wastes to the Waste Isolation Pilot Plant (WIPP), pending issuance of a No-Migration Determination of the operational phase. Pretreatment to meet the WIPP Waste Acceptance Criteria may be required.

RF-W012

Combustibles/TRM

8.4 Technology Status

A. Status of the technology to treat this waste:

C. Technology exists but needs modification

B. Identified technologies:

Repackaging to meet WIPP WAC

RF-W012

Combustibles/TRM

Technology Status (continued)

C. Need..

reason and status for modification:

Testing is needed to adapt technology to site specific compositions and radionuclides.

D. Basis for the technology status:

The existing technologies are not directly suitable for use with radioactive mixed wastes and require development work to bridge the gap between non-radioactive and radioactive streams.

| | |
|---------|------------------|
| RF-W012 | Combustibles/TRM |
|---------|------------------|

8.4 Technology Status (continued)

E. Technology development associated with treatment of waste stream:

Technology exists. Needs modification or verification for application to DOE waste streams.

F. Relevant TTP..

ADS..

TTP #: RF142001 Subtask 02 ADS #: 3822 TDD # : 3822.F17 (THERMAL) / #3822.F21 (NON-THERMAL)

RF-W012

Combustibles/TRM

Treatment Concerns

A. Special or unique treatment or facility concerns that this waste stream presents and that may impact the use of standard treatment methods:

The radioactive nature of the waste stream requires that the candidate technologies be examined to identify necessary process or equipment modifications dictated by the radioactivity.

Regulatory Concerns

9.1 Compliance Agreements

A. For waste covered by an EPA or state LDR compliance agreement.. and when it was issued:

FFCA II - May 10,1991

RF-W012

Combustibles/TRM

9.2 Applicable Regulations

A. RCRA: Yes
B. State hazardous waste: Yes
C. TSCA: No
D. CERCLA: No

9.3 Waste meets LDR treatment standard: No

A. Basis for determination:

Process knowledge

9.4 Delisting

A. Waste stream has been delisted or is being considered for delisting: No
B. A petition has been submitted:
C. Date of submission:
D. Date of approval:

9.5 Waste Minimization Activities

A. Applicable activities:

A. Good operating practices
B. Technology changes
F. Changes in operating status

B. Appropriate waste minimization codes:

W13

RF-W012

Combustibles/TRM

Waste Minimization Activities (continued)

C. Description of waste minimization activities:

10. Storage Location

A. Current storage location:

Building 776, RCRA Unit 11 & 69
Building 374, RCRA Unit 19
Building 664, RCRA Unit 20 and RTR
Building 569, RCRA Unit 59
Building 371, RCRA Unit 63
Building 771, RCRA Unit 665 & 90.75

RF-W012

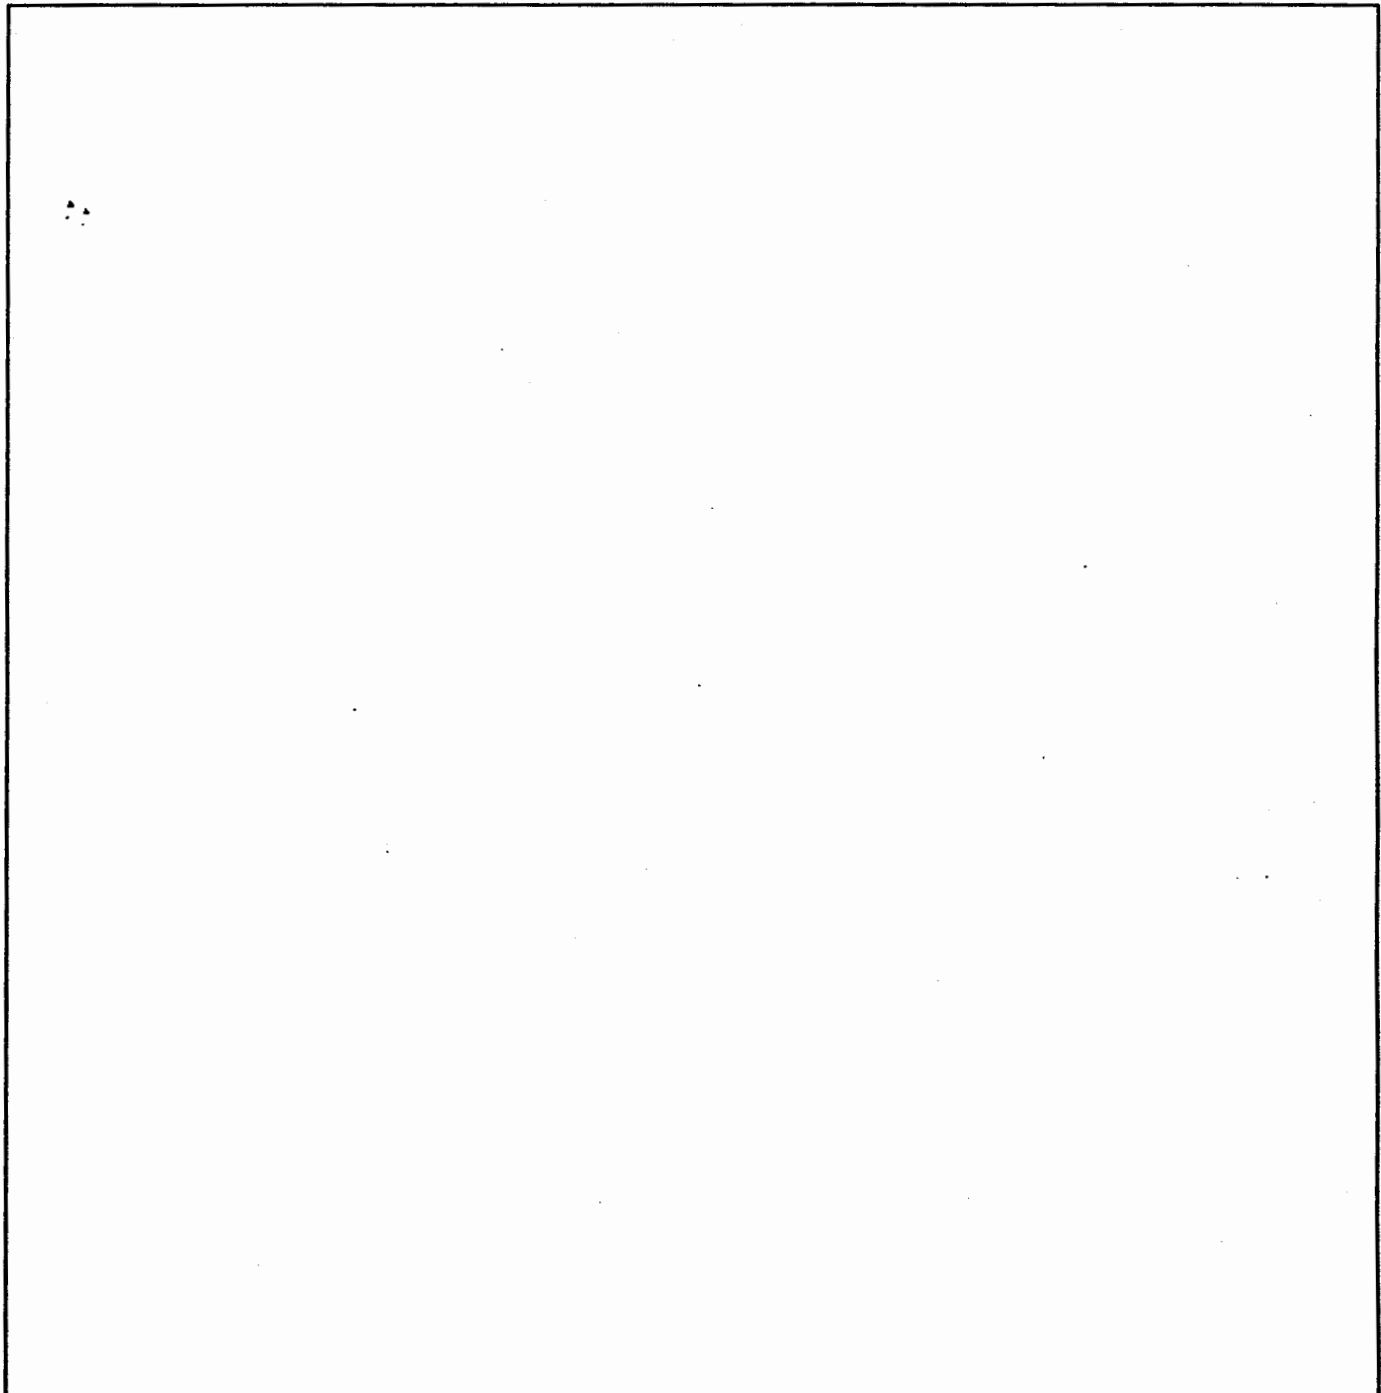

Combustibles/TRM

11. Data Acceptance

11.1 Information about this waste stream was omitted because it is classified: No

11.2 Date form completed: 12/21/93

11.3 Additional Comments:

ASSUMPTIONS:

1. Activities reported by individual sites in 1993 IDB are complete and accurate except for values marked as UNK which are counted as 0.
2. Equivalent Pu239 Activities.
3. Calculations to "decay" values reported by DOE sites were performed correctly and assumptions stated in the 1993 IDB are valid.
4. Site reporting was done in accordance with the instructions in the 1993 IDB data call.
5. All values stated in curies in scientific notation.

METHODOLOGY:

The figures presented here were arrived at by summing the calculated decayed values in the 1993 IDB from data reported by DOE sites managing TRU waste in response to a formal nationwide data call.

NOTE: The figures here require scaling by an appropriate methodology to arrive at "WIPP Design" values.

APPENDIX J

APPENDIX J

METHODOLOGY FOR CHANGING TRU WASTE GENERATOR/STORAGE SITE IDCs

In order to develop a waste characterization package for each waste stream at each DOE TRU waste generator/storage site, it was necessary to correlate the information in the MWIR, the NID, and the IDB. Because these databases were generated at different times to meet different requirements, the nomenclature, waste descriptions, waste codes, waste groupings, and waste streams can be different in each database.

Changing TRU Waste Generator/Storage Site IDCs

An important step in developing the correlation between the three databases was to relate the waste streams in the MWIR with those in the NID. If the MWIR waste stream did not have a direct correlation with a NID waste stream (IDCs did not match), then the information in the MWIR was closely examined to determine the physical and chemical properties of the waste stream.

There are several sections in the MWIR that provide information on waste stream characterization. The first sections evaluated were the "Waste Stream Description" and the "Waste Matrix Code." The "Waste Stream Description" section generally provided a physical and chemical description of the stream. The detail of information provided varied by site and by waste stream. At times it provided information about the generating process and required treatment to meet WIPP WAC. The "Waste Matrix Code" section provided a general overview of the physical and chemical waste form. The WMCs were especially helpful in determining the physical state of the waste when the waste stream description did not define the waste as solid, particulate, liquid, or sludge. Additionally, if the waste stream description provided a variety of types of waste (e.g., sludge, combustibles, etc.) the WMC was helpful in determining the composition of the majority of the waste stream. A list of specific waste matrix constituents was provided for each waste stream. These were usually similar for each stream. At times, several dissimilar codes were provided for one stream. An overall composite matrix code was provided for these streams, which was assumed to be the characterization of the majority of the waste stream (as defined in Appendix C of the WTWBIR).

If the MWIR data were not adequate to describe the waste stream, other sections of the MWIR were evaluated. The "Generating Site" section was used primarily to determine the generating site of waste streams stored at the INEL. The "Waste Names/WS ID" section provided a brief description of the waste stream. This was especially helpful in characterizing IN waste streams. This section provided "Waste Stream IDs" and "Previous Waste Stream IDs." These IN identification numbers could be related to the identification numbers of the generating sites, thus making it possible to go to the waste descriptions of the generating sites.

The "Cation/Anion" section provided information regarding previous treatment of the waste. This was helpful in determining if the waste has been compacted or solidified. The "Other Characterization" section was used in determining if a waste stream was organic or inorganic. The "Waste Packaging" section provided some information on the physical state of the waste, especially for liquid waste streams. The "MTRU Readiness" section was helpful in determining if the waste stream required treatment prior to meeting the WIPP WAC. Liquid, particulate, and reactive waste streams were identified as requiring treatment. The "Treat./Tech.," "Treatment Concerns," and "Regulatory Concerns" sections provided additional details on the treatment requirements of the waste stream and descriptions of the final waste form.

After evaluating all information in the MWIR, the waste streams in the NID (for the same TRU waste generating/storage site) were reviewed to identify a similar waste stream. Most of the waste streams in the NID are described in detail in the TRUCON (DOE, 1992). If adequate information was not available in the NID to develop an understanding of the waste stream, further information in TRUCON was reviewed. If a similar waste stream from the same site could be identified in the NID, the waste material parameter data from this NID waste stream were assigned to the particular waste stream profile.

If a similar waste stream from the same site could not be identified in the NID, then waste streams in the NID from other sites were reviewed and a similar waste stream was identified. The waste material parameter data from this NID waste stream were assigned to the waste stream profile.

There were four conditions that required the site IDC to be modified for the purposes of the WTWBIR.

1. The waste stream description indicated that the waste was expected to be WIPP WAC certifiable, but there was no corresponding IDC in the NID for that waste stream.
2. The waste stream description indicated that the waste was a liquid waste. Liquid waste streams do not meet disposal criteria for WIPP. It was assumed that these waste streams will be solidified prior to emplacement in the WIPP. The waste stream was assigned an IDC and waste material parameter data that corresponds to the solidified final waste form. When solidification occurs, there will be a volume increase. This volume increase was assumed to be 5:1.
3. The waste stream description indicated that the waste was a particulate waste stream. Particulate waste streams do not meet disposal criteria for WIPP. It was assumed that these waste streams will be solidified prior to emplacement in the WIPP. The waste stream was assigned an IDC and waste material parameter data that corresponds to the solidified final waste form. When solidification occurs, there will be a volume increase. This volume increase was assumed to be 4:1.
4. The TRU waste generating/storage site listed the waste stream as "unknown," but the waste stream description provided enough information to reclassify the waste.

APPENDIX L

APPENDIX L WTWBIR DATABASE DESCRIPTION

A database was set up to support the WTWBIR. This database is referred to as the WTWBIR database and is used to roll up the waste data in the WTWBIR. The database is operated in the Microsoft Access Version 2.0 system.

The primary sources for the data used in the WTWBIR database are the Phase II MWIR and the NID. Both of these sources are described or defined in Section 1.3.4 of the WTWBIR. The data dictionary for the WTWBIR is listed in Table L-2 of this appendix. The table is organized in groups based on the source of the data.

L.1 MIXED WASTE INVENTORY REPORT DATA

Each record in the database represents one waste stream as defined by a unique waste stream (UNIQUE_WS) that directly corresponds to the same field in the MWIR database. Only the mixed TRU waste records were imported. The data from some MWIR fields were not imported directly, but were used to produce new fields in the WTWBIR database. The MWIR-projected volume fields were added to produce one field in the WTWBIR database for a total projected volume. The total stored volume (TOTVOL) was imported directly from the similarly named field in the MWIR. The PCB-related fields in the MWIR were used to define a negative or positive entry for a new field, called PCBQ, which was used to determine whether a stream was regulated for PCBs. This field is similar to the ASBESTOSQ field imported from the MWIR used to determine whether a stream was regulated for asbestos. The data in other fields were imported directly without change.

The reports and tables produced for the WTWBIR are produced from different data sorts based on the MWIR fields and some modified MWIR fields added based on expert judgment. The data are sorted into waste stream profiles based on WMCs, WMCGs by site, CH or RH requirements, and the total WIPP inventory. Waste streams are defined by the unique waste stream identification number in the field UNIQUE_WS. The sites are defined in the field WS_SITE. The WMC was assigned to each stream in the MWIR in the field WS_MATCODE. This parameter is described in the MWIR form instructions as a "treatability group" and definitions are provided for each treatability group number based on waste forms and potential treatment options (see WTWBIR Appendix C). The WS_MATCODE represents a general description of the waste form and contents. The field ASSIGN_MTCDD10 was added by the WTWBIR team to identify the WMC used for sorting data for the tables and reports in the WTWBIR.

The field MATRIX_NAME was also added to describe groups of WMCs. In the WTWBIR the WMCs are sorted into a final set of 11 WMCGs. These WMCGs are based on similar physical and chemical properties. The names for the final WMCGs and the associated WMCs are shown in Table 1-2 in Chapter 1 of the WTWBIR. The names from Table 1-2 appear in the MATRIX_NAME field for each waste stream record. This field was used to sort for those tables and reports based on the 11 WMCGs assigned by the WTWBIR team.

A field called SCALED_VOL has been added for the total volume of each waste stream that will be disposed in the WIPP. This is a calculated field used only for the CH-TRU waste streams and is the amount of waste necessary to fill WIPP to its capacity. Additional waste volume was calculated for each waste stream proportionate to the sum of stored and projected volumes for each stream such that the sum of the scaled volumes for CH-TRU

waste equaled 180,000 m³. Enough waste is already identified to fill the WIPP to the regulatory capacity for RH-TRU waste.

Additional waste stream records were added to the database for non-mixed TRU waste at each site. The Phase II MWIR report includes only the mixed waste streams at each TRU waste generator/storage site. The INEL non-mixed TRU waste streams were included in the Phase I MWIR report but not in the Phase II report. Therefore, for INEL, the non-mixed TRU waste streams are imported from the Phase I MWIR. For other sites, non-mixed TRU waste streams were estimated based on expert judgement and the IDB for 1993. The IDB includes total volumes for all TRU waste for each waste storage/generator site. The amount of non-mixed TRU waste was estimated by subtracting the volumes for each site (except INEL) reported in the MWIR from the total TRU waste volumes reported in the IDB. These volumes for each site were then assigned to several different waste streams related to specific WMCs. The WMCs, volumes, IDCs, etc. were assigned based on expert judgement, previous site data, and informal contacts with knowledgeable site personnel. These waste streams can be identified by the UNIQUE_WS number. For mixed TRU waste streams from the MWIR, the number is of the form RF-W110 whereas for WTWBIR added streams the number is of the form RF-T110. This numbering system does not apply to the INEL non-mixed TRU waste streams because the numbering used in the phase I MWIR was retained.

L.2 NONRADIONUCLIDE INVENTORY DATABASE

The NID information was not imported directly, but was processed to produce the parameter information required for each record. The fields derived from the NID are identified in Table L-1 of this report. The NID information was rolled up into the parameters as identified by these fields. For example, weights of metals such as brass, copper, tantalum, and materials simply described as "metals" were rolled up under the field INOTMxxx (where xxx is minimum, maximum, or average) which stands for "inorganic other metals." Note that because some materials are described only as metals, aluminum and iron can be in the INOTMxxx field as well as in the INFExxx or INALxxx fields.

It is assumed for the purposes of this version of the WTWBIR (Revision 0) that all CH-TRU waste is packaged in standard 55-gallon steel drums with plastic liners and RH-TRU waste is packaged in the RH shipping containers. Because this is the case for every container and stream, it also is assumed unnecessary for this data to be explicitly entered in the database. The amount of steel in the drums is reported separately in the waste stream profiles.

Two categories of sludges and solidified materials are represented by fields. These are solidified inorganic solids (SINxxx) and solidified organic solids (SORxxx). The particular category into which a sludge or solidified material is placed is determined by the overall matrix of the resulting material after any solidification or stabilization efforts. For example, a small amount of organic liquids/sludges solidified in cement would be placed in the "inorganic solids" category and a drum of organic-based resin beads would be placed in the "organic solids" category.

The rest of the fields are reasonably self explanatory, but additional discussion on ORGCxxx, ORGRxxx, and ORGPxxx, may be helpful. The field ORGCxxx includes all cellulose-based materials and will typically include paper, cloth, wood, kimwipes and other materials derived from plant based materials. It is assumed that cloth is plant-derived material such as cotton and not plastic-based material such as rayon or nylon. The data does not describe the type of cloth. ORGRxxx consists of rubber-based materials. Included in this category are hypalon,

neoprene, and surgeons gloves. ORGPxxx represents plastics such as Lucite, polyethylene, Tyvek, Teflon and polyvinyl chloride. Plastic bags are used extensively in packaging the waste and would be included in this category. The plastic drum liners are not included in this category and are listed separately.

Each record derived from the NID is associated with an IDC number by the site as an identification code for a particular waste stream or type of waste. Expert judgement was used to assign an appropriate IDC to each MWIR waste stream (see Appendix J of the WTWBIR). The IDC then represented the relationship between an MWIR waste stream and the NID-derived material parameter data. The NID information provided weights for materials in an average drum and sometimes provided minimum and maximum weights for the materials. These data were used to calculate densities of particular materials for each IDC. These weights for each material parameter represent the waste profile for each IDC and, hence, for each MWIR waste stream.

Waste material parameters from the NID were rolled up into more general categories. The best way to describe this is with a hypothetical example in Table L-1.

TABLE L-1. NID INFORMATION

| Waste Material Parameter | Minimum (wt%) | Average (wt%) | Maximum (wt%) |
|--------------------------------|---------------|---------------|---------------|
| Paper | 10 | 30 | 80 |
| Kimwipes | 5 | 15 | 40 |
| Cloth | 0 | 5 | 10 |
| Cellulosics | | | |
| Drum Weights (kg) (waste only) | 50 | 95 | 150 |

The average weight percent does not add to 100 percent because other parameters, such as metals, make up the rest of an average drum. As shown in the fourth line of Table L-1, the data would roll up into the WTWBIR database as cellulosic materials. The result in the WTWBIR would be as follows:

Weight per drum (Kg)

| Parameter | Min | Avg | Max |
|-----------|-----|------|-----|
| Cellulose | 7.5 | 47.5 | 150 |

The minimum is the sum of the minimum weight percents in the NID, multiplied by the minimum weight of waste (i.e., 15 percent x 50 kg = 7.5 kg) in the drum. The average is the sum of the average weight percents multiplied by the average weight of waste (i.e., 50 percent x 95 kg = 42.5 kg) in the drum. The maximum is the sum of the maximum weight percentages multiplied by the maximum weight of waste (i.e., 100 percent x 150 kg = 150 kg) in the drum. In this case the maximum weight percentages add to more than 100 percent, which is physically impossible; therefore, 100 percent is used for the maximum weight percentage. When tables and reports are computed for the WTWBIR, the weights per drum are converted to weight per cubic meter based on 0.208 cubic meters per 55-gallon drum.

The rollups of these material parameters by WMCGs or by site use the volumes from the MWIR information in the WTWBIR database. The rollups by WMCGs or by site require combining data for several MWIR waste streams. The averages for the material parameters are calculated from the NID-derived average densities modified by the MWIR volume fractions and summed as follows:

$$\text{Average Density of rollup group} = \text{Average Density,} \quad \times \quad \frac{(\text{Volume MWIR Stream}_i)}{(\text{Total Volume of Group})} \quad + \quad \bullet \quad \bullet \quad \bullet$$

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the MWIR waste streams in a particular site-specific rollup. The maximum density is chosen in a similar manner, except that the largest maximum density was chosen.

In many cases, the NID does not have data for minimum and maximum percentages, even though average percentages are provided. In these cases, for rollup purposes only, the minimum is assumed to be zero and the maximum is assumed to be equal to the average. This ensures that the calculated and rolled up maximum densities are greater than the average densities. However, the maximum density may not be a true maximum but the maximum average density.

L.3 TABLES AND REPORTS FOR THE WTWBIR

The tables and reports for the WTWBIR were produced using the facilities provided by the Microsoft Access Version 2.0 database system. These tables and reports consist primarily of various sorts based on waste streams, WMCs, sites, etc. and summations of volumes and material parameter weights. Queries and report specifications were set up as defined within the Access system and quality controlled in compliance with the Quality Assurance Plan CTS_WTAC_0001.

L.4 WTWBIR TEAM

The data entry, manipulations, and reporting was conducted in conformance to a Quality Assurance Plan (CTS-WTAC-0001). The basic concept of the plan was to:

- Maintain record copies of the database at different points in the development.
- Maintain a paper trail of additions and changes to the database.
- Document and verify the correct use of the database to produce the reports and tables used in the WTWBIR.

This was accomplished by documenting and verifying the changes, additions, corrections, and report and table generation through the use of formal change forms signed and dated by the implementor and checker. The implementor is the individual who initially makes the changes or develops the report or table and the checker is a another individual who checks and verifies that the initial work was correct. If the initial implementation was not correct, the checker confers with the implementor, changes are agreed upon, and the checker and implementor both check that the changes are properly implemented.

The change form is also used by anyone on the WTWBIR team to request a change or addition to the database. In this case, the form also includes the requestors name and the date requested. The requestor can also be the checker or implementor but not both.

The database manager is responsible for maintaining the record copies of the database, tracking and ensuring proper use of change forms and ensuring that the technical lead for the WTWBIR team is cognizant of changes being made to the data.

L.5 NONRADIONUCLIDE DATABASE

The data in the NID was provided by IT. A quality control check of the data was conducted by IT using internal quality assurance plans. The WTWBIR team's quality assurance plan accepted the data as received from IT and ensured that the data was correctly manipulated and imported into the WTWBIR database.

L.6 MIXED WASTE INVENTORY REPORT

This is a published database used extensively to develop the WTWBIR database. The WTWBIR quality assurance plan accepted the data as published and ensured that the data was correctly manipulated and imported into the WTWBIR database.

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|----------------------|--|
| UNIQUE_WS | Waste stream identification number from Phase II MWIR |
| WASTESTREA | Short for "Waste Stream Description": descriptive information attached to the waste stream record by the interim storage site. From Phase II MWIR |
| WASTETYPE | For the purposes of the WTWBIR, a binary choice between mixed TRU waste and TRU waste. |
| WS_ID_IMWR | Waste stream identification in the Interim Mixed Waste Inventory Report, if applicable and reported |
| WS_ID_SITE | Waste stream identification assigned locally at the interim storage site |
| Field_Office | Abbreviation of DOE field office responsible for interim storage site |
| Generator | Abbreviation of the site where the waste was generated |
| ID Code | Site-specific IDCs assigned to the specified stream by the interim storage site |
| IDC1 | IDC, first reported by site, if applicable |
| WS-SITE | Interim storage site abbreviation |
| WS_TRUCON | First TRUCON assigned by site, if applicable |
| WS_TRUCON1 | Second TRUCON assigned by site, if applicable |
| WS_MATCODE | Waste stream treatability group number assigned by the site for the Phase II MWIR |
| WS_MATNAME | Name associated with the treatability group number assigned by the site for the Phase II MWIR |
| Assign_MTCD10 | Treatability group number assigned by WTWBIR team on the basis of professional judgement and review of reported and available data |
| MATRIX_NAME | The name assigned by the WTWBIR team to group waste streams by common waste parameters. Used to roll up waste streams for the WTWBIR (See Table 1-2) |
| ASBESTOSQ | Binary response as to whether or not the waste stream is regulated for asbestos (YES or NO) |

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|---------------|--|
| PCBQ | Binary response as to whether or not the waste stream is regulated for PCBs |
| Cunit | Units of volume used to specify CVolume, normally g for gallons |
| CVolume | Internal volume of the container specified. Normally 55-gal. drums for Rev. 0 |
| Stored_Volume | Total volume in m ³ stored at the specified site at end of 1992; extracted from the Phase II MWIR, including WTWBIR adjustments |
| PROJ_SUM | Projected additional amount generated in the future that will go to the WIPP; extracted from the Phase II MWIR, including WTWBIR adjustments |
| Scaled | The additional volume needed to fill the WIPP with CH-TRU waste to 180,000m ³ |
| INALavg | Aluminum-based materials, density in kg/m ³ for a specific waste stream |
| INALmax | Aluminum-based materials, maximum reported density in kg/m ³ for a specific waste stream |
| INALmin | Aluminum-based materials, minimum reported density in kg/m ³ for a specific waste stream |
| INFEavg | Iron-based materials, volume-weighted average, for a specific waste stream |
| INFEmax | Iron-based materials, maximum reported, for a specific waste stream |
| INFEmin | Iron-based materials, minimum reported, for a specific waste stream |
| INOTMavg | Other inorganic metals, volume-weighted average, for a specific waste stream |
| INOTMmax | Other inorganic metals, maximum reported, for a specific waste stream |
| INOTMmin | Other inorganic metals, minimum reported, for a specific waste stream |
| INOTOavg | Other inorganic materials, other materials, volume-weighted average, for a specific waste stream |
| INOTOmax | Other inorganic materials, other materials, maximum reported, for a specific waste stream |
| INOTOmin | Other inorganic materials, other materials, minimum reported, for a specific waste stream |

TABLE L-2. WTWBIR DATA DICTIONARY

| | |
|----------|--|
| ORGCavg | Organic materials, cellulose, volume-weighted average, for a specific waste stream |
| ORGCmax | Organic materials, cellulose, maximum reported, for a specific waste stream |
| ORGCmin | Organic materials, cellulose, minimum reported, for a specific waste stream |
| ORGOTavg | Organic materials, other, volume-weighted average, for a specific waste stream |
| ORGOTmax | Organic materials, other, maximum reported, for a specific waste stream |
| ORGOTmin | Organic materials, other, minimum reported, for a specific waste stream |
| ORGPavg | Organic materials, plastic, volume-weighted average, for a specific waste stream |
| ORGPmax | Organic materials, plastic, maximum reported, for a specific waste stream |
| ORGPmin | Organic materials, plastic, minimum reported, for a specific waste stream |
| ORGRavg | Organic materials, rubber, volume-weighted average, for a specific waste stream |
| ORGRmax | Organic materials, rubber, maximum reported, for a specific waste stream |
| ORGRmin | Organic materials, rubber, minimum reported, for a specific waste stream |
| SINavg | Solidified materials, inorganic matrix, volume-weighted average, for a specific waste stream |
| SINmax | Solidified materials, inorganic matrix, maximum reported, for a specific waste stream |
| SINmin | Solidified materials, inorganic matrix, minimum reported, for a specific waste stream |
| SLavg | Soils, volume-weighted average, for a specific waste stream |
| SLmax | Soils, maximum reported, for a specific waste stream |
| SLmin | Soils, minimum reported, for a specific waste stream |
| SORavg | Solidified materials, organic matrix, volume-weighted average, for a specific waste stream |

TABLE L-2. WTWBIR DATA DICTIONARY

| | |

PREFACE

The information in this report summarizes the U.S. Department of Energy's (DOE) transuranic (TRU) waste inventory, projections, and characteristics. Revision 0 of the Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR) published in June 1994, was the first attempt ever made by the DOE complex to report all of its TRU waste at the waste stream level. The waste data reported in Revision 0 was considered preliminary until quality checks of the data were completed by the DOE TRU waste generator/storage sites. Data changes resulting from the site reviews are contained herein.

The primary differences between Revision 0 and Revision 1 of the WTWBIR are as follows:

- The WIPP baseline inventory reported in Revision 0 was compiled from three existing DOE databases, whereas, inventory data in Revision 1 was collected directly from the sites through a request made by the National TRU Program Office.
- The nonmixed, TRU waste streams reported in Revision 0 were derived from the volume differences between the Integrated Data Base (IDB) and Mixed Waste Inventory Report (MWIR), while the nonmixed TRU waste streams contained in Revision 1 are as reported by the TRU waste generator/storage sites.
- Revision 1 of the WTWBIR reports radionuclide data at the waste stream level. Where sites provided radionuclide data as the waste stream level, it is replicated in Appendix A. A WIPP radionuclide inventory is provided in Table 4-2. This table is derived from the data submitted to support the IDB. Revision 0 reported the radionuclide data at the WIPP level.
- Revision 1 reports the waste volumes in the final waste form that will be sent to WIPP. All previous databases, including Revision 0 of WTWBIR, report the waste in terms of volumes in storage before processing to meet WIPP requirements.
- The total radionuclide inventory for contact-handled (CH) TRU waste is much higher in Revision 1 than reported in Revision 0. This is due to two reasons: 1) Savannah River Site waste that was previously reported as "unknown" had not been included in the estimates, and 2) the "projected" part (1993-2022) of the CH-TRU radionuclide inventory was inadvertently left out of the totals reported in Revision 0, causing the inventory to be approximately 25% low. Revision 1 corrects the inventory reporting error.
- The total radionuclide inventory for remote-handled (RH) TRU waste is also much higher in Revision 1. During calculation of the RH-TRU inventory the volume defined by the sites included more waste than the repository is authorized to accept. During those calculations, the IDB radionuclide numbers only covered the "stored" part of the inventory. This made the RH-TRU inventory reported in Revision 0 to be low by a factor of approximately 3-4. Revision 1 corrects the inventory reporting error.
- Oak Ridge National Laboratory has reported a very conservative inventory for U-235 in its RH-TRU waste (≈ 367 curies). In order to provide a more realistic estimate of the U-235 inventory, an anticipated transportation requirement for the RH-TRU cask was imposed in Revision 1. This requirement modifies the U-235 estimate reported in Revision 0.

EXECUTIVE SUMMARY

The *Waste Isolation Pilot Plant (WIPP) Transuranic Waste Baseline Inventory Report (WTWBIR)* establishes a methodology for grouping wastes of similar physical and chemical properties, from across the U.S. Department of Energy (DOE) transuranic (TRU) waste system, into a series of "waste profiles" that can be used as the basis for waste form discussions with regulatory agencies. The majority of this document reports TRU waste inventories of DOE defense sites. An appendix is included which provides estimates of commercial TRU waste from the West Valley Demonstration Project.

The WIPP baseline inventory is estimated using waste streams identified by the DOE TRU waste generator/storage sites, supplemented by information from the Mixed Waste Inventory Report (MWIR) and the 1994 Integrated Data Base (IDB). The sites provided and/or authorized all information in the Waste Stream Profiles except the EPA (hazardous waste) codes for the mixed inventories. These codes were taken from the MWIR (if a WTWBIR mixed waste stream was not in MWIR, the sites were consulted). The IDB was used to generate the WIPP radionuclide inventory. Each waste stream is defined in a waste stream profile and has been assigned a waste matrix code (WMC) by the DOE TRU waste generator/storage site. Waste stream profiles with WMCs that have similar physical and chemical properties can be combined into a waste matrix code group (WMCG), which is then documented in a site-specific waste profile for each TRU waste generator/storage site that contains waste streams in that particular WMCG.

Based on methodology presented in this WTWBIR, a maximum of 11 site-specific waste profiles have been identified for contact-handled (CH) TRU waste and a maximum of 11 have been identified for remote-handled (RH) TRU waste for each site. Each of these site-specific waste profiles have unique WMCG criteria and they are developed, if appropriate, for each of the TRU waste generator/storage sites. A particular site-specific waste profile, with a specific WMCG, can be combined with other site-specific waste profiles having identical WMCGs from the TRU waste generator/storage sites to derive a WIPP waste profile.

The anticipated inventory of TRU waste is defined as the sum of retrievably stored waste (waste generated after 1970) plus currently projected TRU waste volumes. The anticipated inventory for CH-TRU waste is not sufficient to fill the maximum allowed capacity of WIPP (calculated: 6.2 million cubic feet [$\approx 176,000$ cubic meters]), and scaling has been developed as a means for Sandia National Laboratories' model to examine the impacts of the full repository. Scaling has also been applied to the RH-TRU inventory since sufficient volume has not been identified in the anticipated RH-TRU inventory to fill WIPP to the RH-TRU design capacity (≈ 7080 cubic meters). Additionally, there is a high uncertainty in and a current lack of data on wastes produced from decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the anticipated CH-TRU inventory has been "scaled" to the maximum allowed WIPP capacity and the RH-TRU to the design capacity. The scaling of the inventories in this and future revisions of the WTWBIR will be derived from the best available data and assumptions.

An example of five waste streams at two sites (Figure 3-2 in the main body of the report) has been used to illustrate the waste profile methodology. Total WIPP inventory volumes for the WIPP waste profiles are provided.

Using the same waste profile methodology, the WTWBIR also estimates the WIPP disposal inventory (anticipated inventory that has been scaled to WIPP design capacity) in terms of 10 waste material parameters and additional packaging materials that have been identified as inputs needed for the system prioritization methodology (SPM) and performance assessment (PA) calculations. The 10 waste material parameters and additional packaging materials are waste constituents that occur in TRU waste and are input parameters for one or more SPM and PA models or are required to adequately describe the waste form. These parameters may change as a result of SPM and PA efforts.

The 10 waste material parameters have been grouped by their chemical/physical properties and are indicated in bold lettering. The 10 waste material parameters and additional packaging materials that are defined and included in the WTWBIR are:

- Inorganics
 - **Iron-based metals/alloys**
 - **Aluminum-based metals/alloys**
 - **Other metals**
 - **Other inorganic materials**
- Organics
 - **Cellulosics**
 - **Rubber**
 - **Plastics**
- Solidified Materials
 - **Inorganic matrix**
 - **Organic matrix**
- Soils
- Packaging Materials
 - **Steel**
 - **Plastic**
 - **Lead**

The waste material parameter information is reported in kilograms per cubic meter of waste matrix (kg/m^3). The waste material parameters in the waste stream, site-specific, and WIPP waste profiles are expressed on a weight/volume basis. However, the occurrence of more than one waste material parameter at the maximum value within a waste stream is highly unlikely. If needed, during SPM and PA (Tables 5-1 and 5-2) calculations, the sampling statistics (if used) must be controlled so that several waste material parameters do not get sampled all at their maximum value (weight/volume), lest the average weight/volume is exceeded. To illustrate the waste profile methodology, five waste streams from two sites are used as examples. This revision of the WTWBIR provides a diskette that contains the WIPP TRU Waste Baseline Inventory Database in Microsoft Access®.

Although the initial purpose of this report is to provide data to be included in the Sandia National Laboratories/New Mexico SPM and PA processes, all data are presented and explained in such a way that they can be adapted as needed for other applications. The WTWBIR, Revision 1, is presented in three parts: Volume 1 contains this Executive Summary through Chapter 9 and the WTWBID diskette; Volume 2 contains Appendix A, Waste Stream Profiles; and Volume 3 Appendices B through J.

1. INTRODUCTION

1.1 BACKGROUND

The Waste Isolation Pilot Plant (WIPP) is a transuranic (TRU) waste management facility operated by the U.S. Department of Energy (DOE). The WIPP is currently identified as the permanent disposal site for DOE TRU waste.

TRU waste is defined as waste that is contaminated with alpha-emitting radionuclides with an atomic number greater than 92, with half-lives greater than 20 years, and concentrations of TRU isotopes greater than 100 nanocuries per gram of waste (DOE, 1988). TRU wastes are classified as either contact-handled (CH) waste or remote-handled (RH) waste, depending on the dose rate at the surface of the waste container. CH-TRU wastes are packaged TRU wastes with an external surface dose rate of 200 millirems (mrem) or less per hour, while RH-TRU wastes are packaged TRU wastes with an external surface dose rate exceeding 200 mrem per hour. Unless otherwise indicated, for purposes of this document, all references to TRU waste include TRU waste and mixed TRU waste (waste that contains both radioactive and hazardous components, as defined by the Atomic Energy Act and the Resource Conservation and Recovery Act [RCRA] as codified in Title 40 Code of Federal Regulations [CFR] Parts 264, 265, 268, and 270 [EPA, 1980a; 1980b; 1986; and 1983]).

The DOE is committed to demonstrating compliance with all applicable regulations prior to permanent disposal of TRU wastes in the WIPP repository. These regulations are the environmental standards for management and disposal of TRU wastes as mandated in 40 CFR Part 191 (EPA, 1993) and Part 194 (DOE, 1995), and the RCRA regulations. Compliance will be demonstrated through Sandia National Laboratory/New Mexico (SNL/NM) performance assessment (PA) calculations based on the inventory of existing and currently projected waste streams developed in this document, as reported by the DOE TRU waste generator/storage sites. The WIPP is scheduled to receive and dispose of TRU wastes from 10 major and several minor DOE TRU waste generator/storage sites (see Figure 1-1).

1.2 PURPOSE

The purpose of this report, the *Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report* (WTWBIR), is to document the disposal inventory of TRU waste to be emplaced in WIPP as defined by the DOE TRU waste generator/storage sites. This inventory of CH-TRU and RH-TRU waste will be used in the SNL/NM systems prioritization methodology (SPM)/PA calculations and sensitivity analyses that will support the development of compliance applications to the appropriate regulatory agencies regarding the operations and post-closure timeframes of the WIPP repository.

To accomplish this purpose, the WTWBIR has been developed from the best available information and process knowledge provided by the DOE TRU waste generator/storage sites. In support of SPM/PA, the WTWBIR describes a process for grouping individual waste streams with similar physical and chemical properties into waste profiles, based on their waste matrix code (WMC) (DOE, 1993a) assigned by the DOE TRU waste generator/storage sites. Waste profiles with similar WMCs, are then combined across the DOE TRU waste system to provide estimated total volumes and total waste material parameters. The methodology for this grouping and combining is discussed in detail in Section 2.3, Methodology for Development of Disposal Inventory.

Figure 1-1. U.S. Department of Energy Transuranic Waste Generator/Storage Sites.

The individual waste streams also are evaluated to estimate the occurrence and quantities of non-radioactive waste material parameters as defined in Appendix C and listed in Table 1-1 (e.g., cellulose, plastics, iron-based metals/alloys, etc.) that have been identified by SNL/NM as being potentially important to the performance of the WIPP repository. The methodology, assumptions, and totals of these waste material parameters are described in Chapter 5, Waste Material Parameters.

**TABLE 1-1. TECHNICAL DATA NEEDS FOR SYSTEMS PRIORITIZATION
METHODOLOGY/PERFORMANCE ASSESSMENT WASTE MATERIAL PARAMETERS**

| Waste Material Parameter | Input Variable in Current SPM/PA Models | | Input Variable in SPM/PA Models Under Development | Input Variable in Possible Future SPM/PA Models |
|------------------------------|---|----------------------------|---|---|
| | Gas Generation | Mechanical Characteristics | | |
| Iron-Based Metals/Alloys | YES | YES | YES | YES |
| Aluminum-Based Metals/Alloys | YES ⁽²⁾ | YES | YES | YES |
| Other Metals | | YES | | YES |
| Other Inorganic Materials | | YES | YES | YES |
| Cellulose | YES | YES | YES | YES |
| Plastics | YES ⁽²⁾ | YES | YES | YES |
| Rubber | YES ⁽¹⁾ | YES | YES | YES |
| Solidified Inorganic Matrix | | YES | YES | YES |
| Solidified Organic Matrix | | YES | YES | YES |
| Soils | | YES | | |

(1) Only 50 weight percent included

(2) Added for SPM-2 (Sanchez, 1995)

The information/data presented in this report is derived from the WIPP Transuranic Waste Baseline Inventory Database (WTWBID). The only currently defined application of the WTWBID in this revision of the WTWBIR is in support of the SPM/PA calculations. However, the WTWBID can support other projects and applications requiring waste information in formats different than that used in the WTWBIR. The WTWBID structure and a data dictionary are included in Chapter 7 of this report.

1.3 WASTE INVENTORY TERMINOLOGY

The derivation of a disposal inventory from individual waste streams is a formidable and complex process. To document each step of this process, a system of waste inventory terminology needs to be defined so the reader may more easily follow the process. The following sections provide definitions of terminology used throughout the WTWBIR. These definitions also are summarized in Chapter 8, Glossary. A list of acronyms and abbreviations used are provided in the front of the document.

1.3.1 Inventory Terminology

Stored Inventory – That part of the TRU inventory currently in retrievable storage at the time of the last data call for inventory information is known as "stored inventory." For Revision 1, stored waste includes that waste in storage as of December 31, 1993. Retrievably stored waste includes waste stored since approximately 1970 in buildings or in berms with earthen cover and **does not include any waste that was buried prior to 1970** (DOE, 1994b).

Projected Inventory – That part of the TRU inventory that has not been generated but is currently estimated to be generated at some time in the future by the TRU waste generator/storage sites is considered "projected inventory." Because of the uncertainty associated with ER and D&D waste inventory projections, the ER and D&D wastes are not included in the projected inventory. For Revision 1, a projected inventory includes waste scheduled for generation between calendar years (CY) 1994 and 2022. "Newly generated waste" also is sometimes used as a synonym for the projected inventory.

Anticipated Inventory – For the WTWBIR, this is the sum of the stored and projected inventories, calculated:

$$\begin{array}{ccccc} \text{Stored} & & \text{Projected} & & \text{Anticipated} \\ \text{Inventory} & + & \text{Inventory} & = & \text{Inventory} \end{array}$$

Scaling – The process for adjusting, if needed, the projected inventory to the design limit (disposal inventory) of the WIPP repository is called "scaling." Section 2.3, describes the scaling process used for developing the WTWBIR.

$$\text{Projected Inventory} \xrightarrow{\text{Scaling}} + \text{Stored Inventory} = \text{Disposal Inventory}$$

Disposal Inventory – The total design ($\approx 176,000 \times 10^5 \text{ m}^3$ for CH-TRU and 7080 m^3 for RH-TRU) inventory defined for WIPP emplacement (after scaling, if necessary) to be used for SPM and PA calculations is the "disposal inventory."

1.3.2 Waste Matrix Code Terminology

Waste Matrix Code (WMC) - The WMCs were developed by DOE, in response to the Federal Facilities Compliance Act (FFCA)(Public Law 102-386, 1992), as a methodology to aid in classifying mixed waste streams in the DOE system into a series of four-digit codes (e.g., 5400; Heterogeneous Waste) that represent different physical/chemical matrices. The WMC is assigned

by the TRU waste generator/storage sites. The WTWBIR has adopted this system to remain consistent with the Mixed Waste Inventory Report (MWIR)(DOE, 1994a) which was a database-derived report to meet the first deliverable under the FFCAct. The WMC methodology has been applied to nonmixed TRU waste streams for consistency.

Waste Matrix Code Group (WMCG) – A WMCG consists of a series of WMCs that for SPM or PA purposes have similar physical and chemical properties. An example of combining three WMCs which either contain particulates or are cemented particulate waste is presented below:

| | | |
|--|---|-----------------------|
| WMC 3100 (inorganic process residues) | } | Solidified Inorganics |
| WMC 3110 (inorganic particulates) | | |
| WMC 3150 (solidified process residues) | | |

Because of the restriction on particulate wastes in the *TRU Waste Acceptance Criteria (WAC) for the Waste Isolation Pilot Plant*, Revision 4 (DOE, 1991), all particulate waste will usually be immobilized prior to shipment to WIPP. Therefore, all three of these WMCs would be the same basic waste form when emplaced in WIPP and have similar physical and chemical properties. The combined WMCG for this example is solidified inorganics. Table 1-2 presents all anticipated WMCs for TRU waste and indicates in which WMCG each WMC occurs for the WTWBIR. There are 11 WMCGs used in this WTWBIR. The last two rows in Table 1-2 group WMCs that will not be accepted at WIPP unless additional characterization and/or processing occurs to meet the WIPP WAC (DOE, 1991).

1.3.3 Waste Profile Terminology

Waste Stream Profile – This is a description of a CH-TRU or RH-TRU waste stream potentially destined for shipment to and disposal in WIPP, if authorized under permits and certifications by appropriate regulatory agencies. The waste stream profile is presented in tabular format and is intended to provide a summary of important information about a particular waste stream. Examples of information included in a waste stream profile are:

- Currently used identification codes, including the DOE TRU waste site matrix description;
- WMC assigned by the TRU waste generator/storage sites;
- Volumes of waste currently in retrievable storage and waste projected to be generated: estimated minimum, average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.);
- Indication as to whether the waste is CH-TRU or RH-TRU; and
- Hazardous waste codes (EPA codes) from MWIR or as assigned by the DOE TRU waste generator/storage sites for the RCRA regulated portion of the waste stream. Some waste streams (waste stream profiles) contain hazardous waste codes that would not be currently acceptable for disposal in WIPP (e.g., D001, D002, and D003) under the most recent WIPP Part B Permit Application (DOE, 1993b). These hazardous waste codes are applied to the waste in its current physical form. These waste streams will have to be treated for any unacceptable hazardous waste codes prior to transport to WIPP for disposal.

TABLE 1-2. WASTE MATRIX CODE GROUP NAMES

| Waste Matrix Code Group | Waste Matrix Codes |
|---|--|
| Solidified Inorganics | 1000 ¹ , 1100 ¹ , 1110 ¹ , 1120 ¹ , 1130 ¹ , 1140 ¹ , 1190 ¹ , 1200 ¹ , 1210 ¹ , 1220 ¹ , 1230 ¹ , 1240 ¹ , 1290 ¹ , 3000 ² , 3100, 3110 ³ , 3111 ³ , 3112 ³ , 3113, 3115 ³ , 3116 ³ , 3119 ³ , 3120, 3121, 3122, 3123, 3124, 3125, 3129, 3130, 3131 ³ , 3132 ¹ , 3139 ^{1 or 3} , 3150, 3190, 3900 ² , 6100 ⁴ , 6120 ⁵ , 6130 ⁶ , 6140 ⁵ , 6190 ⁴ , 6200 ⁷ , 6210 ⁸ , 6230 ⁸ , 6290 ⁷ , 7300 ³ , 9100 ² , 9200 ² |
| Salt Waste | 3000 ² , 3140, 3141, 3142, 3143, 3149, 3900 ² |
| Solidified Organics | 2000 ¹ , 2100 ¹ , 2110 ¹ , 2120 ¹ , 2190 ¹ , 2200 ¹ , 2210 ¹ , 2220 ¹ , 2290 ¹ , 2900 ¹ , 3000 ² , 3114, 3200, 3210, 3211, 3212, 3213, 3219, 3220, 3221, 3222, 3223, 3229, 3230, 3290, 3900 ² , 6100 ⁴ , 6110 ⁵ , 6190 ⁴ , 6200 ⁷ , 6290 ⁷ , 9100 ² , 9200 ² |

TABLE 1-2. WASTE MATRIX CODE GROUP NAMES (CONTINUED)

- ¹ Liquid waste streams are assumed to be solidified prior to sending to WIPP.
- ² WMCs 3000, 3900, 9100, and 9200 are placed in "solidified inorganics," "salt waste," or "solidified organics," depending on the information provided by the TRU waste generator/storage site.
- ³ Particulate waste streams are assumed to be solidified prior to sending to WIPP.
- ⁴ WMCs 6100 and 6190 are placed in "solidified organics," or "solidified inorganics," depending on the information provided by the TRU waste generator/storage site.
- ⁵ Liquid lab pack waste is assumed to be solidified prior to sending to WIPP.
- ⁶ Solid lab packs are assumed to be solidified prior to sending to WIPP.
- ⁷ WMCs 6200 and 6290 are placed in "solidified organics," "solidified inorganics," or "heterogeneous" if the waste stream must be solidified per the generator/storage site. They are placed in "uncategorized metal," or "lead/cadmium metal waste" if they are primarily nonreactive metal contaminated with reactive metal. Reactive waste streams must be treated prior to shipment to WIPP.
- ⁸ Waste stream is assumed to be treated prior to sending to WIPP. Volume change is provided by the TRU waste generator/storage site.
- ⁹ WMC 5000 is placed in "uncategorized metal," "lead/cadmium metal," "inorganic non-metal," "combustible," "graphite," "heterogeneous," or "filter," depending on the information provided by the generator/storage site.
- ¹⁰ WMC 7000 and 9300 are placed in "uncategorized metal" or "lead/cadmium metal," depending on the information provided by the generator/storage site.
- ¹¹ WMCs 7400, 7410, 7420, and 7490 are assumed to be drained of liquid and contain only metal waste.
- ¹² These waste streams are excluded from disposal in WIPP at this time, e.g., PCB and asbestos wastes (see Table 3-2).
- ¹³ If adequate information is provided by the generator/storage site, these WMCs are changed. If there is not enough information, these waste streams remain as "unknown" and are excluded from disposal in WIPP until characterized.

- Comments provided by the TRU waste generator/storage sites to further explain the data provided.
- Footnotes generated by the WTWBIR team to explain information provided by the generator/storage sites.
- TRUPACT-II Content (TRUCON) Codes (DOE, 1992) and No Migration Variance Petition (NMVP) (DOE, 1990) identifiers.

Figure 1-2 provides an example of a blank waste stream profile form. The methodology for developing waste stream profiles is provided in Chapter 3 and printouts of TRU waste stream profiles are provided in Appendix A.

Site-Specific Waste Profile – This represents a WMCG at a particular DOE TRU waste generator/storage site. That is, one or more waste stream profiles at a particular DOE TRU waste site, that have been placed in the same WMCG, are summarized in the site-specific waste profile. Examples of information included in a site-specific waste profile are:

- DOE TRU waste generator/storage site identification;
- The WMCG that the profile represents;
- Listing of the waste streams (represented by waste stream profiles provided by the TRU waste generator/storage sites) that are included in the site-specific waste profile, including the waste stream identification;
- Volumes of stored and currently projected waste; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

Figure 1-3 provides an example of a blank site-specific waste profile form. The methodology for developing site-specific waste profiles is provided in Chapter 3 and printouts of TRU site-specific waste profiles are provided in Appendix B.

WIPP Waste Profile – The WIPP waste profile represents a summary of TRU waste at all DOE TRU waste generator/storage sites that have an identical WMCG. Examples of information included in a WIPP waste profile are:

- Profile name;
- The WMCG that the profile represents;
- Listing of the DOE TRU waste sites (represented by the same WMCG) that are included in the WIPP waste profile, including the name of the DOE TRU waste site;
- Volumes of stored and currently projected waste for each site for the particular WMCG represented; and
- Summary of minimum, volume weighted average, and maximum weights of waste material parameters per cubic meter of waste volume (e.g., iron-based metals/alloys, aluminum-based metals/alloys, cellulose, etc.).

1.3.4 Database Terminology

Mixed Waste Inventory Report (MWIR) – The MWIR refers to the latest release of information from the MWIR database that supports requirements under the FFCAct of 1992 (Public Law 102-386). The latest version of the MWIR documentation/files is *Distribute [Distribution] of Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (DOE, 1994a).

Integrated Data Base (IDB) – The IDB refers to the latest version of the Integrated Data Base: U.S. Spent Fuel and Radioactive Waste Inventories, Projections, and Characteristics (DOE, 1994b).

WIPP Transuranic Waste Baseline Inventory Database (WTWBID) – The WTWBID is the database specifically developed to support the WTWBIR and any other applications that might need waste information on a waste-stream basis or for higher-level roll-ups.

1.3.5 Other Terminology

Waste Material Parameter – This is one or more nonradioactive waste constituents that occur in a TRU waste stream that is an input parameter into one or more current SPM or PA models, an SPM or PA model under development, a potential future model, or is required to adequately describe the waste form (see Appendix C). The 10 waste material parameters have been grouped by their chemical/physical properties and are indicated in bold lettering. The 10 waste material parameters and additional packaging materials that are reported in densities and included in the WTWBIR are:

- Inorganics
 - **Iron-based metals/alloys**
 - **Aluminum-based metals/alloys**
 - **Other metals**
 - **Other inorganic materials**
- Organics
 - **Cellulosics**
 - **Rubber**
 - **Plastics**
- Solidified Materials
 - **Inorganic matrix**
 - **Organic matrix**
- Soils
- Packaging Materials
 - **Steel**
 - **Plastic**
 - **Lead**

Definitions for these waste material parameters can be found in Chapter 5.

1.4 OBJECTIVES

The objectives of the WTWBIR are threefold:

1. **Establish a consistent DOE complex-wide methodology for grouping wastes of similar physical and chemical composition.** A consistent methodology, in support of SPM/PA, for grouping TRU wastes of similar physical and chemical properties into "waste profiles" will provide a common frame of reference for discussion of TRU waste issues with regulatory organizations.
2. **Define the anticipated disposal inventory of TRU wastes destined for WIPP.** The anticipated inventory of CH-TRU and RH-TRU wastes is defined as the sum of the existing volumes of stored and currently projected waste streams at each of the TRU waste generator/storage sites. The design capacities of WIPP are calculated as follows:
 - Maximum CH-TRU capacity = 6.2 million cubic feet (~176,000 cubic meters) (Public Law 102-579, 1992),
 - RH-TRU design capacity = 7080 cubic meters = 7955 canisters x 0.89 cubic meters/canister

Scaling of the CH-TRU and RH-TRU waste projected inventories is necessary to attain the WIPP design limit. There is a high level of uncertainty in and a current lack of data on waste produced by decontamination and decommissioning (D&D) and environmental restoration (ER) activities. Therefore, the projected inventory has been scaled to the WIPP capacity (disposal inventory). The scaling of the inventory in this and future revisions of the WTWBIR is derived from the best available data and assumptions.

3. **Calculate the disposal inventory in terms of waste material parameters.** Several waste material parameters (e.g., iron-based metals/alloys, rubber, plastics, etc.) have been identified by SNL/NM as being potentially significant in relation to the performance of the WIPP repository (see Table 1-1). Calculating the WIPP disposal inventory in terms of these parameters provides input for the SPM and PA calculations and sensitivity analyses needed to determine compliance with federal standards.

1.5 TRU SYSTEM-WIDE DATA ASSUMPTIONS

As stated earlier, the WTWBIR was developed using the best available information from the TRU waste generator/storage sites. Some sites used different assumptions and methodologies for reporting its waste stream data. Because of these differences, the WTWBIR team had to make assumptions and take specific steps to ensure consistency among the sites' reported data. This section addresses the system-wide assumptions and actions taken by the WTWBIR team in rolling up the waste stream data. For a description of site-specific assumptions, see Appendix A.

1.5.1 Waste Material Parameter Assumptions

The waste material parameter information reported by the sites must be summed and averaged to obtain data at the site-specific and WIPP waste profile levels. For some waste streams, however, not all of the waste parameter data were available from the sites. In order to calculate

material parameters from the waste stream data provided by the sites, the following assumptions were made by the WTWBIR team:

- If only the average waste material value was provided for a specific waste stream, the average value was assigned to the minimum and maximum values.
- If the maximum value was provided and the minimum value was zero, the average value was computed as half of the maximum value.
- If only the minimum value was provided, the minimum was assigned to both the maximum and average values.
- If only the final waste form group was provided, the average set of parameters was calculated by volume averaging the parameters from other waste streams of the same final waste form group.

Waste material parameter data contained in the body of this report are based on these assumptions, whereas, individual waste stream profiles included in Appendix A contain the original, unchanged data as reported by the generator/storage sites.

1.5.2 Inventory Volume Assumptions

Other assumptions had to be made by the WTWBIR team to ensure consistency in WIPP inventory volumes:

- The volume reported for the years 1992 and 1993 was supposed to be cumulative, whereas, the values for the remaining years were to be reported as generation volume per year. Since not all of the sites reported their inventory in this manner, the WTWBIR team had to recalculate the volumes provided to attain a cubic meter/year basis for some waste stream volumes;
- Many sites did not provide final waste form volumes. Final waste form volumes are used in determining the overall WIPP inventories. In those instances, the WTWBIR team assumed that the reported, current volume would be the same as the final waste form volume.

1.5.3 Packaging Material Assumptions

The TRU waste container data was not reported consistently. While most did, many of the sites did not provide data for final form in WIPP approved containers. Some reported their waste in current containers while others did not provide container information. Adjustments had to be made to the data to:

- Achieve consistency at the waste stream level in the presentation of data in the waste stream profiles (Appendix A)
- Produce the upper-level waste packaging rollups needed by SPM/PA as inputs to the modeling activities.

Waste Profile Assumptions

The WTWBIR team assigned the TRUCON and NMVP codes based on the best available information. Each waste stream profile in Appendix A was reviewed for consistency in reporting packaging configurations. In cases where incomplete information was submitted by the TRU

sites, clarifications were requested from the TRU waste generator/storage sites. In those cases where clarifications were not received from the TRU sites, the following assumptions were made, concerning the waste stream profiles:

- If the site provided final form containers, the final form containers (i.e., drums, standard waste boxes [SWB], or RH canisters) were used.
- In some cases where final waste form containers were not provided a 55-gallon drum was assumed.
- If a particular waste container was reported by the sites (but no further information was provided) or was assigned by the WTWBIR team (e.g., 55-gallon drum), "standard" values of the waste container properties (see Table 1-3) were added to the waste profile forms. An example of this process is listed below for a reported 55-gallon drum without any additional information:
 - Type of material used to fabricate the waste container (steel)
 - The internal volume of the container (0.208 m^3)
 - Inclusion of a "standard" density for the container (131 kg/m^3).
- If sites reported a "plastic" or "rigid" liner without any further definition of the liner then the values in Table 1-3 were used in the waste stream profiles:
 - A 90-mil high density polyethylene (HDPE) liner was assumed
 - The density for that type of liner was assumed (37 kg/m^3).
- If the container fields called "Number Stored" and "Number Projects" are left blank, it is because of one of the following reasons:
 - There is a change from one type of waste container to another on the waste profile form page 2 (different internal container volumes) and therefore the number of containers stored and projected represent different volumes and a direct comparison is not possible.
 - There is an unresolved discrepancy between the number of containers and the volumes quoted on the waste stream profile. It has been assumed that the waste volumes are the most accurate information provided by the TRU waste sites.

For CH-TRU waste containers, the following assumptions were also made:

- If waste was reported in containers larger than drums, then the waste was divided into SWBs with standard plastic bag liners. The standard internal volume for SWBs (Table 1-3) and the reported waste stream volume were used to determine the number of SWBs.
- If the waste was reported in a liquid or sludge form (i.e., tanks), the WTWBIR team assumed that the waste will be placed in drums with rigid liners. No treatment volume expansion was included unless reported as such by the sites.

For RH-TRU waste, the following assumptions were made:

- If the waste was reported in drums, the drums were assumed to be overpacked in RH canisters at three drums per canister.
- If the waste was not reported to be in drums, the waste was assumed to be direct loaded into RH canisters. The standard internal volume for RH canisters and the reported waste stream volume were used to determine the number of RH canisters.
- The lead in the RH canister (465 kg/m^3) is assumed in the packaging rollups even if it is not stated on each RH waste stream profile.

Table 1-3. Packaging Material Assumptions

| Container Configuration | Steel (kg/m^3) | Plastic (kg/m^3) | Lead (kg/m^3) | Volume (m^3) |
|---|------------------------------|--------------------------------|-----------------------------|----------------------------|
| 55-gallon drum | 131 | 37 | N/A | 0.208 |
| SWB (direct load) | 154 | 1.2 | N/A | 1.89 |
| SWB (overpack) (4 55-gallon drums) | 210 | 16 | N/A | 1.89 |
| RH-TRU Canister | 435 | 0 | 465 | 0.89 |
| RH-TRU Canister (overpack of 3 55-gallon drums) | 527 | 26 | 465 | 0.89 |

Assumptions to Produce Packaging Estimates on a System-Wide Basis

In order to add up the packaging materials for the waste as it would arrive at WIPP, the following standard container configuration was used for computing waste packaging materials from all sites. If the site provided final waste form containers, the final form containers (i.e., drums, standard waste boxes [SWB], or RH Canisters) were used, but standard liners were assumed. This was done because many sites did not provide liner information. The inclusion of standard liners produces a conservative estimate for PA and SPM calculations.

1.5.4 Radionuclide Information Assumptions

There are some waste streams from TRU waste sites which report for some waste streams incomplete radionuclide information (e.g., some show mixed fission products but no transuranic isotopes). These waste streams are expected to be demonstrated to be TRU upon completion of the radionuclide characterization.

The waste stream profiles provided in Appendix A contain waste stream specific radionuclide information, if provided by the TRU waste sites. Some sites provided only isotopic mixes, which are explained in Appendix H.

1.5.5 Comparison of IDB versus WTWBIR Waste Volumes

Differences occur between the waste volumes reported in the draft Revision 10 of the IDB (Appendix I) and those reported in Chapter 6 on a site level. Listed below is the currently-known logic for some of the differences:

- In the IDB, 40% of the INEL CH-TRU waste and 50% of the Hanford CH-TRU waste reported is assumed to be low-level waste by INEL and Hanford and is not included in the WTWBIR
- Some of the projected waste at ANL-E in the WTWBIR is accounted for in the Hanford projections. This is not the case for the IDB.
- The ANL-W waste reported for WTWBIR is included in the INEL IDB waste volumes.
- The totals for SRS CH-TRU and RH-TRU projected waste volumes in the draft Revision 10 IDB are in error. The corrected IDB total projected CH-TRU is 13,700 m³ and for RH-TRU, 35.9 m³.

These inconsistencies and others between the WTWBIR and IDB for TRU waste volumes is a main focus of the Revision 2 data update of the WTWBIR.

1.6 BASELINE INVENTORY UPDATES

The WTWBIR represents the best available TRU waste inventory information in support of the WIPP Project. It is anticipated that the WTWBIR will be updated periodically. This update cycle will be modified based on the availability of additional waste information or the data needs of the WIPP Project as determined by the DOE.

1.7 DOCUMENT ORGANIZATION

The WTWBIR is organized into chapters of text, figures, tables and supporting appendices. It flows from specific, detailed TRU waste information (provided by the TRU waste generator/storage sites) to the top level development and description of waste profiles and waste material parameters. The contents of remaining chapters in this document are summarized below:

- Chapter 2 discusses the methodology used to define the TRU waste disposal inventory.
- Chapter 3 outlines the methodology used to derive waste stream profiles, site-specific waste profiles, and WIPP waste profiles.
- Chapter 4 provides the WIPP disposal radionuclides inventory. The methodology used for deriving the inventories is also included.
- Chapter 5 rolls up the waste material parameter information assigned at the waste stream profile level in Chapter 3 to obtain parameter totals. These totals are presented as parameter weights per volume.
- Chapter 6 presents stored and projected CH-TRU and RH-TRU inventories by site and a system-wide rollup of CH-TRU and RH-TRU volumes.
- Chapter 7 contains a description of the WTWBIR and a data dictionary.
- Chapter 8 contains a glossary of important terms used in this document.
- Chapter 9 lists references cited in the WTWBIR.
- Several appendices also are provided to either present more detailed waste inventory information or to describe the methodology in more detail. The appendices are provided in Volumes 2 and 3 of this WTWBIR.

2. TRU WASTE DISPOSAL INVENTORY

2.1 INTRODUCTION

The TRU waste disposal inventory is derived from existing information on waste, which has been provided by the DOE TRU waste generator/storage sites and is predominately based on process knowledge. In addition to the general process knowledge of a waste stream for nonradionuclide parameters, the radionuclide inventories from the IDB TRU waste site submittals (DOE, 1994b) are derived from non-destructive assay, with some analytical analyses (to detect isotopes that do not lend themselves to non-destructive analyses or to evaluate waste streams that cannot be effectively analyzed through non-destructive methods), and on-site accountability and tracking records of special nuclear materials including any changes of isotopic ratios during processing. This chapter is designed to assist the reader by describing the existing waste information used to derive the inventory and the methodology used to correlate and combine the existing data into a WIPP disposal inventory.

2.2 SOURCE OF TRU WASTE INFORMATION

Transuranic waste information primarily exists in two forms within the DOE TRU waste system:

- On-site documentation developed by the TRU waste generator/storage sites during the history of their operations.
- Summary reports, usually prepared to support WIPP documentation requirements. These summary reports have either been generated by the DOE area office in charge of WIPP or at the DOE-Headquarters (HQ) level. The information contained in these reports is derived from the TRU waste generator/storage sites.

2.2.1 Site-Specific Waste Information

The TRU waste generator/storage sites use a variety of on-site documents and records in order to derive the information listed in the individual waste streams in Appendix A. The documents/records can include many different sources, some of which might be the following: procurement records, waste stream process manuals, operating procedures, on-site safety documentation, process diagrams, waste production records, storage records, on-site waste database management systems, interviews with existing and former workers, transportation records, waste container tracking records, on-site documentation prepared for local, state, or regional regulators. This list is not meant to be inclusive or representative of all records used at every site. It is intended to be used for example purposes only. The number and types of documents can vary greatly from site-to-site so it is impractical to list them as references in this document.

Each DOE TRU waste site was provided, by the WTWBIR team, WTWBIR Revision 0 data packages defining the characterization of each TRU waste stream at their site. The generator/storage sites reviewed, changed, and authorized the characterization as valid for use in developing the WIPP inventory.

2.2.2 Existing Summary Documents on TRU Waste Information

In support of various programs, the DOE has published a series of documents over the years in support of various programs which contain varying amounts of waste information. Listed below are those documents that have formed the foundation of summary TRU waste information prior to the publication of the WTWBIR.

Mixed Waste Inventory Report

The FFCAct required that the DOE, within 180 days of enactment of the FFCAct, submit to the EPA Administrator and the governor of each state in which the DOE stores or generates mixed wastes a report that contains:

- National inventory of all mixed wastes, regardless of the time they were generated, on a state-by-state basis and
- National inventory of mixed waste treatment capacities and technologies.

The FFCAct also stipulated specific reporting requirements for each of these inventories. The DOE submitted the six-volume set entitled: *U.S. Department of Energy Interim Mixed Waste Inventory Report: Waste Streams, Treatment Capacities and Technologies*, DOE/NBM-1100, dated April 1993 (DOE, 1993c), to fulfill these requirements. Since issuance of the "interim" report, DOE has requested additional information from the DOE TRU waste generator/storage sites and published two updated reports entitled:

- *Release of Phase I Mixed Waste Inventory Report Data*, dated April 1, 1994 (Phase I MWIR) (DOE, 1994c), which includes a data diskette (Version .97B) and the draft *Mixed Waste Inventory Report Data Base System User's Guide*.
- *Distribute [Distribution] of the Phase II Mixed Waste Inventory Report Data*, dated May 17, 1994 (Phase II MWIR) (DOE, 1994a), which includes a data diskette (Version 1.00) and the draft *User's Guide for National Data Base System for the Final Mixed Waste Inventory Report* (May 1994).

The Phase II MWIR was the basis of the mixed waste streams that were included in Revision 0 of the WTWBIR. The DOE waste generator/storage sites have reviewed the existing waste streams from Revision 0 of the WTWBIR and have updated the information. In a very few cases mixed waste streams from the Phase II MWIR have been deleted by the generating/storage sites from Revision 1 of the WTWBIR. Any waste stream that was published in the Phase II MWIR and has a waste stream profile in the WTWBIR contains an identification code in the "MWIR ID" and "WIPP ID" fields on the waste stream profile forms (see Figure 1-2). The identification codes are assigned using the following format:

- DD-WXXX;
 - DD = Site Identification Code (from Figure 1-1)
 - XXX = Three digit numerical code assigned by DOE-HQ

Some sites have submitted "new" mixed waste streams with the Revision 1 WTWBIR data call, which were not in the Phase II MWIR. Therefore, these waste streams have not been assigned DD-WXXX identification numbers by DOE-HQ. Those mixed TRU waste streams which have been reported for the first time in Revision 1 of the WTWBIR have been designated as:

- DD-MXXX (DD and XXX have same meaning as for the MWIR waste streams, except that the three digit numerical code was assigned by the WTWBIR team)

Waste streams that are nonmixed TRU waste do not appear in the Phase II MWIR. Nonmixed TRU waste streams that appear in the WTWBIR have been designated as follows:

- DD-TXXX (DD and XXX have the same meaning as for MWIR waste streams, except that the three digit numerical code was assigned by the WTWBIR team)

INEL included some nonmixed waste streams in the Phase I MWIR which had the MWIR characteristic DD-WXXX identification. These have been retained in the WTWBIR, but all other nonmixed TRU waste streams have used the DD-TXXX designation, including some "new" nonmixed waste streams from INEL.

Integrated Data Base

The IDB (DOE, 1994b) is published by Oak Ridge National Laboratory (ORNL) for the DOE. The ORNL assembles radioactive waste inventories provided by DOE TRU waste generator/storage sites. This database does not report by waste stream, but rather, by the total inventory at each DOE site. The IDB also contains the radionuclide isotopic distribution for the waste stored at each site. Because consistent reporting is not available at the waste stream level, the radionuclide information in the IDB is the basis for the Revision 1 WTWBIR inventory for radionuclides (see Chapter 4). Where sites provided radionuclide data, it is replicated in Appendix A. A WIPP disposal radionuclide inventory is provided in Table 4-2. This table is derived from unpublished IDB submittals from the TRU waste sites.

Other Sources of TRU Waste Information

There are three additional summary documents that have been produced which contain extensive information about TRU waste. The amount and form of the documentation varies between documents due to the initial purpose for including waste information. These include:

- TRUCON (DOE, 1992) - The TRUPACT-II Content (TRUCON) Code document was developed to provide waste information to the Nuclear Regulatory Commission in support of the TRUPACT-II certification application. The TRUCON concentrated on those waste parameters that were important for safe transportation of TRU waste (e.g., thermal heat loading, criticality, free liquids, etc.)
- NMVP (DOE, 1990) - The No-Migration Variance Petition (NMVP) was developed by DOE to obtain a variance from the land disposal restrictions for mixed waste as allowed under 40 CFR 268.6 (EPA, 1986). The NMVP waste information concentrated on defining the volumes of various known TRU and MTRU waste streams in the DOE system at that time, and identifying the hazardous constituents expected to be found in the MTRU waste streams. Text was provided in the NMVP on each known waste stream at that time which summarized the process knowledge and sampling and analysis information available (many WTWBIR waste streams were not defined at the time the NMVP was developed).
- WIPP RCRA Part B Permit Application (DOE, 1993b) - This document which will be revised and submitted to obtain a Part B Permit for WIPP to the State of New Mexico. This document will represent in some parts an update of the NMVP and will incorporate much information from the WTWBIR.

TRU waste streams that are included in the TRUCON and the NMVP are cross correlated, if possible, to WTWBIR waste streams in Appendix F. The designation of each waste stream in the TRUCON and NMVP, if applicable, can be found on the waste stream profile (Figure 1-2). The WTWBIR should be considered the most current source of waste stream information when there is a discrepancy in information between the WTWBIR and the TRUCON or NMVP documents.

2.3 METHODOLOGY FOR DEVELOPMENT OF DISPOSAL INVENTORY

Development of the WIPP TRU waste disposal inventory is accomplished by a series of steps starting with the individual waste streams submitted by the TRU waste generator/storage sites that are identified in Appendix A. These waste stream profiles are grouped together, based on similar physical and chemical properties, into common "WIPP waste profiles," which should facilitate discussions concerning the disposal waste inventory with regulatory agencies and stakeholders. The waste profiles also contain information on waste material parameters that could affect the performance of the WIPP repository and that may be direct inputs to the SPM and PA models. A more detailed explanation of the waste profile methodology is found in Chapter 3.

Because the existing stored and currently projected CH-TRU waste streams do not contain sufficient volume to fill the maximum allowed (designed) capacity of WIPP, scaling of the projected inventories is necessary to attain the following WIPP design inventory:

- Maximum CH-TRU design inventory = 6.2 million cubic feet (~176,000 cubic meters) (Public Law 102-579, 1992)

The anticipated inventory (as defined in Section 1.3.1) consists of 11 overall CH-TRU WIPP waste profiles based on the physical and chemical properties of the waste streams. The CH-TRU scaling factor is computed as follows:

- For CH waste:

$$\frac{\text{design inventory} - \text{stored inventory}}{\text{projected inventory}} = \text{CH-TRU scaling factor}$$

The RH-TRU anticipated inventory would be scaled using the same methodology. If the anticipated RH-TRU and CH-TRU inventories are less than the WIPP design limits, the projected inventory in future revisions of the WTWBIR will include volumes of waste anticipated from D&D and ER activities as these estimates are made available.

The disposal inventory is the total inventory to be used in SPM and PA calculations. To calculate the disposal inventory by WMCG for CH-TRU waste, the projected inventory is multiplied by the scaling factor, added to the stored inventory for each WMCG and summed together. See Section 3.3.2 for further details.

3. WASTE PROFILE METHODOLOGY

3.1 WASTE STREAM PROFILE METHODOLOGY

3.1.1 Introduction

The lowest tier of information in the WTWBIR is the waste stream profile, which documents specific information for each separate TRU waste stream identified by each DOE TRU waste generator/storage site. In this chapter the waste stream profile will be discussed along with the methodology for grouping waste streams into site-specific profiles and WIPP waste profiles.

3.1.2 Waste Stream Profile Description

Each DOE TRU waste generator/storage site was provided data packages that contained the waste material parameter characterization as defined in the WIPP disposal inventory (WTWBIR, Revision 0). Each DOE site was asked to review the data packages and update the information as necessary (see Appendix D for the WTWBIR Revision 1 Questionnaire). Additionally, the sites were required to generate data packages for waste streams that were not defined. This data submittal from the DOE generator/storage sites provided approximately 360 individual TRU waste streams that were used in developing the waste stream profiles (see Appendices A and J). These waste stream profiles were developed using information from the sources listed in Section 2.2. Figure 3-1 provides an example TRU waste stream profile for an INEL waste stream.

In addition to presenting the quantity of waste material parameters in each DOE waste stream, the waste stream profile also provides a cross-reference (top of the waste stream profile form) to the different waste stream nomenclature used in previously generated DOE documents (i.e., TRUCON, NMVP). Appendix F provides a cross correlation table for a WTWBIR waste stream with the NMVP and the TRUCON. The fields utilized on the waste stream profile, the sources of the information, and a short explanation of the data located in a particular field are described in Table 3-1. A complete set of the waste stream profiles is provided in Appendices A and J. Because the West Valley Demonstration Project (WVDP) is a commercial TRU waste site, it is not part of the WIPP inventory, but the WVDP waste stream profiles are provided in Appendix J for information purposes.

The sites were not requested to provide the EPA codes as this information was derived from the Phase II MWIR. EPA codes for mixed waste streams not defined in MWIR were provided by the generator/storage site. During development of the MWIR, DOE directed the TRU waste generator/storage sites to append their hazardous waste codes (EPA codes) to further define the waste in order to develop an appropriate treatment technology. These code designations and descriptions are presented in Appendix G. For example, D003 is defined by EPA as reactive. DOE further defined this code as D003A (reactive cyanide), D003B (reactive sulfides), D003C (explosives), D003D (water reactives), and D003E (other reactives).

3.1.3 Assignment of the Waste Matrix Code Group

The DOE TRU waste generator/storage sites have assigned an overall WMC to each waste stream based on the current form of the waste. The WIPP Project has developed the WIPP WAC (DOE, 1991) for any waste packages to be shipped to WIPP to ensure the safe handling and emplacement of the waste packages in the WIPP. In general, the waste forms acceptable for emplacement in WIPP are described in Table 1-2. Each waste stream has been assigned a WMC by the TRU waste generator/storage site that defines the general physical and chemical properties of the waste.

WASTE STREAM PROFILES (continued)**

| Information Field | Source of Information | Explanation |
|---|------------------------------------|---|
| MATERIAL PARAMETERS | TRU waste sites | Record the "Upper Limit"; "Lower Limit"; and "Average" in kg/m ³ for each waste material parameter, if known |
| <u>STORED TRU WASTE AND ESTIMATED RATES OF WASTE GENERATION</u> | TRU waste sites | Provides estimate of stored volumes of waste at the "End of 1992"; "End of 1993" and estimated projections for waste generation. Information is recorded for waste stream volumes as stored or generated and in terms of "final volume" for shipment to WIPP. |
| <u>TYPICAL ISOTOPIC COMPOSITION</u> | TRU waste sites | Provides estimate of "typical" radionuclide concentration expected in waste stream in a curies/m ³ basis; if concentrations are unknown, only isotopes may be listed. |
| TYPICAL EPA CODES APPLICABLE | MWIR or TRU generator/storage site | Identifies the applicable EPA codes for waste for as it exists at sites;. |
| <u>COMMENTS</u> | TRU waste sites | Lists comments/assumptions on the container information provided by TRU waste sites. |
| <u>FOOTNOTES</u> | WTWBIR | Explain data provided by TRU waste generating/storage sites and/or list assumptions made by the WTWBIR. |

The WMC is located on the first page of each waste stream profile. The assignment of the WMC is based on DOE guidance document (DOE, 1993a).

For the purpose of this document, TRU waste generator/storage sites were requested to provide WMCGs for final waste forms; that is, after the sites process, treat, or repackage the waste. The WMCG is indicated on page 1 of the waste stream profile. For most waste stream profiles, the TRU waste generator/storage sites have provided estimates of the waste material parameters (e.g., an INEL waste stream profile is used for illustrative purposes in Figure 3-1). However, in some cases the TRU waste generator/storage sites were unable to provide waste material parameter values for some waste streams. This resulted in two possible changes to the overall methodology presented in this chapter:

- In many cases the TRU waste generator/storage site could categorize the waste stream profile into one of the final 11 WIPP WMCGs (Table 1-2) but could not give any waste material parameter information. In these cases, the WTWBIR assumes the same range and average waste material parameters for the particular WIPP waste profile. For example, if a salt waste stream did not contain any waste material parameter information, but has been

identified by a TRU waste generator/storage site as being a salt waste form, then the volume of that waste stream was added to the total volume of all other salt waste streams.

- In a few cases, TRU waste generator/storage sites were unable to categorize a TRU waste stream into one of the final WIPP WMCGs (Table 1-2). In these cases the waste stream profile is placed in the "unknown" category. The "unknown" waste streams are documented as part of the WIPP inventory, but are not used in any of the scaling of CH-TRU waste volumes necessary to fill WIPP to its design capacity. "Unknown" wastes will have to be characterized and may require treatment prior to emplacement in WIPP.

The TRU waste generator/storage sites have identified several waste streams that are regulated under the Toxic Substances Control Act (TSCA) (i.e., containing asbestos or polychlorinated biphenyls [PCBs]). Because the concentration of the asbestos and/or PCBs is unknown, it is assumed that these waste streams cannot be accepted at WIPP under the proposed draft WIPP RCRA Part B Permit Application. These waste streams are summarized in Table 3-2 and are not included in the WTWBIR.

3.2 SITE-SPECIFIC WASTE PROFILE METHODOLOGY

Waste streams at each TRU waste generator/storage site with similar WMCs can be grouped together into WMCGs (Table 1-2) for a site-specific waste profile. The methodology for grouping waste streams from two different generator/storage sites is shown in Figure 3-2. The grouping of individual waste stream profiles into a site-specific waste profile is based on the similar physical and chemical properties of the waste streams and how that information is used in the SPM and PA models. In the example in Figure 3-2, due to their similar mechanical properties, concrete waste, glass waste, firebrick waste, and ceramic waste mainly influence the estimation of porosity and permeability in the SPM/PA calculations. Therefore, the three waste streams at DOE TRU Waste Site #1 and the two at DOE TRU Waste Site #2 can be grouped together at each site based on similar physical and chemical properties and placed into the site-specific waste profile "inorganic non-metal" waste, with the WMCG defined in Table 1-2.

A site-specific waste profile is developed at each of the TRU waste generator/storage sites for each of the WMCGs that have individual waste streams at the site. These site-specific waste profiles provide a roll-up of the waste material parameter and volume information found in the waste stream profiles for each site. Since there are 11 WMCGs, there are a maximum of 11 possible CH-TRU and 11 possible RH-TRU site-specific waste profiles at any generator/storage site; however, most sites have fewer profiles due to differences in waste segregation practices. An example site-specific waste profile is provided in Figure 3-3. Table 3-3 lists the sources of information for site-specific waste profiles. All the site-specific waste profiles for TRU waste are provided in Appendix B.

3.3 WIPP WASTE PROFILE METHODOLOGY

3.3.1 Introduction and Methodology

The WIPP waste profiles are the highest tier of information in the WTWBIR. Site-specific waste profiles with the same WMCGs are combined across the TRU waste generator/storage sites into what is defined as an overall WIPP waste profile.

TABLE 3-2. TOXIC SUBSTANCES CONTROL ACT (TSCA) TRU WASTE

| WIPP ID | WASTE STREAM NAME | ASBESTOS | PCBs |
|---------|---|----------|------|
| IN-W309 | Absorbed Organic Liquids | No | Yes |
| MD-W002 | Absorbed Aqueous Liquids | No | Yes |
| LL-T005 | HEPA filters | Yes | No |
| MD-M001 | Asbestos Debris | Yes | No |
| MD-T013 | Leaded gloves/aprons | No | Yes |
| MD-T008 | Uncategorized plastics/rubber debris | No | Yes |
| MD-T012 | Uncategorized heterogeneous debris | Yes | No |
| RL-M005 | TRU Mixed Inorganic Homogeneous Solids with Mercury | No | Yes |
| RL-M021 | TRU Mixed Inorganic Debris PCBs with Mercury | No | Yes |
| RL-M022 | TRU Mixed Leaded Gloves/Aprons PCBs with Mercury | No | Yes |
| RL-M023 | TRU Mixed Organic Debris PCBs with IGN, CORR, REAC | No | Yes |
| RL-M024 | TRU Mixed Organic Labpacks with PCBs | No | Yes |
| RL-T030 | Non-mixed Inorganic Debris with PCBs | No | Yes |

As described in Sections 3.1 and 3.2, each waste stream from each TRU waste generator/storage site is defined in a waste stream profile, then grouped by site WMCGs into site-specific waste profiles. These site-specific waste profiles are then rolled-up into WIPP waste profiles by combining identical WMCGs from all the TRU waste generator/storage sites. For example, all site-specific waste profiles for "inorganic non-metal" waste are grouped together to generate the WIPP waste profile, "inorganic non-metal" waste. The WIPP waste profiles are presented in Figures 3-4 through 3-23 at the end of this chapter.

3.3.2 WIPP Waste Profile Roll-Ups

To illustrate the methodology for grouping similar site-specific waste profiles into WIPP waste profiles, the WIPP waste profile for "inorganic non-metal" waste (exemplified in Figure 3-2) is provided in Figure 3-8. As with site-specific waste profiles, there can be a maximum of 11 possible WIPP waste profiles for CH-TRU and 11 possible WIPP waste profiles for RH-TRU

| Waste Stream Volume | TRU waste sites | Provides estimates of retrievably stored, projected, and total volumes of TRU and mixed TRU wastes by waste stream. |
| Waste Material Parameters | TRU waste sites | Provides total density estimates of selected waste materials in a particular WMCG for the entire site. |

waste. Table 3-4 lists the sources of information used for the WIPP waste profiles. Using volumes for all the TRU waste streams (including the mixed and non-mixed TRU waste volumes) in the WTWBID, a disposal inventory of TRU waste has been developed using the methodology described in this and the preceding sections. This inventory is presented in Table 3-5 (by WMCGs) and depicts both the anticipated and disposal inventory volumes.

**TABLE 3-4. SOURCES OF INFORMATION USED
IN WIPP WASTE PROFILES**

| Information Field | Source of Information | Explanation |
|--------------------------------|---------------------------|--|
| Waste Matrix Code Group (WMCG) | WTWBIR or TRU waste sites | Groups waste streams that have similar chemical and physical properties (Table 1-2) |
| DOE Site Volumes | TRU waste sites | Provides estimates of retrievably stored, projected, and total volumes of TRU and TRU mixed wastes by DOE site |
| Waste Material Parameters | TRU waste sites | Provides weight estimates of selected waste materials in a particular WMCG for the DOE Complex |

The anticipated CH-TRU inventory volumes are the sum of the "stored" and "projected" volumes in Table 3-5. The procedure to scale to the disposal inventory is summarized below:

- The target design volume of CH-TRU waste beyond that identified by the generator/storage sites is decreased by the "unknown" waste volume ($176,000 - 1700 = 176,000$ [there is no significant increase due to rounding]).

The "unknown" volume of waste in Table 3-5 is subtracted from the stored inventory and from the projected inventory.

- The "unknown" waste will have to be added back into the total scaled inventory because it is assumed that this waste will be characterized and then shipped to WIPP.
- Applying a modified version of the formula given in Section 2.3:

$$\frac{1.76 \times 10^5 - 7.13 \times 10^4}{5.1 \times 10^4} = 2.05 \text{ (scaling factor)}$$

(modified design inventory) – (modified stored inventory)
(modified projected inventory)

- Multiply the CH-TRU waste projected inventory volumes by the scaling factor 2.05 for all the WMCGs, except for the "unknown" waste and add the stored volumes (which results in the numbers in the "Disposal Inventory" column of Table 3-5).
- Add the CH-TRU waste volumes in the fourth column, including the "unknown" waste, to attain the estimated WIPP disposal inventory volume).

The CH-TRU waste stream volume on a system-wide WMCG basis is increased by 42 percent to account for the difference between the anticipated inventory and the repository design limit.

A similar methodology has been developed to scale the RH-TRU inventory. The anticipated RH-TRU inventory volumes are the sum of the "stored" and "projected" volumes in Table 3-5. The procedure to scale to the disposal inventory is summarized below:

- The target design volume of RH-TRU waste beyond that identified by the generator/storage sites is decreased by the "unknown" waste volume (7080 - 35 = 7045).

The "unknown" volume of waste in Table 3-5 is subtracted from the stored inventory and from the projected inventory.

- The "unknown" waste will have to be added back into the total scaled inventory because it is assumed that this waste will be characterized and then shipped to WIPP.
- Applying a modified version of the formula given in Section 2.3:

$$\frac{7045 \quad - \quad 1158}{3595 \text{ (modified projected inventory)}} = 1.64 \text{ (scaling factor)}$$

(modified design inventory) – (modified stored inventory)

- Multiply the RH-TRU waste projected inventory volumes by the scaling factor 1.64 for all the WMCGs, except for the "unknown" waste and add the stored volumes (which results in the numbers in the "Disposal Inventory" column of Table 3-5).
- Add the RH-TRU waste volumes in the fourth column, including the "unknown" waste, to attain the estimated WIPP disposal inventory volume).

The RH-TRU waste stream volume on a system-wide WMCG basis is increased by 48 percent to account for the difference between the anticipated inventory and the repository design limit.

4. WIPP DISPOSAL RADIONUCLIDE INVENTORY

4.1 INTRODUCTION

The TRU waste generator/storage sites were requested in the Revision 1 data call to submit estimates of the radionuclide inventory on a waste stream basis. Most sites complied with the data request, but many waste streams submitted to the WTWBID did not contain this information. Due to the short timeframe given the TRU waste generator/storage sites for the Revision 1 data call, sufficient time was not available to derive the data to support each waste stream. The radionuclide data provided on a waste stream basis in Appendix A of the WTWBIR is currently for information purposes only.

4.2 METHODOLOGY

Since the waste-stream specific radionuclide data is insufficient to derive a radionuclide inventory, the site-wide radionuclide inventories reported in the Integrated Data Base (IDB) were used. The most recent IDB (DOE, 1994b) will be used which contains unpublished radionuclide data by site for stored TRU wastes as of December 31, 1993 (Appendix I).

There are still some volume differences at a TRU waste generator/storage site level between the IDB and the WTWBIR (see Section 1.5.4). Closure between the two data sets should be achieved with the Revision 2 WTWBIR data call and publication of Revision 2 of the WTWBIR. Therefore, the volume data from the IDB database (DOE, 1994b) has been used to make the estimates of stored and projected volumes used in deriving the radionuclide information. By using the volume and radionuclide data from the IDB database, there exists one internally consistent set of data for estimating the radionuclide inventory.

IDB radionuclide data is only available for stored TRU waste. Therefore, this historical radionuclide data will also be used to make estimates of the projected radionuclide inventories and for any necessary scaling. Until estimates are available from the TRU waste generator/storage sites on projected radionuclide inventories, the IDB represents the only comprehensive database.

The WIPP radionuclide disposal inventory for CH-TRU waste has been calculated as follows:

- The stored and projected volumes from the IDB (DOE, 1994b) data have been used for the volume estimates and are included in Table 4-1.
- The radionuclide data included as part of the data submitted for the IDB (DOE, 1994b) represents the stored waste only. Appendix E provides the radionuclide inventory by TRU waste site for the stored inventories listed in Table 4-1. These numbers have been decayed to December 1993, using the Radioactive Decay and Accumulation Code (RADAC) System (DOE, 1994d).
- For a particular site and radionuclide, divide the reported inventory for that radionuclide from the IDB (Appendix E) by the volume of stored waste at that site from the IDB (Table 4-1). This results in a curies/m³ estimate for all reported radionuclides at each site.
- The projected volumes of waste are assumed to have the same radionuclide concentrations on a cubic meter basis as the stored waste at each site.

- Since Bettis Atomic Power Laboratory (BT) and Ames Laboratory (AL) reported no existing CH-TRU waste volume inventory, there is no radionuclide inventory for these sites in the IDB. The projected volumes from these two sites, BT (123.5 m³), and AL (0.09 m³) have been grouped with the INEL projected CH-TRU waste and assumed to have the same isotopic composition.
- The total volume of projected CH-TRU waste from the IDB in Table 4-1, if added to the stored waste volumes from the IDB, exceeds the capacity of WIPP (176,000 m³)
- To calculate the radionuclide inventory the total projected CH-TRU waste is adjusted as follows:
 - Maximum design capacity for CH-TRU = 176,000 m³
 - Stored CH-TRU volume = 104,000 m³
 - Allowable projected volume = (176,000 - 104,000) x 10⁵ m³ = 72,000 m³
 - Projected waste adjustment factor =

$$\frac{\text{Allowable projected volume}}{\text{Projected volume reported by sites}} = \frac{72,000 \text{ m}^3}{64,600 \text{ m}^3} = 1.11$$

- Therefore, the projected radionuclide inventory for each radionuclide at each site is calculated as follows:

$$\text{Stored Radionuclide Inventory} + \left(\text{Concentration of radionuclide in stored waste in curies/m}^3 \times \text{Volume of projected waste at site} \times 0.65 \right) = \text{Total CH-TRU inventory for radionuclide at that site}$$

The building of the WIPP radionuclide disposal inventory for RH-TRU waste has been calculated similar to the CH-TRU radionuclide inventory, with the exception of the following:

- Three RH-TRU waste streams that are projected waste streams only were submitted with no accompanying isotopic information: RL-M201, RL-T202, and SR-T001. THESE WASTE STREAMS, WHICH ACCOUNT FOR THE PROJECTED HANFORD AND SRS RH-TRU WASTE VOLUMES, HAVE BEEN OMITTED FROM THE RADIONUCLIDE INVENTORY CALCULATIONS due to the lack of radionuclide information. The RH-TRU projected volumes in the Draft Revision 10 IDB (Appendix I) include both the reported volumes in the two projected Hanford RH-TRU waste streams and the "suspect" volumes reported in the comment field of the two Hanford waste streams (RL-M201 and RL-T202 Appendix A).
- BT did not report stored RH-TRU inventories and the projected inventories have been omitted because no radionuclide information is available.
- The sum of the stored and projected volumes of RH-TRU waste from the TRU waste sites is less than the design capacity of WIPP (7080 m³) for RH-TRU waste.

- To calculate the radionuclide inventory the total projected RH-TRU waste is adjusted as follows:

- Design capacity for RH-TRU = 7080 m³
- Stored RH-TRU volume = 941 m³
- Therefore the needed projected waste volume is:

$$7080 \text{ m}^3 - 941 \text{ m}^3 = 6139 \text{ m}^3$$

- The projected RH-TRU waste volume (excluding the 2 RL and SR waste streams) is 957 m³
- The projected waste volume must be increase by the following factor to "scale" to fill the RH-TRU design capacity:

$$\frac{6139 \text{ m}^3}{957 \text{ m}^3} = 6.41$$

- Therefore, the projected radionuclide inventory for each radionuclide at each site is calculated as follows:

$$\text{Stored Radionuclide Inventory} + \left(\text{Concentration of radionuclide in stored waste in curies/m}^3 \times \text{Volume of projected waste at site} \times 6.41 \right) = \text{Total RH-TRU inventory for radionuclide at that site}$$

Table 4-2 represents the total radionuclide inventory for CH-TRU and RH-TRU wastes as derived from the Revision 10 IDB database, including any adjustment needed to the projected volumes of waste in order to fill the WIPP to the maximum CH-TRU and RH-TRU design limit.

A comparison of the disposal radionuclide inventories in Revision 0 and in Revision 1 of the WTWBIR shows large changes. Listed below are the dominant reasons for these changes:

- The total radionuclide inventory for CH-TRU waste is much higher than that included in the Revision 0 of the WTWBIR. This is primarily due to two changes:
 - The SR has reported a large volume of CH-TRU projected waste in the IDB ($\approx 62,000 \text{ m}^3$), which was previously reported as "unknown." With the historically high Pu-238 content, this considerably raises the total curies in the CH-TRU inventory.
 - During the calculations for the Revision 0 inventory, the "projected" part (1994–2022) of the CH-TRU radionuclide inventory was inadvertently left out of the totals reported, causing the inventory numbers to be low ($\approx 25\%$). This has been corrected in this inventory definition.

- The total radionuclide inventory for RH-TRU waste is also much higher than that included in the Revision 0 of the WTWBIR. During calculation of the RH-TRU inventory the volume defined by the sites included more waste than the repository could hold. During those calculations, a misunderstanding occurred about the fact that the IDB radionuclide numbers only covered the "stored" part of the inventory. This caused the Revision 0 WTWBIR reported RH-TRU inventory to be low by a factor of approximately 3 – 4. This has been corrected in this inventory definition.
- Oak Ridge National Laboratory (ORNL) has reported a very conservative inventory for U-235 in RH-TRU waste (≈ 367 curies before scaling). In order to provide a less conservative estimate of the U-235 inventory, an anticipated transportation requirement of the RH-TRU cask has been imposed.

The new estimate for U-235 in ORNL RH-TRU waste has been calculated from the anticipated initial transportation limit in the RH-TRU cask of 325 grams (DOE, 1991) of Pu-239 fissile gram equivalent (FGE). Assuming a 1:1 equivalence of U-235 FGE (as required by the TRUPACT-II SARP; Nuclear Packaging, 1991) to Pu-239, this provides a bounding limit of 325 grams of U-235/canister \times 7955 canisters \times 2.19×10^{-6} curies/gram = 5.66 curies of U-235 in RH-TRU waste inventory. This number has been substituted in Table 4-2 to replace the overly conservative data reported by ORNL.

Table 4-1. CH-TRU and RH-TRU IDB Waste Inventories

| CH-TRU Site | Stored IDB-ORNL (m³) | Projected IDB-ORNL (m³) |
|--------------------|--|---|

| SR ⁴ | 0.0 | 35.9* |
| Sum RH-TRU | 941.0³ | 956.74 |

* Excluded from the IDB-based RH-TRU radionuclide inventory rollups because no radionuclide information was submitted.

1. 40% of this stored inventory assumed to be low-level waste.
2. 50% of this stored inventory assumed to be low-level waste.
3. Does not include 5.3 m³ of RH-TRU at NTS which is anticipated to be CH-TRU after repackaging.
4. The IDB volumes for SRS projected CH-TRU and RH-TRU waste have been corrected since issuance of the Draft Revision 10 IDB (Appendix I).

5. WASTE MATERIAL PARAMETERS

5.1 INTRODUCTION

Some waste materials that occur in TRU waste may degrade over the 10,000-year regulatory period and estimates of masses/volume are needed for performance modeling (Table 1-1). Some of these waste materials may produce gas by either chemical, microbial, or radiolytic processes (WIPP PA, 1993). These types of processes need to be evaluated as part of the WIPP SPM and PA modeling effort to analyze their impact on repository behavior.

5.2 PARAMETER DESCRIPTION

This chapter identifies and defines the waste material parameters to be evaluated in performance assessment calculations. The same methodology used for defining waste stream profiles and combining them into site-specific and WIPP waste profiles is used to develop a disposal inventory for WIPP by waste material parameters (see Figure 3-2). Waste material parameter information is provided for each waste stream profile by the TRU waste generator/storage sites (Figure 1-2). In those cases where waste material parameter information could not be provided by the TRU waste generator/storage sites, an alternative methodology was adopted as described in Section 3.1.3. This waste material parameter information is used to estimate the anticipated WIPP inventory, which is then scaled to obtain the repository design limit (disposal inventory), if needed. This inventory is presented as a weighted average with a maximum and minimum expected weight/volume for each waste material parameter.

The waste material parameter information, which is provided by the TRU waste generator/storage sites, consists of 10 waste material parameters and additional packaging materials that are direct inputs into the SPM and PA models. These are presented below.

Inorganics

- Iron-based metals/alloys – This designation is meant to include iron and steel alloys in the waste and does not include the waste container materials.
- Aluminum-based metals/alloys – Aluminum or aluminum-based alloys in the waste materials.
- Other Metals – All other metals found in the waste materials (e.g., copper, lead, zirconium, tantalum, etc.). The lead portion of lead rubber gloves/aprons is also included in this category.
- Other Inorganic Materials – Include inorganic non-metal waste materials such as concrete, glass, firebrick, ceramics, sand, and inorganic sorbents.

Organics

- Cellulosics – Includes those materials generally derived from high polymer plant carbohydrates. Examples are paper, cardboard, kimwipes, wood, cellophane, cloth, etc.
- Rubber – Includes natural or manmade elastic latex materials. Examples are Hypalon®, neoprene, surgeons' gloves, leaded-rubber gloves (rubber part only), etc.

- Plastics – Includes generally manmade materials, often derived from petroleum feedstock. Examples are polyethylene, polyvinylchloride, Lucite, Teflon, etc.

Solidified Materials

- Inorganic Matrix – This includes any homogenous materials consisting of sludge or aqueous-based liquids that are solidified with cement, Envirostone[®], or other solidification agents. Examples are wastewater treatment sludge, cemented aqueous liquids, and inorganic particulates, etc.
- Organic Matrix – This includes cemented organic resins, solidified organic liquids, and sludges.

Soils

- Generally consists of naturally occurring soils that have been contaminated with inorganic waste materials.

Packaging Materials

The TRU waste generator/storage sites have been asked to define waste streams in each waste stream profile expressed as final waste form and volumes in containers that are currently approved for shipment. Listed below are the currently approved CH-TRU packaging configurations for TRUPACT-II (DOE, 1991) and anticipated approved RH-TRU packaging configurations (DOE, 1991):

- TRUPACT-II
 - 55-gallon drum
 - Standard Waste Box (SWB)
 - 55-gallon drums overpacked in SWB.
- RH-TRU cask (anticipated acceptable packaging configurations for the RH-TRU cask)
 - RH-TRU canister
 - three 55-gallon or 30-gallon drums overpacked in a RH-TRU canister.

In cases where the sites defined a type of waste container, but not the weight/volume of the packaging, assumptions were made about the weight of the containers in order to include these estimates as part of the overall inventory destined for WIPP. If overpacking a waste container was necessary for transport in a shipping cask, overpacking was assumed. The densities assumed are included as part of the "TRU system-wide data assumptions" included in Section 1.5.

- Steel – The weight of the steel part of the packaging from container information provided by the TRU waste generator/storage sites. Any necessary overpacking is included in the weight.
- Plastics – The weight of any plastic packaging submitted by the TRU sites. When weight of a rigid liner is not given a 90-mil HDPE liner is assumed.

- Lead – The weight of the Pb shielding in a RH canister is assumed if not provided by the TRU waste sites. The weight is included in the "Packaging Material Assumptions" in Chapter 1.5.3.

5.3 METHODOLOGY

The rollups of waste material parameters by WMCGs or by site use the volumes from the WTWBID. The roll ups by WMCGs or by site require combining data from several WTWBID waste streams. The averages for the material parameters are calculated from the average densities provided by the TRU waste generator/storage sites modified by the WTWBID volume fractions and summed as follows:

$$\begin{array}{l} \text{Average Density} \\ \text{of waste material} \\ \text{parameter} \end{array} = \text{Average Density}_i \times \frac{\begin{array}{c} \text{(Volume WTWBIR} \\ \text{Stream}_i) \end{array}}{\begin{array}{c} \text{(Total Volume of} \\ \text{WMCG)} \end{array}} + \dots$$

where i is an index representing individual waste streams of the same WMCG

The minimum density is chosen as the smallest minimum density of a particular waste material parameter in the WTWBID waste streams in a particular site-specific rollup. The maximum density is chosen in a similar manner, except that the largest maximum density was chosen.

In many cases, the TRU waste generator/storage sites did not have data for minimum and maximum percentages, even though average percentages are provided. In these cases, for rollup purposes only, the minimum is assumed to be zero and the maximum is assumed to be equal to the average. This ensures that the calculated and rolled up maximum densities are greater than the average densities. However, the maximum density may not be a true maximum but the maximum average density (see Chapter 7 for further WTWBID information).

5.4 WIPP WASTE MATERIAL PARAMETER ROLLUPS

The waste material parameters that are inputs into the SPM process and PA models are presented in Table 5-1 for CH-TRU waste and Table 5-2 for RH-TRU waste. These tables represent the WIPP disposal inventory of waste material parameters. These waste material parameters are the final rollups of the WIPP waste profiles in Figures 3-4 to 3-23.

5.5 UTILIZATION OF WASTE MATERIAL PARAMETER DATA IN APPLICATIONS

The waste material parameter data presented in Tables 5-1 and 5-2 must be used with certain limitations. If the "average" weight/volume (density) composition of CH-TRU and RH-TRU wastes in terms of the waste material parameters is needed then the middle column of Tables 5-1 and 5-2 labelled "Average" should be used in the calculations. If the task requires a distribution of values then the "Maximum" and "Minimum" columns should be used in conjunction with the "Average" column with the following limitations:

Table 5-1

WIPP CH-TRU Waste Material Parameter Disposal Inventory

| | | (Kg/m3) | | |
|-----------------------------|-------------------------|----------------|----------------|----------------|
| | <u>Materials</u> | <u>Maximum</u> | <u>Average</u> | <u>Minimum</u> |

Table 5-2

WIPP RH-TRU Waste Material Parameter Disposal Inventory

(Kg/m3)

| | <u>Materials</u> | <u>Maximum</u> | <u>Average</u> | <u>Minimum</u> |
|-----------------------------|-------------------------|----------------|----------------|----------------|
| Inorganics | Iron Based | 1.7E+03 | 9.4E+01 | 0.0E+00 |
| | Aluminum Based | 2.6E+02 | 1.8E+01 | 0.0E+00 |
| | Other Metals | 9.1E+02 | 1.0E+01 | 0.0E+00 |
| | Other Inorganics | 2.0E+03 | 3.1E+01 | 0.0E+00 |
| Organics | Cellulose | 9.6E+02 | 2.7E+01 | 0.0E+00 |
| | Rubber | 1.9E+02 | 4.8E+00 | 0.0E+00 |
| | Plastics | 5.5E+02 | 2.4E+01 | 0.0E+00 |
| Solidified Materials | Inorganic | 1.1E+03 | 1.3E+02 | 0.0E+00 |
| | Organic | 3.7E+00 | 1.7E-03 | 0.0E+00 |
| Soils | | 1.9E+02 | 1.8E+00 | 0.0E+00 |
| Container Materials | | | | |
| | Steel | | 447 | |
| | Plastic/Liners | | 3.2 | |
| | Lead | | 465 | |
| | Steel Plug | | 2145 | |

- The sum of all the waste material parameters in the "average" column represents the "average" weight of a cubic meter of CH-TRU or RH-TRU expected at WIPP. For instance, the "average" cubic meter of CH-TRU waste expected at WIPP is (see Table 5-1):

$$559.5 \text{ kg/m}^3 \text{ CH-TRU waste} + 173 \text{ kg/m}^3 \text{ of packaging} = 732.5 \text{ kg/m}^3$$

- The weight of packaging is not expected to vary, so if any "sampling" of distributions of densities is required, the sampling should only be on the waste part of the above equation.
- If sampling of the waste material parameters is needed, the sum of the densities of all waste material parameters sampled for any iteration **SHOULD NOT EXCEED THE AVERAGE DENSITY OF THE WASTE AS DEFINED IN THE "AVERAGE" COLUMN SUMMATION.** That is, one cannot sample on the upper range for all waste material parameters or sample all waste material parameters at the lower end of the range. By default, if some waste material parameters are sampled at higher values than the average some will have to be sampled at lower values than average so that the density of the waste always remains the same (sum of the "average" column).

The same sampling methodology, if needed, should be used for the RH-TRU waste as reported in Table 5-2.

TO OBTAIN THE TOTAL WASTE MATERIAL PARAMETER WEIGHTS FOR THE DISPOSAL INVENTORY, USERS OF THE DATA SHOULD MULTIPLE THE AVERAGE DENSITIES OF THE WASTE MATERIAL PARAMETERS FOR CH-TRU (TABLE 5-1) AND RH-TRU (TABLE 5-2) BY THE DESIGN BASIS VOLUME.

For example:

The expected (average) CH-TRU inventory of combustibles for WIPP is (Table 5-1):

$$170 \text{ kg/m}^3 \times 176,000 \text{ m}^3 \text{ (design basis)} = 29,900,000 \text{ kg combustibles}$$

For steel in CH-TRU waste:

$$83 \text{ kg/m}^3 \text{ (waste)} + 140 \text{ kg/m}^3 \text{ (container)} = 223 \text{ kg/m}^3$$

$$223 \text{ kg/m}^3 \times 176,000 \text{ m}^3 = 3,900,000 \text{ kg steel}$$

6. STORED AND PROJECTED CH-TRU AND RH-TRU INVENTORIES BY SITE

As described in Chapter 3, each waste stream from each waste generating/storage site is characterized in a waste stream profile (Appendix A). These waste stream profiles are rolled up by WMCGs for each generator/storage site. Summary tables of contact-handled and remote-handled waste volumes are provided in Tables 6-1 and 6-2. Summary profiles of waste volumes by WMCG for each site are provided in Tables 6-3 through 6-22.

7. WIPP TRANSURANIC WASTE BASELINE INVENTORY DATABASE

A WIPP Transuranic Waste Baseline Inventory Database (WTWBID) has been developed to support the Waste Isolation Pilot Plant Transuranic Waste Baseline Inventory Report (WTWBIR). This database was used to roll up the waste data and print out the various tables and reports used in the WTWBIR. The database is operated in the Microsoft Access Vs. 2.0 system.

7.1 DATABASE DESCRIPTION

The database actually consists of two databases with essentially the same primary data tables. The first database is WTWBIR.MDB. This database contains the original data submitted by the sites or agreed with the sites through discussions with WTWBIR personnel. This database is used to produce the forms in Appendix A. The second database is called REPORTS.MDB and is used to produce the tables and figures in the rest of the report. There are two databases because the basic data in WTWBIR.MDB must be manipulated to produce rational roll ups of the data for the reports and figures. These manipulations are described in this section of the report.

Each record in the database represents one waste stream as defined by a unique waste stream ID (WIPP_ID). In the case where the WTWBIR waste stream is the same as a waste stream reported in phase 2 of the MWIR, the WIPP_ID is the same as the MWIR ID (UNIQUE_WS). Some streams, primarily non mixed and a few mixed waste streams, were not reported in the MWIR. In these cases, if the site did not assign a proper ID, a WIPP_ID was assigned by the WTWBIR team.

The reports and tables produced for the WTWBIR are produced from different data sorts based on the WTWBIR-ID, Site_Name, Handling and Final_Waste_Form fields. The Site_Name refers to the sites as defined in the field WS_SITE. The Site_Name specifies the site which reported and is typically storing the waste. The generator site may differ from the storage site. The Handling field defines whether the waste is categorized as CH or RH waste. The Final_Waste_Form defines a general grouping based on the physical and chemical properties in the waste stream. These are broader waste matrix code groupings (WMCG) (Table 1-2) based generally on the MWIR treatability groups which are described in the MWIR form instructions. In Revision 0 of the WTWBIR, these Final_Waste_Forms were referred to as Matrix_Names.

The volumes are rolled up from the cumulative stored volumes and projected volumes provided by the sites. The stored volumes are based on the cumulative end of 1993 volumes in the database. Some sites provided stored volumes for 1992 and projected volumes for 1993 while other sites provided stored volumes for 1993. In order to be consistent, the stored volumes for sites that based their stored volumes on 1992 were calculated by adding the 1992 volume to the 1993 projected volume. Projected volumes were calculated by adding the volumes for 1994 through 2022.

In Table 3-5, a column was calculated to match the maximum design capacity of WIPP for CH waste. This was done by increasing all the Final_Waste_Form projected volumes proportionately, except Unknown, so that the total CH volume would equal the maximum WIPP capacity. Additional waste volume was calculated for each waste stream proportionate to the projected volumes for each stream such that the sum of the scaled volumes for contact handled waste equaled 175,600 cubic meters. Enough waste is already identified to fill the WIPP to capacity for remote handled waste.
