### ACTIVE INSTITUTIONAL CONTROLS DURING POST-CLOSURE

#### Introduction

Under the requirements of 20.4.1.500 NMAC (incorporating 40 CFR §264.118(b), the following activities identified as active institutional controls during post-closure are incorporated into the Post-Closure Plan.

The post-closure requirements of this permit include 20.4.1.500 NMAC, incorporating:

- 40 CFR §264.117(a)(1), which requires that

"Post-closure care for each hazardous waste management unit subject to the requirements of §264.117 through 264.120 must begin after completion of closure of the unit and continue for 30 years after that date..."

- 40 CFR §264.601, which requires that

"A miscellaneous unit must be...maintained and closed in a manner that will ensure protection of human health and the environment..."

- and 40 CFR §264.603, which requires that

"A miscellaneous unit that is a disposal unit must be maintained in a manner that complies with §264.601 during the post-closure care period."

The containment requirements for a disposal system for transuranic (**TRU**) radioactive wastes are defined in Title 40 CFR §191.13 (U.S. Environmental Protection Agency [**EPA**] 1993). 40 CFR §191.14 is titled Assurance Requirements. With regard to the active institutional controls aspect of Assurance Requirements, 40 CFR §191.14 states the following:

"To provide the confidence needed for long-term compliance with the requirements of §191.13, disposal of spent fuel or high-level or transuranic wastes shall be conducted in accordance with the following provisions... (a) Active institutional controls over disposal sites should be maintained for as long a period of time as is practicable after disposal; however, performance assessments that assess isolation of the wastes from the accessible environment shall not consider any contribution from active institutional controls for more than 100 years after disposal... "

40 CFR §191.12 states the following:

"Active institutional controls mean:

- 1) controlling access to a disposal site by any means other than passive institutional controls,

- 1           2)     performing maintenance operations or remedial actions at a site,
- 2           3)     controlling or cleaning up releases from a site, or
- 3           4)     monitoring parameters related to disposal system performance."

4     **Purpose:** This Permit Attachment describes the design of a system that the Permittees will  
5     implement for compliance with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR  
6     §264.118(b)) and 40 CFR §191.14(a) to control access to the Waste Isolation Pilot Plant (**WIPP**)  
7     disposal site and implement maintenance and remedial actions pertaining to the site access  
8     controls. In addition, this Permit Attachment addresses the scheduling process for control of  
9     inspection, maintenance, and periodic reporting related to long-term monitoring. Long-term  
10    monitoring addresses the monitoring of disposal system performance, as required by 40 CFR  
11    §191.14(b), and environmental monitoring, in accordance with this Permit and the Consultation  
12    and Cooperation Agreement between the U.S. Department of Energy (**DOE**) and the state of  
13    New Mexico. The scheduling process will also address evaluation of testing activities related to  
14    the permanent marker system design contained within the passive institutional controls (not  
15    required by this permit).

16    Implementation of active institutional controls at the WIPP will commence when final facility  
17    closure is achieved, as specified in Module II and Permit Attachment I. Implementation of active  
18    institutional controls marks the transition from the active life of the facility (which ends upon  
19    certification of closure) to the post-closure care period, as specified in 20.4.1.500 NMAC  
20    (incorporating 40 CFR §264 Subpart G). The Permittees will continue the imposition of active  
21    institutional controls under this Permit until NMED approves the post-closure certification  
22    specified in Module VI and Permit Attachment J.

23    Decommissioning activities include decontamination and site restoration. The decontamination  
24    effort will be completed prior to sealing of the shafts to allow disposal of all derived waste  
25    (radioactive and/or mixed waste derived from TRU/TRU-mixed waste received at the WIPP) into  
26    the repository. The implementation of active institutional controls upon certification of facility  
27    closure will prevent human intrusion into the repository. The Permittees' restoration efforts will  
28    return the land disturbed by the WIPP activities to a stable ecological state that will assimilate  
29    with the surrounding undisturbed ecosystem. Necessary exceptions to returning the site to its  
30    full pre-WIPP condition include measurements associated with long-term monitoring.

31    **Scope:** The active institutional control requirements include a means of controlling access to  
32    the site of the repository's surface footprint (the repository area projected to the surface) and  
33    maintenance, including corrective actions, for access control system components. Active control  
34    of access to the site will be exercised by the Permittees for the duration of the post-closure care  
35    period. Although the Permittees are only required to maintain active institutional controls until  
36    approval of the post-closure certification by NMED, the Permittees will continue active  
37    institutional controls for at least one hundred (100) years after final facility closure to satisfy  
38    other regulatory requirements. Control of access will prevent intrusion into the disposed waste  
39    by deep drilling or mining for natural resources. This Permit Attachment also specifies a process  
40    for scheduling activities related to the long-term monitoring of the repository. Some of the  
41    activities supporting the monitoring programs will be initiated during the active life of the facility  
42    to establish databases. These activities are planned to continue beyond closure through the  
43    time after removal of the site structures and return of the land disturbed by the WIPP activities to  
44    a stable ecological state that will assimilate with the surrounding undisturbed ecosystem. Long-

1 term monitoring requirements will be necessarily integrated with efforts toward returning the  
2 land to a stable ecological state.

3 **Background:** The WIPP was sited and designed as a research and development facility to  
4 demonstrate the safe disposal of radioactive wastes. The wastes are derived from DOE  
5 defense-related activities. Specifically, the mission of the WIPP project is to conduct research,  
6 demonstration, and siting studies relevant to the permanent disposal of TRU wastes. Most of  
7 these wastes will be contaminated with hazardous constituents, making them mixed wastes.

8 The LWA addresses the disposal phase of the WIPP project, the period following closure of the  
9 site, and the removal of the surface facilities. The LWA set aside 10,240 acres (4,144 hectares)  
10 located in Eddy County, 26 miles (42 kilometers) east of Carlsbad, New Mexico, as the WIPP  
11 site. A 277-acre (112-hectare) portion within the 10,240 acres (4,144 hectares) is bounded by a  
12 barbed wire fence. This fenced area contains the surface facilities and the mined salt piles for  
13 the WIPP site. Figure J1-1 is a cutaway illustrating the spatial relationship of the surface  
14 facilities and the underground repository.

15 Upon receipt of the necessary certifications and permits from the EPA and the New Mexico  
16 Environment Department, the Permittees will begin disposal of contact-handled (**CH**) and  
17 **remote-handled (RH)** TRU and TRU mixed waste in the WIPP. This waste emplacement and  
18 disposal phase will continue until the regulated capacity of the repository of 6,200,000 cubic feet  
19 (175,588 cubic meters) of TRU and TRU mixed waste has been reached, and as long as the  
20 Permittees comply with the requirements of the Permit. For the purposes of this Permit  
21 Attachment, this time period is assumed to be 25 years. The waste will be shipped from ~~to~~ DOE  
22 facilities across the country in specially designed transportation containers certified by the  
23 Nuclear Regulatory Commission. The transportation routes from these facilities to the WIPP  
24 have been predetermined. The CH TRU **mixed** waste will be packaged in 55-gallon (208-liter),  
25 85-gallon (320-liter), 100-gallon (379-liter) steel drums, standard waste boxes (**SWBs**), and/or  
26 ten drum overpacks (**TDOPs**). An SWB is a steel container having a free volume of  
27 approximately 65 cubic feet (1.8 cubic meters). Figure J1-2 shows the general arrangement of a  
28 seven-pack of drums and an SWB as received in a Contact-Handled Package. **RH TRU mixed**  
29 **waste inside a Remote-Handled Package is contained in one or more of the allowable**  
30 **containers described in Permit Attachment M1.**

31 Upon receipt and inspection of the waste containers in the waste handling building, the  
32 containers will be moved into the repository 2,150 feet (655 meters) below the surface. The  
33 containers will then be transported to a disposal room. (See Figure J1-1 for room and panel  
34 arrangement.) The initial seven disposal rooms are in Panel 1. Panel 1 is the first of eight  
35 panels planned to be excavated. Special supports and ground control corrective actions have  
36 been implemented in Panel 1 to ensure its stability. Upon filling an entire panel, that panel will  
37 be closed to isolate it from the rest of the repository and the ventilation system. During the  
38 period of time it takes to fill a given panel, an additional panel will be excavated. Sequential  
39 excavation of Panels 2 through 8 will ensure that these individual panels remain stable during  
40 the entire time a panel is being filled with waste. Ground control maintenance and evaluation  
41 with appropriate corrective action will be required to ensure that Panels 9 and 10 (ventilation  
42 and access drifts in the repository) remain stable.

1 Decontamination of the WIPP facility will commence with a detailed radiation survey of the  
2 entire site. Contaminated areas and equipment will be evaluated and decontaminated in  
3 accordance with applicable requirements. Where decontamination efforts identify areas that  
4 meet clean closure standards for permitted container storage units and are below radiological  
5 release criteria, routine dismantling and salvaging practices will determine the disposition of the  
6 material or equipment involved. Material and equipment that do not meet these standards and  
7 criteria will be emplaced in the access entries (Panels 9 and/or 10). Upon completion of  
8 emplacement of the contaminated facility material, the entries will be closed and the repository  
9 shafts will be sealed. Final repository closure includes sealing the shafts leading to the  
10 repository. Figure J1-3 illustrates the shaft sealing arrangement. Certification of closure will end  
11 disposal operations and initiate the post-closure care period for implementation of active  
12 institutional controls.

### 13 J1.1 Active Institutional Controls

14 Active institutional controls during post-closure consist of three elements:

- 15 C controlling access to a disposal site,
- 16 C performing maintenance operations or remedial actions at a site, and
- 17 C controlling or cleaning up releases from a site.

18 The LWA has removed the WIPP site from public use as a site for mining and other types of  
19 mineral resource extraction. Since any type of exploration activity would require authorization,  
20 the issuance of approval to intrude upon the repository is precluded by the LWA. The existence  
21 of the LWA as law permits meeting the requirements of the first element above by implementing  
22 low technology barriers. These barriers include a posted fence and active surveillance at a  
23 frequency that denies sufficient time for an individual or organization to intrude into the  
24 repository undetected using today's drilling technology. Maintenance and remedial actions at  
25 the WIPP site will be conducted by the Permittees at the time of implementing the access  
26 controls for the site. The control or cleanup of releases from the site will be conducted as part of  
27 the operational program prior to sealing of the shafts. This is necessary to ensure that all  
28 derived waste is disposed of within the repository prior to shaft sealing.

29 The Permittees shall maintain the access controls. This requirement includes the maintenance  
30 and corrective actions necessary to ensure that the fence and patrol requirements (surveillance)  
31 are met. The active institutional controls to be implemented by the Permittees after final closure  
32 are the following:

- 33 1. A fence line will be established to control access to the repository footprint area  
34 on the surface. A standard four-strand (three barbed and one unbarbed, in  
35 accordance with the Bureau of Land Management specifications) wire fence will  
36 be erected along the perimeter of the repository surface footprint. To provide  
37 access to the repository footprint during construction of the berm (which may be  
38 built in multiple sections simultaneously), the fence will have gates placed  
39 approximately midway along each of the four sides. these gates will remain  
40 locked with access controlled by the Permittees. The western gate will be 20 feet

- 1 (6 meters) wide. The remaining three gates will each be 16 feet (4.9 meters)  
2 wide. Additional fencing will be constructed where appropriate for remote  
3 locations that are used for disposal system monitoring. Such fences will meet the  
4 same construction specifications as the repository footprint perimeter fence.
- 5 2. Unpaved roadways 16 feet (4.9 meters) wide will be established along the  
6 perimeter of the barbed wire fence as well as along the WIPP site boundary.  
7 These roadways will be constructed so as to provide ready vehicle access to any  
8 point around the fenced perimeter and the site boundary. These roadways will  
9 facilitate inspection and maintenance of the fenceline and will allow visual  
10 observation of the repository footprint and the site boundary to the extent  
11 permitted by the lay of the land. These roadways will connect to the paved south  
12 access road. Roads to remote sites will also be constructed and maintained  
13 where appropriate.
- 14 3. The fence line will be posted with signs having, as a minimum, a legend reading  
15 "Danger—Unauthorized Personnel Keep Out" (20.4.1.500 NMAC (incorporating  
16 40 CFR §264.14[c])) and warning against entering the area without specific  
17 permission of the Permittees. The legend must be written in English and  
18 Spanish. The signs must be legible from a distance of at least 25 feet (7.6  
19 meters). The size of the visual warning and the spacing of the warning signs will  
20 be sufficiently large and close to ensure that one or more of the signs can be  
21 seen from any approach prior to an individual actually making contact with the  
22 fence line. In no case will the spacing be greater than 300 feet (91.5 meters).
- 23 4. The Permittees will ensure that periodic inspection and expedited corrective  
24 maintenance are conducted on the fence line, its associated warning signs, and  
25 roadways.
- 26 5. The Permittees will provide for routine periodic patrols and surveillance of all  
27 areas controlled by or under the authority of the Permittees by personnel trained  
28 in security surveillance and investigation.
- 29 6. The Permittees will implement the periodic monitoring requirements of the long-  
30 term monitoring system.
- 31 7. The Permittees will submit a Permit modification request for any proposed  
32 modifications to the active institutional controls appropriate for access control, as  
33 specified in 20.4.1.900 NMAC (incorporating 40 CFR 270.42).
- 34 8. The Permittees will immediately take appropriate action to address abnormal  
35 conditions identified during periodic surveillance and inspections. Abnormal  
36 conditions include any natural or human-caused conditions which would affect  
37 the integrity of the active institutional controls.
- 38 9. Reports addressing activities associated with the performance of the active  
39 access controls after final closure will be prepared periodically according to

1 applicable requirements by the Permittees for submittal to the appropriate  
2 regulatory and legislative authorities.

### 3 J1.1.1 Repository Footprint Fencing

4 Access to an area approximately 2,780 feet by 2,360 feet (875 meters by 720 meters) will be  
5 controlled by a four-strand barbed wire fence. A single gate will be included along each side of  
6 the fence for access. These gates will remain locked with access controlled by the Permittees.  
7 Around the perimeter of the fence, an unpaved roadway 16 feet (4.9 meters) wide will be cut to  
8 allow for patrolling of the perimeter. Figure J1-4 is an illustration of the fence line in relation to  
9 the repository footprint. Patrolling of the perimeter is based upon the need to ensure that no  
10 mining or well drilling activity is initiated that could threaten the integrity of the repository.

11 Fencing off an area larger than the disposal area footprint would not significantly reduce the risk  
12 of intrusion but would interfere with cattle grazing established prior to the LWA. The LWA states  
13 that the Secretary of Energy can allow grazing to continue where it was established prior to  
14 enactment of the LWA. Based upon current drilling technologies, discussions with local well  
15 drilling organizations, and observation of well drilling activities in the WIPP vicinity, it typically  
16 requires at least two to three days for a driller to set up a deep drilling rig and commence actual  
17 drilling operations. Attaining the 2,150-foot (655-meter) depth that would approach the  
18 repository horizon takes at least another week to 10 days. Based upon current drilling practices,  
19 patrolling the fenced area two to three times weekly would identify any potential drilling activity  
20 well before any breach of the repository could occur. Therefore, the perimeter fence will be  
21 patrolled three times weekly after final closure.

22 Construction of access control systems using higher technology than described is not required.  
23 Likewise, continuous surveillance whether human or electronic is not required.

### 24 J1.1.2 Surveillance Monitoring

25 The Permittees will conduct periodic surveillance of the site and the repository footprint during  
26 the post-closure period. Unpaved roadways around the WIPP site boundary and around the  
27 repository footprint will facilitate such surveillance. Contractual arrangements with a local  
28 organization such as the Eddy County Sheriff's Department may be established which would  
29 provide some distinct advantages. Among the advantages are the following:

- 30 C deputies are trained in patrol and surveillance activities,
- 31 C deputies are authorized to arrest members of the general public who are found to  
32 be violating trespassing laws,
- 33 C the liability associated with apprehension, attempted apprehension, or  
34 circumstances arising from attempts would remain with the Sheriff's Department,  
35 and
- 36 C the general area to be patrolled is already a part of the Sheriff's area of  
37 responsibility.

1 Surveillance will consist of drive-by patrolling around the fenced perimeter a minimum of three  
2 times per week. In the course of the patrol, particular note will be taken of the fence integrity. In  
3 addition, the locked condition of each gate will be checked to ensure that gate integrity is  
4 maintained and there is no evidence of tampering. Surveillance will also include visual  
5 observation of the entire enclosed area for any signs of human activity. Additionally, surveillance  
6 patrols will be conducted around the site boundary's perimeter for signs of unauthorized human  
7 activities. A routine summary of each month's surveillance activity will be prepared documenting  
8 the date and time of each patrol and any unusual circumstances that may have been observed.  
9 This surveillance routine will continue throughout the post-closure care period.

#### 10 J1.1.3 Maintenance and Remedial Actions

11 Anticipated maintenance and remedial action issues during the post-closure care period are  
12 minimal and should encompass such issues as

- 13 C fence and road maintenance,
- 14 C repair of any damage that occurs,
- 15 C response to evidence of potential erection of drilling equipment, and
- 16 C response to unauthorized entry into prohibited areas.

17 The Permittees will provide maintenance services within a reasonable time after the need is  
18 identified during routine patrolling activity. Any observed vandalism or unauthorized entry will be  
19 investigated and action will be taken as the circumstances warrant.

#### 20 J1.1.4 Control and Clean-up of Releases

21 The decontamination process and disposal of the derived waste will be completed prior to  
22 sealing the shafts and final facility closure. With the location of the WIPP repository at 2,150 feet  
23 (655 meters) below the surface and with panels closed and shafts sealed, the potential for  
24 releases of radioactive material or hazardous constituents following the sealing of the shafts is  
25 precluded. There will be no credible pathway for releases from the repository other than human  
26 intrusion. Routine patrols in accordance with access control requirements will preclude human  
27 intrusion into the repository during the post-closure period.

#### 28 J1.1.5 Groundwater Monitoring

29 Groundwater monitoring is the only monitoring program required by the Permit that will be  
30 conducted throughout the post-closure care period. The post-closure groundwater monitoring  
31 requirements are specified in Permit Module VI and Permit Attachment L.

#### 32 J1.2 Additional Post-Closure Activities

33 With the certification of closure of WIPP and return of the land disturbed by the WIPP activities  
34 to a stable ecological state that will assimilate with the surrounding undisturbed ecosystem,  
35 continuous occupancy of the site for operational and security purposes will cease. Any

1 additional activities will be imposed through the Post-Closure Care Permit issued by NMED after  
2 certification of closure.

### 3 J1.3 Quality Assurance

4 The quality assurance and quality control plan will be applied to the procurement of materials for  
5 and the erection of the fencelines enclosing the repository footprint. In particular, quality control  
6 inspection of the placement and tensioning of the barbed wire and chain link fabric will be  
7 applied and utilized to provide reasonable assurance that the fencing structures will function  
8 during the post-closure care period with normal maintenance.

9 Quality assurance and quality control will also be applied to the sampling and analyses  
10 supporting the environmental monitoring program. Contractors collecting samples and  
11 laboratories conducting analyses for the Permittees shall be qualified in accordance with  
12 guidelines prescribed in the most current edition of the Permittees' quality assurance program  
13 document at the time that the contracts are awarded.
