2 **VOLATILE ORGANIC COMPOUND MONITORING PLAN**

3 N-1 Introduction

4 This Permit Attachment describes the monitoring plan for volatile organic compound (**VOC**)  
5 emissions from mixed waste that may be entrained in the exhaust air from the U.S. Department  
6 of Energy (**DOE**) Waste Isolation Pilot Plant (**WIPP**) Underground Hazardous Waste Disposal  
7 Units (**HWDUs**) during the disposal phase at the facility. The purpose of VOC monitoring is to  
8 ensure compliance with the VOC action levels and limits specified in Permit Part 4. This VOC  
9 monitoring plan consists of two programs: (1) the Repository VOC Monitoring Program (**RVMP**),  
10 which assesses compliance with the action levels in Permit Part 4, Section 4.6.2.3; and (2) the  
11 Disposal Room VOC Monitoring Program (**DRVMP**) (includes ongoing disposal room VOC  
12 monitoring), which assesses compliance with the disposal room action levels and limits in  
13 Permit Part 4, Tables 4.6.3.2 and 4.4.1. This plan includes the monitoring design, a description  
14 of sampling and analysis procedures, quality assurance (**QA**) objectives, and reporting  
15 activities.

16 N-1a Background

17 The Underground HWDUs are located 2,150 feet (ft) (655 meters [m]) below ground surface, in  
18 the WIPP underground. As defined for this Permit, an Underground HWDU is a single  
19 excavated panel consisting of seven rooms and two access drifts designated for disposal of  
20 contact-handled (**CH**) and remote-handled (**RH**) transuranic (**TRU**) mixed waste. Each room is  
21 approximately 300 ft (91 m) long, 33 ft (10 m) wide, and 13 ft (4 m) high. Access drifts connect  
22 the rooms and have the same cross section. The Permittees shall dispose of TRU mixed waste  
23 in Underground HWDUs designated as Panels 1 through 8.

24 This plan addresses the following elements:

25 1. Rationale for the design of the VOC monitoring programs, based on:

- 26
- Possible pathways from WIPP during the active life of the facility
  - Demonstrating compliance with the disposal room limits by monitoring VOCs  
27 in underground disposal rooms
  - Demonstrating compliance with the ambient air monitoring action levels by  
28 monitoring VOC emissions on the surface
  - VOC sampling operations at WIPP
  - Optimum locations for sampling
- 29
- 30
- 31
- 32

33 2. Descriptions of the specific elements of the VOC monitoring programs, including:

- 34
- The type of monitoring conducted
  - Sampling locations
  - The monitoring interval
- 35
- 36

- 1                   • The specific hazardous constituents monitored
- 2                   • VOC monitoring schedule
- 3                   • Sampling equipment
- 4                   • Sampling and analytical techniques
- 5                   • Data recording/reporting procedures
- 6                   • Notification and action levels for remedial action

7 The technical basis for Disposal Room VOC Monitoring is discussed in detail in the Technical  
8 Evaluation Report for Room-Based VOC Monitoring (WRES, 2003).

### 9 N-1b Objectives of the Volatile Organic Compound Monitoring Plan

10 The CH and RH TRU mixed waste disposed in the WIPP Underground HWDUs contain VOCs  
11 which could be released from WIPP during the disposal phase of the project. This Plan  
12 describes how:

- 13           • VOCs released from waste panels will be monitored to confirm that the running annual  
14 average risk to the non-waste surface worker due to VOCs in the air emissions from  
15 the Underground HWDUs do not exceed the action levels identified in Permit Part 4,  
16 Section 4.6.2.3. and calculated from measured VOC concentrations using risk factors  
17 identified in Table 4.6.2.3. Appropriate remedial action, as specified in Permit Section  
18 4.6.2.4, will be taken if the action levels in Permit Part 4, Section 4.6.2.3 are reached.
- 19           • VOCs released from waste containers in disposal rooms will be monitored to confirm  
20 that the concentration of VOCs in the air of closed and active rooms in active panels  
21 do not exceed the VOC disposal room limits identified in Permit Part 4, Table 4.4.1.  
22 Appropriate remedial action, as specified in Permit Part 4, Section 4.6.3.3, will be  
23 taken if the original sample results are greater than or equal to the action levels in  
24 Permit Part 4, Table 4.6.3.2.

### 25 N-2 Target Volatile Organic Compounds

26 The target VOCs for repository monitoring (Station VOC-C and VOC-D) and disposal room  
27 monitoring are presented in Table N-1.

28 These target VOCs were selected because together they represent approximately 99 percent of  
29 the carcinogenic risk due to air emissions of VOCs.

### 30 N-3 Monitoring Design

31 Detailed design features of this plan are presented in this section. This plan uses available  
32 sampling and analysis techniques to measure VOC concentrations in air. Subatmospheric  
33 sample collection units are used in the Repository and Disposal Room VOC Monitoring  
34 Programs. These sample collection units are described in greater detail in Section N-4a(2).

### 35 N-3a Sampling Locations

36 Air samples will be collected at the WIPP facility to quantify airborne VOC concentrations as  
37 described in the following sections.

1 N-3a(1) Sampling Locations for Repository VOC Monitoring

2 Mine ventilation air, which could potentially be impacted by VOC emissions from the  
3 Underground HWDUs identified as Panels 1 through 8, will exit the underground through the  
4 Exhaust Shaft. Building 489 has been identified as the location of the maximum non-waste  
5 surface worker exposure. Air samples will be collected from Station VOC-C located at the west  
6 air intake for Building 489 (Figure N-1) to quantify VOCs in the ambient air. Background VOCs  
7 will be measured by sampling from Station VOC-D located at groundwater pad WQSP-4 (Figure  
8 N-1). This pad is located approximately one mile southeast (upwind based on the predominant  
9 wind direction) of the Exhaust Shaft within the WIPP facility boundary.

10 N-3a(2) Sampling Locations for Disposal Room VOC Monitoring

11 For purposes of compliance with Section 310 of Public Law 108-447, the VOC monitoring of  
12 airborne VOCs in underground disposal rooms in which waste has been emplaced will be  
13 performed as follows:

- 14 1. A sample head will be installed inside the disposal room behind the exhaust drift  
15 bulkhead and at the inlet side of the disposal room.
- 16 2. TRU mixed waste will be emplaced in the active disposal room.
- 17 3. When the active disposal room is filled, another sample head will be installed to the  
18 inlet of the filled active disposal room. (Figure N-3 and N-4)
- 19 4. The exhaust drift bulkhead will be removed and re-installed in the next disposal room  
20 so disposal activities may proceed.
- 21 5. A ventilation barrier will be installed where the bulkhead was located in the active  
22 disposal room's exhaust drift. Another ventilation barrier will be installed in the active  
23 disposal room's air inlet drift, thereby closing that active disposal room.
- 24 6. Monitoring of VOCs will continue in the now closed disposal room. Monitoring of VOCs  
25 will occur in the active disposal room and all closed disposal rooms in which waste has  
26 been emplaced until commencement of panel closure activities (i.e., completion of  
27 ventilation barriers in Room 1).

28 This sequence for installing sample locations will proceed in the remaining disposal rooms until  
29 the inlet air ventilation barrier is installed in Room 1. An inlet sampler will not be installed in  
30 Room 1 because disposal room sampling proceeds to the next panel.

31 N-3b Analytes to Be Monitored

32 The VOCs that have been identified for repository and disposal room VOC monitoring are listed  
33 in Table N-1. The analysis will focus on routine detection and quantification of these target  
34 analytes in collected samples. As part of the analytical evaluations, the presence of other  
35 compounds (i.e., non-target VOCs) will also be monitored. Some non-target VOCs may be  
36 included on the laboratory's target analyte list as additional requested analytes (**ARAs**) to gain a  
37 better understanding of potential concentrations and associated risk. The analytical laboratory  
38 will be directed to calibrate for ARAs, when necessary. The analytical laboratory will also be  
39 directed to classify and report other non-target VOCs as tentatively identified compounds (**TICs**)

1 when tentative identification can be made. The evaluation of TICs in original samples will  
2 include those concentrations that are  $\geq 10$  percent of the relative internal standard. The  
3 evaluation of ARAs only includes concentrations that are greater than or equal to the MRLs  
4 listed in Table N-2.

5 Non-target VOCs classified as ARAs or TICs meet the following criteria: (1) are listed in  
6 Appendix VIII of 40 Code of Federal Regulations (**CFR**) Part 261 (incorporated by reference in  
7 20.4.1.200 New Mexico Administrative Code (**NMAC**)), and (2) are detected in 10 percent or  
8 more of any original VOC monitoring samples collected over a 12-month timeframe. Non-target  
9 VOCs will be added, as applicable, to the analytical laboratory target analyte list for both the  
10 repository and disposal room VOC monitoring programs, unless the Permittees can justify their  
11 exclusion. Non-target VOCs reported as "unknown" by the analytical laboratory are not  
12 evaluated due to indeterminate identifications.

13 Additional requested analytes and TICs detected in the repository and disposal room VOC  
14 monitoring programs will be placed in the WIPP Operating Record and reported to the New  
15 Mexico Environment Department (**NMED**) in the Semi-Annual VOC Monitoring Report as  
16 specified in Permit Part 4, Section 4.6.2.2. As applicable, the Permittees will also report the  
17 justification for exclusion of the ARA or TIC from the target analyte list (e.g., the compound does  
18 not contribute to more than one percent of the risk; the compound persists in the background  
19 samples at similar concentrations). If new targets are required, the Permittees will submit the  
20 appropriate permit modification annually (in October) to update Table 4.6.2.3 to include the new  
21 analyte and associated recommended U.S. Environmental Protection Agency (**EPA**) risk values  
22 for the inhalation unit risk (**IUR**) and reference concentration (**RfC**). Added compounds will be  
23 included in the risk assessment described in Section N-3e(1).

#### 24 N-3c Sampling and Analysis Methods

25 The VOC monitoring programs include a comprehensive VOC monitoring program established  
26 at the facility; equipment, training, and documentation are already in place.

27 The sampling methods used for VOC monitoring are based on the concepts contained in the  
28 EPA Compendium Method TO-15 (EPA, 1999). The TO-15 sampling concept uses 6-liter  
29 passivated stainless-steel canisters to collect integrated air samples at each sample location.  
30 This conceptual method will be used as a reference for collecting the samples at WIPP. The  
31 samples will be analyzed using gas chromatography/mass spectrometry (**GC/MS**) under an  
32 established QA/quality control (**QC**) program. Laboratory analytical procedures have been  
33 developed based on the concepts contained in both TO-15 and 8260B. Section N-5 contains  
34 additional QA/QC information for this project.

35 The TO-15 method is an EPA-recognized sampling concept for VOC sampling and speciation. It  
36 can be used to provide subatmospheric samples, integrated samples, or grab samples, as well  
37 as compound quantitation for a broad range of concentrations. This sampling technique is also  
38 viable for use while analyzing the sample using other EPA methods such as 8260B.

39 For subatmospheric sampling, air is collected in an initially evacuated passivated canister.  
40 When the canister is opened to the atmosphere, the differential pressure causes the sample to  
41 flow into the canister. Flow rate and duration are regulated with a flow-restrictive inlet and flow  
42 controller. The air will pass through a particulate filter to prevent sample and equipment  
43 contamination. Passivated sampling equipment components are used to inhibit adsorption of  
44 compounds on the surfaces of the equipment. The required Method Reporting Limit (**MRL**) for

1 the RVMP is 0.2 parts per billion by volume (**ppbv**) in SCAN mode and 0.1 ppbv in SIM mode.  
2 Consequently, low concentrations can be measured. The required MRL for DRVMP is 500  
3 ppbv (0.5 parts per million by volume (**ppmv**)) to allow for reliable quantitation. The MRL is a  
4 function of instrument performance, sample preparation, sample dilution, and all steps involved  
5 in the sample analysis process. The DRVMP will employ sample collection units that will  
6 provide a subatmospheric sample within a short duration (less than 1 hour). Passivated  
7 sampling lines will be installed in the disposal room as described in Section N-3a(2) and  
8 maintained (to the degree possible) after the room is closed, until the panel associated with the  
9 room is closed. The independent lines will run from the sample inlet point to a sampling manifold  
10 located in an area accessible to sampling personnel.

11 N-3d Sampling Schedule

12 The Permittees will perform sampling on the following schedule in accordance with standard  
13 operating procedures.

14 N-3d(1) Sampling Schedule for Repository VOC Monitoring

15 Routine collection of a 24-hour time-integrated sample will be conducted two times per week.  
16 The RVMP sampling will continue until the certified closure of the last Underground HWDU.

17 N-3d(2) Sampling Schedule for Disposal Room VOC Monitoring

18 The disposal room sampling in open panels will occur once every two weeks, unless the need to  
19 increase the frequency to weekly occurs in accordance with Permit Section 4.6.3.3.

20 Beginning with Panel 3, disposal room sampling in filled panels will occur monthly until final  
21 panel closure unless an explosion-isolation wall is installed. The Permittees will sample VOCs in  
22 Room 1 of each filled panel.

23 N-3e Data Evaluation and Reporting

24 N-3e(1) Data Evaluation and Reporting for Repository VOC Monitoring

25 When the Permittees receive laboratory analytical data from an air sampling event, the data will  
26 be validated as specified in Section N-5d. After obtaining validated data from an original surface  
27 VOC monitoring sample obtained during an air sampling event, the data will be evaluated to  
28 determine whether the VOC emissions from the Underground HWDUs exceed the action levels  
29 in Permit Part 4, Section 4.6.2.3. The values are calculated in terms of excess cancer risk for  
30 compounds believed to be carcinogenic and hazard index (**HI**) for non-carcinogens as follows:

31 Calculate the carcinogenic risk for the non-waste surface worker (for each target VOC) using  
32 the following equation:

$$R_{VOCj} = \frac{Conc_{VOCj} \times EF \times ED \times IUR_{VOCj} \times 1000}{AT} \quad (N-1)$$

34 Where:

1  $R_{VOC_j}$  = Risk due to exposure to target VOC<sub>j</sub>  
2  $Conc_{VOC_j}$  = Concentration target VOC<sub>j</sub> at the receptor (mg/m<sup>3</sup>), calculated as the  
3 concentration at VOC-C (mg/m<sup>3</sup>) – the concentration at VOC-D (mg/m<sup>3</sup>)  
4  $EF$  = Exposure frequency (hours/year) = 1,920 hours per year  
5  $ED$  = Exposure duration, years = 10 years  
6  $IUR_{VOC_j}$  = Inhalation unit risk factor from Table 4.6.2.3 (µg/m<sup>3</sup>)<sup>-1</sup>  
7  $AT$  = Averaging time for carcinogens, = 613,200 hours based on 70 years  
8 1,000 = µg/mg

9 The total carcinogenic risk is then the sum of the risk due to each carcinogenic target VOC:

10 
$$\text{Total Carcinogenic Risk} = \sum_{j=1}^m R_{VOC_j} \quad (\text{N-2})$$

11 Where:

12  $\text{Total Risk must be less than } 10^{-5}$   
13  $m$  = the number of carcinogenic target VOCs

14

15 The formula for calculating the non-carcinogenic hazard index is similar:

16 
$$HI_{VOC_j} = \frac{Conc_{VOC_j} \times EF \times ED}{AT \times RfC_{VOC_j}} \quad (\text{N-3})$$

17 Where:

18  $HI_{VOC_j}$  = Hazard Index for exposure to target VOC<sub>j</sub>  
19  $Conc_{VOC_j}$  = Concentration target VOC<sub>j</sub> at the receptor (mg/m<sup>3</sup>), calculated as the  
20 concentration at VOC-C (mg/m<sup>3</sup>) – the concentration at VOC-D (mg/m<sup>3</sup>)  
21  $EF$  = Exposure frequency (hours/year) = 1,920 hours per year  
22  $ED$  = Exposure duration, years = 10 years  
23  $RfC_{VOC_j}$  = Reference concentration from Table 4.6.2.3 (mg/m<sup>3</sup>)  
24  $AT$  = Averaging time for non-carcinogens, = 87,600 hours, based on exposure duration

25 The total hazard is the sum of the hazard index due to each non-carcinogenic target VOC:

26 
$$\text{Total Hazard Index} = \sum_{j=1}^m HI_{VOC_j} \quad (\text{N-4})$$

1 Where:

2 *Hazard Index must be less than or equal to 1.0*

3 *m = the number of non-carcinogenic target VOCs*

4 The total carcinogenic risk (Equation N-2) and the total HI (Equation N-4) calculated from the  
5 surface VOC concentrations for each sampling event will be compared directly to the action  
6 levels in Permit Part 4, Section 4.6.2.3. This will establish whether any of the concentrations of  
7 VOCs in the emissions from the Underground HWDUs exceeded the risk and HI action levels at  
8 the time of the sampling.

9 As specified in Permit Part 4, the Permittees shall notify the Secretary in writing, within seven  
10 calendar days of obtaining validated analytical results, whenever the risk or HI exceeds the  
11 action levels specified in Permit Part 4, Section 4.6.2.3.

12 The surface VOC concentrations for each target VOC that is calculated for each sampling event  
13 will then be averaged with the surface VOC concentrations calculated for the air sampling  
14 events conducted during the previous 12 months. This will be considered the running annual  
15 average concentration for each target VOC. The running annual average risk and HI will be  
16 compared to action levels specified in Permit Part 4, Section 4.6.2.3. When a VOC is added to  
17 the target analyte list, the running annual average concentration will be calculated using all  
18 available data.

19 As specified in Permit Part 4, the Permittees shall notify the Secretary in writing, within seven  
20 calendar days of obtaining validated analytical results, whenever the running annual average  
21 risk or HI (calculated after each sampling event) exceeds the action levels specified in Permit  
22 Part 4, Section 4.6.2.3.

23 The Permittees will maintain a database with the VOC air sampling data and the results will be  
24 reported to the Secretary as specified in Permit Part 4.

#### 25 N-3e(2) Data Evaluation and Reporting for Disposal Room VOC Monitoring

26 When the Permittees receive laboratory analytical data from an air sampling event, the data will  
27 be validated as specified in Section N-5d. The validated data will be evaluated to determine  
28 whether the VOC concentrations in the air of any closed room, the active open room, or the  
29 immediately adjacent closed room exceeded the Action Levels for DRVMP specified in Permit  
30 Part 4, Table 4.6.3.2.

31 The Permittees shall notify the Secretary in writing, within seven calendar days of obtaining  
32 validated analytical results, whenever the concentration of any VOC specified in Permit Part 4,  
33 Table 4.4.1 exceeds the action levels specified in Permit Part 4, Table 4.6.3.2.

34 The Permittees shall submit to the Secretary the Semi-Annual VOC Monitoring Report specified  
35 in Permit Section 4.6.2.2 that also includes results from disposal room VOC monitoring.

#### 36 N-4 Sampling and Analysis Procedures

37 This section describes the equipment and procedures that will be implemented during sample  
38 collection and analysis activities for VOCs at WIPP.

1 N-4a Sampling Equipment

2 The sampling equipment that will be used includes: 6-liter (L) stainless-steel passivated  
3 canisters, passive air sampling kits (**PASKs**), subatmospheric sampling assemblies, passivated  
4 stainless-steel tubing, and one or more in-line filters. A discussion of each of these items is  
5 presented below.

6 N-4a(1) Sample Canisters

7 Six-liter, stainless-steel canisters with passivated interior surfaces will be used to collect and  
8 store all ambient air and disposal room samples for VOC analyses collected as part of the  
9 monitoring processes. These canisters will be cleaned and certified (batch certification  
10 acceptable for disposal room monitoring) prior to their use, in a manner similar to that described  
11 by Compendium Method TO-15. The canisters will be certified clean to below the required  
12 reporting limits for the VOC analytical method for the target VOCs. The vacuum of certified  
13 clean canisters will be verified as adequate upon initiation of a sample cycle as described in  
14 standard operating procedures (**SOPs**). The sample canisters are initially evacuated at the  
15 analytical laboratory to <0.05 mm Hg (50 mtorr).

16 N-4a(2) Sample Collection Units

17 The sample collection unit for surface VOC samples is a commercially available PASK  
18 comprised of components that regulate the rate and duration of air flow into a sample canister.  
19 It can be operated either manually, using canister valves, or unattended, using a programmable  
20 timer.

21 The sample collection unit for disposal room VOC monitoring is a subatmospheric sampling  
22 assembly that regulates the rate and duration of air flow into a sample canister. The  
23 subatmospheric sampling assembly also allows for purging of sample lines to ensure that a  
24 representative sample is collected.

25 Sample collection units will use passivated components for the sample flow path. When sample  
26 canisters installed on sample collection units are opened to the atmosphere, the differential  
27 pressure causes the sample to flow into the canister at a regulated rate. By the end of each  
28 sampling period, the canisters will be near atmospheric pressure. Detailed instructions on  
29 sample collection will be given in SOPs. A conceptual diagram of the VOC sample collection  
30 units are provided in Figure N-2.

31 N-4a(3) Sample Tubing

32 The tubing used as a sample path is comprised of passivated stainless-steel to prevent the  
33 inner walls from absorbing sample constituents and/or contaminants when they are pulled from  
34 the sample point to the sample collection unit.

35 N-4b Sample Collection

36 Sample collection for VOCs at the WIPP facility will be conducted in accordance with written  
37 SOPs that are kept on file at the facility. These SOPs will specify the steps necessary to ensure  
38 the collection of samples that are of acceptable quality to meet the applicable data quality  
39 objectives in Section N-5.

1 Repository VOC samples will be 24 -hour time-integrated samples for each sampling event.  
2 Alternative sampling durations may be defined for assessment purposes and to meet the data  
3 quality objectives. The selection of sampling days will be specified in SOPs and will be  
4 alternated from week-to-week in order to avoid potential bias created by plant operations.

5 Sample flow for the PASK will be set using an in-line mass flow controller. The flow controllers  
6 are initially factory-calibrated and specify a typical accuracy of better than 10 percent full scale.  
7 Additionally, each air flow controller is calibrated at a manufacturer-specified frequency using a  
8 National Institute of Standards and Technology (**NIST**) primary flow standard.

9 To verify the matrix similarity and assess field sampling precision, field duplicate samples will be  
10 collected (two canisters filled simultaneously) for each VOC monitoring program at an overall  
11 frequency of at least 5 percent (see Section N-5a).

12 Prior to collecting the active open disposal room and closed room samples, the sample lines are  
13 purged to ensure that the air collected is not air that has been stagnant in the tubing. This is  
14 important in regard to the disposal room sample because of the long lengths of tubing  
15 associated with these samples.

#### 16 N-4c Sample Management

17 Field sampling data sheets will be used to document the sampler conditions under which each  
18 sample is collected. These data sheets have been developed specifically for VOC monitoring at  
19 the WIPP facility. The individuals assigned to collect the specific samples will be required to fill  
20 in all of the appropriate sample data and to maintain this record in sample logbooks. The  
21 program team leader will review these forms for each sampling event.

22 All sample containers will be marked with identification at the time of collection of the sample. A  
23 Request-for-Analysis Form will be completed to identify the sample canister number(s), sample  
24 type and type of analysis requested.

25 All samples will be maintained, and shipped if necessary, at ambient temperatures. Collected  
26 samples will be transported in appropriate containers. Prior to leaving the underground for  
27 analysis, sample containers may undergo radiological screening, which will ensure that  
28 contaminated samples or equipment will not be transported to the surface. Samples will not be  
29 accepted by the receiving laboratory personnel unless they are properly labeled and sealed to  
30 ensure a tamper-free shipment.

31 An important component of the sampling program is a demonstration that collected samples  
32 were obtained from the locations stated and that they reached the laboratory without alteration.  
33 To satisfy this requirement, evidence of collection, shipment, laboratory receipt, and custody will  
34 be documented with a completed Chain-of-Custody Form. Chain-of-custody procedures will be  
35 followed closely, and additional requirements imposed by the laboratory for sample analysis will  
36 be included as necessary.

37 Individuals collecting samples will be responsible for the initiation of custody procedures. The  
38 chain of custody will include documentation as to the canister certification, location of sampling  
39 event, time, date, and the name of the individual handling the samples. Deviations from  
40 procedure will be considered variances. Variances must be preapproved by the program  
41 manager and recorded in the project files. Unintentional deviations, sampler malfunctions, and  
42 other problems are nonconformances. Nonconformances must be documented and recorded in

1 the project files. All field logbooks/data sheets must be incorporated into WIPP's records  
2 management program.

### 3 N-4d Maintenance of Sample Collection Units

4 Periodic maintenance for sample collection units and associated equipment will be performed  
5 as needed. This maintenance may include cleaning, replacement of damaged or malfunctioning  
6 parts, and leak testing. Additionally, complete spare sample collection units will be maintained  
7 on-site to minimize downtime because of equipment malfunction.

### 8 N-4e Analytical Procedures

9 Analytical procedures used in the analysis of VOC samples from canisters are based on  
10 concepts contained in Compendium Method TO-15 (EPA, 1999) and in SW-846 Method 8260B  
11 (EPA, 1996).

12 Analysis of samples will be performed by a certified laboratory. Methods will be specified in  
13 procurement documents and will be selected to be consistent with Compendium Method TO-15  
14 (EPA, 1999) or EPA recommended procedures in SW-846 (EPA, 1996). Additional detail on  
15 analytical techniques and methods will be given in laboratory SOPs.

16 The Permittees will establish the criteria for laboratory selection, including the stipulation that  
17 the laboratory follow the procedures specified in the appropriate Air Compendium or SW-846  
18 method and that the laboratory follow EPA protocols. The selected laboratory shall demonstrate,  
19 through laboratory SOPs, that it will follow appropriate EPA SW-846 requirements and the  
20 requirements specified by the EPA Air Compendium protocols. The laboratory shall also provide  
21 documentation to the Permittees describing the sensitivity of laboratory instrumentation. This  
22 documentation will be retained in the facility operating record and will be available for review  
23 upon request by NMED.

24 The SOPs for the laboratory currently under contract will be maintained in the operating record  
25 by the Permittees. The Permittees will provide NMED with an initial set of applicable laboratory  
26 SOPs for information purposes, and provide NMED with any updated SOPs on an annual basis  
27 by January 31.

28 Data validation will be performed by the Permittees. Copies of the data validation report will be  
29 kept on file in the operating record for review upon request by NMED.

### 30 N-5 Quality Assurance

31 The QA activities for the VOC monitoring programs will be conducted in accordance with the  
32 documents: *EPA Guidance for Quality Assurance Project Plans QA/G-5* (EPA, 2002) and the  
33 *EPA Requirements for Preparing Quality Assurance Project Plans, QA/R-5* (EPA, 2001). The  
34 QA criteria for the VOC monitoring programs are listed in Table N-2. This section addresses the  
35 methods to be used to evaluate the components of the measurement system and how this  
36 evaluation will be used to assess data quality. The QA limits for the sampling procedures and  
37 laboratory analysis shall be in accordance with the limits set forth in the specific EPA Method  
38 referenced in standard operating procedures employed by either the Permittees or the  
39 laboratory. The Permittees standard operating procedures will be in the facility Operating  
40 Record and available for review by NMED at anytime. The laboratory standard operating

1 procedures will also be in the facility Operating Record and will be supplied to the NMED as  
2 indicated in Section N-4e.

3 N-5a Quality Assurance Objectives for the Measurement of Precision, Accuracy, Sensitivity,  
4 and Completeness

5 QA objectives for this plan will be defined in terms of the following data quality parameters.

6 **Precision.** For the duration of this program, precision will be defined and evaluated by the RPD  
7 values calculated between field duplicate samples and between laboratory duplicate samples.

$$8 \quad RPD = \left( \frac{(A - B)}{(A + B)/2} \right) * 100 \quad (N-5)$$

9 where: A = Original sample result

10 B = Duplicate sample result

11 **Accuracy.** Analytical accuracy will be defined and evaluated through the use of analytical  
12 standards. Because recovery standards cannot reliably be added to the sampling stream,  
13 overall system accuracy will be based on analytical instrument performance evaluation criteria.  
14 These criteria will include performance verification for instrument calibrations, laboratory control  
15 samples, sample surrogate recoveries (when required by method or laboratory SOPs), and  
16 sample internal standard areas. Use of the appropriate criteria as determined by the analytical  
17 method performed, will constitute the verification of accuracy for target analyte quantitation  
18 (i.e., quantitative accuracy). Evaluation of standard ion abundance criteria for BFB will be used  
19 to evaluate the accuracy of the analytical system in the identification of targeted analytes, as  
20 well as the evaluation of unknown contaminants (i.e., qualitative accuracy).

21 **Sensitivity.** Sensitivity will be defined by the required MRLs for the program. Attainment of  
22 required MRLs will be verified by the performance of statistical method detection limit (**MDL**)  
23 studies in accordance with 40 *Code of Federal Regulations* §136. The MDL represents the  
24 minimum concentration that can be measured and reported with 99 percent confidence that the  
25 analyte concentration is greater than zero. An MDL study will be performed by the program  
26 analytical laboratory prior to sampling and analysis, and annually thereafter.

27 **Completeness.** Completeness will be defined as the percentage of the ratio of the number of  
28 valid sample results received (i.e., those which meet data quality objectives) versus the total  
29 number of samples collected. Completeness may be affected, for example, by sample loss or  
30 destruction during shipping, by laboratory sample handling errors, or by rejection of analytical  
31 data during data validation.

32 N-5a(1) Evaluation of Laboratory Precision

33 Laboratory sample duplicates and blank spike/blank spike duplicates (**BS/BSD**) will be used to  
34 evaluate laboratory precision. QA objectives for laboratory precision are listed in Table N-2, and  
35 are based on precision criteria proposed by the EPA for canister sampling programs (EPA,  
36 1991). These values will be appropriate for the evaluation of samples with little or no matrix  
37 effects. Because of the potentially high level of salt-type aerosols in the WIPP underground  
38 environment, the analytical precision achieved for WIPP samples may vary with respect to the

1 EPA criteria. RPDs for BS/BSD analyses will be tracked through the use of control charts. RPDs  
2 obtained for laboratory sample duplicates will be compared to those obtained for BS/BSDs to  
3 ascertain any sample matrix effects on analytical precision. BS/BSDs and laboratory sample  
4 duplicates will be analyzed at a frequency of 10 percent, or one per analytical lot, whichever is  
5 more frequent.

#### 6 N-5a(2) Evaluation of Field Precision

7 Field duplicate samples will be collected at a frequency of at least 5 percent for the RVMP and  
8 at least 5 percent for the DRVMP. The data quality objective for field precision is 35 percent for  
9 each set of field duplicate samples.

#### 10 N-5a(3) Evaluation of Laboratory Accuracy

11 Quantitative analytical accuracy will be evaluated through performance criteria on the basis of  
12 (1) relative response factors generated during instrument calibration, (2) analysis of laboratory  
13 control samples (**LCS**), and (3) recovery of internal standard compounds. The criteria for the  
14 initial calibration (5-point calibration) is  $\leq 30$  percent relative standard deviation for target  
15 analytes. After the successful completion of the 5-point calibration, it is sufficient to analyze only  
16 a midpoint standard for every 24 hours of operation. The midpoint standard will pass a 30  
17 percent difference acceptance criterion for each target compound before sample analysis may  
18 begin.

19 A blank spike or LCS is an internal QC sample generated by the analytical laboratory by spiking  
20 a standard air matrix (humid zero air) with a known amount of a certified reference gas. The  
21 reference gas will contain the target VOCs at known concentrations. Percent recoveries for the  
22 target VOCs will be calculated for each LCS relative to the reference concentrations. Objectives  
23 for percent recovery are listed in Table N-2, and are based on accuracy criteria proposed by the  
24 EPA for canister sampling programs (EPA, 1991). LCSs will be analyzed at a frequency of 10  
25 percent, or one per analytical lot, whichever is more frequent.

26 Internal standards will be introduced into each sample analyzed, and will be monitored as a  
27 verification of stable instrument performance. In the absence of any unusual interferences,  
28 areas should not change by more than 40 percent over a 24-hour period. Deviations larger than  
29 40 percent are an indication of a potential instrument malfunction. If an internal standard area in  
30 a given sample changes by more than 40 percent, the sample will be reanalyzed. If the 40  
31 percent criterion is not achieved during the reanalysis, the instrument will undergo a  
32 performance check and the midpoint standard will be reanalyzed to verify proper operation.  
33 Response and recovery of internal standards will also be compared between samples, LCSs,  
34 and calibration standards to identify any matrix effects on analytical accuracy.

#### 35 N-5a(4) Evaluation of Sensitivity

36 The presence of aerosol salts in underground locations may affect the MDL of the samples  
37 collected in those areas. The sample inlet of these sample collection units will be protected  
38 sufficiently from the underground environment to minimize salt aerosol interference. Up to two  
39 filters, inert to VOCs, will be installed in the sample flow path to minimize particulate  
40 interference.

41 The MDL for each of the target VOCs will be evaluated by the analytical laboratories before  
42 sampling begins. The initial and annual MDL evaluation will be performed in accordance with 40

1 *Code of Federal Regulations* §136, and with EPA/530-SW-90-021, as revised and retitled,  
2 “Quality Assurance and Quality Control” (Chapter 1 of SW-846) (1996).

3 N-5a(5) Completeness

4 The expected completeness for this program is greater than or equal to 95 percent. Data  
5 completeness will be tracked monthly.

6 N-5b Sample Handling and Custody Procedures

7 Sample packaging, shipping, and custody procedures are addressed in Section N-4c.

8 N-5c Calibration Procedures and Frequency

9 Calibration procedures and frequencies for analytical instrumentation are listed in Section N-4e.

10 N-5d Data Reduction, Validation, and Reporting

11 Field sampling data sheets will contain documentation of all pertinent data for the sampling and  
12 will at a minimum include the following; sample identification, sample location, sample collection  
13 date, initial vacuum, ending vacuum, collection start and collection stop time, flow rate and  
14 ambient temperature.

15 Data validation procedures will include at a minimum, a check of all field data sheets for  
16 completeness and correctness. Sample custody and analysis records will be reviewed by the  
17 analytical laboratory QA officer and the analytical laboratory supervisor at a frequency of at least  
18 10 percent.

19 Electronic Data Deliverables (**EDDs**) are provided by the laboratory prior to receipt of hard copy  
20 data packages. EDDs will be evaluated within five calendar days of receipt to determine if VOC  
21 concentrations are at or above action levels in Permit Part 4, Section 4.6.3.2 for disposal room  
22 VOC monitoring data, or the action levels specified in Permit Part 4, Section 4.6.2.3 for  
23 repository monitoring data. If the EDD indicates that VOC concentrations are at or above these  
24 action levels or concentrations, the hard copy data package will be validated within five calendar  
25 days as opposed to the 14 calendar day time frame.

26 Data will be reported as specified in Section N-3(e) and Permit Part 4.

27 Acceptable data for this VOC monitoring plan will meet stated precision and accuracy criteria.  
28 The QA objectives for precision, accuracy, and completeness as shown in Table N-2 can be  
29 achieved when established methods of analyses are used as proposed in this plan and  
30 standard sample matrices are being assessed.

31 N-5e Performance and System Audits

32 The Permittees will evaluate whether the monitoring systems and analytical methods are  
33 functioning properly through performance and system audits. The assessment period will be  
34 determined by the Permittees. System audits will initially address start-up functions for each  
35 phase of the project. These audits will consist of on-site evaluation of materials and equipment,  
36 review of certifications for canisters and measurement and test equipment, review of laboratory  
37 qualification and operation and, at the request of the QA officer, an on-site audit of the

laboratory facilities. The function of the system audit is to verify that the requirements in this plan have been met prior to initiating the program. System audits will be performed at or shortly after the initiation of the VOC monitoring programs and on an annual basis thereafter.

Performance audits will be accomplished as necessary through the evaluation of analytical QC data by performing periodic site audits throughout the duration of the project, and through the introduction of third-party audit cylinders (laboratory blinds) into the analytical sampling stream. Performance audits will also include a surveillance/review of data associated with canister certifications and measurement and test equipment, a project-specific technical audit of field operations, and a laboratory performance audit. Field logs, logbooks, and data sheets, as applicable will be reviewed during data validation. Blind-audit canisters will be introduced once during the sampling period. Details concerning scheduling, personnel, and data quality evaluation are addressed in the QAPjP.

By May 1, 2016 the Permittees shall develop and implement a RVMP Laboratory Performance Evaluation Plan (**LPEP**) that has been reviewed and approved by the Secretary prior to use, for Repository VOC ambient monitoring. In addition to the timely submittal of validated data packages under this LPEP to the Secretary, the results shall also be reported annually in the October Semi- Annual VOC Monitoring Report. The second contract laboratory performing the performance evaluation to be used for comparison to the primary contract laboratory shall use the required MRLs as required in Table N-2, which are defined to be equivalent to the CRQLs. Any contract laboratory involved in this program shall have a site specific quality assurance project plan and an associated QA/QC program that are acceptable and aligned with EPA guidance. The LPEP shall, at a minimum, include the following sections:

1. Table of Contents
2. Introduction
3. Background
4. Scope/Objectives: this section shall include comparative testing of subatmospheric sampling containers, the field background canisters, and a test of the cleanliness of the canister less than the SIM mode MRL in Table N-2.
5. Laboratory Specific SOPs
6. Sampling Methodologies
7. Analytical Methodologies
8. Quality Assurance Requirements
9. Schedules
10. Reporting: data packages shall contain all applicable sections found in the document "*Statement-of-Work for the Analysis of Air Toxics from Superfund Sites*" (EPA 1990), Exhibit B, Section 2, "*Reporting Requirements and Order of Data Deliverables*" and as approved by the Secretary.

As an alternative to the LPEP, the Permittees will notify the Secretary of their intention to require the contract laboratory to participate in proficiency testing. The Permittees will then, within 90 days, submit to the NMED for approval, a proposal for proficiency testing. If the Permittees are unable to develop a proficiency testing plan that is acceptable to the NMED, then the Permittees will prepare and submit the LPEP. The proposal for proficiency testing will include the following, as applicable:

- Specific analytical method(s)
- Schedule for proficiency testing implementation

- 1 • Provision for the periodic reporting of proficiency testing results and corrective actions, if  
2 any

3 Results of proficiency testing will be reported in the Semi-Annual VOC Monitoring Report as  
4 specified in Permit Part 4, Section 4.6.2.2.

#### 5 N-5f Preventive Maintenance

6 Maintenance of sample collection units is described briefly in Section N-4d Maintenance of  
7 analytical equipment will be addressed in the analytical laboratory SOP.

#### 8 N-5g Corrective Actions

9 If the required completeness of valid data (95 percent) is not maintained, corrective action may  
10 be required. Corrective action for field sampling activities may include recertification and  
11 cleaning of sample collection units, reanalysis of samples, additional training of personnel,  
12 modification to field and laboratory procedures, and recalibration of measurement and test  
13 equipment.

14 Laboratory corrective actions may be required to maintain data quality. The laboratory  
15 continuing calibration criteria indicate the relative response factor for the midpoint standard will  
16 be less than 30 percent different from the mean relative response factor for the initial calibration.  
17 Differences greater than 30 percent will require recalibration of the instrument before samples  
18 can be analyzed. If the internal standard areas in a sample change by more than 40 percent,  
19 the sample will be reanalyzed. If the 40 percent criterion is not achieved during the reanalysis,  
20 the instrument will undergo a performance check and the midpoint standard will be reanalyzed  
21 to verify proper operation. Deviations larger than 40 percent may indicate instrument  
22 malfunction.

23 The laboratory results for samples, duplicate analyses, LCSs, and blanks should routinely be  
24 within the QC limits. If results exceed control limits, the reason for the nonconformances and  
25 appropriate corrective action must be identified and implemented.

#### 26 N-5h Records Management

27 The VOC Monitoring Programs will require administration of record files (both laboratory and  
28 field data collection files). The records control systems will provide adequate control and  
29 retention for program-related information. Records administration, including QA records, will be  
30 conducted in accordance with applicable DOE, MOC, and WIPP requirements.

31 Unless otherwise specified, VOC monitoring plan records will be retained as lifetime records.  
32 Temporary and permanent storage of QA records will occur in facilities that prevent damage  
33 from temperature, fire, moisture, pressure, excessive light, and electromagnetic fields. Access  
34 to stored VOC Monitoring Program QA Records will be controlled and documented to prevent  
35 unauthorized use or alteration of completed records.

36 Revisions to completed records (i.e., as a result of audits or data validation procedures) may be  
37 made only with the approval of the responsible program manager and in accordance with  
38 applicable QA procedures. Records of project activities will be maintained at the WIPP site.  
39 Documentation will be available for inspection by internal and external auditors.

1 N-6 Sampling and Analysis Procedures for Disposal Room VOC Monitoring in Filled Panels

2 Disposal room VOC samples in filled panels will be collected using the subatmospheric  
3 pressure grab sampling technique described in Compendium Method TO-15 (EPA, 1999). This  
4 method uses an evacuated passivated canister (or equivalent) that is under vacuum (0.05 mm  
5 Hg) to draw the air sample from the sample lines into the canister. The sample lines will be  
6 purged prior to sampling to ensure that a representative sample is collected. The passivation of  
7 tubing and canisters used for VOC sampling effectively seals the inner walls and prevents  
8 compounds from being retained on the surfaces of the equipment. By the end of each sampling  
9 period, the canisters will be near atmospheric pressure.

10 The analytical procedures for disposal room VOC monitoring in filled panels are the same as  
11 specified in Section N-4e.
